7.1 Variation in Trip Rate-Weekday Versus Weekend

Table 7-9 indicates the variation in vehicle trip rate by day of week. The average household trip rate was highest on Saturdays. The average auto occupancy was also highest on Saturdays. However, the average vehicle trip rate was highest on a weekday (Tuesday). Weekday vehicle trip rate on any given day was higher than vehicle trip rate for Saturday or Sunday. Freeway traffic counts for the Valley indicate more volumes during weekdays than during weekends.

Vehicle Trip Rate by Day of Week			
Travel Day	Average Household Trip Rate by Day of Week	Average Occupancy by Day of Week	Average Vehicle Trip Rate by Day of Week
Sunday	9.26	2.49	3.72
Monday	9.05	1.98	4.57
Tuesday	11.04	1.52	7.26
Wednesday	11.09	1.83	6.06
Thursday	8.52	2.11	4.04
Friday	10.89	2.04	5.34
Saturday	13.67	3.44	3.97

Locations Table

1. All home locations were geo-coded.
2. About ninety-five percent of work and school locations were geo-coded.

Trips Table

1. Based upon weighted data, Auto continues to be a dominant mode of transportation. Walk trips constitute 9 percent of overall trips (but not all of these trips are modeled), while bike trips constituted about 1 percent of overall trips. The transit share of trips is slightly above 1 percent.
2. Overall auto occupancy is higher in 2008-2009 NHTS than when compared to 2001 MAG household travel survey. NHTS captured a much higher rate of HOV travel than the MAG 2001 household travel survey.
3. Work trips constitute a lower percentage of overall trips in 2008-2009 than when compared to 2001 MAG household travel survey.
4. Average trip length between home and work has increased between 2001 MAG household travel survey and 2008-2009 National Household Travel Survey dataset for MAG. The average (reported) trip length increased to 12.92 miles (weighted data for weekday) in 2008 NHTS from 10.6 miles (estimated) in 2001 survey.
5. The average daily household trip rate (weighted) in 2008 travel survey (10.50) is higher than the corresponding value in 2001 household travel survey (7.38).
6. The average vehicle occupancy (weighted) was higher during the weekends (3.44 on Saturday and 2.49 on Sunday) than during weekdays (1.88).
7. The average person trip rate was highest during a weekend and the average auto occupancy was highest during a weekend. However, the average vehicle trip rate was the highest during the weekday.

10.2 Conclusions

Data from the NHTS Add-on surveys have been successfully used for travel demand models estimation and calibration. Data quality was either comparable to or exceeded that of similar surveys and was suitable for its intended applications. The data set contains necessary details and is easy to work with. Data imputation was required (example, for school locations) and warrants consideration of innovative GPS-based approaches.

The performed analysis demonstrated general applicability of the survey data for analytical purposes as well as for the purposes of models estimation, calibration and validation. A few issues with the survey data were identified and analyzed. The survey had a relatively small sample of transit users, thus its applicability for some of transit modeling tasks is questionable.

Segments like low-income households and Hispanic households were under-sampled. Targeted effort to reach these population groups will be required in future regional travel surveys. Pilot studies could be recommended prior to the original survey, concentrating on these household segments. For the 2008 NHTS, there is no record of any pilot study in the literature provided to MAG.

The NHTS survey tour/trip production rates were found to be comparable to other surveys. Overall 2008 Add-on NHTS survey data proved to be a valuable dataset suitable for advanced transportation modeling, planning and analytical work. Emerging GPS-based methodologies should be carefully considered for future survey efforts in order to support advanced transportation models and analyses.

The average reported trip duration was 20 minutes. As shown in Table T-17, 70% of all trips were 20 minutes or shorter. Trips by Transit tended to be the longest, while those by walk and bike were the shortest. Tables T-18 through T-22 show the reported trip durations by mode for the standard trip purposes.

Figure 7-10 shows the frequency distribution of all trips by trip duration. About 65 percent of all reported trips have duration of at the most 15 minutes. Similarly, *Figure 7-11* shows the frequency distribution of all trips by trip length. About 42 percent of all reported trips have a trip length of at the most 3 miles. From the NHTS data, the average reported trip length for HBW trip (all days) was about 12.61 miles.

Note: The 2035 road network includes all of the improvements from the RTP except the proposed action.

Operational Performance of Freeways in the MAG Region

The previous section concluded that traffic volumes would increase between 2010 and 2035 because of increases in capacity (additional lanes) and demand (additional VMT). This section presents the analytical results addressing how these changes in traffic volumes would affect system efficiency in terms of level of service (LOS). The analysis focuses on the region's freeway system and presents the duration of LOS E or F (congested conditions) as modeled by the MAG regional travel demand model. The duration of LOS E or F conditions is determined by comparing the ratio of the projected traffic volume to the capacity (2,030 vehicles per hour per lane) of the freeway segment as presented in Table 10. Figures 3 and 4 present the morning (AM) peak travel period results for 2010 and 2035, respectively. Figures 5 and 6 present the evening (PM) peak travel period results for 2010 and 2035, respectively.

Table 10. Duration LOS E or F as Volume-to-Capacity Ratio

Volume-to-Capacity Ratio	Duration LOS E or F
≤ 0.86	no congestion
> 0.86 to 1.01	less than 2 hours
> 1.01 to 1.06	from 2 to 3 hours
> 1.06	greater than 3 hours

SWCA Comments on ADOT South Mountain Freeway Draft EIS (April 2013) Prepared for PARC et al.

ADEQUACY OF THE NEPA ANALYSIS

	Chapter	Section/Subsection	Page(s)	Resource Area	Comment
219	1	All	1-22	General NEPA – Purpose and Need	Chapter 1 of the DEIS, *Purpose and Need*, presents a lengthy and elaborate explanation of the need for the proposed freeway ("as recognized in over 25 years of transportation planning") based on Phoenix area growth rates from 1950 to the present day coupled with MAG growth projections to 2035. However, even if one accepts these future growth projections as reasonably accurate and that the "need" is real, there is nothing in the stated "purpose" to demonstrate why the proposed freeway remedy must be built within the selected Study Area and nowhere else. In short, other reasonable alternatives exist that could also fulfill the stated Purpose and Need, but these have been arbitrarily excluded from detailed analysis in violation of 40 CFR 1502.14. (Also see question/answer 2a of "Forty Most Asked Questions Concerning CEQ's NEPA Regulations": "In determining the scope of alternatives to be considered, the emphasis is on what is 'reasonable' rather than on whether the proponent or applicant likes or is itself capable of carrying out a particular alternative. Reasonable alternatives include those that are practical or feasible from the technical and economic standpoint and using common sense, rather than simply desirable from the standpoint of the applicant.")
220	1	All	1-22	General NEPA – Study Area	NEPA requires that the EIS "Rigorously explore and objectively evaluate all reasonable alternatives [emphasis added]," including those "not within the jurisdiction of the lead agency" (40 CFR 1502.14(a) and (c)). In reviewing the April 2013 South Mountain Freeway (Loop 202) Draft Environmental Impact Statement and Section 4(f) Evaluation, we find no technical or scientific rationale or justification presented as to why the project Study Area comprises the precise area it does. Why is it declared to fall along these particular boundaries and not others? The impression is that these boundaries were drawn for political and procedural reasons to comport with MAG's and ADOT's previous planning efforts, rather than to allow a comprehensive, objective NEPA assessment. Specifically, this Study Area appears configured so as to exclude freeway alternatives further south or west (including potential alternatives in Pinal or Pima Counties), thus deliberately avoiding evaluation of other "reasonable alternatives" to the Pecos Road alignment.
221				General NEPA – Omitted, Outdated, and Inaccurate Information Used as Basis for Impact Analysis and Public Comment	Standard practice in preparing NEPA documents, per CEQ regulations at 40 CFR 1502.24 ("Methodology and Scientific Accuracy"), is to use, and to present to the public, the "best available" scientific and technical information. Moreover, in accordance with Section 515 of the Treasury and General Government Appropriations Act for Fiscal Year 2001 (Public Law 106-554; H.R. 5658), the federal Office of Management and Budget (OMB) issued Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by Federal Agencies, which state they are "designed to help agencies ensure and maximize the quality, utility, objectivity and integrity of the information that they disseminate (meaning to share with, or give access to, the public)" and, furthermore, that "It is crucial that information Federal agencies disseminate meets these guidelines." (OMB 2002) It is our assessment that ADOT has failed in the *South Mountain Freeway (Loop 202) Draft Environmental Impact Statement and Section 4(f) Evaluation* to present to the public the "best available" scientific and technical information. This is particularly true of the following resources and associated impact analyses. Air Quality: • The data presented in Figure 4-18 *Comparison of National Economic and Demographic Growth Indicators and Air Emissions, 1970-2005*, is outdated. The U.S. EPA website http://www.epa.gov/airtrends/aqtrends.html#comparison provides data through 2011. • The subsection fails to include a discussion of more recent ambient monitoring data for calendar years 2011 and 2012. The *MCAQD 2011 Air Monitoring Network Review* is readily available (http://www.maricopa.gov/aq/divisions/monitoring/docs/pdf/2011_Network_Assessment.pdf) and should have been employed in the analysis. Furthermore, the most recent available ambient monitoring data from 2012 should have been incorporated into the DEIS. These data are available at: http://www.epa.gov/airdata/. • Figure 4-20 *Nonattainment Areas for Particulate Matter, Carbon Monoxide, and Ozone, Maricopa County*, is not up-to-date.
222	All	All	All		

1

Code	Issue	Response
219	**Purpose and Need**	As discussed beginning on page 1-11 of the Draft Environmental Impact Statement, the proposed action is needed to serve projected growth in population and accompanying transportation demand and to correct existing and projected transportation system deficiencies. The analyses in the Draft Environmental Impact Statement used socioeconomic and traffic projections at the regional analysis zone and traffic analysis zone levels. At the time of publication of the Draft Environmental Impact Statement, Census 2010-based socioeconomic data at the regional analysis zone and traffic analysis zone levels had not been adopted by the Maricopa Association of Governments and were not available to the project team. Therefore, the data used in the Draft Environmental Impact Statement were the most appropriate information available. As presented in text beginning on page 3-1 of the Draft Environmental Impact Statement, a comprehensive alternatives development and screening process was undertaken that represented an objective, defensible, and fully disclosed logical, sequential, step-by-step process using data and expertise from multiple disciplines applied to a comprehensive set of alternatives to establish the appropriate range of reasonable alternatives for detailed study in the Draft Environmental Impact Statement. The Maricopa Association of Governments approved new population, employment, housing, and traffic projections in June 2013. The new data are presented in the Final Environmental Impact Statement beginning on page 1-11. The purpose and need and analysis of alternatives were updated and reevaluated using these new socioeconomic projections and corresponding projections related to regional traffic. While new projections based on the 2010 Census showed a lower anticipated population and vehicle miles traveled in 2035 than the previous projections, the conclusions reached in the Draft Environmental Impact Statement were validated in the Final Environmental Impact Statement (see Chapter 3, *Alternatives*). The Federal Highway Administration and the U.S. Environmental Protection Agency approved the air quality conformity determination that includes the Maricopa Association of Governments regional travel demand model that produced the traffic projections used in the traffic analysis for the project (see Final Environmental Impact Statement page 3-27). The model projects demand for multiple modes of travel, including automobile, bus, and light rail. Driving patterns and alternative modes of transportation are among the key model inputs used to forecast travel demand in the Study Area.
220	**Purpose and Need**	The parameters for delineation of the Study Area are described in Chapter 1, *Purpose and Need*, of the Draft and Final Environmental Impact Statements as the area defining the transportation problem. As presented in the chapter, transportation models were used to determine where the characteristics of the transportation problem would diminish, and, generally, it is at these locations where the definition of the Study Area took shape. This effort was coordinated with stakeholder agencies, including the U.S. Environmental Protection Agency. The statement that the project team excluded alternatives outside of the Study Area is not supported by the facts presented in the Draft Environmental Impact Statement. Alternatives considered in the Draft Environmental Impact Statement included many that were located outside of the Study Area. Examples include the Riggs Road Alternative (see page 3-9), the State Route 85/Interstate 8 Alternative (see page 3-9), the U.S. Route 60 Extension (see page 3-12), the Interstate 10 Spur (see page 3-12), and the Central Avenue Tunnel (see page 3-12).
221		Comment noted. Specific comments are addressed below.

(Response 222 begins on next page)

SWCA Comments on ADOT South Mountain Freeway Draft EIS (April 2013) Prepared for PARC et al.

While footnote "b" attempts to address an expansion to the 8-hour ozone nonattainment area, it does not include the Pinal County PM2.5 nonattainment area approximately 15 miles to the south of the project. An interactive GIS map available on ADEQ's website identifies the current nonattainment boundaries in the vicinity of the project http://gisweb.azdeq.gov/arcgis/emaps/?topic=nonattain

- Figure 4-24 *Priority Mobile Source Air Toxics Emissions, 1999, On-road Versus Other Sources*, presents outdated information. More recent data should have been obtained from: http://www.epa.gov/ttn/chief/eiinformation.html

While we agree the EPA transportation guidance provided on December 20, 2010, established modeling guidance for performing transportation conformity along with a 2-year grace period. However, based upon the FHWA's *Information: Interim Guidance Update on Mobile Source Air Toxic Analysis in NEPA* released on December 6, 2012, states "At the end of this grace period, i.e., beginning December 20, 2012, project sponsors should use MOVES to conduct emissions analysis for NEPA purposes," http://www.fhwa.dot.gov/environment/air_quality/air_toxics/policy_and_guidance/agintguidmem.cfm

Noise:

- Vibration from blasting is qualitatively discussed in the Topography, Geology, and Soils section of the DEIS; however, vibration from non-blasting construction activities and from operational impacts is not discussed anywhere within the DEIS. Procedures for screening and analyzing for vibrational impacts from construction and highway operation are provided in the U.S. Department of Transportation Federal Transit Administration "Transit Noise and Vibration Impact Assessment" (2006): http://www.fta.dot.gov/documents/FTA_Noise_and_Vibration_Manual.pdf

The DEIS notes that "To further clarify the process of noise analysis and the evaluation of noise abatement, ADOT adopted a Noise Abatement Policy (NAP), last updated in 2007" (pg. 4-80). However, the most recently issued ADOT Noise Abatement Policy is dated July 13, 2011; it superseded the 2007 version cited in the DEIS. It does not appear that the DEIS utilized the most recent ADOT Noise Abatement Policy in the noise analysis. The latest copy is available here: http://www.azdot.gov/highways/Env/Env_Common/Documents_Technical_Noise.asp

- The DEIS includes an incomplete review of the regulations regarding noise. The only regulations analyzed in the DEIS for noise impacts in any detail are those dealing with the Federal Highway Administration Noise Abatement Criteria (found in 23 CFR 772), and the ADOT Noise Abatement Plan dated 2007 (which isn't even the most up-to-date version). The following additional laws and guidelines could also impact the project:
  - Noise Control Act of 1972, as amended (PL 92-574, 42 USC 4901 et seq.);
  - The Quiet Communities Act of 1978 (42 USC 4913) promoting the development of state and local noise control programs;
  - U.S. Department of Transportation Federal Transit Administration (FTA) guidelines that specifically addresses issues of community noise (FTA-VA-90-1003-06);
  - Occupational Safety and Health Administration (OSHA) Occupational Noise Exposure, Hearing Conservation Amendment (Federal Register 48[46]:9738-9785);
  - U.S. Department of Housing and Urban Development (24 CFR 51.101(a)(8)); and
  - County, city, or local noise ordinances applicable to the project.

Water Resources:

Analysis of water availability makes use of outdated and/or erroneous information, in two specific instances.

- Water levels are referenced from 1992; more recent information is readily available from the Arizona Department of Water Resources (https://gisweb.azwater.gov/waterresourcedata/)
- A feasibility study regarding water availability in the Ahwatukee Foothills area dated 1996 is relied upon to assess viable sources of replacement water for lost groundwater wells. Reliability on this report has resulted in erroneous information, as it indicates

Code	Issue	Response
222	**Air Quality**	The data presented in Figure 4-18 of the Draft Environmental Impact Statement are included to demonstrate that emissions of criteria pollutants have decreased and continue to decrease. More recent data merely make a stronger case that these emissions have declined and do not change the conclusion. The monitoring data presented beginning on page 4-60 of the Draft Environmental Impact Statement demonstrate pollutant trends in the Study Area. More recent data merely make a stronger case that these emissions have declined and do not change the conclusion. Where information was deemed important to decision-making—for example, more recent trends in attainment status for various criteria pollutants—that information has been included. See for example the discussion on particulate matter that begins on page 4-61. Pinal County is not included in the Study Area and is, therefore, not discussed. All nonattainment areas presented in Figure 4-20 on page 4-61 of the Draft Environmental Impact Statement are current. As clarification, the title of Figure 4-20 was changed in the Final Environmental Impact Statement from "Nonattainment Areas for Particulate Matter, Carbon Monoxide, and Ozone, Maricopa County" to "Nonattainment and Maintenance Areas for Particulate Matter, Carbon Monoxide, and Ozone, Maricopa County." 40 Code of Federal Regulations § 93.111(c) was followed to conduct a qualitative analysis for particulate matter (PM_{10}) for the proposed action. This analysis complied with National Environmental Policy Act requirements for the development of the Draft Environmental Impact Statement. In December 2010, the U.S. Environmental Protection Agency established transportation conformity guidance for performing quantitative particulate matter ($PM_{2.5}$ and PM_{10}) hot-spot analyses for transportation projects and established a 2-year grace period. U.S. Environmental Protection Agency conformity guidance continues to allow qualitative particulate matter (PM_{10}) hot-spot conformity analyses for analyses that were started before or during the grace period and if the final environmental document for the project is issued no more than 3 years after issuance of the draft environmental document. A particulate matter (PM_{10}) qualitative analysis was performed for this project because the initial air quality technical analysis report for the proposed action was produced in October 2005. The Arizona Department of Transportation and Federal Highway Administration have updated the qualitative analysis to a quantitative analysis for the Final Environmental Impact Statement to ensure that a state-of-the-art analysis is completed for the proposed project. The results of the analysis are summarized in the prologue to the Final Environmental Impact Statement (page xiii) and are more fully described beginning on page 4-68 of the Final Environmental Impact Statement. The carbon monoxide and particulate matter (PM_{10}) analyses demonstrated that the proposed freeway would not contribute to any new localized violations, increase the frequency or severity of any existing violation, or delay timely attainment of the National Ambient Air Quality Standards or any required interim emissions reductions or other milestones. The mobile source air toxics discussion was also updated to reflect the Federal Highway Administration's 2012 guidance. This discussion begins on page 4-77 of the Final Environmental Impact Statement.
223	**Traffic**	There are no federal requirements directed specifically to highway traffic induced vibration. All studies the highway agencies have done to assess the impact of operational traffic induced vibrations have shown that both measured and predicted vibration levels are less than any known criteria for structural damage to buildings. The noise analysis was updated for the Final Environmental Impact Statement using most recent Federal Highway Administration and Arizona Department of

SWCA Comments on ADOT South Mountain Freeway Draft EIS (April 2013) Prepared for PARC et al.

					that effluent is available as a source of water. The referenced effluent plant was removed in the late 1990s and is no longer a viable source of replacement water.
					Socioeconomics:
					• Growth projections should have cited 2012 Arizona Department of Administration (ADOA) estimates, rather than 2009 Maricopa Association of Governments (MAG) projections—the MAG data significantly overstates future growth compared to current ADOA projections.
					• DEIS assessments of real estate and homes values are based on 2006 data—i.e., data from before the recent recession and housing market downturn began. This is misleading. More current datasets are available and should have been presented and used for impact analysis in the DEIS.
					• Though ADOA projections and other recent data sources are preferable, at the very least ADOT could have consistently utilized readily available 2010 Census data rather than 2000 Census data (no explanation is given as to why this was not done).
					It is a great disservice to the general public and stakeholder groups for ADOT to present outdated and inaccurate data in the DEIS in its representation of environmental and social conditions around the proposed Loop 202 South Mountain Freeway. For most members of the public, the opportunity to comment on the Draft EIS is the only real chance they will have to voice their opinions and concerns.
					The impact analyses contained in the April 2013 DEIS are, in many cases, based on documents and data which are known to be inaccurate. If the inputs are flawed, the conclusions in the DEIS are likewise flawed. Thus, ADOT is presenting an EIS analysis that is not accurate, yet will likely be the only version of the document that the overwhelming majority of the public will ever have the opportunity—or ability—to comment on.
225					
	AIR QUALITY				
	Ch. 4	General Comment	-	Air Quality	The DEIS discussion is incomplete or lacking in the following areas:
					• There is no discussion with regard to federally listed Class I areas. The Clean Air Act and its supporting regulations are intended to protect human health, our natural and man-made environments, and to preserve visibility of scenic vistas by preventing the degradation of air quality;
					• Provides no quantitative or qualitative discussion on air quality impact difference between the alternatives during construction (e.g., fugitive dust emissions during construction, emissions due to concrete batch or hot-mix asphalt plants, construction workforce and non-road equipment tailpipe emissions;
					◦ Provides no discussion with regard to potential air quality impacts due to ongoing maintenance activities (i.e., re-striping, re-surfacing, landscaping maintenance, etc.);
					• Provides no discussion of whether a carpooling lane will be included and the potential benefits impacts; and
					• Provides no clear discussion of cumulative impacts including reasonably foreseeable development.
					• It is unclear what vehicle traffic mix was used for the emission estimates/modeling.
					• It is unclear whether increases in heavy duty diesel traffic from the CANAMEX project and other truck traffic (such as commercial trucks having a haul load origin or destination in the Phoenix metro area) were included in this assessment.
	Ch. 4	Figure 4-18	4-58	Air Quality	The data presented in Figure 4-18 *Comparison of National Economic and Demographic Growth Indicators and Air Emissions, 1970-2005*, is outdated. The U.S. EPA website http://www.epa.gov/airtrends/2at trends.html#comparison provides data through 2011.
	Ch. 4	Subsection - Criteria Pollutants	4-58 thru 4-59	Air Quality	While this section describes attainment and nonattainment areas it is completely silent on maintenance areas. This is important as the Study Area is located in a currently designated CO Maintenance Area.
	Ch. 4	Table 4-27	4-59	Air Quality	While the data provided within Table 4-27 National Ambient Air Quality Standards, is accurate and up-to-date, the actual 1-hour and annual standards for nitrogen dioxide should be listed in parts per billion (ppb). http://www.epa.gov/air/criteria.html
226					

3

Code	Issue	Response
223 (cont.)		Transportation policy and traffic projections provided by the Maricopa Association of Governments in August 2013. This updated analysis begins on page 4-88 of the Final Environmental Impact Statement. No substantial differences between the analyses presented in the Draft and the Final Environmental Impact Statements resulted. As stated in the Council on Environmental Quality's Regulations for Implementing the Procedural Provisions of the National Environmental Policy Act, environmental impact statements should be analytic rather than encyclopedic (40 Code of Federal Regulations Part 1502.2(a). Those noise regulations of direct consequence to the proposed action were discussed.
224	**Groundwater**	As noted on page 4-97 of the Draft Environmental Impact Statement, although groundwater level data in Ahwatukee Foothills Village were shown from 1972 to 1992, this information was gathered from the U.S. Geological Survey in 2009. Groundwater data in other areas may indeed be more current. This information would not alter the conclusions of this section of the Draft Environmental Impact Statement. The comment is correct that wastewater effluent is not available as a replacement source and is not being used. The City of Phoenix did operate a wastewater reclamation facility in this area, but it was removed from service and demolished. The City of Phoenix still owns the property, but all facilities have been removed from the site. Thus, only two water sources are available for irrigation and lake supply for the Foothills Community Association: the well that would be acquired and potable water from the City of Phoenix. The discussion on page 4-100 of the Draft Environmental Impact Statement has been modified in the Final Environmental Impact Statement to reflect that reclaimed wastewater would not be available; however, the conclusion on page 4-100 is still appropriate. As stated on page 4-100 of the Draft Environmental Impact Statement, "In the event that well replacement were to be impossible, Arizona Department of Transportation would still replace the water that would be lost through the acquisition."
225	**Purpose and Need**	The analyses in the Draft Environmental Impact Statement used socioeconomic and traffic projections at the regional analysis zone and traffic analysis zone levels. At the time of publication of the Draft Environmental Impact Statement, Census 2010-based socioeconomic data at the regional analysis zone and traffic analysis zone levels had not been adopted by the Maricopa Association of Governments and were not available to the project team. Therefore, the data used in the Draft Environmental Impact Statement were the most appropriate information available. The Maricopa Association of Governments approved new population, employment, housing, and traffic projections in June 2013. The new data are presented in the Final Environmental Impact Statement beginning on page 1-11. The purpose and need and analysis of alternatives were updated and reevaluated using these new socioeconomic projections and corresponding projections related to regional traffic. While new projections based on the 2010 Census showed a lower anticipated population and vehicle miles traveled in 2035 than the previous projections, the conclusions reached in the Draft Environmental Impact Statement were validated in the Final Environmental Impact Statement (see Chapter 3, *Alternatives*). The traffic analysis demonstrated that the proposed project is needed today and will continue to be needed into the future. The new projections were also used to update the air and noise analyses for the Final Environmental Impact Statement (see sections beginning on pages 4-68 and 4-88, respectively).

Code	Issue	Response
226	**Air Quality**	Mobile sources are not regulated for impacts on visibility in Class 1 areas (40 Code of Federal Regulations § 51.307). Quantification of short-term impacts associated with construction or maintenance activities is not required; qualitative discussion may be found under *Mitigation* on page 4-85 of the Final Environmental Impact Statement. The proposed high-occupancy vehicle lane is discussed on page 3-19 of the Draft Environmental Impact Statement. Cumulative impacts are discussed on page 4-167 of the Draft Environmental Impact Statement. Vehicle traffic mix projections were provided by Maricopa Association of Governments and are consistent with the regional conformity analyses; they are discussed in greater detail in the air quality technical report prepared for the project. The results of the analyses are summarized in the Draft Environmental Impact Statement and have been updated in the Final Environmental Impact Statement. The air quality analysis has been updated for the Final Environmental Impact Statement using most recent Federal Highway Administration and U.S. Environmental Protection Agency guidance and traffic projections provided by the Maricopa Association of Governments in August 2013. This updated analysis begins on page 4-68 of the Final Environmental Impact Statement. No substantial differences between the analyses presented in the Draft and the Final Environmental Impact Statements resulted.
	Trucks	The Maricopa Association of Governments regional travel demand model forecasts approximately 10 percent truck traffic on the South Mountain Freeway in 2035 (see Final Environmental Impact Statement page 3-64). This percentage is similar to current conditions on Interstate 10 between Loop 101 and Interstate 17 and on U.S. Route 60. Air quality and noise modeling for the Draft and Final Environmental Impact Statements used this forecast truck traffic (see Final Environmental Impact Statement pages 4-68 and 4-100, respectively).
227	**Air Quality**	The maintenance area is discussed in the subsection, *Carbon Monoxide*, on page 4-59 Draft Environmental Impact Statement. As clarification, the title of Figure 4-20 was changed in the Final Environmental Impact Statement from "Nonattainment Areas for Particulate Matter, Carbon Monoxide, and Ozone, Maricopa County" to "Nonattainment and Maintenance Areas for Particulate Matter, Carbon Monoxide, and Ozone, Maricopa County."
228	**Air Quality**	According to the U.S. Environmental Protection Agency, the official level of the annual nitrogen dioxide standard is 0.053 parts per million. See footnote #2 (epa.gov/air/criteria.html).

Code	Comment Document
229	SWCA Comments on ADOT South Mountain Freeway Draft EIS (April 2013) Prepared for PARC et al. Ch. 4 | Subsection – Characteristics of Criteria Pollutants | 4-60 thru 4-62 | Air Quality | The subsection fails to include a discussion of more recent ambient monitoring data for calendar years 2011 and 2012. For example: • According to Maricopa County Air Quality Department's *2011 Air Monitoring Network Review*, there were a total of 18 unique days when at least one monitor exceeded the ozone standard. There were 70 individual exceedances of the 8-hour standards at 14 different sites. For the year there was one violation of the 8-hour ozone standard. • In terms of PM10, there were 19 unique days when at least on e monitor exceeded the 24-hour standard and 11 sites that violated the 24-hour standard. It should be noted that some of these exceedances were petitioned to be classified as exceptional events; however, EPA approval of these requests can take over a year. • In addition, there were 9 unique days when at least one monitor exceeded the standard; however, there were no violations of the 24-hour or annual PM2.5 standards. The MCAQD *2011 Air Monitoring Network Review* should have been obtained from: http://www.maricopa.gov/aq/divisions/monitoring/docs/pdf/2011_Network_Assessment.pdf Furthermore, the most recent available ambient monitoring data from 2012 should have been incorporated into the DEIS and is available at: http://www.epa.gov/airdata/.
230	Ch. 4 | Figure 4-20 | 4-61 | Air Quality | *Figure 4-20 Nonattainment Areas for Particulate Matter, Carbon Monoxide, and Ozone, Maricopa County*, is not up-to-date. While footnote "b" attempts to address an expansion to the 8-hour ozone nonattainment area further to the south, Figure 4-20 does not include the Pinal County PM2.5 nonattainment area approximately 15 miles to the south of the project. An interactive GIS map is available on ADEQ's website identifies the current nonattainment boundaries in the vicinity of the project http://iswweb.azdeq.gov/arcgis/emaps/?topic=nonattain
231	Ch. 4 | Figure 4-23 | 4-62 | Air Quality | It is unclear what time period (i.e., year) is being presented in Figure 4-23 *Sources of the 188 Hazardous Air Pollutants Regulated by the Environmental Protection Agency*. Data from 2008 should have been obtained from: http://www.epa.gov/ttn/chief/eiinformation.html
232	Ch. 4 | Figure 4-24 | 4-62 | Air Quality | Figure 4-24 *Priority Mobile Source Air Toxics Emissions, 1999, On-road Versus Other Sources*, presents outdated information. More recent data from 2008 should have been obtained from: http://www.epa.gov/ttn/chief/eiinformation.html
233	Ch. 4 | Local Emissions of Priority MSATs | 4-64 | Air Quality | The DEIS fails to discuss the findings of Joint Air Toxics Assessment Project (JATAP) which occurred within the DEIS Air Quality Study Area. According to data collected during the Pilot Study (March 2003 – March 2004), annual average concentrations of formaldehyde, acetaldehyde, benzene and 1,3 butadiene were on the high end of the range when compared to EPA funded assessment of other U.S. cities.
234	Ch. 4 | Table 4-30 | 4-65 | Air Quality | It is unclear as what year is being represented in Table 4-30 *Priority Mobile Source Air Toxic Emissions, South Phoenix*. Data from 2008 should have been obtained from: http://www.epa.gov/ttn/chief/eiinformation.html
	Ch. 4 | Environmental Consequences – CO | 4-65 | Air Quality | The EPA transportation guidance provided on December 20, 2010, established modeling guidance for performing transportation conformity and under certain circumstances allows for a 2-year grace period. However, based upon the FHWA's *Information: Interim Guidance Update on Mobile Source Air Toxic Analysis in NEPA* released on December 6, 2012, states "At the end of this grace period, i.e., beginning December 20, 2012, project sponsors should use MOVES to conduct emissions analysis for NEPA purposes." Therefore, in accordance with FWHA guidance the CO analysis presented in the DEIS should have been updated using MOVES2010, which is the current EPA/FHWA approved model.
	Ch. 4 | Environmental Consequences – CO | 4-65 | Air Quality | It is unclear whether the maximum projected 1-hour and 8-hour CO concentrations at intersections/interchanges reported on Table 4-31 and 4-32 include background concentrations or existing permitted stationary sources in the study area.
	Ch. 4 | Environmental Consequences – Ozone | 4-65 | Air Quality | The DEIS lacks discussion of potential impacts with regard to ozone on a quantitative or even a qualitative level. While we agree that O3 is a regional pollutant, just because another agency is responsible for the developing plans to reduce emissions of O3 precursors does not mean that potential impacts due to ozone should have been discounted.
	Ch. 4 | Environmental | 4-65 | Air Quality | The EPA transportation guidance provided on December 20, 2010, established modeling guidance for performing transportation

4

Code	Issue	Response
229	**Air Quality**	The carbon monoxide analysis presented on page 4-65 of the Draft Environmental Impact Statement was updated on page 4-75 of the Final Environmental Impact Statement to represent current conditions. The Arizona Department of Transportation also conducted a quantitative particulate matter (PM_{10}) hot-spot analysis that is discussed on page 4-76 of the Final Environmental Impact Statement. The carbon monoxide and particulate matter (PM_{10}) analyses demonstrated that the proposed freeway would not contribute to any new localized violations, increase the frequency or severity of any existing violation, or delay timely attainment of the National Ambient Air Quality Standards or any required interim emissions reductions or other milestones. As noted on page 4-76 of the Final Environmental Impact Statement, since ozone is a regional pollutant, there is no requirement to analyze potential impacts and no possibility of localized violations of ozone to occur at the project level. The Maricopa Association of Governments is responsible for developing plans to reduce emissions of ozone precursors in the Maricopa area. The Preferred Alternative is included in the *Regional Transportation Plan* that has been determined by the U.S. Department of Transportation to conform to the State Implementation Plan on February 12, 2014.
230	**Air Quality**	Pinal County is not included in the Study Area and is, therefore, not discussed. All nonattainment areas presented in Figure 4-20 on page 4-61 of the Draft Environmental Impact Statement are current. As clarification, the title of Figure 4-20 was changed in the Final Environmental Impact Statement from "Nonattainment Areas for Particulate Matter, Carbon Monoxide, and Ozone, Maricopa County" to "Nonattainment and Maintenance Areas for Particulate Matter, Carbon Monoxide, and Ozone, Maricopa County."
231	**Air Quality**	As noted in the footnote reference to Figure 4-23, the information was based on the Federal Highway Administration publication, Transportation Air Quality Facts and Figures, January 2006. The data referenced were from 1999. This figure was removed from the Final Environmental Impact Statement.
232	**Air Quality**	As noted in the footnote reference to Figure 4-23, the information was based on the Federal Highway Administration publication, Transportation Air Quality Facts and Figures, January 2006. This figure was removed from the Final Environmental Impact Statement.
233	**Air Quality**	Summary information about the findings of the Joint Air Toxics Assessment Project study is provided as background information in the Draft and Final Environmental Impact Statements, but the study itself is not relevant to the type of analysis done pursuant to the Federal Highway Administration's mobile source air toxics guidance, which is an emissions analysis. Monitored ambient concentrations of mobile source air toxics (the focus of the Joint Air Toxics Assessment Project) do not inform this type of analysis. While monitoring data can be useful for defining current conditions in the affected environment (to the extent that the monitoring data are current), they don't tell us anything about future conditions, or the impacts of the project itself, which is why an emissions analysis was performed. The mobile source air toxic analysis presented beginning on page 4-77 of the Final Environmental Impact Statement is an estimated inventory of mobile source air toxic emissions for the entire Study Area for 2025 and 2035. This approach was used because the inventory estimate accounts for changes in traffic and emissions on all roadways affected by a proposed project, and would, therefore, be a more reliable predictor of changes in exposure to mobile source air toxics.

(Response 234 begins on next page)

SWCA Comments on ADOT South Mountain Freeway Draft EIS (April 2013) Prepared for PARC et al.

Code	Comment Document				
	Ch. 4	Subsection – Characteristics of Criteria Pollutants	4-60 thru 4-62	Air Quality	The subsection fails to include a discussion of more recent ambient monitoring data for calendar years 2011 and 2012. For example: • According to Maricopa County Air Quality Department's *2011 Air Monitoring Network Review*, there were a total of 18 unique days when at least one monitor exceeded the ozone standard. There were 70 individual exceedances of the 8-hour standards at 14 different sites. For the year there was one violation of the 8-hour ozone standard. • In terms of PM10, there were 19 unique days when at least one monitor exceeded the 24-hour standard and 11 sites that violated the 24-hour standard. It should be noted that some of these exceedances were petitioned to be classified as exceptional events; however, EPA approval of these requests can take over a year. • In addition, there were 9 unique days when at least one monitor exceeded the standard; however, there were no violations of the 24-hour or annual PM2.5 standards. The MCAQD *2011 Air Monitoring Network Review* should have been obtained from: http://www.maricopa.gov/aq/divisions/monitoring/docs/pdf/2011_Network_Assessment.pdf Furthermore, the most recent available ambient monitoring data from 2012 should have been incorporated into the DEIS and is available at: http://www.epa.gov/airdata/
	Ch. 4	Figure 4-20	4-61	Air Quality	Figure 4-20 *Nonattainment Areas for Particulate Matter, Carbon Monoxide, and Ozone, Maricopa County*, is not up-to-date. While footnote "b" attempts to address an expansion to the 8-hour ozone nonattainment area further to the south, Figure 4-20 does not include the Pinal County PM2.5 nonattainment area approximately 15 miles to the south of the project. An interactive GIS map is available on ADEQ's website identifies the current nonattainment boundaries in the vicinity of the project http://lasweb.azdeq.gov/arcgis/rest/services/emapaz/Pages/emapaz.aspx
	Ch. 4	Figure 4-23	4-62	Air Quality	It is unclear what time period (i.e., year) is being presented in Figure 4-23 *Sources of the 188 Hazardous Air Pollutants Regulated by the Environmental Protection Agency*. Data from 2008 should have been obtained from: http://www.epa.gov/ttn/chief/eiinformation.html
	Ch. 4	Figure 4-24	4-62	Air Quality	Figure 4-24 *Priority Mobile Source Air Toxics Emissions, 1999, On-road Versus Other Sources*, presents outdated information. More recent data from 2008 should have been obtained from: http://www.epa.gov/ttn/chief/eiinformation.html
	Ch. 4	Local Emissions of Priority MSATs	4-64	Air Quality	The DEIS fails to discuss the findings of Joint Air Toxics Assessment Project (JATAP) which occurred within the DEIS Air Quality Study Area. According to data collected during the Pilot Study (March 2003 – March 2004), annual average concentrations of formaldehyde, acetaldehyde, benzene and 1,3 butadiene were on the high end of the range when compared to EPA funded assessment of other U.S. cities.
	Ch. 4	Table 4-30	4-65	Air Quality	It is unclear as what year is being represented in Table 4-30 *Priority Mobile Source Air Toxic Emissions, South Phoenix*. Data from 2008 should have been obtained from: http://www.epa.gov/ttn/chief/eiinformation.html
235	Ch. 4	Environmental Consequences – CO	4-65	Air Quality	The EPA transportation guidance provided on December 20, 2010, established modeling guidance for performing transportation conformity and under certain circumstances allows for a 2-year grace period. However, based upon the FHWA's *Information: Interim Guidance Update on Mobile Source Air Toxic Analysis in NEPA* released on December 6, 2012, states "At the end of this grace period, i.e., beginning December 20, 2012, project sponsors should use MOVES to conduct emissions analysis for NEPA purposes." Therefore, in accordance with FWHA guidance the CO analysis presented in the DEIS should have been updated using MOVES2010, which is the current EPA/FHWA approved model.
236	Ch. 4	Environmental Consequences – CO	4-65	Air Quality	It is unclear whether the maximum projected 1-hour and 8-hour CO concentrations at intersections/interchanges reported on Table 4-31 and 4-32 include background concentrations or existing permitted stationary sources in the study area.
237	Ch. 4	Environmental Consequences – Ozone	4-65	Air Quality	The DEIS lacks discussion of potential impacts with regard to ozone on a quantitative or even a qualitative level. While we agree that O3 is a regional pollutant, just because another agency is responsible for the developing plans to reduce emissions of O3 precursors does not mean that potential impacts due to ozone should have been discounted.
235	Ch. 4	Environmental	4-65	Air Quality	The EPA transportation guidance provided on December 20, 2010, established modeling guidance for performing transportation

Code	Issue	Response
234	**Air Quality**	The footnote to Figure 4-30 on page 4-65 of the Draft Environmental Impact Statement references data from the 2004 Joint Air Toxics Assessment Project. These data are from 2003–2004.
235	**Air Quality**	40 Code of Federal Regulations § 93.111(c) was followed to conduct a qualitative analysis for particulate matter (PM_{10}) for the proposed action. This analysis complied with National Environmental Policy Act requirements for the development of the Draft Environmental Impact Statement. In December 2010, the U.S. Environmental Protection Agency established transportation conformity guidance for performing quantitative particulate matter ($PM_{2.5}$ and PM_{10}) hot-spot analyses for transportation projects and established a 2-year grace period. U.S. Environmental Protection Agency conformity guidance continues to allow qualitative particulate matter (PM_{10}) hot-spot conformity analyses for analyses that were started before or during the grace period and if the final environmental document for the project is issued no more than 3 years after issuance of the draft environmental document. A particulate matter (PM_{10}) qualitative analysis was performed for this project because the initial air quality technical analysis report for the proposed action was produced in October 2005. The Arizona Department of Transportation and Federal Highway Administration have updated the qualitative analysis to a quantitative analysis for the Final Environmental Impact Statement to ensure that a state-of-the-art analysis is completed for the proposed project. The results of the analysis are summarized in the prologue to the Final Environmental Impact Statement (page xiii) and are more fully described beginning on page 4-68 of the Final Environmental Impact Statement. The carbon monoxide and particulate matter (PM_{10}) analyses demonstrated that the proposed freeway would not contribute to any new localized violations, increase the frequency or severity of any existing violation, or delay timely attainment of the National Ambient Air Quality Standards or any required interim emissions reductions or other milestones.
236	**Air Quality**	The modeling protocols area is discussed in greater detail in the air quality technical report prepared for the project. The results of the analyses are summarized in the Draft Environmental Impact Statement. The carbon monoxide analyses used a background value of 2 parts per million. This has been updated in the Final Environmental Impact Statement (see page 4-75).
237	**Air Quality**	As noted on page 4-76 of the Final Environmental Impact Statement, since ozone is a regional pollutant, there is no requirement to analyze potential impacts and no possibility of localized violations of ozone to occur at the project level. The Maricopa Association of Governments is responsible for developing plans to reduce emissions of ozone precursors in the Maricopa area. The Preferred Alternative is included in the *Regional Transportation Plan* that has been determined by the U.S. Department of Transportation to conform to the State Implementation Plan on February 12, 2014.

Code	Comment Document

SWCA Comments on ADOT South Mountain Freeway Draft EIS (April 2013) Prepared for PARC et al.

		Consequences – Particulate Matter			
238	Ch. 4	Environmental Consequences – Particulate Matter	4-65	Air Quality	conformity along with a 2-year grace period. However, based upon the FHWA's *Information: Interim Guidance Update on Mobile Source Air Toxic Analysis in NEPA* released on December 6, 2012, states "At the end of this grace period, i.e., beginning December 20, 2012, project sponsors should use MOVES to conduct emissions analysis for NEPA purposes." http://www.fhwa.dot.gov/environment/air_quality/policy_and_guidance/agintguid3mem.cfm The December 20, 2010 FR notice (Vol. 75, No. 243) specifies "that any quantitative PM hot-spot analyses conducted during the grace period must use MOVES1010a, since MOBILE6.2 does not have the capabilities to produce viable results for project-level PM emissions analysis and is therefore not appropriate for this purpose." Therefore, in accordance with FWHA guidance the PM analysis presented in the DEIS should have used MOVES2010, which is the current EPA/FHWA approved model.
239	Ch. 4	Environmental Consequences – Particulate Matter	4-65	Air Quality	The FHWA guidance specifies "the implications of MOVES on MSAT emissions estimates compared to MOBILE are" lower estimates of total MSAT emissions; significantly lower benzene emissions; significantly higher diesel PM emissions, especially for lower speeds. Consequently, diesel PM is projected to be the dominate component of the emissions totals." Therefore, in accordance with FWHA guidance the MSAT analysis presented in the DEIS should have used MOVES2010, which is the current EPA/FHWA approved model.
240	Ch. 4	Environmental Consequences – Particulate Matter	4-65	Air Quality	Was a formal interagency consultation process conducted to determine whether the current qualitative analysis is adequate for the purpose of full disclosure of potential PM10 and PM2.5 impacts associated with the action alternatives?
238	Ch. 4	Mobile Source Air Toxics – Emissions Model	4-70	Air Quality	The analysis fails to address impacts of PM2.5. This is a significant flaw as the project is within approximately 15 miles of the Pinal County PM2.5 nonattainment area.
241	Ch. 4	Mobile Source Air Toxics – Emissions Model	4-70	Air Quality	The DEIS states "The implications of MOVES related to MSAT emissions estimates compared with MOBILE as used in this analysis are lower estimated of total MSAT emissions; and significantly lower benzene emissions; significantly higher DPM emissions, especially for lower speeds." Therefore, in accordance with FWHA guidance the MSAT analysis presented in the DEIS should have used MOVES2010, which is the current EPA/FHWA approved model.
242	Ch. 4	Figure 4-28	4-71	Air Quality	MSAT emissions and impacts during construction of proposed action and the alternatives are lacking. Furthermore, it is unclear whether morning and afternoon rush hour short-term emissions were included in the modeling?
243	Ch. 4	Table 4-34	4-72	Air Quality	It is unclear what type of vehicle is being represented by this graph (i.e., gasoline passenger vehicle, diesel passenger vehicle, heavy-duty diesel truck, etc.). The DEIS should be updated to clarify what type vehicle this represents and provide a comparison to the other vehicle classes.
238					It is unclear in both ADOT's *Environmental Planning Group Draft Report Air Quality Assessment South Mountain Freeway SR 202L* dated March 1, 2013 and the DEIS what is the breakdown of VMT for light duty/ heavy duty gasoline and diesel vehicles under the various alternatives? The assessment and DEIS should have clearly specified the vehicle mix. As stated in the DIES "The implications of MOVES related to MSAT emissions estimates compared with MOBILE as used in this analysis are lower estimated of total MSAT emissions; and significantly lower benzene emissions; significantly higher DPM emissions, especially for lower speeds." Therefore, in accordance with FWHA guidance the MSAT analysis presented in the DEIS should have used MOVES2010, which is the current EPA/FHWA approved model.

Code	Issue	Response
238	**Air Quality**	As noted on page 4-70 of the Draft Environmental Impact Statement, MOBILE6.2 was used to project emissions at a regional level consistent with 40 Code of Federal Regulations Part 93.111(c), since the mobile source air toxics analysis for the proposed action started before or during the grace period for using the MOVES2010 emissions model. However, the mobile source air toxics analysis presented on page 4-70 of the Draft Environmental Impact Statement was updated on page 4-77 of the Final Environmental Impact Statement using the MOVES2010 model.
239	**Air Quality**	The air quality analysis parameters were determined through the process established by the Arizona Department of Transportation interagency consultation procedures [40 Code of Federal Regulations § 93.105(c)(1) (i)].
240	**Air Quality**	Maricopa County is in attainment for the particulate matter ($PM_{2.5}$) National Ambient Air Quality Standard; the Pinal County particulate matter ($PM_{2.5}$) nonattainment area is not included in the Study Area.
241	**Air Quality**	The Arizona Department of Transportation is evaluating construction delivery methods for the proposed freeway. One concept is to deliver it as a single design-build project. This method would accelerate the construction duration for the entire project to around 3 to 3.5 years. Another concept would be to deliver the project in a more traditional method, breaking the 22-mile corridor into nine segments (each 1 to 3 miles long) and constructing them in phases. Each segment would be under construction for 1 to 3 years, and the total construction duration for the entire corridor would be 5 to 6 years. A discussion of construction implementation is provided beginning on page 3-59 of the Final Environmental Impact Statement. Any particular area of the Preferred Alternative would not be expected to see construction activities beyond an approximate 2-year period. The mobile source air toxics analyses as presented in the Draft Environmental Impact Statement were based on average daily traffic volumes over a 1-year period. However, a quantitative project-level particulate matter (PM_{10}) hot-spot analysis has been prepared for the proposed project. The results of the analysis are summarized in the prologue to the Final Environmental Impact Statement (page xiii) and are more fully described beginning on page 4-68 of the Final Environmental Impact Statement. For this analysis, emission factors were generated for the morning peak, midday hours, afternoon peak, and overnight. Particulate matter (PM_{10}) emissions were modeled incorporating operating conditions included in the U.S. Environmental Protection Agency's *Transportation Conformity Guidance for Quantitative Hot-spot Analyses in $PM_{2.5}$ and PM_{10} Nonattainment and Maintenance Areas*, publication number EPA-420-B-13-053, dated November 2013. The development of the particulate matter (PM_{10}) hot-spot modeling protocol for this analysis used a formal interagency consultation process.
242	**Air Quality**	The data presented were based on the U.S. Environmental Protection Agency's MOBILE6.2 national defaults, including the national default vehicle fleet mix.
243	**Air Quality**	Vehicle traffic mix projections were provided by the Maricopa Association of Governments.

SWCA Comments on ADOT South Mountain Freeway Draft EIS (April 2013) Prepared for PARC et al.

Code				Comment Document
244	Ch. 4	Table 4-34	4-72	Air Quality	ADOT's Environmental Planning Group Draft Report Air Quality Assessment South Mountain Freeway SR 202L dated March 1, 2013, which is the basis for the modeled impact results presented in the DEIS, does not account for increases in heavy duty diesel vehicles from the CANAMEX project and/or Phoenix-area origination and destination traffic, as "Average daily traffic volumes are projected to range from approximately 60,000 to over 200,000; heavy-truck traffic is expected to account for approximately 5-7% of the volume (MAG, 2010b)." The potential increases to heavy-truck traffic could result in significant increases to criteria pollutant and MSAT emissions, and vehicles originating from outside of the United States may not have the same level of emission controls or diesel fuel standards. In addition, it is unclear whether the potential increases to heavy-truck traffic were considered based on the natural bypass potential of the project. The DEIS should have accounted for all increases in heavy-duty diesel vehicle traffic from the CANAMEX project, Phoenix-area origination and destination traffic, as well as considered additional increases due to the natural bypass potential of the project.
245	Ch. 4	MSAT Information Status	4-74	Air Quality	The DEIS fails to discuss studies conducted in support of Joint Air Toxics Assessment Project (JATAP), which included air toxic measurements, numerical modeling, exposure modeling and risk assessment for the metropolitan Phoenix area. The DEIS should have included a discussion on these studies and should have be obtained from the *Phoenix, Arizona Air Toxics Assessment – Final Comprehensive Report* dated September 2011 and available at: http://www.epa.gov/ttnamti1/files/20022/2004csatam/CSATAMJATAPFR305ep11.pdf
246	Ch. 4	MSAT Information Status	4-74	Air Quality	The DEIS fails to discuss the "Mobile Source Air Toxics (MSATs) at Three Schools Next to US 95 in Las Vegas, Nevada" (May 2010). This report was prepared for the Nevada Department of Transportation and provides a discussion on the: 1) indoor and outdoor concentrations of MSATs to which students are exposed at the three schools near US 95; 2) the influence of US 95 vehicle traffic on MSAT concentrations at the three schools, both before and after the November 2007 freeway expansion; and 3) the effectiveness and MSAT removal efficiencies of HVAC/filtration systems before and after modified air filtration systems were installed at each school. The DEIS should have included a discussion of this study as it provides a potential mitigation strategy for reducing MSAT exposure at schools.
	Ch. 4	No-Action Alternative	4-76	Air Quality	The DEIS states "MSATs emissions for the entire regional Study Area would decline regardless of whether the proposed action were constructed." Does this statement consider increases to heavy-truck traffic associated with trucks bypassing the Phoenix downtown area as well as those from the CANAMEX project, and from Phoenix-area origination and destination traffic? Therefore, in accordance with FWHA guidance the MSAT analysis presented in the DEIS should have used MOVES2010, which is the current EPA/FHWA approved model, and should have included the projected increases in heavy truck traffic.
	Ch. 4	No-Action Alternative	4-76	Conformity	Neither the DEIS or the supporting technical report provides the conformity determination (i.e., the conformity analysis demonstrating the project conforms).
	NOISE				
	Ch. 4	General Comment	-	Noise	The DEIS discussion is incomplete or lacking in the following areas: • Provides no discussion with regard to potential noise impacts due to ongoing maintenance activities (i.e., re-striping, re-surfacing, landscaping maintenance, etc.); • Provides no clear discussion of cumulative impacts including reasonably foreseeable development; and • It is unclear what vehicle traffic mix was used for the noise modeling

Code	Issue	Response
244	**Air Quality**	The Mexico to Canada route (commonly referred to as the CANAMEX route) is described in detail on page 3-64 of the Draft Environmental Impact Statement. The locally preferred route includes Interstate 8 and State Route 85 to bypass the Phoenix metropolitan area. State Route 85 is currently being reconstructed as a four-lane, divided highway with limited-access control, and Interstate 8 is a four-lane, divided Interstate freeway with full access control. Existing signs at each terminus designate the route as a truck bypass of metropolitan Phoenix. This route would continue to be available for interstate and interregional travel. Trucks crossing from Mexico to Arizona are restricted to the commercial zones within 25 miles of the border. The Federal Motor Carrier Safety Administration is administering a United States-Mexico cross-border, long-haul trucking pilot program. The program tests and demonstrates the ability of Mexico-based motor carriers to operate safely in the United States beyond the municipalities and commercial zones along the United States-Mexico border (see <fmcsa.dot.gov/intl-programs/trucking/trucking-program.aspx>). Petróleos Mexicanos (better known as Pemex), the Mexican state-owned petroleum company, has guaranteed 15 parts per million in its sulfur diesel fuel in the border region (see <http://transportpolicy.net/index.php?title=Mexico:_Fuels:_Diesel_and_Gasoline>). All air quality analyses included projected truck traffic Provided by the Maricopa Association of Governments.
245	**Air Quality**	Summary information about the findings of the Joint Air Toxics Assessment Project study is provided as background information in the Draft and Final Environmental Impact Statements, but the study itself is not relevant to the type of analysis done pursuant to the Federal Highway Administration's mobile source air toxics guidance, which is an emissions analysis. Monitored ambient concentrations of mobile source air toxics (the focus of the Joint Air Toxics Assessment Project) do not inform this type of analysis. While monitoring data can be useful for defining current conditions in the affected environment (to the extent that the monitoring data are current), they don't tell us anything about future conditions, or the impacts of the project itself, which is why an emissions analysis was performed. The mobile source air toxic analysis presented beginning on page 4-77 of the Final Environmental Impact Statement is an estimated inventory of mobile source air toxic emissions for the entire Study Area for 2025 and 2035. This approach was used because the inventory estimate accounts for changes in traffic and emissions on all roadways affected by a proposed project, and would, therefore, be a more reliable predictor of changes in exposure to mobile source air toxics.
246	**Air Quality**	The National Near Roadway Mobile Source Air Toxic Study is discussed on page 4-74 of the Draft Environmental Impact Statement, but not in great detail. As stated in the Council on Environmental Quality's Regulations for Implementing the Procedural Provisions of the National Environmental Policy Act, environmental impact statements should be analytic rather than encyclopedic [40 Code of Federal Regulations Part 1502.2(a)]. The mobile source air toxics emissions information presented in the Draft and Final Environmental Impact Statements demonstrates mobile source air toxics emissions at the study area level would be much lower in the future. The U.S. Environmental Protection Agency's MOVES model also predicts lower mobile source air toxics emissions in the future. Therefore, there is no basis for the assumption that mitigation would be needed.

Code	Comment Document

SWCA Comments on ADOT South Mountain Freeway Draft EIS (April 2013) Prepared for PARC et al.

Ch. 4	Table 4-34	4-72	Air Quality	ADOT's Environmental Planning Group Draft Report Air Quality Assessment South Mountain Freeway SR 202L dated March 1, 2013, which is the basis for the modeled impact results presented in the DEIS, does not account for increases in heavy duty diesel vehicles from the CANAMEX project and/or Phoenix-area origination and destination traffic, as "Average daily traffic volumes are projected to range from approximately 60,000 to over 200,000; heavy-truck traffic is expected to account for approximately 5-7% of the volume (MAG, 2010b)." The potential increases to heavy-truck traffic could result in significant increases to criteria pollutant and MSAT emissions, and vehicles originating from outside of the United States may not have the same level of emission controls or diesel fuel standards. In addition, it is unclear whether the potential increases to heavy-truck traffic were considered based on the natural bypass potential of the project. The DEIS should have accounted for all increases in heavy-duty diesel vehicle traffic from the CANAMEX project, Phoenix-area origination and destination traffic, as well as considered additional increases due to the natural bypass potential of the project.
Ch. 4	MSAT Information Status	4-74	Air Quality	The DEIS fails to discuss studies conducted in support of Joint Air Toxics Assessment Project (JATAP), which included air toxic measurements, numerical modeling, exposure modeling and risk assessment for the metropolitan Phoenix area. The DEIS should have included a discussion on these studies and should have be obtained from the *Phoenix, Arizona Air Toxics Assessment – Final Comprehensive Report* dated September 2011 and available at: http://www.epa.gov/ttnamti1/files/20032004csatam/CSATAMJATAPFR30Sep11.pdf
Ch. 4	MSAT Information Status	4-74	Air Quality	The DEIS fails to discuss the "Mobile Source Air Toxics (MSATs) at Three Schools Next to US 95 in Las Vegas, Nevada" (May 2010). This report was prepared for the Nevada Department of Transportation and provides a discussion on the: 1) indoor and outdoor concentrations of MSATs to which students are exposed at the three schools near US 95; 2) the influence of US 95 vehicle traffic on MSAT concentrations at the three schools, both before and after the November 2007 freeway expansion; and 3) the effectiveness and MSAT removal efficiencies of HVAC/filtration systems before and after modified air filtration systems were installed at each school. The DEIS should have included a discussion of this study as it provides a potential mitigation strategy for reducing MSAT exposure at schools.
Ch. 4	No-Action Alternative	4-76	Air Quality	**The DEIS states "MSATs emissions for the entire regional Study Area would decline regardless of whether the proposed action were constructed." Does this statement consider increases to heavy-truck traffic associated with trucks bypassing the Phoenix downtown area as well as those from the CANAMEX project, and from Phoenix-area origination and destination traffic?**
Ch. 4	No-Action Alternative	4-76	Conformity	**Therefore, in accordance with FHWA guidance the MSAT analysis presented in the DEIS should have used MOVES2010, which is the current EPA/FHWA approved model, and should have included the projected increases in heavy truck traffic.** **Neither the DEIS or the supporting technical report provides the conformity determination (i.e., the conformity analysis demonstrating the project conforms).**
NOISE				
Ch. 4	General Comment	-	Noise	**The DEIS discussion is incomplete or lacking in the following areas:** • **Provides no discussion with regard to potential noise impacts due to ongoing maintenance activities (i.e., re-striping, re-surfacing, landscaping maintenance, etc.);** • **Provides no clear discussion of cumulative impacts including reasonably foreseeable development; and** • **It is unclear what vehicle traffic mix was used for the noise modeling**

6

247 248 249

Code	Issue	Response
247	**Trucks**	Vehicle traffic mix projections were provided by the Maricopa Association of Governments and are consistent with the regional conformity analyses; they are discussed in greater detail in the air quality technical report prepared for the project. As noted on page 4-70 of the Draft Environmental Impact Statement, MOBILE6.2 was used to project emissions at a regional level consistent with 40 Code of Federal Regulations Part 93.111(c), since the mobile source air toxics analysis for the proposed action started before or during the grace period for using the MOVES2010 emissions model. However, the mobile source air toxics analysis presented on page 4-70 of the Draft Environmental Impact Statement was updated on page 4-77 of the Final Environmental Impact Statement using the MOVES2010 model.
248	**Air Quality**	As stated on page 4-76 of the Draft Environmental Impact Statement, the proposed action is contained within the currently approved *Regional Transportation Plan* and the Maricopa Association of Government's Fiscal Year 2011–2015 TIP contains several references to the South Mountain Freeway project. Therefore, the proposed action would conform to the approved transportation plan and transportation improvement program. The carbon monoxide and particulate analyses demonstrated that the proposed freeway would not contribute to any new localized violations, increase the frequency or severity of any existing violation or delay timely attainment of the National Ambient Air Quality Standards or any required interim emissions reductions or other milestones.
249	**Noise**	Analysis of noise impacts associated with maintenance activities are not required by Arizona Department of Transportation and Federal Highway Administration policy. Cumulative noise impacts are addressed on page 4-176 of the Draft Environmental Impact Statement. Vehicle traffic mix projections were provided by the Maricopa Association of Governments and are consistent with the regional conformity analyses; they are discussed in greater detail in the noise technical report prepared for the project.

Code	Comment Document

SWCA Comments on ADOT South Mountain Freeway Draft EIS (April 2013) Prepared for PARC et al.

250	Ch. 4	Noise Criteria	4-80	Noise	The DEIS notes that "To further clarify the process of noise analysis and the evaluation of noise abatement, ADOT adopted a Noise Abatement Policy (NAP), last updated in 2007" (4-80). However, the most recently issued ADOT Noise Abatement Policy is dated July 13, 2011, which superseded the 2007 version cited in the DEIS. It does not appear that the DEIS utilized the most recent ADOT Noise Abatement Policy in the noise analysis.
251	Ch. 4	Noise Criteria	4-80	Noise	The DEIS includes an incomplete review of the regulations regarding noise. The only regulations analyzed in the DEIS for noise impacts in any detail are those dealing with the Federal Highway Administration Noise Abatement Criteria (found in 23 CFR 772), and the ADOT Noise Abatement Plan dated 2007 (which isn't even the most up-to-date version). The following additional laws and guidelines could impact the project: • Noise Control Act of 1972, as amended (PL 92-574, 42 USC 4901 et seq.); • The Quiet Communities Act of 1978 (42 USC 4913) promoting the development of state and local noise control programs; • U.S. Department of Transportation Federal Transit Administration (FTA) has published a guideline that specifically addresses issues of community noise (FTA-VA-90-1003-06); • Occupational Safety and Health Administration (OSHA) Occupational Noise Exposure, Hearing Conservation Amendment (Federal Register 48[46]:9738-9785); • U.S. Department of Housing and Urban Development (24 CFR 51.101(a)(8)); and • County, city, or local noise ordinances applicable to the project.
252	Ch. 4	Table 4-40 – Noise Analysis Results, Western and Eastern Sections	4-84	Noise	It appears that not all sensitive receptors that could be impacted by noise from the project were identified and impacts predicted for, only the ones closest to the project were analyzed. For example, multiple schools located within approximately 0.5 mi of the project or alternatives that could be impacted were not evaluated, such as the following: • Kyrene de la Estrella; • Kyrene del Milenio; • Kyrene de la Sierra; • Desert Vista High School; • Keystone Montessori; • Horizon Community Learning Center; • St. John Bosco Interparish Catholic School; • Betty Fairfax High School; • Cheatham Elementary School; • Country Gardens Charter School; • Summit School of Ahwatukee; and • Sunridge Elementary School.
253	Ch. 4	Construction Noise Inset	4-89	Noise	Both the DEIS and the accompanying Noise Report use as a proxy for noise-related construction impacts from the project "measurements" from "4 freeway construction project in Arizona that assessed the collective impact of construction noise" (p. 4-89 in the DEIS and p. 3-17 of the Noise Report) However, the specific freeway construction project was not mentioned; therefore, the comparability of these measurements to the proposed project is questionable and cannot be ascertained from the data provided.
254	Ch. 4	Mitigation for Vibration-related Impacts Inset	4-115	Topography, Geology, and Soils	Vibration from blasting is qualitatively discussed in the Topography, Geology, and Soils section of the DEIS; however, vibration from non-blasting construction activities and from operational impacts is not discussed anywhere within the DEIS. Procedures for screening and analyzing for vibrational impacts from construction and highway operation are provided in the U.S. Department of Transportation Federal Transit Administration "Transit Noise and Vibration Impact Assessment" (2006).
	WATER RESOURCES				
255	4	Water Resources	4-93	Surface Water	The DEIS correctly identifies that there are impaired waters within the project area (page 4-93). However, the importance of this designation is not fully carried through the analysis. ADOT's Statewide Stormwater Permit (Permit No. AZS000018-2008) has specific monitoring criteria associated with impaired waters and specific mitigation criteria that shall be implemented for impaired waters. These

Code	Issue	Response
250	**Noise**	The noise analysis has been updated for the Final Environmental Impact Statement using most recent Federal Highway Administration and Arizona Department of Transportation policy and traffic projections provided by the Maricopa Association of Governments in August 2013. This updated analysis begins on page 4-88 of the Final Environmental Impact Statement. No substantial differences between the analyses presented in the Draft and the Final Environmental Impact Statements resulted.
251	**Noise**	As stated in the Council on Environmental Quality's Regulations for Implementing the Procedural Provisions of the National Environmental Policy Act, environmental impact statements should be analytic rather than encyclopedic [40 Code of Federal Regulations Part 1502.2(a)]. Those noise regulations of direct consequence to the proposed action were discussed.
252	**Noise**	As stated on page 4-82 of the Draft Environmental Impact Statement, over 220 sensitive receivers were evaluated from a traffic noise perspective. All of the receivers represent noise sensitive land uses in proximity to the proposed project. These receivers were closer to the proposed action than the schools listed; therefore, these receivers would have higher noise levels than the schools more distant from the proposed action. Analysis of noise impacts is conducted in accordance with Arizona Department of Transportation and Federal Highway Administration policy.
253	**Noise**	The measurements were collected during the construction of State Route 202L (Red Mountain Freeway) near Mesa Drive. This information has been added to the text box on page 4-98 of the Final Environmental Impact Statement.
254	**Noise**	There are no federal requirements directed specifically to highway traffic induced vibration. All studies the highway agencies have done to assess the impact of operational traffic induced vibrations have shown that both measured and predicted vibration levels are less than any known criteria for structural damage to buildings.
255	**Water Resources**	The specific water quality constituents that cause the impairment change from year to year as the Arizona Department of Environmental Quality and U.S. Environmental Protection Agency assess and evaluate the water quality standards; therefore, the specific contaminants from the Section 303(d) list are not noted in the Draft Environmental Impact Statement. The primary constituent that causes impairment (total dissolved solids) is discussed on page 4-93 of the Draft Environmental Impact Statement. Specific best management practices would not be known until final design when the stormwater pollution prevention plan would be developed. The Flood Control District of Maricopa County has shared drainage systems with the municipalities and stormwater discharges that have the potential to reach the Salt and Gila rivers; therefore, the Flood Control District of Maricopa County has established and implemented monitoring requirements to comply with Arizona Pollutant Discharge Elimination System regulations, as discussed beginning on page 4-93 of the Draft Environmental Impact Statement. Discussion of Arizona Pollutant Discharge Elimination System requirements and the Arizona Department of Transportation's permit requirements through individual permits begins on page 4-94 of the Draft Environmental Impact Statement.

Code	Comment Document

SWCA Comments on ADOT South Mountain Freeway Draft EIS (April 2013) Prepared for PARC et al.

					specific criteria are not discussed.
					The specific water quality constituents are not identified that cause the impairment of these waters. This lack of disclosure prevents full analysis of the expected impact to these impaired waters due to both construction and operation of the proposed freeway.
					The analysis concludes that "Implementation of BMPs associated with any of the action alternatives would reduce water quality impacts on the receiving waters of the Salt and Gila rivers. Both construction and operational impacts may be mitigated through the use of BMPs." (page 4-101) This conclusion is not supported by the existing disclosure. Without disclosure of 1) the types of impairment on the Salt and Gila Rivers, 2) the specific monitoring/mitigation required under the ADOT Statewide permit, and 3) analysis of the types of contaminants to be discharged from the project, the conclusion as stated is arbitrary and unsupported.
256	4	Water Resources	4-93	Surface Water	Specific to the impaired waters, the analysis also concludes that "increased pollutant loading from freeway operation might further impair listed reaches of the Salt River and might need measures in addition to existing permit controls to achieve or maintain water quality standards in accordance with CWA Section 303(d)." (page 4-97) This analysis is incomplete. It would be reasonable to extend the analysis to disclose a) what measures might be needed, and b) whether those measures would be effective. Without disclosure of 1) the type of impairment, 2) the types of contaminants, and 3) the prescribed mitigation measures and their effectiveness, disclosure of impacts to the impaired waters is partial and limited.
257	4	Secondary and Cumulative Impacts	4-173	Surface Water	The impaired waters should be identified on at least one of the maps included in the Water Resources section. Instead they appear in the Waters of the U.S. section later in the DEIS. The analysis indicates in several places that along the Eastern route, surface water discharge would be routed onto lands owned by the Gila River Community, and that this currently occurs. "The drainage design features of the E1 Alternative would be such that drainage patterns from the South Mountains toward the Gila River would not be altered. Currently, drainage flows generally from the north to the south, passing under Pecos Road through a series of culverts following natural drainages/washes. The E1 Alternative would include small drainage basins and channels on the northern side of the freeway to treat the water quality and meter and direct drainage flows under the freeway and onto Community land in the same manner as they are currently." (4-98) This passage highlights a general lack in the Cumulative Impacts section of the EIS. The fundamental first step in assessing cumulative impacts is to define what other Reasonably Foreseeable Actions overlap the project in both time and space. No list of Reasonably Foreseeable Actions is provided in the DEIS. Lacking this fundamental background information results in an inadequate framework for assessing cumulative impacts. From the analysis of cumulative impacts of water resources, the reasonably foreseeable actions considered appear to be fairly generic. Specifically, the potential for development along the south side of the Eastern alignment, on the Gila River Indian Community, ought to have been explicitly assessed for its likelihood of occurring. Potential development in this area has a high likelihood of changing the location of stormwater discharges and the impact of those stormwater discharges.
258	4	Water Resources	4-100	Groundwater	The future discharge of stormwater is stated as being identical to that occurring at present. This is a valid method of identifying any direct impacts from the project. It is not, however, a valid method of identifying any cumulative impacts from the project, as there may be reasonably foreseeable development south of Pecos Road that would alter conditions from the current situation. Analysis of impacts as required under NEPA and other laws has several fundamental components: 1) The "best available scientific and technical information" shall be used (CEQ) 2) The analysis is not arbitrary (Administrative Procedures Act) 3) Resources are interrelated and the direct impacts on one resource may engender indirect impacts on other resources; these indirect impacts must be assessed (CEQ)

8

Code	Issue	Response
256	**Waters of the US**	A reference to the figure on which the impaired waters are shown has been added to the discussion on page 4-101 of the Final Environmental Impact Statement. The sentence, "Several reaches of the Salt and Gila rivers are on the Section 303(d) list, including that portion of the Salt River in the Study Area" has been modified to read: "Several reaches of the Salt and Gila rivers are on the Section 303(d) list, including that portion of the Salt River in the Study Area (see Figure 4-36 on page 4-116)."
257	**Secondary and Cumulative Impacts**	As noted on page 4-171 of the Draft Environmental Impact Statement, the type of activities that could contribute to cumulative impacts included general development patterns. Development on the Gila River Indian Community is a tribal function and requires no approval from other jurisdictions or notice to other jurisdictions regarding pending development. As a result, development along the Gila River Indian Community boundary is speculative. It is, however, difficult to conceive of a development project on the Gila River Indian Community that would cause upstream impacts to the level described in the comment. As noted in the comment, according to 46 *Federal Register* 18026 (March 23, 1981), an environmental impact statement must discuss reasonably foreseeable actions. These are actions that are likely to occur or probable, rather than those that are merely possible. The Federal Highway Administration and Arizona Department of Transportation have committed to continue coordination with the Arizona Game and Fish Department, Gila River Indian Community Department of Environmental Quality, and U.S. Fish and Wildlife Service regarding wildlife concerns as a result of the freeway (see *Mitigation*, beginning on page 4-126 of the Draft Environmental Impact Statement and on page 4-138 of the Final Environmental Impact Statement).

SWCA Comments on ADOT South Mountain Freeway Draft EIS (April 2013) Prepared for PARC et al.

9

4	Water Resources	4-100	Groundwater	

The disclosure of impacts on water availability is insufficient with respect to these three fundamental requirements: 1) the analysis does not make use of the best available information, 2) application of the analysis is applied in an arbitrary manner, and 3) interrelated indirect impacts are insufficiently analyzed. Each of these three components is addressed individually below.

The analysis of water availability does not use the "best available scientific and technical information."

Concerns were raised to ADOT through the scoping process about the destruction of supply wells located along the Eastern alternative (Pecos Road). ADOT appears to be aware of these concerns, as an attempt is made to directly address them on page 4-100 of the DEIS. This page specifically analyzes wells used for water supply for the Foothills golf courses. The analysis included on page 4-100 makes use of information that is both outdated and erroneous. This leads to an insufficient analysis that does not make use of the "best available scientific and technical information". There are three major concerns:

1. The sole information utilized (a report from 1996) is seriously out-of-date. A 17-year period in a rapidly growing community like the Ahwatukee Foothills Village has resulted in the use of a report that is no longer either reliable or appropriate to use.

2. Based on information in the 1996 report, ADOT identifies that the Foothills Community Association has multiple sources of water available other than the supply wells to be lost: effluent, well water, and municipal water supplied by the City of Phoenix. Because ADOT used outdated information, the analysis does not disclose to the reader that effluent is entirely unavailable within the area. The wastewater treatment plant referenced in the DEIS was removed by the City of Phoenix in the late 1990s. This key information that--effluent is completely unavailable--was reportedly made available to ADOT. It was not, however, used in the analysis of water supply availability. Using outdated information has led to the use of an erroneous assumption—that effluent is available for use. This disclosure does not reflect the "best available scientific and technical information."

3. The analysis of water replacement on page 4-100 is flawed in another way. The analysis states: "According to comments received, several wells have been drilled in the area and have either produced small amounts of water or no water." The difficulty this presents is summarized as such: "It is understood that finding a suitable location for a new well in this area may be difficult." Most of the analysis is dedicated to the process that would be undertaken to drill a new well, despite the difficulty that would be encountered in doing so. This difficulty is dismissed by indicating there are at least two other sources of water: effluent and municipal water. As indicated above, effluent is not a viable water source.

The statement that drilling a new well "...may be difficult" seriously downplays the importance of the wells that will be lost, the unique hydrogeology of this area, and the rarity of how productive these particular wells are. The relative difficulty in finding water north from Pecos Road is illustrated in Figure 1 below, which illustrates data from 27 wells between roughly 40th Street and Desert Foothills Parkway (Source: ADWR Well Registry, https://gisweb.azwater.gov/waterresourcedata/WellRegistry.aspx, accessed 6/22/13). The wells to be lost are the most productive in the community. Farther north from Pecos Road most wells appear to be completed in bedrock rather than alluvium, as reflected by the much lower (or non-existent) pumping rates. This well information is readily available, and in fact was used by ADOT (page 4-96) solely for illustrative purposes. It was not, however, used in order to prepare a full disclosure of the impacts when these unique supply wells along Pecos Road are lost. Again, the analysis does not use the "best available scientific and technical information."

It should be noted that other independent studies regarding the difficulty of siting new wells in the area were also made available to ADOT (i.e., Brown and Caldwell, 1995), but do not appear to have been used.

259

Code	Issue	Response
259	**Water Resources**	Page 4-100 of the Draft Environmental Impact Statement states that finding a suitable location for a new well in this area may be difficult. Productivity of the well in bedrock formations is primarily based on intercepting fractures, and that can be very difficult to do. The Arizona Department of Transportation is aware of the difficult conditions that exist in replacing wells in this area. The Arizona Department of Transportation is also aware of the productivity of the well in question. The comment is correct that wastewater effluent is not available as a replacement source and is not being used. The City of Phoenix did operate a wastewater reclamation facility in this area, but it was removed from service and demolished. The City of Phoenix still owns the property, but all facilities have been removed from the site. Thus, only two water sources are available for irrigation and lake supply for the Foothills Community Association: the well that would be acquired and potable water from the City of Phoenix. In this Final Environmental Impact Statement, the discussion on page 4-100 of the Draft Environmental Impact Statement has been modified in the Final Environmental Impact Statement to reflect that reclaimed wastewater would not be available; however, the conclusion on page 4-100 is still appropriate. As stated on pages 4-100 of the Draft Environmental Impact Statement, "In the event that well replacement were to be impossible, the Arizona Department of Transportation would still replace the water that would be lost through the acquisition." Depending on whether an action alternative were to become the Selected Alternative, it may be possible to keep certain wells in their current location, but move the well controls and associated piping to outside of the right-of-way. Such an analysis would be performed later in the design process. If a well were adversely affected by construction activities, the well might need to be abandoned or the well owner would be compensated by drilling a new well according to State regulations/standards (see text box on page 4-100 of the Draft Environmental Impact Statement). The number of wells potentially affected would be consistent with that of a project the magnitude of the proposed action, and the well replacement program as outlined by State law has been regularly implemented by the Arizona Department of Transportation to effectively mitigate well impacts associated with its projects throughout the region.

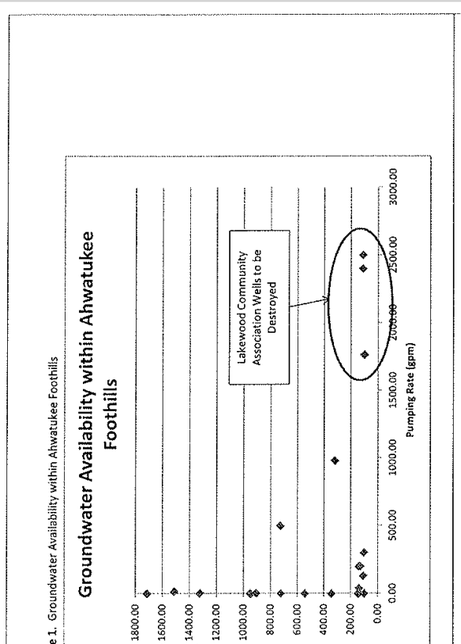
SWCA Comments on ADOT South Mountain Freeway Draft EIS (April 2013) Prepared for PARC et al.

Figure 1. Groundwater Availability within Ahwatukee Foothills



260

4	Water Resources	4-100	Groundwater

The analysis of water availability is applied in an arbitrary manner, and is not complete.

In addition to being technically flawed by the use of outdated information and by not fully assessing available information, the analysis presented by ADOT has been applied in an arbitrary manner. The detailed analysis regarding water availability (page 4-100) focused solely on the Foothills Community Association and the potential loss of their wells. The DEIS does not analyze nearby entities that would experience the same impacts, or entities anywhere else along the potential freeway route. One specific example is the Lakewood Community Association. As shown in Figure 1, the supply wells currently used by the Lakewood community would be even more difficult to replace given their large pumping capacity. The DEIS arbitrarily discloses impacts to one entity (Foothills Community Association) and not the other (Lakewood Community Association), no more than a few miles away. Further, no other impacts to domestic wells or supply wells are disclosed anywhere along any of the alternative routes, despite the potential for significant impacts to be present as demonstrated by the Foothills Community Association wells.

With respect to the total number of wells to be impacted (Table 4-41), this type of tabulation is not a useful or sufficient analysis. A thorough analysis would, at the least, identify the number of domestic or exempt wells, the number of supply or non-exempt wells, the presence of monitoring wells, and the ownership of major supply wells.

261

10

Code	Issue	Response
260		Comment noted.
261	**Water Resources**	Because of the public concern expressed during the environmental impact statement process, page 4-100 of the Draft Environmental Impact Statement focuses on the Foothills Community Association to provide more details on the well acquisition, condition assessment, and replacement process used by the Arizona Department of Transportation. The Arizona Department of Transportation understands, and states on page 4-100 of the Draft Environmental Impact Statement, that finding a suitable location for a new well in this area may be difficult. Depending on whether an action alternative were to become the Selected Alternative, it may be possible to keep certain wells in their current location, but move the well controls and associated piping to outside of the right-of-way. Such an analysis would be performed later in the design process. Table 4-41, on page 4-98 of the Draft Environmental Impact Statement, discloses the number of wells that may be acquired by each action alternative and, as noted on page 4-98 of the Draft Environmental Impact Statement, some of these wells are abandoned wells. This information was updated in the Final Environmental Impact Statement on page 4-106. The comment suggests that the wells that would be adversely affected should be further classified as domestic, supply, or monitoring, and well ownership should be noted. This additional level of detail would not assist the environmental impact statement decision-making process.

Code	Comment Document
262	SWCA Comments on ADOT South Mountain Freeway Draft EIS (April 2013) Prepared for PARC et al. 4 | Water Resources | 4-100 | Groundwater The analysis of water availability fails to take into account significant indirect effects. Analysis of impacts under NEPA does not require that speculative impacts be assessed, but it does require that reasonably foreseeable impacts be addressed, and in particular indirect impacts that may affect another resource. The DEIS fails to disclose significant adverse indirect impacts resulting from the loss of these supply wells. ADOT states that there are three sources of water: effluent, groundwater, and municipal water. The best available scientific and technical information indicates that two of these sources—effluent and groundwater—are either completely unavailable or their availability is going to be challenging. That leaves only one source of water: municipal water from the City of Phoenix. The DEIS correctly states that City of Phoenix water is significantly more expensive than groundwater. It does not, however, fully investigate the impact of this cost. There are two reasonably foreseeable outcomes if only City of Phoenix water is available: 1) The golf courses within the Foothills community become economically infeasible. There are several analogs that suggest this is a reasonable effect. One course in the Ahwatukee area has recently closed because of financial difficulties. One other course already has seasonal shutdowns due to water expenses. State law restricts increases of association fees, making associations relatively unresponsive to large increases in costs. That increased costs of water would have a negative effect is not speculative. The economic fallout from the loss of a golf course—not only to the course owner and operator but to the many homeowners with home values that would be impacted—is reasonably foreseeable and should have been disclosed as an indirect environmental impact of losing supply wells. 2) The lakes within the Lakewood community would likely also become economically infeasible, for the same reasons. These are large lakes that require significant amounts of water. The costs of supplying municipal water to these lakes would be prohibitive, and the association would not be able to raise fees to respond (in Arizona HOA fee increases are statutorily capped at a maximum of 5% per annum). These lakes are the centerpiece of the Lakewood community. The loss of these lakes would have a significant negative impact on homeowners in the area, including to neighborhood property values, recreational opportunities, and aesthetic values. The loss of these lakes is reasonably foreseeable and should have been disclosed as an indirect environmental impact of losing supply wells. 11
262	4 | Secondary and Cumulative Impacts | 4-173 | Water Availability Based on the above concerns, the assessment of cumulative impacts of water availability is lacking. The DEIS states: "Ongoing planned and permitted residential, commercial, and industrial development in the region would likely continue to place a demand on water availability. The proposed action would have little cumulative effect on water availability." (emphasis added)
263	4 | Water Resources | 4-97 | Groundwater Given the outcomes of attempting to replace water lost to both Foothills Community Association and Lakewood Community Association, there would be stresses placed on other aspects of the water delivery system within the City of Phoenix. This has not been analyzed properly as either a direct, indirect, or cumulative impact. A comment typical throughout the document, but specific to groundwater resources is the use of outdated information. Specifically, groundwater levels are shown from 1992, almost 20 years in the past. If new information is not available, it is the responsibility of the agency to either obtain that information, or state clearly why that cannot be done. (CEQ Regs 1502.22)
264	4 | Water Resources | 4-97 | Groundwater Curiously, elsewhere in the document "Topography, Geology, and Soils" more up-to-date groundwater levels are presented. The analysis of water quality is insufficient. While existing background water quality (page 4-97) is of interest, the more important concern is the potential for the proposed freeway route to impact known areas of contamination. This is not disclosed in the assessment of water resources. There are several basic and readily available data sources that should have been consulted for this analysis. At a

Code	Issue	Response
262	**Water Resources**	The comment is correct that wastewater effluent is not available as a replacement source and is not being used. The City of Phoenix did operate a wastewater reclamation facility in this area, but it was removed from service and demolished. The City of Phoenix still owns the property, but all facilities have been removed from the site. Thus, only two water sources are available for irrigation and lake supply for the Foothills Community Association: the well that would be acquired and potable water from the City of Phoenix. In the Final Environmental Impact Statement, the discussion on page 4-100 of the Draft Environmental Impact Statement has been modified to reflect that reclaimed wastewater would not be available (see page 4-108 of the Final Environmental Impact Statement); however, the conclusion on page 4-100 is still appropriate. As stated on page 4-100 of the Draft Environmental Impact Statement, "In the event that well replacement were to be impossible, Arizona Department of Transportation would still replace the water that would be lost through the acquisition." Page 4-100 of the Draft Environmental Impact Statement states that finding a suitable location for a new well in this area may be difficult. Productivity of the well in bedrock formations is primarily based on intercepting fractures, and that can be very difficult to do. The Arizona Department of Transportation is aware of the difficult conditions that exist in replacing wells in this area. The procedure identified on page 4-100 of the Draft Environmental Impact Statement defines the procedure that the Arizona Department of Transportation would use to replace adversely affected wells, and also identifies the general costs the Arizona Department of Transportation would incur to replace the lost water sources. As noted in this discussion, if it were necessary to provide replacement water instead of a new well, the Arizona Department of Transportation would, in negotiations with the well owner, include the difference between the costs of pumping the well and the costs of the new replacement water source. Depending on whether an action alternative were the Selected Alternative, it may be possible to keep certain wells in their current location, but move the well controls and associated piping to outside of the right-of-way. Such an analysis would be performed later in the design process.
263	**Water Resources**	As noted on page 4-97 of the Draft Environmental Impact Statement, although groundwater level data in Ahwatukee Foothills Village were shown from 1972 to 1992, this information was gathered from the U.S. Geological Survey in 2009. Groundwater data in other areas may indeed be more current; however, this additional level of detail would not assist the environmental impact statement decision-making process.
264	**Hazardous Materials**	Both the Van Buren Tank Farm and the West Van Buren Water Quality Assurance Revolving Fund site were identified and considered during development of the Draft Environmental Impact Statement (see pages 4-97 and 4-153 of the Draft Environmental Impact Statement and the Draft Initial Site Assessment prepared for the proposed project). These sites are primarily groundwater-impact sites, and groundwater is found at a depth of over 60 feet below the footprint of the Preferred Alternative. Given the separation distance between the adversely affected medium (groundwater) and the construction zone (near-surface in these locations), the project team determined that these sites would not pose a risk to construction or to the general public once the facility were completed. This assessment has been clarified in the Final Environmental Impact Statement on page 4-165.

Code	Comment Document

SWCA Comments on ADOT South Mountain Freeway Draft EIS (April 2013) Prepared for PARC et al.

					minimum: 1) known Leaking Underground Storage Tank (LUST) sites, 2) known State (WQARF) or Federal (CERCLA) superfund sites, and 3) known or suspected landfills, either historic or active (the location along the Salt River makes this a particularly important item to assess in the DEIS).
265	4	Waters of the U.S.	4-112	Waters of the U.S.	The DEIS states: "The general and special conditions of the Section 404 Individual Permit would minimize impacts on jurisdictional waters to the extent practicable. ADEQ would issue Section 401 Individual certification for compliance with water quality prior to Section 404 permit issuance." The issuance of the Section 401 Individual certification in light of the impaired nature of the Salt and Gila River should have been discussed.
	SOCIOECONOMICS				
266	1	Context of the purpose and need	1-1, 1-5	Socioeconomics	Purpose and Need (Chapter 1) states that demand for travel is based on capacity, transportation demand, and social and economic needs. Chapter 1 further states that MAG's regional travel demand model is used to forecast travel demand and that one of the inputs used includes socioeconomic data based on population and economic forecasts. Data used throughout the DEIS for projected population estimates are not consistent with Arizona Department of Administration estimates (see below). Population project estimates used throughout the DEIS are higher than the state range of estimates. Therefore, inputs into the travel demand model are likely skewing the model output, which is the foundation of two of the three elements of the project purpose and need.
266	1	Purpose and Need	1-11	Socioeconomics	in the DEIS, projected growth estimates Maricopa County population to be 6.5 million by 2035 (citing MAG 2009b), however 2012 population projections estimated for Maricopa County by the Arizona Department of Administration (ADOA) estimate population in the county to be 5.2 million (low), 5.7 million (medium), or up to 6.2 million (high). http://www.workforce.az.gov/population-projections.aspx Therefore the DEIS is using a population estimate for the County that is not consistent with the state's estimates. The DEIS estimates are 1.3 million to 500,000 more than state recognized projections. The ADOA estimates are intended "provide reliable unbiased projections of future population growth and a single state repository for current population references enabling sound planning and decision making by government and private entities." No indication is provided as to why a new system for projections is used and why it is so inconsistent with the ADOA estimates.
267	1	Purpose and Need	1-11	Socioeconomics	DEIS states that 50% of the 6.5 million in population growth is expected to occur in areas that would be immediately served by the proposed action. This freeway is intended to be part of a regional transportation system intended to improve regional connectivity, regional capacity, etc. (see DEIS page 1-10). Therefore statement about service area is irrelevant to the purpose and need.
	1, 3, 4	Study Area		Socioeconomics	Study Area is not well defined. Chapter 1 states that it is limited to southern Phoenix metropolitan area (page 1-1), while Chapter 3 further defines the study area in a figure caption (Figure 3-1). Chapter 3 defines the study area as the southwestern portion of Maricopa County, defined by a gap in the freeway network, limited by South Mountain and GRIC. No discussion is included on why there is a gap in the transportation network here, and why this is the only gap area. Why couldn't the study area and therefore alternatives include a connection south of the Gila River Indian Community (i.e., in Pinal County), or along Riggs Road or Queen Creek Road within the GRIC? This study area is further used in Chapter 4 when discussing social and economic conditions and impacts. As above, the South Mountain freeway is a regional freeway serving broader regional needs; therefore, for the purpose of the socioeconomic analysis, the study area is too restrictive. There is no reason the study area can't be different for socioeconomics than for other resources.
	4	Regional Demographic context	4-20	Socioeconomics	Regarding population growth, see comment above. Projections are higher and potentially inflated with no explanation as to why a different source is used and why the estimates are different.
	4	Population and Employment	4-20	Socioeconomics	It would be more appropriate to use a range of projection estimates as provided by ADOA. Using ADOA estimates for Maricopa County for 2035, population will increase 50–75% (not 85%) between 2005 and 2035. Projections on the ADOA website are from 2012 while projections in the DEIS are from 2009 or earlier (MAG 2009b).
	4	Population and	4-20	Socioeconomics	Per CEQ regulations, agencies are required to use the best available data in the analysis and in the decision making process. Data

Code	Issue	Response
265	**Water Resources**	According to 33 Code of Federal Regulations 323.3, a permit is required for discharges of dredged or fill material into waters of the United States. As noted on page 4-110 of the Draft Environmental Impact Statement, as design proceeds, the Arizona Department of Transportation would prepare and submit an application to the U.S. Army Corps of Engineers for a permit under Section 404 of the Clean Water Act. Steps are outlined beginning on page 4-110 of the Draft Environmental Impact Statement. Minimization of impacts would be achieved and unavoidable impacts would be mitigated to the extent reasonable and practicable. These steps are outlined beginning on page 4-110 of the Draft Environmental Impact Statement.
266	**Purpose and Need**	The analyses in the Draft Environmental Impact Statement used socioeconomic and traffic projections at the regional analysis zone and traffic analysis zone levels. At the time of publication of the Draft Environmental Impact Statement, Census 2010-based socioeconomic data at the regional analysis zone and traffic analysis zone levels had not been adopted by the Maricopa Association of Governments and were not available to the project team. Therefore, the data used in the Draft Environmental Impact Statement were the most appropriate information available. The Maricopa Association of Governments approved new population, employment, housing, and traffic projections in June 2013. The new data are presented in the Final Environmental Impact Statement beginning on page 1-11. The purpose and need and analysis of alternatives were updated and reevaluated using these new socioeconomic projections and corresponding projections related to regional traffic. While new projections based on the 2010 Census showed a lower anticipated population and vehicle miles traveled in 2035 than the previous projections, the conclusions reached in the Draft Environmental Impact Statement were validated in the Final Environmental Impact Statement (see Chapter 3, *Alternatives*). The traffic analysis demonstrated that the proposed project is needed today and will continue to be needed into the future.
267	**Purpose and Need**	The Draft Environmental Impact Statement does not state that there would be 6.5 million in population growth. In 2005, there were already 3.7 million people in Maricopa County, so the increase between 2005 and 2035 would be 2.8 million people, and 44 percent of that growth would occur in the area served by the proposed freeway. This information supports the definition of the Study Area and the need for a major transportation system in the southwestern portion of the Phoenix metropolitan area.

SWCA Comments on ADOT South Mountain Freeway Draft EIS (April 2013) Prepared for PARC et al.

					minimum: 1) known Leaking Underground Storage Tank (LUST) sites, 2) known State (WQARF) or Federal (CERCLA) superfund sites, and 3) known or suspected landfills, either historic or active (the location along the Salt River makes this a particularly important item to assess in the DEIS).
4	Waters of the U.S.	4-112	Waters of the U.S.		The DEIS states: "The general and special conditions of the Section 404 (Individual Permit would minimize impacts on jurisdictional waters to the extent practicable. ADEQ would issue Section 401 Individual certification for compliance with water quality prior to Section 404 permit issuance."
					The issuance of the Section 401 individual certification in light of the impaired nature of the Salt and Gila River should have been discussed.
SOCIOECONOMICS					
1	Context of the purpose and need	1-1, 1-5	Socioeconomics		Purpose and Need (Chapter 1) states that demand for travel is based on capacity, transportation demand, and social and economic needs. Chapter 1 further states that MAG's regional travel demand model is used to forecast travel demand and that one of the inputs used includes socioeconomic data based on population and economic forecasts. Data used throughout the DEIS for projected population estimates are not consistent with Arizona Department of Administration estimates (see below). Population project estimates used throughout the DEIS are higher than the state range of estimates. Therefore, inputs into the travel demand model are likely skewing the model output, which is the foundation of two of the three elements of the project purpose and need.
1	Purpose and Need	1-11	Socioeconomics		In the DEIS, projected growth estimates Maricopa County population to be 6.5 million by 2035 (citing MAG 2009b), however 2012 population projections estimated for Maricopa County by the Arizona Department of Administration (ADOA) estimate population in the county to be 5.2 million (low), 5.7 million (medium), or up to 6.2 million (high). http://www.workforce.az.gov/population-projections.aspx Therefore the DEIS is using a population estimate for the County that is not consistent with the state's estimates. The DEIS estimates are 1.3 million to 300,000 more than state recognized projections. The ADOA estimates are intended "provide reliable unbiased projections of future population growth and a single state repository for current population references enabling sound planning and decision making by government and private entities." No indication is provided as to why a new system for projections is used and why it is so inconsistent with the ADOA estimates.
1	Purpose and Need	1-11	Socioeconomics		DEIS states that 50% of the 6.5 million in population growth is expected to occur in areas that would be immediately served by the proposed action. This freeway is intended to be part of a regional transportation system intended to improve regional connectivity, regional capacity, etc. (see DEIS page 1-10). Therefore statement about service area is irrelevant to the purpose and need.
1, 3, 4	Study Area		Socioeconomics		Study Area is not well defined. Chapter 1 states that it is limited to southern Phoenix metropolitan area (page 1-11), while Chapter 3 further defines the study area as the southwestern portion of Maricopa County, defined by a gap in the freeway network, limited by South Mountain and GRIC. No discussion is included of why there is a gap in the transportation network here, and why this is the only gap area. Why couldn't the study area and therefore alternatives include a connection south of the Gila River Indian Community (i.e., in Pinal County), or along Riggs Road or Queen Creek Road within the GRIC? This study area is further used in Chapter 4 when discussing social and economic conditions and impacts. As above, the South Mountain freeway is a regional freeway serving broader regional needs; therefore, for the purpose of the socioeconomic analysis, the study area is too restrictive. There is no reason the study area can't be different for socioeconomics than for other resources.
4	Regional Demographic context	4-20	Socioeconomics		Regarding population growth, see comment above. Projections are higher and potentially inflated with no explanation as to why a different source is used and why the estimates are different.
4	Population and Employment	4-20	Socioeconomics		It would be more appropriate to use a range of projection estimates as provided by ADOA. Using ADOA estimates for Maricopa County for 2035, population will increase 50–75% (not 85%) between 2005 and 2035. Projections on the ADOA website are from 2012 while projections in the DEIS are from 2009 or earlier (MAG 2009b).
4	Population and	4-20	Socioeconomics		Per CEQ regulations, agencies are required to use the best available data in the analysis and in the decision making process. Data

Code	Issue	Response
268	**Study Area**	The parameters for reference to the Study Area are defined in Chapter 1, *Purpose and Need*, of the Draft and Final Environmental Impact Statements as the area defining the transportation problem. As presented in the chapter, transportation models were used to determine where the characteristics of the transportation problem would diminish and generally, it is at these locations where the definition of the Study Area took shape. This effort was coordinated with stakeholder agencies, including the U.S. Environmental Protection Agency. The comment references the term, *Study Area*, in terms of the analytical requirements associated with impact analyses. Each element of the environment has independent, unique (while sometimes overlapping) geographic limits for impact analyses. These limits are established by technical expertise, knowledge, the application of recognized and accepted analytical methods and assumptions, and characteristics unique to the proposed action. Methodology reports were prepared for all elements and shared with agency peers and internal team members to validate methods and limits of study prior to conducting analyses, and results were validated by peers. During impact analyses, limits were adjusted, as appropriate, based on changes in project design as well as in-field observations. Impact analyses results were the subject of the application of scientific-community–recognized techniques with the appropriate amount of presentation in accordance with the efficiency and decision-making provisions of the National Environmental Policy Act. Chapter 2, *Gila River Indian Community Coordination*, of the Draft and Final Environmental Impact Statements text goes to great lengths to discuss limitations of study on Gila River Indian Community land. Chapter 3, *Alternatives*, of the Draft and Final Environmental Impact Statements provides substantial discussion on why alternatives on Riggs or Queen Creek roads were eliminated from further study. Any alternative on Gila River Indian Community land must consider tribal sovereignty. Tribal sovereignty is based in the inherent authority of Native American tribes to govern themselves. While this notion of sovereignty is manifested in many areas, generally Native American land is held in trust by the United States. Native American communities have the authority to regulate land uses and activities on their lands. States have very limited authority over activities within tribal land (see page 2-1 of the Final Environmental Impact Statement). From a practical standpoint, this means that the Arizona Department of Transportation and Federal Highway Administration do not have the authority to survey tribal land, make land use (including transportation) determinations directly affecting tribal land, or condemn tribal land for public benefit through an eminent domain process.
269	**Purpose and Need**	The analyses in the Draft Environmental Impact Statement used socioeconomic and traffic projections at the regional analysis zone and traffic analysis zone levels. At the time of publication of the Draft Environmental Impact Statement, Census 2010-based socioeconomic data at the regional analysis zone and traffic analysis zone levels had not been adopted by the Maricopa Association of Governments and were not available to the project team. Therefore, the data used in the Draft Environmental Impact Statement were the most appropriate information available. The Maricopa Association of Governments approved new population, employment, housing, and traffic projections in June 2013. The new data are presented in the Final Environmental Impact Statement beginning on page 1-11. The purpose and need and analysis of alternatives were updated and reevaluated using these new socioeconomic projections and corresponding projections related to regional traffic. While new projections based on the 2010 Census showed a

269 (cont.)		lower anticipated population and vehicle miles traveled in 2035 than the previous projections, the conclusions reached in the Draft Environmental Impact Statement were validated in the Final Environmental Impact Statement (see Chapter 3, *Alternatives*). The traffic analysis demonstrated that the proposed project is needed today and will continue to be needed into the future. The Maricopa Association of Governments' control total for Maricopa County is consistent with the "ADOA—Medium Series."
270	**Purpose and Need**	The reference in the Draft Environmental Impact Statement was to the Study Area, not to Maricopa County or to the state of Arizona. Therefore, the Arizona Department of Administration numbers do not apply. The Maricopa Association of Governments approved new population, employment, housing, and traffic projections in June 2013. The new data are presented in the Final Environmental Impact Statement beginning on page 1-11. The purpose and need and analysis of alternatives were updated and reevaluated using these new socioeconomic projections and corresponding projections related to regional traffic. While new projections based on the 2010 Census showed a lower anticipated population and vehicle miles traveled in 2035 than the previous projections, the conclusions reached in the Draft Environmental Impact Statement were validated in the Final Environmental Impact Statement (see Chapter 3, *Alternatives*). The traffic analysis demonstrated that the proposed project is needed today and will continue to be needed into the future.
271	**Design**	The main line of the E1 Alternative would not have a bicycle route as part of the design. Continuous east–west riding would be possible in the neighborhoods adjoining the alternative and along Chandler Boulevard.
272	**Section 4(f) and Section 6(f)**	The proposed action would not have impacts on recreational opportunities or cause any changes to recreational experiences. With the exception of the Maricopa Trail, the affected trails are planned (future) facilities. Impacts on proposed trails are discussed in the Draft Environmental Impact Statement Section 4(f) section. Because the proposed action would be constructed as an elevated span that would clear the existing Maricopa Trail segment, no impact from a social perspective was determined to be likely. The social conditions section of the Draft Environmental Impact Statement addresses issues regarding community character and access; specific parkland impacts are addressed in the Draft Environmental Impact Statement Chapter 5, *Section 4(f) Evaluation*.
273	**Traffic**	The impacts noted in the comment are primarily temporary construction impacts. These are covered in the section, *Temporary Construction Impacts*, beginning on page 4-161 of the Draft Environmental Impact Statement. The determination to not include an interchange at 32nd Street was made in coordination with the City of Phoenix (see Figure 3-8 on page 3-15 of the Draft Environmental Impact Statement). The interchange was eliminated based on undesirable residential displacements, proximity to nearby schools, and cost. In 2006, the City of Phoenix conducted a traffic circulation study to evaluate the impacts of the proposed freeway on the local street system, including the shift of access to Foothills Reserve and Calabrea from Pecos Road to Chandler Boulevard. The City study found no adverse effects on the local street system from the freeway (see Appendix 3-1 in the Final Environmental Impact Statement).

SWCA Comments on ADOT South Mountain Freeway Draft EIS (April 2013) Prepared for PARC et al.

	4	Employment	4-21	Socioeconomics	throughout the section is out of date (see comments above).
	4	Community Character	4-21	Socioeconomics	Last paragraph states growth in the region has essentially halted since the 2007 recession; however ADOA indicates some small growth every year (1.1–1.8%) between now and 2035. Statement in the DEIS about growth is not accurate.
	4	Community Character/General	4-21	Socioeconomics	Pecos Road is a significant recreational bicycle route; no discussion is included about what construction of the highway would do to recreational use of this road.
	4	Community Character/General	4-21	Socioeconomics	Social Conditions often include a discussion of recreation opportunities and changes to those in terms of community character; or sense of place. No discussion is included in the DEIS that addresses changes in recreation opportunities or changes to recreationist experiences; Section 4(f) impacts are discussed in Chapter 5 (trail, parkland, etc.) and impacts to these resources from a Section 4(f) perspective, but no discussion of the impacts from a social perspective is discussed. This should have been included in the social conditions or as a separate section of the DEIS.
	4	Environmental Consequences (all alternatives)		Socioeconomics	Impacts discussion in Chapter 4 is limited to long-term impacts to arterials (reduction in traffic). Only a brief mention of the short-term impacts of construction is made at the end of Chapter 4, however this discussion should have been carried into the resource analysis to paint a complete picture. Construction will result in traffic delays, traffic re-routes (intentional and casual) noise, air emissions, etc. The statement is made (DEIS page 4-21) that there would be no adverse impacts to access to schools, however if construction impacts are considered (which they have to be), this statement is not true for short-term impacts. The statement is similarly not true for the long term. Under any of the action alternatives, the removal of the traffic interchange at 32nd Street would, for example, significantly curtail access to at least four nearby schools: Kyrene de los Lagos Elementary School, Desert Vista High School, Kyrene Akimel A-al Middle School, and Kyrene de la Estrella Elementary School.
274	4	Environmental Justice	4-30, 4-36	Socioeconomics	**The unit of analysis for the affected environment (census block-level, census block group) for Environmental Justice is appropriate.** **Affected Environment, Affected Populations identified the presence of minority and low-income populations throughout the study area.** **However, we disagree with the area of potential adverse environmental impacts being limited to the right-of-way footprint only. The ROW footprint for impacts is appropriate for displacements (direct impacts) only. Environmental justice populations can experience indirect adverse impacts such as adverse changes in air quality, noise levels, visual impacts, hazardous materials, property value, etc.** **Impacts to Environmental Justice populations are understated/underestimated in this DEIS as impact discussion is limited to direct impacts. Undue hardship is not defined when the analysis states "impacts would be temporary and would not cause undue hardship."** **The idea behind impacts being disproportionate, especially as it relates to low-income populations, is that they are often unable to relocate to avoid an adverse environmental impact—this is particularly true on tribal lands such as the GRIC, where individual residences may frequently be linked to a family's personal allotment of land. Therefore, although everyone in the ROW (including non-environmental justice population) would be affected, if there are environmental justice populations—which the DEIS says there are—then the effects are disproportionate on those populations.**
275	4	Environmental Justice	4-36	Socioeconomics	It is difficult for the reader to fully assess environmental justice impacts because air and noise are not analyzed in terms of general attenuation distance. Similarly, for property value impacts, no discussion is included to understand if there would be property value changes, if they would be negative, generally how far out those impacts would be experienced, and if EJ populations would be impacted. Generally, there is no discussion of how far away from the freeway impacts would be experienced, and therefore no discussion of potential environmental-justice impacts from air and noise, property value, etc.
276	4	Displacements and Relocations	4-40	Socioeconomics	Assessment of real estate values uses home values from 2006, 7 years ago. This data represents values prior to the 2007+ recession and is not the most recent, best available data. The housing market is quite different than it was in 2006; more recent data should have been employed in the analysis.
276	4	Economic Impacts	4-46+	Socioeconomics	There is no discussion of current housing inventory in the Study Area (not just the footprint/ROW), or of property values impacts at all, despite being a topic of concern over the long course of the project; property value as a public concern is expressed multiple times in Chapter 6 of the DEIS. ADOT's 2001 assessment of the impacts of freeways on property values from the expansion of the Superstition Freeway/US60 did find that there were economic benefits to property values from increased access and to multifamily residential, but that there were also

13

Code	Issue	Response
274	**Environmental Justice and Title VI**	Impacts related to air quality, noise, visual resources, and hazardous materials are considered in the Draft Environmental Impact Statement for all populations, including environmental justice populations (see Draft Environmental Impact Statement page 4-58 [air quality], page 4-79 [noise], page 4-155 [visual resources], and page 4-152 [hazardous materials], respectively). The section entitled *Title VI and Environmental Justice*, beginning on page 4-29 in the Draft Environmental Impact Statement, presents acceptable methods, data, and assumptions to assess the potential for disproportionately high and adverse effects from the proposed action on environmental justice populations and disparate impacts to populations protected under Title VI. Based upon the content of the section, no such effects would result from the action alternatives. In light of comments received on the Draft Environmental Impact Statement, the above-referenced conclusions were confirmed in the preparation of the Final Environmental Impact Statement. To provide further clarity, the discussions of environmental justice and Title VI were separated and additional text explaining the relationship of environmental justice and Title VI to various environmental elements was added throughout Chapter 4, *Affected Environment*, *Environmental Consequences, and Mitigation*, as exemplified by the inserted text on page 4-29 of the Final Environmental Impact Statement. Land acquisition and relocation assistance services for the project shall be available to all individuals without discrimination in accordance with the Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970, as amended (Uniform Act). The Uniform Act provides uniform, fair, and equitable treatment of people whose property is impacted or who are displaced as a result of the project, including those with special needs. Advisory assistance services and compensation practices are described in detail in the Arizona Department of Transportation's *Right-of-way Procedures Manual*, located at <azdot.gov/business/RightofWay_Properties/booklets-and-manuals>. For further discussion, see page 4-51 of the Final Environmental Impact Statement and Appendix 4-1. There would be no direct impacts on Gila River Indian Community land, nor would there be any adverse impacts that would require relocations from the Gila River Indian Community or allotment land.
275	**Neighborhoods/ Communities**	A review of the literature reveals few detailed and comprehensive analyses of the relationship between the transportation infrastructure and residential property values (Transportation Research Record: Journal of the Transportation Research Board, No. 2174, Transportation Research Board of the National Academies, Washington, D.C., 2010, pages 138–47; "Impact of Highways on Property Values: Case Study of the Superstition Freeway Corridor"). A recent study by the California Department of Transportation concluded that freeway facilities did not substantially affect sales prices in residential areas adjacent to the facility. The study concluded that it is the visibility of the freeway that may influence selling price and not distance or noise. As a result, the researchers generally concluded that the more the visibility of a new freeway is reduced, the less it would determine the sales price of homes sold in the area.
276	**Neighborhoods/ Communities**	The availability and valuation assessment of residential properties has been updated in the Final Environmental Impact Statement (see page 4-47).

Code	Comment Document

SWCA Comments on ADOT South Mountain Freeway Draft EIS (April 2013) Prepared for PARC et al.

277

4	Economic impacts	4-46+	Socioeconomics	negative impacts to property values on single-family residential housing (ADOT 2003). Impacts were based on distance to the freeway as well as a variety of other factors. The DEIS should have included a discussion of property values, both current in the study area (not just the right-of-way) as well as differentiating between impacts during construction and during operation.
				Property tax discussion is limited to direct loss of revenue through direct loss of properties (displaced, only in the ROW). No assessment is included of potential reductions in property tax revenue from changes in home prices in the study area if the project is constructed.

South Mountain Freeway 202 DEIS
Comments Prepared for PARC et al.
By: Rick Haddow

From approximately 2006 through 2012, I worked for the Arizona Department of Transportation ("ADOT") as a District Environmental Coordinator. As a District Environmental Coordinator for ADOT, I was responsible for, in part, overseeing environmental planning and compliance with regard to ADOT construction projects and related public outreach. Prior to working with ADOT, I was with the Maricopa County Health Department, Division of Environmental Services for approximately 18 years. While with the County I, in part, designed and implemented the ambient air monitoring system network to determine attainment status for criteria pollutants throughout the County – including the area impacted by the proposed South Mountain/Loop 202 Freeway. I have also worked, and continue to work, as an environmental consultant. As set forth in my CV, which is attached hereto, I have significant experience in assessing environmental impacts and the mitigation thereof, as well as in air and water monitoring, modeling, and permitting.

278

I recently reviewed the ADOT Draft Environmental Impact Statement for the South Mountain/ Loop 202 Freeway ("DEIS") and was shocked at what was presented. The DEIS is mostly standard boiler plate information as copied from regulatory documents. The use of data, the methodology employed, and the conclusions presented in the DEIS are absolutely without technical merit and do not comply with the fundamental concepts and purpose of an environmental impact statement. The DEIS does not protect or properly inform the citizens of the level of risk to public health by building the freeway. Following are some of my comments based on my thirty years of experience in the environmental field.

279

The DEIS utilizes faulty wind speed data and methodology in doing its modeling. Wind speed is an essential part of the air shed modeling that ADOT used to determine, in part, regional stability – which relates to inversion layers and local weather patterns vis-à-vis projected freeway pollution. For example, the DEIS inputs are based on times that are not concurrent with pollution building hours. The DEIS also fails to correlate the morning traffic hours 0500 to 1100 during the build up of tail pipe emissions during an air shed inversion. The ability to determine CO and Particulate concentrations needs accurate wind data measurements during periods expected to have high pollutant concentrations.

280

The South Mountain Transportation Corridor Study ("SMTC") – a scoping document/component of the DEIS – confirms that South Mountain greatly influences the local air shed movement. According to the SMTC, down slopes bring cooler air in the evenings. The SMTC and the DEIS, however, fail to indicate that this process intensifies the morning desert inversion, exacerbating pollutant concentrations. Air quality will worsen by the influence of the mountain and any build option. The mountain creates its own small air shed, which is not evaluated by the DEIS. All reporting data uses valley wide components for stated results.

1

Code	Issue	Response
278	**Environmental Impact Statement Process**	The study used state-of-the-practice, scientific community methods and similarly accepted methods. Methods, assumptions, and data were developed early in the environmental impact statement process and peer reviewed by the Federal Highway Administration, the Arizona Department of Transportation, and other federal, State, and local agencies. Peer reviewers concluded that the methods, assumptions, and data are appropriate. The Draft Environmental Impact Statement has sufficient technical merit, does comply with "fundamental concepts and purpose of an environmental impact statement," and does appropriately and properly inform the public. The Arizona Department of Transportation and Federal Highway Administration, in cooperation with the U.S. Army Corps of Engineers, the U.S. Bureau of Indian Affairs, and the Western Area Power Administration, prepared the Draft and Final Environmental Impact Statements and Section 4(f) Evaluation in accordance with the National Environmental Policy Act of 1969 [42 United States Code § 4332(2)(c)], Section 4(f) of the U.S. Department of Transportation Act of 1966 (49 United States Code § 303, as amended), and Section 404 of the Clean Water Act of 1977 (33 United States Code § 1251). All of these agencies are experienced in the review of National Environmental Policy Act documents and have found the logical sequence of decision making to be sound and in line with National Environmental Policy Act requirements. The Draft Environmental Impact Statement and Section 4(f) Evaluation 1) satisfies Federal Highway Administration and Arizona Department of Transportation's environmental analysis requirements; 2) provides a comparison of the social, economic, and environmental impacts that may result from implementation of the proposed action—construction and operation of a major transportation facility; and 3) identifies measures to avoid, reduce, or otherwise mitigate adverse impacts.
279	**Air Quality**	The air quality assessment for the proposed freeway analyzed impacts from carbon monoxide and particulate matter (PM_{10}) and followed U.S. Environmental Protection Agency guidelines. The carbon monoxide and particulate matter (PM_{10}) analyses demonstrated that the proposed freeway would not contribute to any new localized violations, increase the frequency or severity of any existing violation, or delay timely attainment of the National Ambient Air Quality Standards or any required interim emissions reductions or other milestones. For mobile source air toxics, the analysis showed that for the Study Area, constructing the freeway would have a marginal effect on annual emissions in 2025 and 2035 (less than a 1 percent difference in total annual emissions between the Preferred Alternative and No-Action Alternative). With the Preferred Alternative in 2035, modeled mobile source air toxics emissions would decrease by 57 percent to more than 90 percent, depending on the pollutant, despite a 47 percent increase in vehicle miles traveled in the Study Area compared with 2012 conditions. The air quality analyses were updated for the Final Environmental Impact Statement, including a quantitative particulate matter (PM_{10}) analysis, and are more fully described beginning on page 4-68 of the Final Environmental Impact Statement. Modeling methodology and results were reviewed by the Federal Highway Administration, Arizona Department of Transportation, and Maricopa Association of Governments.

(Response 279 continues on next page)

Code	Comment Document

281

The sampling and stability data relied on by the SMTC and the DEIS is inaccurate. ADOT relies on air data taken at the Phoenix airport in the middle of the Valley without terrain conditions that proximate the region impacted by the South Mountain Freeway. Even based on the airport data, however, ADOT finds E and F stability 57% of the time. That is, according to ADOT "air shed mixing poorest diffusion condition." The actual 202 stability would be much worse, compounding Phoenix airport conditions by stronger temperature inversions because of the mountain's location and size. More pollutants from the freeway next to the ground will be trapped more quickly with significantly higher expected pollutant concentrations in the Ahwatukee community.

ADOT DEIS did not use MCAQD DELTA Temperature instruments for calculating inversion conditions to determine accurate pollutant concentration projections. ADOT DEIS technical documents clearly show that Maricopa County Air Quality delta T systems data was not used for actual ground level measurements of temperature inversions. Without this data of actual inversion strength, which shows how quickly pollutant concentrations will increase, any modeling cannot accurately reflect the population exposure to those pollutants. Stability and Air Quality modeling conducted by ADOT as set forth in the DEIS provides no useful data and must not be used to determine potential air pollution concentrations of the South Mountain 202 freeway.

282

ADOT used Aircraft Communications Addressing and Reporting System (ACARS) for vertical temperatures and wind profiles. This method does not correlate to ground level inversion strength for population exposure and is not a scientific method or remotely reasonable to conclude accurate results. Data used does not have any quality assurance or quality control measurements. This means the equipment used does not have proven repeatability to produce the same temperature or wind speed for any given measurement. Moreover, no standard heights were used for correlating air shed temperatures. For example, one data point is measured at 2000 feet the next is at 3000 feet separated by miles and not at the same time of day. These random numbers were used by ADOT in a model without identifying the program.

Any results derived from the ACARS data are incomplete, not relevant, and mislead the community with technical jargon trying to show justification of expected air quality concentrations for each build and no build situation. Not only is the data not taken from the freeway project area, the data is randomly gathered at different heights, locations, and times. If a temperature sensor or wind speed and direction system cannot produce the same temperature/direction/speed each time for the same given test, the data is not valid and must not be used for modeling. As indicated previously, the data used in the DEIS is not valid without any quality assurance and quality control data to support measurements.

281

ADOT incorrectly uses ambient delta temperatures for determining air quality inversions. Page 18 of the DEIS Technical Report of the air quality section shows ambient delta temperature differences between air quality monitoring stations separated by many miles and different elevations. This spatial distance is not how to determine inversion strength. The DEIS report author produces figures, graphs and explanation of their findings of inversions found and expected in the future. This clearly shows that ADOT does not

Code	Issue	Response
279 (cont.)		The U.S. Environmental Protection Agency-recommended wind speed of 1 meter per second was used in the modeling. Traffic volumes during the evening peak hour were used in the modeling to represent worst-case conditions. During the time that Maricopa County was in nonattainment for carbon monoxide, it was as a result of exceedances of the 8-hour standard associated with evening traffic.
280	**Air Quality**	The South Mountains may redirect airflow, but they do not stop airflow.
281	**Air Quality**	At the request of (then) Arizona State Senator John Huppenthal, short-term monitoring of meteorological conditions at Pecos Road and 24th and 40th streets was conducted during 2006 and 2007. Results of this sampling and data from various Maricopa County Air Quality Department monitoring sites were included in the technical report for informational purposes only.

(Response 282 begins on next page)

Code	Comment Document

understand air quality modeling and misrepresents the danger to the citizens from Loop 202 Freeway pollution.

281 Delta temperature is used vertically with two temperature sensors comparing the difference of temperature between them. Standard Delta temperature systems used for air quality modeling and forecasting daily air quality by County and State officials has one temperature sensor at three meters and the other at ten meters, directly above each other. An inversion is when the air at the lower sensor is cooler than the upper sensor regardless of the ambient temperature. Inversion strength is only a few degrees, with five degrees being a very strong inversion. The facts, figures, and explanation of the DEIS technical documents using delta temperature clearly show the report has no merit. Those in the atmospheric measurement business understand that the DEIS author does not understand the meaning of delta temperature, how it is obtained, used or its ability for meaningful input into air quality models. An example of this lack of understanding can be found on page 29 of the ADOT Technical Report, Air Quality section, which states that, "[t]he difference in the hourly temperatures at the two locations were again plotted to provide an indication of the atmosphere's stability; the results are represented in figure 15. Positive numbers indicate that the temperatures at SMPP were warmer than at Pecos road location and represent inversion conditions during that hour." Inversion measurements to determine pollution concentrations are never conducted as ADOT purports. What is worse is that those measurements made it into their air quality prediction models, falsely reporting results to the public as good science.

281 Notwithstanding that this NEPA process has taken over 12 years, ADOT has not conducted any studies on atmospheric and/or ambient quality/conditions in the Ahwatukee area. As a result, there is no valid baseline data to input into air quality models that predict how bad the pollution in the area will be. Sites listed for reference to determine air quality for the citizens are nowhere near the impacted area and should not be used to determine air quality north of the Pecos Road alignment. Similarly, there are no temperature soundings for accurate air shed profiling. There are no air toxics measurements taken to understand the current components of the ambient air quality, and there are no wind speed and direction instruments installed as necessary to apply good science for modeling. These wind speed and direction monitors should have been installed north of the Pecos Road alignment east and west throughout the Ahwatukee community and near South Mountain to show how the Ahwatukee air shed does not remove tail pipe emissions from the freeway, but actually washes pollutants to the west in the mornings, shifting north near noon, with winds lastly northeasterly. This normal wintertime pattern known to all Arizona air quality technical persons is not shown or reflected in the ADOT DEIS.

283 In my opinion, wintertime inversions with multiple days of air stagnation will cause exceedances of the ambient air quality standards for the criteria pollutants for any build option inside the Ahwatukee area.

284 My independent research and data review of other local air quality databases with more accurate and relevant measurements (i.e. hourly wind speed and direction, actual

Code	Issue	Response
282	**Air Quality**	The Aircraft Communications Addressing and Reporting System data were not used for modeling; they were included for informational purposes only.
283	**Air Quality**	Phoenix is in nonattainment for particulate matter (PM_{10}) and ozone. Exceedances of ozone attributable to the proposed freeway are unlikely, and the analysis of particulate matter (PM_{10}) impacts also suggests the same for particulate matter (PM_{10}). See page 4-76 of the Final Environmental Impact Statement for the results of the particulate matter (PM_{10}) analysis.
284	**Air Quality**	Identification of data sources used in the comment would have been helpful. The comment would need to provide citations and references for the information provided for further comment response. The air quality assessment for impacts from carbon monoxide followed the U.S. Environmental Protection Agency guidelines in *Guideline for Modeling Carbon Monoxide from Roadway Intersections* (A-OAQPS, 1992). Inputs to the model were based on U.S. Environmental Protection Agency-recommended values or were selected to provide a conservative estimate of impacts. Modeling methodology and results were reviewed by the Federal Highway Administration, Arizona Department of Transportation, and Maricopa Association of Governments. Although the qualitative particulate matter (PM_{10}) hot-spot analysis performed in the Draft Environmental Impact Statement met 40 Code of Federal Regulations § 93.111(c), the Arizona Department of Transportation and Federal Highway Administration have updated the qualitative analysis to a particulate matter (PM_{10}) quantitative analysis for the Final Environmental Impact Statement to ensure that a state-of-the-art analysis is completed for the proposed action. The quantitative project-level particulate matter (PM_{10}) hot-spot analysis prepared for the proposed project is summarized in the prologue to the Final Environmental Impact Statement (page xiii) and is more fully described beginning on page 4-68 of the Final Environmental Impact Statement. The carbon monoxide and particulate matter (PM_{10}) analyses demonstrated that the proposed freeway would not contribute to any new localized violations, increase the frequency or severity of any existing violation, or delay timely attainment of the National Ambient Air Quality Standards or any required interim emissions reductions or other milestones. A particulate matter ($PM_{2.5}$) analysis is not required since the area is in attainment for the particulate matter ($PM_{2.5}$) National Ambient Air Quality Standard.

(Response 279 continues on next page)

Code	Comment Document

inversion strength and air stagnation durations, and many other components of air modeling) shows that the Ahwatukee/Foothills area north of the proposed freeway alignment will exceed both particulate matter (PM) and Carbon Monoxide (CO) standards within 100 meters (micro scale siting) from the edge of roadway of the South Mountain Freeway during adverse weather and meteorological conditions. Valley-wide pollutant concentrations will be high, and any build option will compound and intensify trapped pollution between the freeway and the mountain.

284 Ahwatukee residents 100 to 500 meters (middle scale siting) away from the freeway alignment will most likely experience unhealthy exposures near or at the air quality standards for particulate matter (PM). Diesel Particulate Matter, the fine PM 2.5 µm will be carried further into the community and based on the DEIS list of the components of diesel particulate matter, will present serious health concerns.

285 The data used to support the DEIS does not have quality assurance or quality control and is not valid. All air quality data used must meet quality assurance measurements of precision and accuracy to be valid. Quality control measurements using different testing systems than quality assurance must meet standards (test concentrations). Incorrectly applying slope and intercept calculations to data can potentially reduce air quality measurements into database. Improper testing of air quality instruments will invalidate data. Not meeting the testing frequency requirements for either QA or QC will invalidate data.

Particulate and gaseous samplers and meteorological systems require routine maintenance, failure to maintain equipment as required will invalidate collected air quality data. The DEIS does not ensure data measurements used are valid, traceability of measurement protocols are missing and should make all reports suspect of erroneous results.

286 Page 67 of the technical report on the air quality section states that "the selection of each of the metrological conditions was based on EPA-454-/R 92-005, guidelines for modeling carbon monoxide from roadway intersections." This is not how you would determine the air quality impact of an eight lane freeway. It appears that the DEIS was completed by contractors without experience in the industry and randomly attached meaningless data, facts and figures that do not support the stated ADOT conclusions. ADOT review of submitted air quality technical data and conclusions are without merit, proper review of methodology and applied science. This report provides no real analysis of the stated purpose of the DEIS.

287 The DEIS component addressing the US Army Corps of Engineers section 404 of the clean water act, and the 401 certification by ADEQ is in jeopardy. EPA has found that ADOT has routinely failed to comply with contracts with FHWA, USACOE, ADEQ and USFS to maintain, limit or control sediment discharges into jurisdictional waters of the US. The Gila and Salt rivers are waters of the US inside this planned project. EPA actions have created an environmental program inside of ADOT. This environmental program has failed to implement the most basic construction mitigations. Statewide highway

Code	Issue	Response
285	**Air Quality**	Ambient levels of the criteria pollutants reported were obtained from the Maricopa County Air Quality Department, which follows U.S. Environmental Protection Agency quality assurance/quality control procedures.
286	**Air Quality**	The air quality assessment for impacts from carbon monoxide followed the U.S. Environmental Protection Agency guidelines in Guideline for Modeling Carbon Monoxide from Roadway Intersections (A-OAQPS, 1992). This is accepted methodology. See <epa.gov/ttn/scram/dispersion_prefrec.htm#cal3qhc>.
287	**Water Resources, Waters of the United States**	Controlling and treating runoff is a normal function of the Arizona Department of Transportation projects. No evidence is offered to substantiate such statements. The U.S. Army Corps of Engineers, as a cooperating agency, has participated and contributed in each step of the environmental process. The agency has found the logical sequence of decision making to be sound and in line with National Environmental Policy Act requirements. The Arizona Department of Environmental Quality has also contributed to the process. Both agencies as referenced in the comment have oversight roles in project permitting as established in the Clean Water Act (Sections 401, 402, and 404). Extensive mitigation in accordance with the permitting requirements can be found in the *Water Resources* and *Waters of the United States* sections of Chapter 4 of the Final Environmental Impact Statement. The Arizona Department of Transportation is fully obligated and committed to implementation and adherence to those mitigation strategies.

Code	Comment Document

construction along hillsides have created large and numerous rills (deep cuts down hillsides). These rills, wash sediment into our waterways, polluting the ecosystem. ADOT management down plays environmental stewardship, by stating "we have always done it this way". ADEQ, Army Corps and FHWA do not conduct any inspections. Internal ADOT environmental staff does not influence ADOT management; ADOT management is self environmental regulating without fear of ADEQ, FHWA or other construction partners. FHWA does not provide funding for continued maintenance of hillside erosion after construction. Statewide ADOT does not provide its maintenance highway workers funding to mitigate sediment discharges from hillside rills and failed sediment control features of the original construction best management practices. ADOT has failed to protect the environment in nearly all completed construction sites with the same terrain of the South Mountain 202. It is expected that ADOT will not honor their own Statewide Individual Stormwater permit, allowing sediment discharges during and after construction of the freeway.

288

Tail pipe emissions and other transportation discharges including: material lost from untarpped or improperly tarpped trucks, fluids/chemicals leaking from container vehicles can dry and become reintrained into the atmosphere potentially harming residents closest to freeway.

Tribal lands do contribute to the local air shed loading of particulate matter. The entire area south of the planned freeway is unstable land used and never maintained for dust control. No enforcement ability by Federal, State or County for the impact to the Ahwatukee residents, this additional particulate will be in addition to particulate generated by vehicle emissions.

289

PM10 blown onto the freeway from the Tribal lands to the south will be reintrained into the atmosphere, allowing PM10 normally not reaching the Ahwatukee areas to be re broadcasted into the air and carried into the neighborhood.

A hazardous materials accident would trap the community or create panic to shelter in place with gaseous plume and fire exposure. Most winds will carry hazardous materials and smoke into the area north of the freeway. Potentially trapping people between the plume and their ability to exit safety without traveling through the plume of toxic gases.

290

Visibility will be significantly reduced for all residents looking south, southeast and southwest. Observations of local freeways from local area hill tops inside metro Phoenix clearly shows the dark particulate/tail pipe emissions above valley freeways. This planned freeway will be no different. Heavy particulate and tailpipe emissions will obscure current scenic views.

Code	Issue	Response
288	**Air Quality**	Paved road dust was considered in the quantitative, project-level, particulate matter (PM_{10}) hot-spot analysis prepared for the proposed project. The results of the analysis are summarized in the prologue to the Final Environmental Impact Statement (page xiii) and are more fully described beginning on page 4-68 of the Final Environmental Impact Statement. The carbon monoxide and particulate matter (PM_{10}) analyses demonstrated that the proposed freeway would not contribute to any new localized violations, increase the frequency or severity of any existing violation, or delay timely attainment of the National Ambient Air Quality Standards or any required interim emissions reductions or other milestones.
289	**Air Quality**	According to the 2013 Arizona Department of Transportation A*ir Quality Assessment South Mountain Freeway 202L Draft Report*, review of wind data from the Gila River Indian Community monitoring site at St. Johns suggests that during the morning hours and associated with mountain-drainage air flows and stable atmospheric conditions, wind flows are from the southeast and follow the Gila River channel to the north. Locations to the east of St. Johns experience flow from the east to the lower elevations along the Gila River. During the warmer hours' improved mixing, flows typically follow the river channel and come from the north and northwest. Likewise, during a 1-month-long meteorological monitoring period (November 20, 2006, through December 21, 2006) at Pecos Road and 40th Street and a second 1-month-long monitoring period at Pecos Road and 24th and 40th streets (April 19, 2007, through May 21, 2007), winds during the morning hours typically were from the northeast. During the warmer hours, and with improved mixing, winds typically were from the west.
290	**Air Quality**	Impacts on visibility are primarily related to extremely small aerosols from multiple sources. As noted in the text box on page 4-69 of the Final Environmental Impact Statement, in the Phoenix metropolitan area, about 34 percent of particulate ($PM_{2.5}$) emissions are attributed to on-road mobile sources, which contributes to the brown cloud and visibility issues; however, reductions in on-road mobile source emissions through emission controls have produced visibility improvements. The Arizona Department of Environmental Quality monitors visibility in the Phoenix metropolitan area.

Curriculum Vitae

Richard B. Haddow
6303 E. Windsong St.
Apache Junction, AZ 85119
602-980-5034
Email RHaddowPI@earthlink.net

2006 to January 2012 Arizona Department of Transportation: Globe District Environmental Coordinator

2003 to Present Haddow Environmental Research Organization: Air Quality Expert Witness, EPA Qualified Researcher, AZ State Licensed Investigator, qualifying party.

1985 to 2003 Maricopa County Health Department / Environmental Services: Quality Assurance Manager, Public Health Engineer, Environmental Health Supervisor, Open Burning/Asbestos Manager, Environmental Investigator Supervisor

Knowledge Skills and Abilities (KSA) Technical

Represent the ADOT Globe District Engineer for all environmental programs while providing technical assistance and expertise to local governments. Represented Maricopa County Environmental Services to the MAG Committee, Air Quality Technical Advisory Committee.

Conducted statistical analysis with air quality modeling, meteorological modeling and travel demand modeling to determine air quality equipment siting criteria to meet Maricopa County EPA grant objectives.

Managed and maintained multiple complex databases for air quality modeling. Conducted research studies using demographic and land use data to address the impacts of alternative highway designs.

Conducted stakeholder groups and community workshops on environmental rule making. Forecasted carbon monoxide, particulate and ozone advisories to the public and media. Worked with and for attorneys to collect information and provide testimony as an expert witness. Provided testimony in support of industrial clients against claims that they were in violation of environmental laws. Testified as an expert witness for the Attorney General's Office for Superfund Investigations.

Areas of expert subject matter include: air quality modeling, law enforcement, air pollution chemistry, air monitoring instrumentation and siting, analytical chemistry, air toxics, meteorological monitoring and forecasting, environmental compliance, regulatory analyses, audits, permitting, emissions inventories, environmental data analysis, quality assurance, quality control, soil and water sampling, technical report writing, data acquisition instrumentation calibrations (as well as repair and maintenance), standards testing and traceability.

Conducted environmental investigations.

Earned more than ten semi-annual certifications as an ADEQ visible emissions evaluator EPA Method 9.

Performed technical review of air, soil, water and meteorological data, performance and system auditing, database management, air monitoring and site assessment and selection. Adhered to the Code of Federal Regulations for NAAQS (National Ambient Air Quality Standards).

Experienced in the arenas of water programs, data validation, air pollution training, air pollution prevention, hazardous air pollutants, water supply field inspection, hazardous materials and waste management.

Code	Issue	Response
291		Résumé

Code	Comment Document

Evaluated permit applications to determine the potential impact to communities surrounding industrial facilities in the event of a release (Off Site Consequence Analysis). Prepared complex reports, findings and conclusions and presented to executive management.
Conducted stakeholder group meetings and community workshops to explain complex environmental programs. Worked with neighbors to resolve complex issues that had potential to directly impact their quality of life.

Knowledge Skills and Abilities (KSA) Professional Experience
Represent the ADOT Globe District Engineer for COGs, MPOs and tribal transportation groups. Maricopa County Environmental Services: Worked with groups by means of committee/task force to resolve complex rule making and air quality planning by applying political consensus. Wrote, operated and managed Federal grants with signature authority, as well as multiple ongoing complex programs. Designed, built and maintained an ambient air monitoring program with use of ISTEA funds ($1.2M) to ensure future state transportation monies. Preparation and dissemination of complex models, findings, and conclusions to executive management. Conducted environmental seminars and training programs that simplified the understanding of a highly technical analysis.

Evaluated permit applications for process engineering such as Title V permits and Non Title V permits, including mobile sources. Held regulatory authority over permit holders to ensure compliance within the sand and gravel industry as well as mining and earthmoving operations. Managed multiple ongoing environmental programs. Applied AP-42 emission factors as related to hot asphalt mixing facilities, Portland cement plants, and sand and gravel processing. Reviewed and commented on air quality permit applications to Arizona Department of Environmental Quality (ADEQ) and non-attainment counties. Wrote, implemented and maintained dust control programs. Managed and trained air quality permit investigators. Conducted environmental seminars and training programs for regulated industry groups and regulators. Conducted and managed storm water pollution prevention planning programs (SWPPP).

Operated and managed an ambient air monitoring program in accordance with the USEPA objectives for criteria pollutants: Particulates (PM-10μm & 2.5μm), carbon monoxide, ozone, sulfur dioxide, nitrogen dioxide and lead. Monitored air toxics, hazardous air pollutants, and visibility including enhanced ozone monitoring (PSD). Conducted technical research for the assessment of air quality (modeling). Performed analysis of statistical data to evaluate attainment status of pollutants. Operated and managed the quality assurance program to ensure data met or exceeded ambient air monitoring protocols, methods and traceability of standards. Managed federal and state performance audits. Performed field environmental monitoring and investigations for special studies. Managed a team of air quality assurance technicians, chemists, and electronic technicians. Managed the chemistry laboratory operations. Designed, installed, managed and maintained the network for ambient air monitoring stations in Maricopa County, Arizona. Conducted joint special studies for ozone, particulates, carbon monoxide and visibility with USEPA, ADEQ, and the USDA Forest Service. Managed the database for ambient air quality and quality assurance in the USEPA AIRS database. Designed and managed the gaseous and particulate standards program for QA/QC. Author of the first approved by USEPA for Quality Assurance and Operating Procedures Manual for Field and Office Activities of Maricopa County, Arizona.

Seven

Comments on the SMF DEIS
Re: Cultural Resources Impacts
by Samantha Skenedore, Of Counsel: The Shanker Law Firm, PLC.

Code	Issue	Response

Code	Comment Document

COMMENTS ON THE SOUTH MOUNTAIN FREEWAY
DRAFT ENVIRONMENTAL IMPACT STATEMENT
ISSUED APRIL 2013
REGARDING IMPACTS TO CULTURAL RESOURCES
July 22, 2013

Prepared by Samantha C. Skenandore
Of-Counsel, The Shanker Law Firm, PLC

292 The Federal Highways Administration (the "FHWA") and the Arizona Department of Transportation ("ADOT") prepared and issued a Draft Environmental Impact Statement and Section 4(f) Evaluation (the "DEIS") of the Freeway project pursuant to 42 U.S.C. §4332(2)(c), 49 U.S.C. §303 and 33 U.S.C. §1251 in April 2013. The DEIS particularly addresses the preferred alternative (the "E1 Alternative") for building a major highway known as the South Mountain Loop which will destroy and desecrate a mountain range held sacred by Native Americans from various tribes.[1] The FHWA and ADOT issued the DEIS and selected the E1 Alternative despite the fact that the E1 Alternative will (1) cause irreversible damage to the sacred and historically significant South Mountain,[2] and (2) have a profound negative impact on the religious, cultural and spiritual well-being of Native Americans. Portions of South Mountain lie within the exterior boundaries of a federally-recognized tribe – the Gila River Indian Community (the "GRIC").[3] The GRIC and other tribes have attached a significant traditional, cultural and religious value upon South Mountain and adjacent areas.

293 The FHWA and the ADOT failed to adequately consult with the tribes. This failure is carried over into the DEIS which, as a result, draws flawed conclusions. The FHWA and ADOT should re-initiate the Section 106 process with reasonable and good faith efforts to consult all tribes and amend any and all technical studies identifying, assessing, evaluating and mitigating adverse impacts to cultural resources with tribal input.

294 In addition, the FHWA and ADOT should seek a review by the National Advisory Council on Historic Preservation to conduct a case analysis of the Section 106 deficiencies and strictly adhere to the Council's recommendations for corrective actions. *See* 36 C.F.R. §800.9. The aforementioned recommendations are based on the following:

I. The FHWA and ADOT is non-compliant with Section 106 ("Section 106") of the National Historic Preservation Act of 1966, as amended (16 U.S.C. § 470).

---

[1] *See* ADOT, with concurrence from the FHWA, identified the E1 Alternative as its Preferred Alternative in the Eastern Section (the "E1 Alternative"). *See* ADOT, South Mountain Study Team, *Summary*, P. 38, website available at http://www.azdot.gov/Highways/Valley_Freeways/Loop_202/South_Mountain/PDF/south-mountain-loop-202-docs/EIS/summary/Summary.pdf (viewed July 18, 2013).
[2] The FHWA and ADOT determined that the South Mountain qualified as a Traditional Cultural Property. *See* ADOT, South Mountain Study Team, Summary, Table S-3, p. S-17 available at http://www.azdot.gov/Highways/Valley_Freeways/Loop_202/South_Mountain/PDF/south-mountain-loop-202-docs/EIS/summary/Summary.pdf (viewed July 18, 2013).
[3] For more information on the Gila River Indian Community, please see the official page available at: http://www.gilariver.org/ (viewed July 18, 2013).

Code	Issue	Response
292	**Cultural Resources**	The religious and cultural importance of the South is acknowledged in the Draft Environmental Impact Statement in several locations, notably pages 4-132 and 5-26 as well as in the Summary of the Draft Environmental Impact Statement. The description in the Draft Environmental Impact Statement is based on input received from the Gila River Indian Community and its members and other Indian Nations and their members. The Draft Environmental Impact Statement, after consultation and coordination efforts, accommodates and preserves (to the fullest extent possible from the available alternatives) access to the South Mountains for religious practices. A very small portion of the mountain would be impacted by the proposed freeway (less than 0.03 percent of the total area). Although the Draft Environmental Impact Statement describes the impact on the South Mountains as adverse, Native Americans would not be kept from practicing their beliefs, access to the mountain would be maintained, and mitigation measures would be implemented based on input from members of the Gila River Indian Community. Since the beginning of the environmental impact statement process, the Federal Highway Administration and Arizona Department of Transportation have been carrying out cultural resource studies and engaging in an ongoing, open dialogue with the Gila River Indian Community Tribal Historic Preservation Office regarding the identification and evaluation of places of religious and cultural importance, including the South Mountains, to the Gila River Indian Community that may be adversely affected by the proposed freeway. Information describing the outreach and collaboration can be found in Chapter 2 and in text beginning on pages 4-140 and 5-26 of the Final Environmental Impact Statement. Mitigation measures were suggested in a letter from the Lieutenant Governor of the Gila River Indian Community to the Administrator, Arizona Division, Federal Highway Administration, dated June 23, 2010 (see page A372 of Appendix 2-1 of the Final Environmental Impact Statement). In this letter, the Gila River Indian Community submitted a proposal to address partial measures for the mitigation of adverse effect from the Pecos Road Alignment of the South Mountain Freeway. The Gila River Indian Community's proposal found the engineering solutions acceptable, but stated that implementation and construction of the proposed freeway would require further consultation. In committing to the evaluation of the South Mountains Traditional Cultural Property, the Arizona Department of Transportation and Federal Highway Administration also committed to the Gila River Indian Community's participation in ongoing engineering design refinements and acknowledged the importance of all plants and animals in the traditional culture of the Akimel O'odham and Pee Posh of the Gila River Indian Community. To clarify, use of the mountains for the purposes of the proposed freeway represents two-tenths of one percent of the total mountain range. Since 1988, and as part of this environmental impact statement process, several measures have been undertaken and will be undertaken to further reduce effects on the mountains. These measures, including narrowing the design footprint, acquiring replacement land immediately adjacent to the mountains, and the provision of highway crossings, are outlined in text beginning on page 5-23 of the Draft Environmental Impact Statement.

(Responses continue on next page)

Code	Comment Document
295	Section 106 of the National Historic Preservation Act of 1966, 16 U.S. C. § 470, requires federal agencies, here the FHWA, to take into account the effects of their actions on historic properties listed on or eligible for inclusion in the National Register of Historic Places (the "NRHP")[4] and allow the Advisory Council on Historic Preservation (the "ACHP") a reasonable opportunity to comment. The ACHP promulgated regulations of the historic preservation review process entitled "Protection of Historic Properties" in 36 C.F.R. Part 800. The Section 106 process is designed to properly identify, assess and mitigate adverse actions on cultural resources. The process requires the lead federal agency to identify historic properties and determine if such properties are eligible for listing in the NRHP. To be determined eligible for listing in the NRHP, properties must be a place of significance in American history, architecture, archaeology, engineering or culture and meet at least one or more of the following criteria: **Criterion A**. [A]ssociated with events that have made a significant contribution to the broad patterns of our history; or **Criterion B**. [A]ssociated with the lives of persons significant in our past; or **Criterion C**. [E]mbody the distinctive characteristics of a type, period or method of construction or that represent the work of a master, or that possess high artistic values or that represent a significant distinguishable entity whose components may lack individual distinction; or **Criterion D**. [Y]ielded, or may be likely to yield, information important in prehistory or history. They also must possess integrity of location, design, settings, materials, workmanship, feeling and/or association. Properties may be of local, state or national importance.[5]
296	
297	During the development of the Freeway project, the GRIC underwent the process to obtain a Tribal Historic Preservation Officer (THPO) to assist in identifying and nominating historic properties on GRIC's tribal lands[6] for the purposes of Section

[4] Authorized by the National Historic Preservation Act of 1966, the National Park Service's National Register of Historic Places is part of a national program to coordinate and support public and private efforts to identify, evaluate, and protect America's historic and archeological resources. *See*: http://www.nps.gov/nr/ (viewed on July 19, 2013).
[5] See *Id.* and National Park Service, National Register Bulletin 38, Guidelines for Evaluating and Documenting Traditional Cultural Properties 1990, *available at* www.cr.nps.gov/nr/publications/bulletins/nrb38/htm. Criteria for eligibility for being on the National Register are: "associated with events that have made a significant contribution to the broad patterns of our history; are associated with the lives of persons significant in our past; embody the distinctiveness of a type, period, or method of construction, or…represent the work of a master, or…possess high artistic values, or…represent a significant and distinguishable entity whose components may lack individual distinction; or have yielded, or may be likely to yield, information important in prehistory or history." 36 C.F.R. § 60.4.
[6] Tribal lands means "all lands within the exterior boundaries of any Indian reservation; and …all dependent Indian communities" (16 U.S.C. § 470w(14)).

Code	Issue	Response
293	**Cultural Resources**	Section 106 of the National Historic Preservation Act requires a government-to-government relationship between the Federal Government and Indian tribes as described beginning on page 4-140 of the Final Environmental Impact Statement. Section 106 requires that federal agencies take into account the effects of their undertakings on historic properties. This process requires consultation with tribal authorities. Consultation has occurred with Gila River Indian Community government officials, the Tribal Historic Preservation Officer, the Cultural Resource Management Program, many different tribal authorities, and the State Historic Preservation Office. The consultation has resulted in concurrence from the Gila River Indian Community Tribal Historic Preservation Office and the State Historic Preservation Office on National Register of Historic Places eligibility recommendations (including traditional cultural properties), project effects, and proposed mitigation and measures to minimize harm. This consultation has been ongoing and will continue until any commitments in a record of decision are completed.
294	**Cultural Resources**	The cultural and religious places of importance, like the South Mountains, are acknowledged in the Draft Environmental Impact Statement in several locations, notably pages 4-132 and 5-26. The proposed project would accommodate and preserve (to the fullest extent possible from the available alternatives) access to the South Mountains for religious practices. Section 106 of the National Historic Preservation Act requires a government-to-government relationship between the Federal Government and Indian tribes as described beginning on page 4-140 of the Final Environmental Impact Statement. Section 106 requires that federal agencies take into account the effects of their undertakings on historic properties. This process requires consultation with tribal authorities. Consultation has occurred with Gila River Indian Community government officials, the Tribal Historic Preservation Officer, the Cultural Resource Management Program, many different tribal authorities, and the State Historic Preservation Office. The consultation has resulted in concurrence from the Gila River Indian Community Tribal Historic Preservation Office and the State Historic Preservation Office on National Register of Historic Places eligibility recommendations (including traditional cultural properties), project effects, and proposed mitigation and measures to minimize harm. This consultation has been ongoing and will continue until any commitments in a record of decision are completed. As noted in Table 4-48, which begins on page 4-133 of the Draft Environmental Impact Statement, the Advisory Council on Historic Preservation has been consulted during the Section 106 process.
295	**Cultural Resources**	The Section 106 process of the National Historic Preservation Act is discussed on page 4-128 of the Draft Environmental Impact Statement.
296	**Cultural Resources**	Eligibility criteria for inclusion in the National Register of Historic Places are discussed on page 4-128 of the Draft Environmental Impact Statement.
297	**Cultural Resources**	The Gila River Indian Community's Tribal Historic Preservation Officer is discussed on page 4-128 of the Draft Environmental Impact Statement.

Code	Comment Document
298	106.[7] The South Mountain has been approved as a traditional cultural property under criteria A and B. The South Mountain, known in the Pima language as the "Muhadag Do'ag"[8] and in the Maricopa language as "Avikwaxos" consists of the Ma Ha Tauk, Gila, and Guadalupe Mountain Ranges. The mountain range abuts the northern territory of the GRIC and is the immediate landscape of the northern boundary of the GRIC reservation. A portion of main ridge north and main ridge south of the South Mountain is on GRIC land and serves as the 'Community's main, direct physical link to the South Mountains.' The South Mountain is a prominent figure in oral traditions of both the Akimel O'Odham (Pima) and the Pee Posh (Maricopa).
299	GRIC tribal members and the tribal government hold the South Mountain sacred and see it as central to its creation story. *See* Gila River Indian Community Resolution No. GR-41-07, A Resolution Designating the South Mountain Range (Muhadag, Avikwaxos) as a Sacred Place and Traditional Cultural Property of the Gila River Indian Community. The E1 Alternative would desecrate the South Mountain by cutting through it, resulting in a devastating negative disparate impact culturally, spiritually, and religiously upon GRIC tribal members.
298	On January 6, 1982, the Gila River Indian Community Tribal Council adopted an ordinance declaring "…as a matter of Community policy and legislative determination, that the public interests of the Pima-Maricopa people and the interests of all other persons living within the jurisdiction of the Gila River Indian Community require that the Community adopt a means whereby all sites, location, structures, and objects of sacred, historical or scientific interest or nature will be protected from desecration, destruction, theft, or other interference." *See* Gila River Indian Community Resolution No. GR-01-82. In 1989, the Gila River Indian Community Tribal Council adopted a resolution to preserve the lands of their Hohokam ancestors, by approving the "Policy Statement of the Four Southern Tribes (Salt River Pima-Maricopa Indian Community, Ak-Chin Indian Community, Tohono O'odham Nation, and the Gila River Indian Community) which outlines the Four Tribes' intent to protect, promote, and preserve cultural affinity to the HuHuKam." See Gila River Indian Community Resolution No. GR-15-89. Most importantly to the present review, the Gila River Indian Community Tribal Council adopted a tribal resolution affirming that the South Mountain is "a sacred

[7] In the absence of a Tribal Historic Preservation Officer ("THPO"), the State Historic Preservation Officer assumes the duties of Section 106 review. Since the onset of the project in July 2001 (see DEIS, Table 2-1, Chapter 2), the GRIC successfully created its own Tribal Historic Preservation Office and employed a THPO.
[8] The DEIS neglects to address the accurate meaning of Muhadag Do'ag, the site which is also known as the South Mountain, South Mountain Range and/or Salt River Mountains (Range) based on the prominent and valid oral history of the GRIC. Do'ag means mountain and Muhadag means greasy.

298	**Cultural Resources**	The cultural and religious places of importance, like the South Mountains, are acknowledged in the Draft Environmental Impact Statement in several locations, notably pages 4-132 and 5-26 of the Draft Environmental Impact Statement.
299	**Cultural Resources**	The cultural and religious places of importance, like the South Mountains, are acknowledged in the Draft Environmental Impact Statement in several locations, notably pages 4-132 and 5-26. The description in the Draft Environmental Impact Statement is based on input received from the Gila River Indian Community and its members and other Indian Nations and their members. The Draft Environmental Impact Statement, after consultation and coordination efforts, accommodates and preserves (to the fullest extent possible from the available alternatives) access to the South Mountains for religious practices. Although the Draft Environmental Impact Statement describes the impacts on the South Mountains as adverse, this would not prohibit Native Americans from continuing to practice their beliefs because only a small fraction of the mountain would be affected, replacement lands would be provided, and access to the mountain would be maintained, and mitigation would be implemented based on input by Native Americans. Several action alternatives were subject to the alternatives development and screening process; not just the E1 Alternative and alternatives located on the Community (Figure 3-6 on page 3-10 of the Draft Environmental Impact Statement illustrates a representation of such alternatives). Ultimately the other alternatives were eliminated from further study in the screening process and the Gila River Indian Community decided not to give permission to study alternatives on its land (see Draft and Final Environmental Impact Statement page 3-25). In June 2013, the Maricopa Association of Governments approved new socioeconomic projections for Maricopa County. The purpose and need and analysis of alternatives were updated and reevaluated using these new population, employment, and housing projections and corresponding projections related to regional traffic. The conclusions reached in the Draft Environmental Impact Statement were reconfirmed in the Final Environmental Impact Statement (see Chapter 3, *Alternatives*). Therefore, the Arizona Department of Transportation, with concurrence from the Federal Highway Administration, identified the E1 Alternative as the eastern section of the Preferred Alternative (which includes the W59 Alternative in the western section of the Study Area). In reaching its determination, the Arizona Department of Transportation sought to balance its responsibilities to address regional mobility needs while being fiscally responsible and sensitive to local communities.

298	place/traditional cultural property …that…must be kept inviolate thereby recording the sacredness and significance of South Mountain to the people of the GRIC and its tribal government." *See* Gila River Indian Community Resolution No. GR-41-07 (April 2007). The resolution further states that the GRIC "strongly opposes any alteration of the South Mountain Range for any purpose"…and that any alteration "…would be a violation of the cultural and religious beliefs of the Gila River Indian Community and would have a negative cumulative effect on the continuing lifeways of the people of the Gila River Indian Community." *Id.* The O'odham concept of creation is not something in the past but is an ongoing process - one that GRIC members are intrinsically a part of and are obligated to participate in. Members from the Four Southern Tribes fulfill this duty through perennial ceremonies and rituals designed to preserve and stabilize the earth. Failure to fulfill those obligations is believed to result in great harm to the earth and the people who depend on it. Ceremonies are efforts undertaken for specific purposes in accordance with instructions handed down from generation to generation, and when generations of O'odham people are gathered together in the same time and place to carry out ceremony, this is the embodiment of culture. Rituals are performed in prescribed locations that are unique and specific sites possess different spiritual properties and significance. The O'odham are aware that the plants and animals that exist on the South Mountain range possess a kind of healing that cannot be found anywhere else in their current boundaries. O'odham traditionalists and elders of the Four Southern Tribes use portions of the South Mountain for periodic ceremonies and rituals. These are people who are keepers of the tribal peoples' heritage and culture who possess an essential role believed to sustain the tribal people as a whole. These people are responsible for passing on ceremonies and songs that have been performed for ages. Many O'odham songs are place-specific and refer to a certain mountain or bend in a river, as a way of respecting that place's centrality to O'odham culture and well-being. O'odham traditionalists also are people who follow the way of living from the earth: picking and harvesting traditional foods like many kinds of cactus fruits, foraging for wild plants to use as traditional medicines, and teaching and guiding the young in the cultural and spiritual ways.
300	Due to the fact that the South Mountain range is used and venerated by O'odham tribes and the Freeway project is a large-scale transportation project impacting a large sacred site footprint, strict adherence to Section 106 should have preceded the preparation and issuance of a DEIS. The Freeway project is noncompliant with Section 106 for the reasons set forth below:
300	**a. The DEIS clearly shows that the FHWA and ADOT failed to make reasonable and good faith efforts to consult all federally recognized**

Code	Issue	Response
299 (cont.)		After determining that no prudent and feasible alternatives existed to avoid the South Mountains Traditional Cultural Property, efforts were undertaken to minimize harm. These measures are documented, beginning on page 5-27 of the Draft and Final Environmental Impact Statements. Some of these measures included avoidance of specific sites and providing multiuse crossings and fencing that would limit access by freeway users, but allow Gila River Indian Community members to continue to gain access to the site. In addition, the Federal Highway Administration and Arizona Department of Transportation committed to provide funds for the Gila River Indian Community to conduct a full evaluation of the South Mountains Traditional Cultural Property (see page 4-160 of the Final Environmental Impact Statement). Documentation of these efforts are in a letter from the Lieutenant Governor of the Gila River Indian Community to the Administrator, Arizona Division, Federal Highway Administration, dated June 23, 2010 (see page A372 of Appendix 2-1 of the Final Environmental Impact Statement). In this letter, the Gila River Indian Community submitted a proposal for the "Evaluation of Traditional Cultural Property and Adverse Effects of Transportation Corridor Development posed by the proposed construction of the current Pecos Alignment of the South Mountain Freeway." In committing to the evaluation of the South Mountains Traditional Cultural Property, the Federal Highway Administration and Arizona Department of Transportation also committed to the Gila River Indian Community's participation in ongoing engineering design refinements and acknowledged the significance of all plants and animals in the traditional culture of the Akimel O'odham and Pee Posh of the Gila River Indian Community.
300	**Cultural Resources**	Strict adherence to Section 106 of the National Historic Preservation Act not only preceded the preparation and issuance of a Draft Environmental Impact Statement, but is ongoing and will continue. The Draft and Final Environmental Impact Statements comply with Section 106 of the National Historic Preservation Act. The Section 106 process is documented in Table 4-47 beginning on page 4-145 of the Final Environmental Impact Statement.

Code	Comment Document

Indian tribes that may attach religious and cultural significance to the Area of Potential Effects *See Id.* at §800.3(f)(2).[9]

301

The DEIS appears to suggest that FHWA and ADOT properly noticed, hosted, held and/or facilitated numerous meetings with the GRIC and perhaps, other tribes.[10] Table 2-1 in the DEIS illustrates that the project initiated in July of 2001, however, no subsequent record of meetings with any other tribe (other than the GRIC) is demonstrated in the table until March 18, 2011.[11] In other words, no other tribes appear to have been consulting parties nor were they present at the onset of the project. The only reference to solicitation of tribal input other than the GRIC did not occur until March 18, 2011. The GRIC was the only tribe at the table throughout the majority of the project for *over ten (10) years*. The DEIS fails to demonstrate any reasonable and good faith effort to bring all interested and impacted tribes to the table. Further Table 4-48 demonstrates that only one tribe, the Hopi Tribe, concurred on the Section 106 consultations. According to the DEIS, one other tribe, the Yavapai-Prescott Indian Tribe, deferred its participation to the Southern Tribes and all other tribes, including the GRIC, neither responded nor concurred with the Section 106 findings. The data speaks for itself. The tribes have been left almost entirely out of a project that has been under development since 2001. The tribes, however, are on record for openly and voluntarily asserting the significant cultural, traditional and religious attachment to the sacred site.

Table 4-48 in the DEIS demonstrates that nearly each federally-recognized tribe associated with the Freeway project has opted to either refrain from responding to the FHWA and ADOT or has, in some rare instances, deferred its position to the Southern Tribes. The record, again, reflects an abundant failure on behalf of the FHWA and ADOT to gain meaningful consultation with the affected tribes, having performed outreach to only to the GRIC, one of the Four Southern Tribes. The Salt River Pima-Maricopa Indian Community, Ak-Chin Indian Community, and Tohono O'odham Nation have not been consulted as stakeholders despite the fact that FHWA and ADOT are on record as having been directed to do so by at least one other government - the Yavapai-Prescott Indian Tribe. The record further shows that the majority of the tribes affected by the undertaking were not consulted early in the project's planning process via the initial scoping process, and were consequently not consulted about the technical reports, consultants and cultural expertise necessary to promulgate accurate findings.

---

[9] 36 C.F.R. § 800.3(f)(2)states, "Involving Indian tribes and Native Hawaiian organizations. The agency official shall make a reasonable and good faith effort to identify any Indian tribes or Native Hawaiian organizations that might attach religious and cultural significance to historic properties in the area of potential effects and invite them to be consulting parties. Such Indian tribe or Native Hawaiian organization that requests in writing to be a consulting party shall be one."

[10] *See* South Mountain Freeway (Loop 202) Draft Environmental Impact Statement and Section 4(f) Evaluation, April 2013, Chapter 2-4.

Code	Issue	Response
301	**Cultural Resources**	As noted in Table 4-47, which begins on page 4-145 of the Final Environmental Impact Statement, the Ak-Chin Indian Community, the Gila River Indian Community, the Hopi Tribe, the Salt River Pima-Maricopa Indian Community, the Tohono O'odham Nation, the Yavapai-Apache Tribe, and the Yavapai-Prescott Indian Tribe were included in the initial Section 106 consultation in 2003. At that time, Yavapai-Prescott Indian Tribe deferred to the Four Southern tribes in a response dated September 10, 2003. Hopi concurred, but did not defer at this time. As more information regarding the project was known (and of aboriginal lands), all of the tribes with aboriginal lands within the project (including the Yavapai-Prescott Indian Tribe) were consulted in 2005, 2006, 2012, and 2013. In August 2005, both the Salt River Pima-Maricopa Indian Community and the Tohono O'odham Nation agreed to be a concurring party to the programmatic agreement. A response from Salt River Pima-Maricopa Indian Community dated August 14, 2012, cited an existing consultation management agreement in place between the Four Southern Tribes and stated that the Four Southern Tribes are in consensus that Gila River Indian Community would take the lead in providing comments for the project. As noted in Table 4-47, which begins on page 4-145, and also on page 4-150 of the Final Environmental Impact Statement, all tribes were contacted early in the study and have been consulted on many aspects of the study, including the cultural resource-related reports produced over the course of the study. Consultation with Native America tribes has been extensive and demonstrates a reasonable and good faith effort to include all interested Native American tribes in the process to take their concerns seriously in the planning effort.

303

304

b. The FHWA and ADOT did not have authority to delegate its statutory obligations under Section 106 to conduct consultation and conduct community and public outreach. *See* 36 C.F.R. §800.8

Section 106 states that, "**[f]ederal agencies** are encouraged to coordinate compliance with section 106 and the procedures in this part with any steps taken to meet the requirements of the National Environmental Policy Act (NEPA). Agencies should consider their Section 106 responsibilities as early as possible in the NEPA process, and plan their public participation, analysis, and review in such a way that they can meet the purposes and requirements of both statutes in a timely and efficient manner (emphasis added)." *Id.* at §800.8(1). Further, Section 106 requires that the agency official shall, "(i) Identify consulting parties…; (ii) Identify historic properties and assess the effects of the undertaking on such properties…; (iii) Consult regarding the effects of the undertaking on historic properties with SHPO/THPO, Indian tribes and Native Hawaiian organizations that might attach religious and cultural significance to the affected historic properties, other consulting parties, and the Council, where appropriate, during NEPA scoping, environmental analysis, and the preparation of NEPA documents; (iv) Involve the public in accordance with the agency's published NEPA procedures; and (v) Develop in consultation with identified consulting parties alternatives and proposed measures that might avoid, minimize or mitigate any adverse effects of the undertaking on historic properties and describe them in the EA or DEIS (emphasis added)." *Id.* at §800.8(2). Nowhere in the regulations is the federal agency permitted to delegate these duties, whether through a Programmatic Agreement, or otherwise.

In the instant case, FHWA and ADOT simply delegated its responsibility to consult with the tribal community to the GRIC tribal government. The DEIS appears to suggest that numerous meetings regarding the Freeway project were noticed, hosted and facilitated by the FHWA and ADOT. The DEIS does not clarify whether the GRIC tribal government entities, or any sub-entities thereof actually noticed, hosted and facilitated such meetings. While Section 106 allows for procedural variances when, like in the present case, a DEIS is drafted under the National Environmental Policy Act (the "NEPA"), 42 U.S.C. 4321 et seq., Section 106 does not procedurally allow FHWA or ADOT to delegate the Section 106 initiation and consultation measures to any other entity. *See* 36 C.F.R. §800.8. In other words, FHWA is required to directly initiate and consult tribes and consulting parties. The DEIS record reflects that the FHWA regularly consulted federal and state agencies, however, neglected reasonable and good faith efforts to consult tribes other than the GRIC. The record also shows that FHWA, ADOT and the designated GRIC government entities failed to properly notify and/or consult with GRIC members.

Code	Issue	Response
302	**Cultural Resources**	The Arizona Department of Transportation and Federal Highway Administration did not delegate statutory obligations.
303		Comment noted.
304	**Cultural Resources**	This comment seems to be confusing National Historic Preservation Act Section 106 consultation, project scoping, and Federal Highway Administration/ Arizona Department of Transportation/Gila River Indian Community coordination and planning meetings. Section 106 of the National Historic Preservation Act requires a government-to-government relationship between the Federal Government and Indian tribes as described beginning on page 4-140 of the Final Environmental Impact Statement. Section 106 requires that federal agencies take into account the effects of their undertakings on historic properties. This process requires consultation with tribal authorities. Consultation has occurred with Gila River Indian Community government officials, the Tribal Historic Preservation Officer, the Cultural Resource Management Program, many different tribal authorities, and the State Historic Preservation Office. The consultation has resulted in concurrence from the Gila River Indian Community Tribal Historic Preservation Office and the State Historic Preservation Office on National Register of Historic Places eligibility recommendations (including traditional cultural properties), project effects, and proposed mitigation and measures to minimize harm. This consultation has been ongoing and will continue until any commitments in a record of decision are completed. As noted in Table 4-47, which begins on page 4-145 of the Final Environmental Impact Statement, the Ak-Chin Indian Community, the Gila River Indian Community, the Hopi Tribe, the Salt River Pima-Maricopa Indian Community, the Tohono O'odham Nation, the Yavapai-Apache Tribe, and the Yavapai-Prescott Indian Tribe were included in the initial Section 106 consultation in 2003. At that time, Yavapai-Prescott Indian Tribe deferred to the Four Southern tribes in a response dated September 10, 2003. Hopi concurred, but did not defer at this time. As more information regarding the project was known (and of aboriginal lands), all of the tribes with aboriginal lands within the project (including the Yavapai-Prescott Indian Tribe) were consulted in 2005, 2006, 2012, and 2013. In August 2005, both the Salt River Pima-Maricopa Indian Community and the Tohono O'odham Nation agreed to be a concurring party to the programmatic agreement. A response from Salt River Pima-Maricopa Indian Community dated August 14, 2012, cited an existing consultation management agreement in place between the Four Southern Tribes and stated that the Four Southern Tribes are in consensus that Gila River Indian Community would take the lead in providing comments for the project.

305

The DEIS indicates that FHWA and ADOT utilized the GRIC and its sub-entities such as the Transportation Technical Team (the "TTT")[12] to provide notice, host and facilitate numerous meetings on its behalf. *See* Table 2-1. Section 106, particularly §800.8, does not permit the GRIC to act on FHWA and ADOT's behalf to carry out procedural requirements of the project. Many meetings referenced in the DEIS appeared to be "tribal meetings" that included guest presentations by the FHWA and/or ADOT to the Gila River community members. Tables 2-1 and 2-2 in the DEIS appears to comingle the facts of any particular meeting in terms of meeting the agency's responsibilities under Section 106, particularly, §800.8.

306

c. **Because FHWA and ADOT failed to consult all federally recognized Indian tribes with reasonable and good faith efforts, the identification of historic properties, assessment of adverse effects, and resolution of adverse effects are inaccurate, incomplete and erroneous.**

307

Not only is the South Mountain itself sacred, there are also numerous sites with highly significant meaning and purpose to the GRIC on or near South Mountain and within the Area of Potential Effects of the Freeway project.[13] There are many ancestral burial and archeological sites and ancient shrines throughout the project area and beyond.[14] Further, the Colorado River Indian Tribes,[15] Salt River Pima-Maricopa Indian Community,[16] the Ak-Chin Indian Community,[17] the Tohono O'odham Nation,[18] and the Pascua Yaqui Tribe[19] have expressed and attached traditional, cultural and religious significance to South Mountain.[20]

---

[12] *See Id.* Chapter 2, page 2-3. *See also* Table 2-2 crediting various meetings with the TTT.
[13] For example, tribes associate cultural, traditional and religious significance with the Red Mountain, South Back Mountain, and Sandi Muck Mountain.

[20] The DEIS states "archaeological sites and places considered culturally important by Native American groups would be affected by any of the build alternatives. The Gila River Indian Community (GRIC) and the Salt River Pima-Maricopa Indian Community have both passed Tribal Resolutions designating the South Mountains as a TCP [Traditional Cultural Property] and the Colorado River Indian tribes have said that they also consider the South Mountains a TCP." *See* South Mountain Transportation Corridor Draft Technical Report Summary Cultural Resources p. 4 (August 28, 2008) available at http://www.azdot.gov/southmountainfreeway/PDF/082808_SMCAT_CulturalResources_Summary_Final.pdf) (viewed July 18, 2013).

Code	Issue	Response
305	**Cultural Resources**	Public involvement with the Gila River Indian Community was conducted as requested by the tribal government. Prior to October 2005, early efforts to involve the Gila River Indian Community included attending tribal meetings and monthly meetings with Gila River Indian Community Departments (see discussion beginning on page 2-8 of the Draft Environmental Impact Statement). On October 14, 2005, the Gila River Indian Community requested that all project-related communications take place at a government-to-government level (see letter on page A152 of Appendix 1-1). This request was honored by the Arizona Department of Transportation and Federal Highway Administration. All public involvement efforts were implemented by the Gila River Indian Community's public involvement officer. As stated on page 2-8 of the Draft Environmental Impact Statement, the meetings in 2010 between the Gila River Indian Community's Transportation Technical Team, Arizona Department of Transportation, and the Federal Highway Administration were held in response to a request received from the Governor of the Gila River Indian Community and were not a part of the agency or public scoping process. The information provided to the Transportation Technical Team was used by the Team and the Public Information Office in the Gila River Indian Community's outreach effort prior to the February 2012 coordinated referendum. The referendum and the outreach effort were tribal actions and, other than providing requested information to the Gila River Indian Community, the Arizona Department of Transportation and Federal Highway Administration did not participate in these actions.
306	**Cultural Resources**	Section 106 of the National Historic Preservation Act requires a government-to-government relationship between the Federal Government and Indian tribes as described beginning on page 4-140 of the Final Environmental Impact Statement. Section 106 requires that federal agencies take into account the effects of their undertakings on historic properties. This process requires consultation with tribal authorities. Consultation has occurred with Gila River Indian Community government officials, the Tribal Historic Preservation Officer, the Cultural Resource Management Program, many different tribal authorities, and the State Historic Preservation Office. The consultation has resulted in concurrence from the Gila River Indian Community Tribal Historic Preservation Office and the State Historic Preservation Office on National Register of Historic Places eligibility recommendations (including traditional cultural properties), project effects, and proposed mitigation and measures to minimize harm. This consultation has been ongoing and will continue until any commitments in a record of decision are completed. As noted in Table 4-47, which begins on page 4-145 of the Final Environmental Impact Statement, the Ak-Chin Indian Community, the Gila River Indian Community, the Hopi Tribe, the Salt River Pima-Maricopa Indian Community, the Tohono O'odham Nation, the Yavapai-Apache Tribe, and the Yavapai-Prescott Indian Tribe were included in the initial Section 106 consultation in 2003. At that time, Yavapai-Prescott Indian Tribe deferred to the Four Southern tribes in a response dated September 10, 2003. Hopi concurred, but did not defer at this time. As more information regarding the project was known (and of aboriginal lands), all of the tribes with aboriginal lands within the project (including the Yavapai-Prescott Indian Tribe and the Colorado River Indian Tribes) were consulted in 2005, 2006, 2012, and 2013. In August 2005, both the Salt River Pima-Maricopa Indian Community and the Tohono O'odham Nation agreed to be a concurring party to the programmatic agreement. A response from Salt River Pima-Maricopa Indian Community dated August 14, 2012, cited an existing consultation management agreement in place between the Four Southern Tribes and stated that the Four Southern Tribes are in

306 (cont.)		consensus that Gila River Indian Community would take the lead in providing comments for the project. Since the beginning of the environmental impact statement process for the proposed freeway, the Federal Highway Administration and Arizona Department of Transportation have been carrying out cultural resources studies and engaging in an ongoing, open dialogue with the Gila River Indian Community, its Tribal Historic Preservation Officer and Cultural Resource Management Program, regarding the identification and evaluation of places of religious and cultural importance to the tribe that may be adversely affected by the proposed freeway. The Gila River Indian Community's own Cultural Resource Management Program performed the cultural field investigations and developed recommendations for mitigation for project impacts. As a result of these discussions and of studies conducted by the Gila River Indian Community's Cultural Resource Management Program, the Gila River Indian Community has identified traditional cultural properties that are eligible for listing in the National Register of Historic Places and that could be affected by construction of the proposed South Mountain Freeway. The traditional cultural properties identified are culturally important to other Native American tribes as well.
307	**Cultural Resources**	As noted in Table 4-47, which begins on page 4-145 of the Final Environmental Impact Statement, the Ak-Chin Indian Community, the Gila River Indian Community, the Hopi Tribe, the Salt River Pima-Maricopa Indian Community, the Tohono O'odham Nation, the Yavapai-Apache Tribe, and the Yavapai-Prescott Indian Tribe were included in the initial Section 106 consultation in 2003. At that time, Yavapai-Prescott Indian Tribe deferred to the Four Southern tribes in a response dated September 10, 2003. Hopi concurred, but did not defer at this time. As more information regarding the project was known (and of aboriginal lands), all of the tribes with aboriginal lands within the project (including the Yavapai-Prescott Indian Tribe and the Colorado River Indian Tribes) were consulted in 2005, 2006, 2012, and 2013. In August 2005, both the Salt River Pima-Maricopa Indian Community and the Tohono O'odham Nation agreed to be a concurring party to the programmatic agreement. A response from Salt River Pima-Maricopa Indian Community dated August 14, 2012, cited an existing consultation management agreement in place between the Four Southern Tribes and stated that the Four Southern Tribes are in consensus that Gila River Indian Community would take the lead in providing comments for the project. Since the beginning of the environmental impact statement process for the proposed freeway, the Federal Highway Administration and Arizona Department of Transportation have been carrying out cultural resources studies and engaging in an ongoing, open dialogue with the Gila River Indian Community, its Tribal Historic Preservation Officer and Cultural Resource Management Program, regarding the identification and evaluation of places of religious and cultural importance to the tribe that may be adversely affected by the proposed freeway. Such places are referred to as traditional cultural properties. The Gila River Indian Community's own Cultural Resource Management Program performed the cultural field investigations and developed recommendations for mitigation for project impacts. As a result of these discussions and of studies conducted by the Gila River Indian Community's Cultural Resource Management Program, the Gila River Indian Community has identified traditional cultural properties that are eligible for listing in the National Register of Historic Places and that could be affected by construction of the proposed freeway. In certain cases, listing these properties on the National Register of Historic Places may offer them protection under Section 4(f) of the Department of Transportation Act. The traditional cultural properties identified are culturally important to other Native American tribes as well and as noted in Table 4-47, which begins on page 4-145 of the Final Environmental Impact Statement, these tribes were included in Section 106 consultation.

Code	Comment Document
307	As discussed in subsection (b) above, FHWA and ADOT lacked critical cultural expertise and input that could have more accurately shaped the scope of the technical services used to identify the known and potential cultural resources at issue by not making reasonable and good faith efforts to engage the above-referenced tribes. Should the critical consultation with all tribes have been performed as required by the Section 106 regulations, the footprint of the cultural resources identified would be more accurate and would unquestionably fulfill applicability of cultural significance under the NRHP and National Historic Preservation Act. Further, all tribes were not afforded the opportunity early in the project planning to properly select a qualified contractor to perform the cultural resources studies, many of which the FHWA and the ADOT improperly puts off until the "design phase". The scope of work and approving the qualifications of the identifier of cultural sites are critical procedural oversights when tribal input is absent.
	d. Because FHWA and ADOT failed to fully inform Section 106 consulting parties of the potential environmental impacts of the Freeway project, the consulting parties were unable to provide accurate input on the assessment of adverse effects of all known historic properties.
308	Consulting parties and tribes not consulted were not afforded the technical data available to FHWA and ADOT regarding the substantial risk to the environment prior to the close of the Section 106 process. For example, the consulting parties were not timely provided certain reports, including but not limited to the Environmental Protection Agency's Joint Air Toxic Assessment Project issued in 2005. The deficiencies in the initiation of the Section 106 process combined with the lack of data known to the FHWA and ADOT unquestionably left the consulting parties and tribes not consulted at a disadvantage. Tribes involved in the project, whether consulted or not, are unable to provide meaningful consultation in the Section 106 process when the FHWA and ADOT withholds information that may impact the parties' input on the assessment and mitigation processes within the regulations.
309	If the E1 Alternative were built, there are eight confirmed Traditional Cultural Properties that would be adversely affected. Those properties include petroglyphs, artifact scatter, and prehistoric trails. The DEIS and other associated cultural reports do not provide any concurrence on the improperly scoped traditional cultural studies by the parties and non-consulted tribes and does not demonstrate completion of the Section 106 process, particularly the mitigation measures to be invoked.
310	Until the FHWA and ADOT conforms wholly with informed meaningful consultation with consulting parties and affected tribes, the Section 106 process will remain incomplete and non-compliant.

8

Code	Issue	Response
308	**Cultural Resources**	As noted in Table 4-47, which begins on page 4-145, and also on page 4-159 of the Final Environmental Impact Statement, all tribes were contacted early in the study and have been consulted on many aspects of the study, including the cultural resource-related reports produced over the course of the study. Section 106 of the National Historic Preservation Act requires a government-to-government relationship between the Federal Government and Indian tribes as described beginning on page 4-140 of the Final Environmental Impact Statement Section 106 requires that federal agencies take into account the effects of their undertakings on historic properties. This process requires consultation with tribal authorities. Consultation has occurred with Gila River Indian Community government officials, the Tribal Historic Preservation Officer, the Cultural Resource Management Program, many different tribal authorities, and the State Historic Preservation Office. The consultation has resulted in concurrence from the Gila River Indian Community Tribal Historic Preservation Office and the State Historic Preservation Office on National Register of Historic Places eligibility recommendations (including traditional cultural properties), project effects, and proposed mitigation and measures to minimize harm. This consultation has been ongoing and will continue until any commitments in a record of decision are completed. As stated above, Section 106 requires federal consultation with tribal authorities on the effects of their undertakings on historic properties. Although the Joint Air Toxics Assessment Project is discussed on pages 4-64 and 4-74 of the Draft and Final Environmental Impact Statements, respectively, Section 106 consultation on this report is not required.
309	**Cultural Resources**	The comment that eight traditional cultural properties would be adversely affected is incorrect. Adverse effects to the South Mountains Traditional Cultural Property and one site that is contributing to the South Mountains Traditional Cultural Property (AZ T:12:197) would occur with the construction of the E1 Alternative. No extant petroglyph sites would be adversely affected. The trail sites were determined eligible for listing in the National Register of Historic Places listing under Criterion D as archaeological sites; therefore, as noted on page 5-2 of the Draft Environmental Impact Statement, generally, cultural resources eligible for listing in the National Register of Historic Places under Criterion D are not eligible for protection under Section 4(f). Through consultation and coordination, the Gila River Indian Community Tribal Historic Preservation Office, the Arizona State Historic Preservation Office, and many other tribal authorities concurred with these recommendations (see Table 4-47 on page 4-145 of the Final Environmental Impact Statement for more details on tribal concurrences). Since the beginning of the environmental impact statement process for the proposed freeway, the Federal Highway Administration and Arizona Department of Transportation have been carrying out cultural resources studies and engaging in an ongoing, open dialogue with the Gila River Indian Community, its Tribal Historic Preservation Officer and Cultural Resource Management Program, regarding the identification and evaluation of places of religious and cultural importance to the tribe that may be adversely affected by the proposed freeway. Such places are referred to as traditional cultural properties. The Gila River Indian Community's own Cultural Resource Management Program performed the cultural field investigations and developed recommendations for mitigation for project impacts. As a result of these discussions and of studies conducted by the Gila River Indian Community's Cultural Resource Management Program, the Gila River Indian Community has identified traditional cultural properties that are eligible for listing in the National Register of Historic Places and that could be affected by construction of the proposed freeway. In certain cases, listing these properties on the National

e. **The DEIS lacks crucial aerial photography, charts, maps and diagrams illustrating the potential destruction of cultural properties and fails to address known impacts to religious practice.**

The DEIS fails to provide aerial photography, maps, charts or diagrams that properly informs the public of the Area of Potential Effects upon known and potential cultural sites and resources. Further, the DEIS fails to address any impacts to air, ground and water directly and indirectly related to the cultural resources impacted during the temporary state of construction of the Freeway. The DEIS fails to address documented concerns regarding religious practice including measures to ensure that religious practitioners gain and maintain uninterrupted access to sacred cultural properties and religious practice locations impacted by the Freeway project. In fact, the FHWA and ADOT have determined that the trails located within the project area do not qualify under the NRHP, however, the DEIS lacks any reference as to whether any one of the trails or all of the trails are routes used for religious practice purposes and therefore, should be afforded a higher value of significance under the criterion. Further, shortcomings in the initiation of the Section 106 process, lack of input from affected tribes, lack of good faith and reasonable efforts by the FHWA and ADOT all contribute to faulty application of the criterion against the properties found within the Area of Potential Effects.

In addition, the DEIS does not confirm that the Section 106 process is complete and that the FHWA and ADOT acquired concurrence by the Tribal Historic Preservation Officer or the State Historic Preservation Officer on its findings. The South Mountain Transportation Corridor Study, Citizens Advisory Team Draft Technical Support Summary, Cultural Resources (2008)[21] (the "SMT Corridor Study") confirms that "[t]he greatest number of prehistoric sites would be impacted by the E1 Alternative…"[22] In fact, the E1 Alternative is determined to impact at least 8 sites described as, "1 artifact scatter (limited activity site); 2 lithic quarries; 1 petroglyph site; 4 trail sites".[23] The SMT Corridor Study confirms that the Section 106 process is incomplete[24] and that mitigation measures including work plans, research designs, methods and excavation strategies, burial agreements with the Arizona State Museum and tribes are all outstanding.[25] Instead of completing the process as required and needed on a project of this magnitude, the FHWA and ADOT opted to propose and execute a seemingly unpopular Programmatic Agreement ("PA")

Code	Issue	Response
309 (cont.)		Register of Historic Places may offer them protection under Section 4(f) of the Department of Transportation Act. The traditional cultural properties identified are culturally important to other Native American tribes as well and as noted in Table 4-47, which begins on page 4-145 of the Final Environmental Impact Statement, these tribes were included in Section 106 consultation.
310	**Cultural Resources**	The proposed action's environmental impact statement process has complied with the National Historic Preservation Act Section 106 process, which, for the proposed action, is ongoing and continuing.
311	**Cultural Resources**	The Study Area as shown in Figure 1-1 on page 1-3 of the Draft Environmental Impact Statement includes the area of potential effects. In addition, consultation letters sent to consulting parties included maps and complete reports for their reference. The location of cultural resources are not shown in the Draft Environmental Impact Statement because the publishing of location information would put the sites in danger of pilfering and/or vandalism. Adverse effects to the South Mountains Traditional Cultural Property and one site that is contributing to the South Mountains Traditional Cultural Property (AZ T:12:197) would occur with the construction of the E1 Alternative. No extant petroglyph sites would be adversely affected. The trail sites were determined eligible for listing in the National Register of Historic Places listing under Criterion D as archaeological sites. Through Section 106 consultation and coordination, the Gila River Indian Community Tribal Historic Preservation Office, the Arizona State Historic Preservation Office, and many other tribal authorities concurred with these recommendations (see Table 4-47 on page 4-145 of the Final Environmental Impact Statement for more details on tribal concurrences). As stated above, Section 106 requires federal consultation with tribal authorities on the effects of their undertakings on historic properties. In cases where air, ground, or water attributes were considered important to their eligibility to the National Register of Historic Places, this information would have been addressed during the consultation process. If the Federal Highway Administration had no information suggesting the significance of air, ground, or water attributes, and none of the consulting parties responded to consultation by saying those attributes were important and requesting they be considered, the Federal Highway Administration would have no reason to consider them, and further Section 106 consultation on these attributes would not have been required.
312	**Cultural Resources**	The Study Area as shown in Figure 1-1 on page 1-3 of the Draft Environmental Impact Statement includes the area of potential effects. In addition, consultation letters sent to consulting parties included maps and complete reports for their reference. The location of cultural resources are not shown in the Draft Environmental Impact Statement because the publishing of location information would put the sites in danger of pilfering and/or vandalism. The project would not preclude access to the South Mountains. Adverse effects on traditional cultural practices, including religious activities, would be mitigated through the development and implementation of the traditional cultural property mitigation program being developed for the proposed project through ongoing National Historic Preservation Act Section 106 consultations and by mitigation identified in Chapter 4 of the Draft Environmental Impact Statement that would avoid, reduce, minimize or otherwise mitigate air, ground, and water-related impacts. This applies equally to any impacts during construction of the proposed freeway, should an action alternative be the Selected Alternative. The Draft Environmental Impact Statement describes a proposed action that, after consultation and coordination efforts, would accommodate and preserve (to the

with certain parties and tribes to address "steps and procedures that would be undertaken to address any effects as they were to become known."[26] The decision to enter into a PA not only removes the project activities from the eyes of the public, but circumvents the statutory requirements and public policy governing the approval process of the project.

313

f. **The DEIS fails to confirm that the Tribal Historic Preservation Office has concurred with the FHWA and ADOT's conclusions on eligibility of all cultural sites against the National Registry's criterion.**

The DEIS does not address why the THPO and the GRIC have opted to refrain from concurring on the Section 106 findings. The DEIS should not proceed forward without, in the least, valid Section 106 compliance. The DEIS fails to suggest when concurrence might be reached, why concurrence has not yet been made, and/or any other actions associated with the same.

g. **The DEIS fails to address proposed mitigation measures to the irreversible harm the Freeway project will cause on known cultural resources.**

Without addressing the FHWA and ADOT's planned mitigation of adverse effects upon the known cultural resources, the public, tribes and the Gila River Indian Community remain uninformed and unable to substantively comment on the DEIS. In other words, interested persons are left to speculate on mitigation measures on a large-scale project affecting hundreds of cultural properties. The DEIS does not mention whether it has drafted a mitigation plan, the scope of such a plan, the parties consulted, the measures to be taken, citations to procedural and substantive laws that apply in any such instance, the availability of funding and liability protections, curation agreements, curation space, technical qualifications of on-the-ground archaeologists, curation specialists or assistants, implications and coordination with tribes of any potential implications to the National Graves Protection and Repatriation Act, 25 U.S.C. 3001 et seq.[27] The DEIS confirms that the critical procedural requirement of mitigation in the Section 106 process is lacking.[28]

---

[26] *Id.* at p. 7. The PA received little support from tribes on the record.
[27] The Native American Graves Protection and Protection Act ("NAGPRA") requires federal agencies and institutions that receive federal funding to return Native American "cultural items" to lineal descendants and culturally affiliated Indian tribes and Native Hawaiian organizations. Cultural items include human remains, funerary objects, sacred objects, and objects of cultural patrimony. NAGPRA also establishes procedures for the inadvertent discovery or planned excavation of Native American cultural items on federal or tribal lands. While these provisions do not apply to discoveries or excavations on private or state lands, the collection provisions of NAGPRA may apply to Native American cultural items if they come under the control of an institution that receives federal funding.
[28] Mitigation measures lack proper consultation with tribes and consulting parties and are merely speculative as of the date of this Complaint. *See* ADOT, South Mountain Study Team, *Summary*, Table S-4, p. S-27 available

Code	Issue	Response
312 (cont.)		fullest extent possible from the available alternatives) access to the South Mountains for religious practices. A very small portion of the mountain would be impacted by the proposed freeway (less than 0.03 percent of the total area). Although the Draft Environmental Impact Statement describes the impact on the South Mountains as adverse, Native Americans would not be kept from practicing their beliefs, access to the mountain would be maintained, and mitigation measures would be implemented based on input from members of the Gila River Indian Community. The Federal Highway Administration recommended the trails within the project area as eligible for listing in the National Register of Historic Places under Criterion D as archaeological sites. Based on review of the traditional cultural property technical summary, the Bureau of Indian Affairs, City of Phoenix, State Historic Preservation Office, Cocopah Tribe, Colorado River Indian Tribes, Fort McDowell Yavapai Nation, Gila River Indian Community, Hopi Tribe, Navajo Nation, San Carlos Apache Tribe, Tonto Apache Tribe, and White Mountain Apache Tribe, the Gila River Indian Community Tribal Historic Preservation Officer and Arizona State Historic Preservation Office concurred with these recommendations.
313	**Cultural Resources**	The cultural and religious places of importance, like the South Mountains, are acknowledged in the Draft Environmental Impact Statement in several locations, notably pages 4-132 and 5-26. Section 106 of the National Historic Preservation Act requires a government-to-government relationship between the Federal Government and Indian tribes as described beginning on page 4-140 of the Final Environmental Impact Statement Section 106 requires that federal agencies take into account the effects of their undertakings on historic properties. This process requires consultation with tribal authorities. Consultation has occurred with Gila River Indian Community government officials, the Tribal Historic Preservation Officer, the Cultural Resource Management Program, many different tribal authorities, and the State Historic Preservation Office. The consultation has resulted in concurrence from the Gila River Indian Community Tribal Historic Preservation Office and the State Historic Preservation Office on National Register of Historic Places eligibility recommendations (including traditional cultural properties), project effects, and proposed mitigation and measures to minimize harm. This consultation has been ongoing and will continue until any commitments in a record of decision are completed. Adverse effects to the South Mountains Traditional Cultural Property and one site that is contributing to the South Mountains Traditional Cultural Property (AZ T:12:197) would occur with the construction of the E1 Alternative. No extant petroglyph sites would be adversely affected. The trail sites were determined eligible for listing in the National Register of Historic Places listing under Criterion D as archaeological sites; therefore, as noted on page 5-2 of the Draft Environmental Impact Statement, generally, cultural resources eligible for listing in the National Register of Historic Places under Criterion D are not eligible for protection under Section 4(f). Through consultation and coordination, the Gila River Indian Community Tribal Historic Preservation Office, the Arizona State Historic Preservation Office, and many other tribal authorities concurred with these recommendations (see Table 4-47 on page 4-145 for more details on tribal concurrences).

Code	Issue	Response
313 (cont.)		As noted on page 4-159 of the Final Environmental Impact Statement, a programmatic agreement is a document that spells out the terms of a formal, legally binding agreement between lead agencies and other interested parties for the proper treatment and management of affected cultural resources. The programmatic agreement establishes a process for consultation, review, and compliance with federal and State preservation laws as the effects of the project on historic properties become known. Although the Advisory Council on Historic Preservation declined to participate in the programmatic agreement, the Council concerned with the development of the agreement (see Table 4-47, which begins on page 4-145 of the Final Environmental Impact Statement).
314	**Cultural Resources**	Section 106 of the National Historic Preservation Act requires a government-to-government relationship between the Federal Government and Indian tribes as described beginning on page 4-140 of the Final Environmental Impact Statement. 319

II. The FHWA and ADOT failed to consult the Gila River Indian Community.

As a result of the initiation of the project, the GRIC organized itself to effectively plan and negotiate proposed road modifications within the Gila River Indian Reservation. In particular, the GRIC established a Transportation Technical Team (the "TTT"). *See* Gila River Tribal Resolution GR -76-07 (July 5, 2007).

The FHWA and ADOT met with TTT. The TTT held meetings in the Gila River Indian Community's seven (7) districts. *See* Table 2-1. As discussed above, FHWA and ADOT do not have authority to delegate its consultation and public/community outreach to tribal government or any of tribal government's sub-entities. In other words, the FHWA and ADOT failed to make sufficient and direct efforts to engage Community members. Instead, the FHWA and ADOT substituted its duty for community outreach narrowly to tribal government and/or its sub-entities. The result is that Community members are uniformed, uninvolved and insignificant in the participation of the Freeway project. This outcome is contrary to the public policy as set forth in the NEPA.

For example, FHWA held only one public hearing on May 21, 2013. On April 30, 2013, FHWA and ADOT explicitly offered transportation assistance through the issuance of the City of Phoenix bus passes to GRIC members to attend the only public hearing on May 21. However, FHWA and ADOT never distributed bus passes to GRIC members that wished to attend the May 21 Hearing. *See Statement by Lori Riddle (July 22, 2013).* Therefore, the efforts to engage the Community were disingenuous.

III. The DEIS that proposes the selection of the E1 Alternative, the alternative that results in irreversible damage to traditional cultural properties (South Mountain), erroneously concludes that Section 4(f) of the United States Department of Transportation Act of 1996 does not apply and is violative of Environmental Justice.

The Department of Transportation Act (DOT Act) of 1966 includes a special provision, Section 4(f), which stipulates that the FHWA and other DOT agencies cannot approve the use of land from publicly owned parks, recreational areas, wildlife and waterfowl refuges, or public and private historical sites unless the following conditions apply: (1) there is no feasible and prudent alternative to the use of land, and (2) the action includes all possible planning to minimize harm to the property resulting from use.

Examples of Section 4(f) protected resources are public school playgrounds, public parks, recreational land, wildlife refuges, traditional cultural properties, and historic sites. There are two types of transportation impacts that Section 4(f) looks at direct

Code	Issue	Response
318	**Cultural Resources**	Section 106 of the National Historic Preservation Act requires a government-to-government relationship between the Federal Government and Indian tribes as described beginning on page 4-140 of the Final Environmental Impact Statement Section 106 requires that federal agencies take into account the effects of their undertakings on historic properties. This process requires consultation with tribal authorities. Consultation has occurred with Gila River Indian Community government officials, the Tribal Historic Preservation Officer, the Cultural Resource Management Program, many different tribal authorities, and the State Historic Preservation Office. The consultation has resulted in concurrence from the Gila River Indian Community Tribal Historic Preservation Office and the State Historic Preservation Office on National Register of Historic Places eligibility recommendations (including traditional cultural properties), project effects, and proposed mitigation and measures to minimize harm. This consultation has been ongoing and will continue until any commitments in a record of decision are completed. Public involvement with the Gila River Indian Community was conducted as requested by the tribal government. Prior to October 2005, early efforts to involve the Gila River Indian Community included attending tribal meetings and monthly meetings with Gila River Indian Community Departments (see discussion beginning on page 2-8 of the Draft and Final Environmental Impact Statements). On October 14, 2005, the Gila River Indian Community requested that all project-related communications take place at a government-to-government level (see letter on page A152 of Appendix 1-1). This request was honored by the Arizona Department of Transportation and Federal Highway Administration. All public involvement efforts were implemented by the Gila River Indian Community's public involvement officer. As stated on page 2-8 of the Draft Environmental Impact Statement, the meetings in 2010 between the Gila River Indian Community's Transportation Technical Team, Arizona Department of Transportation, and the Federal Highway Administration were held in response to a request received from the Governor of the Gila River Indian Community . The information provided to the Transportation Technical Team was used by the Team and the Public Information Office in the Gila River Indian Community's outreach effort prior to the February 2012 coordinated referendum. The referendum and the outreach effort were tribal actions and, other than providing requested information to the Gila River Indian Community, the Arizona Department of Transportation and Federal Highway Administration did not participate in these actions.
319	**Tribal Involvement**	The Arizona Department of Transportation provided vouchers for public hearing parking and for public transit to the hearing. For the first time in the State's history, a shuttle bus to the hearing was provided from six locations in the Phoenix area, including two on the Gila River Indian Community (Komatke Boys & Girls Club and the Governance Center in Sacaton). All advertisements for the hearing provided telephone numbers and electronic contact information regarding information on the shuttle schedules and pick-up locations.

II. **The FHWA and ADOT failed to consult the Gila River Indian Community.**

As a result of the initiation of the project, the GRIC organized itself to effectively plan and negotiate proposed road modifications within the Gila River Indian Reservation. In particular, the GRIC established a Transportation Technical Team (the "TTT"). *See* Gila River Tribal Resolution GR -76-07 (July 5, 2007).

The FHWA and ADOT met with TTT. The TTT held meetings in the Gila River Indian Community's seven (7) districts. *See* Table 2-1. As discussed above, FHWA and ADOT do not have authority to delegate its consultation and public/community outreach to tribal government or any of tribal government's sub-entities. In other words, the FHWA and ADOT failed to make sufficient and direct efforts to engage Community members. Instead, the FHWA and ADOT substituted its duty for community outreach narrowly to tribal government and/or its sub-entities. The result is that Community members are uninformed, uninvolved and insignificant in the participation of the Freeway project. This outcome is contrary to the public policy as set forth in the NEPA.

For example, FHWA held only one public hearing on May 21, 2013. On April 30, 2013, FHWA and ADOT explicitly offered transportation assistance through the issuance of the City of Phoenix bus passes to GRIC members to attend the only public hearing on May 21. However, FHWA and ADOT never distributed bus passes to GRIC members that wished to attend the May 21 Hearing. *See Statement by Lori Riddle (July 22, 2013).* Therefore, the efforts to engage the Community were disingenuous.

321

III. **The DEIS that proposes the selection of the E1 Alternative, the alternative that results in irreversible damage to traditional cultural properties (South Mountain), erroneously concludes that Section 4(f) of the United States Department of Transportation Act of 1996 does not apply and is violative of Environmental Justice.**

The Department of Transportation Act (DOT Act) of 1966 includes a special provision, Section 4(f), which stipulates that the FHWA and other DOT agencies cannot approve the use of land from publicly owned parks, recreational areas, wildlife and waterfowl refuges, or public and private historical sites unless the following conditions apply: (1) there is no feasible and prudent alternative to the use of land, and (2) the action includes all possible planning to minimize harm to the property resulting from use.

Examples of Section 4(f) protected resources are public school playgrounds, public parks, recreational land, wildlife refuges, traditional cultural properties, and historic sites. There are two types of transportation impacts that Section 4(f) looks at direct

Code	Issue	Response
320	**Section 4(f) and Section 6(f)**	The cultural and religious places of importance, like the South Mountains, are acknowledged in the Draft Environmental Impact Statement in several locations, notably pages 4-132 and 5-26. In accordance with the National Environmental Policy Act, a range of reasonable action alternatives to carry forward for further analysis was determined through application of multidisciplinary criteria in a logical, step-wise progression. Alternatives were not disposed of or dismissed without a thorough evaluation using the multidisciplinary criteria outlined in the alternatives development and screening process presented in Chapter 3 of the Draft Environmental Impact Statement. The preferred alternative was the outcome to this process. An alternative on the Gila River Indian Community that could have avoided the South Mountains was considered but eliminated from study after the Gila River Indian Community rejected the alternative by referendum. The Draft Environmental Impact Statement concludes that Section 4(f) does apply to the South Mountains Traditional Cultural Property and Chapter 5 of the Draft Environmental Impact Statement presents a robust and fully disclosed Section 4(f) evaluation (see discussion in the Draft Environmental Impact Statement, starting on page 5-26). The outcome of this process was the determination that there was no prudent and feasible alternative to the E1 Alternative. A thorough feasible and prudent avoidance analysis of the South Mountains was conducted as presented in Chapter 5 of the Draft and Final Environmental Impact Statements and concluded avoidance to the direct use of the resource was not feasible and prudent. In support of this response and given the concerns about the South Mountains, consider the following comment from the U.S. Department of the Interior on the Draft Environmental Impact Statement: "Following our review of the Section 4(f) Evaluation, we concur that there is no feasible or prudent alternative to the Preferred Alternative selected in the document, and that all measures have been taken to minimize harm to these resources." The complete letter can be found in Appendix 7, Volume III, on page B4 of the Final Environmental Impact Statement.
321	**Environmental Justice and Title VI**	Since the beginning of the environmental impact statement process, the Federal Highway Administration and Arizona Department of Transportation have been carrying out cultural resources studies and engaging in ongoing, open consultation with the Gila River Indian Community Tribal Historic Preservation Office regarding the identification and evaluation of places of religious and cultural importance to the tribe that may be adversely affected by the proposed freeway. Such places are referred to as traditional cultural properties. As a result of these discussions and of studies conducted by the Gila River Indian Community's Cultural Resource Management Program, the Gila River Indian Community has identified traditional cultural properties that are eligible for listing in the National Register of Historic Places and that could be affected by construction of the proposed freeway. In

Code	Issue	Response
321 (cont.)		certain cases, listing these properties on the National Register of Historic Places may offer them protection under Section 4(f) of the Department of Transportation Act. The traditional cultural properties identified are culturally important to other Native American tribes as well. For more discussion of traditional cultural properties, see the section, *Cultural Resources*, beginning on page 4-140 of the Final Environmental Impact Statement and pages 5-26 through 5-28. The section entitled *Title VI and Environmental Justice*, beginning on page 4-29 in the Draft Environmental Impact Statement, presents acceptable methods, data, and assumptions to assess the potential for disproportionately high and adverse effects from the proposed action on environmental justice populations and disparate impacts to populations protected under Title VI. Based upon the content of the section, no such effects would result from the action alternatives. In light of comments received on the Draft Environmental Impact Statement, the above-referenced conclusions were confirmed in the preparation of the Final Environmental Impact Statement. To provide further clarity, the discussions of environmental justice and Title VI were separated and additional text explaining the relationship of environmental justice and Title VI to various environmental elements was added throughout Chapter 4, *Affected Environment, Environmental Consequences, and Mitigation*, as exemplified by the inserted text on page 4-29 of the Final Environmental Impact Statement.
322	**Section 4(f) and Section 6(f)**	Chapter 5 of the Draft and Final Environmental Impact Statements are dedicated to the discussion of Section 4(f) of the Department of Transportation Act of 1966.
323	**Section 4(f) and Section 6(f)**	When there is a direct use (take) of a Section 4(f) property, analysis to determine whether proximity impacts would result in a constructive use is not applicable (23 Code of Federal Regulations § 774.15) (see Draft Environmental Impact Statement page 5-27). Constructive use would not incorporate land from the Section 4(f) resource, but has proximity impacts so severe that the protected activities, features, or attributes that qualify a resource for protection under Section 4(f) are substantially impaired. Approximately 32 acres of the over 16,000-acre Phoenix South Mountain Park/Preserve and the South Mountains Traditional Cultural Property would be converted to a transportation corridor. The park would still function as a park, offering recreation, interaction with the Sonoran Desert, etc. Although access to the traditional cultural property would be different, Native Americans would still have access to the traditional cultural property and would still be able engage in traditional activities associated with the mountains. The impact on the traditional cultural property would not jeopardize its eligibility for listing in the National Register of Historic Places. Through the consultation process, the Gila River Indian Community Tribal Historic Preservation Officer has been involved in developing measures to minimize harm to the traditional cultural property (see page 5-27 of the Draft Environmental Impact Statement).

Code	Comment Document

impacts: When a 4(f) resource is converted to use for transportation, such as the thirty-one (31) acres of South Mountain for the proposed freeway, as well as a TCP that would be destroyed, if built, indirect impacts including proximity impacts that significantly impair the use of a 4(f) resource are relevant. For example, indirect impacts including proximity impacts could include increased noise levels, changes to views, lighting pollution, or obstructed access to the 4(f) resource (cultural and religious practice). Indirect impacts can intrinsically lead to direct impacts, if the indirect impacts result in the 4(f) resource no longer functioning as it did prior to the Freeway project. This case certainly applies in the present case.

324

The DEIS acknowledges that the South Mountain is sacred to the GRIC and other tribes, is designated as a TCP[29], and is consequently eligible under the NRHP. The DEIS indicates that ten locations have been identified by GRIC as places of cultural importance: the South Mountains, two prehistoric village sites, an active shrine site, two prehistoric petroglyph sites, and four prehistoric trail sites, which are eligible as TCPs. The FHWA and ADOT in consultation with the GRIC confirmed the eligibility of two properties. Five TCPs have been identified within the Area of Potential Effects. The DEIS specifically states that the South Mountains were determined eligible for NRHP listing as a TCP under Criteria A and B.[30]

325

Despite the above findings and conclusions, however, the DEIS suggests that "the E1 Alternative was designed in such a way as to avoid a site that is a contributing element to the South Mountains TCP, resulting in no direct use of this TCP element. A right of way fence would limit access to the site by freeway users, but Community members would continue to gain access to the site as they currently do."[31]

326

Finally, the DEIS outright finds that, "…even with mitigation, implementation of the proposed action would alter the direct physical connection Community members have between their homeland and the South Mountains and would restrict the ability to visit or use these locations in a traditional cultural manner." What is most perplexing is that the DEIS makes an unsubstantiated claim that "…alternatives to avoid use of the South Mountains TCP were evaluated and determined to be not prudent and feasible." In other words, the FHWA and ADOT found the E1 Alternative to be the most prudent and feasible option for the Freeway project.

Code	Issue	Response
324	**Cultural Resources**	The cultural and religious places of importance, like the South Mountains, are acknowledged in the Draft Environmental Impact statement in several locations, notably pages 4-130 and 5-26. Not all of the ten resources identified by the Cultural Resource Management Program as culturally important qualified as traditional cultural properties.
325	**Cultural Resources**	Comment noted.
326	**Section 4(f) and Section 6(f)**	In accordance with the National Environmental Policy Act, a range of reasonable action alternatives to carry forward for further analysis was determined through application of multidisciplinary criteria in a logical, step-wise progression. Alternatives were not disposed of or dismissed without a thorough evaluation using the multidisciplinary criteria outlined in the alternatives development and screening process presented in Chapter 3 of the Draft Environmental Impact Statement. The Preferred Alternative was the outcome to this process. The Draft Environmental Impact Statement concludes that Section 4(f) applies to the South Mountains Traditional Cultural Property and Chapter 5 of the Draft Environmental Impact Statement presents a robust and fully disclosed Section 4(f) evaluation (see discussion in the Draft Environmental Impact Statement, starting on page 5-26). The outcome of this process was the determination that there was no prudent and feasible alternative to the E1 Alternative. A thorough feasible and prudent avoidance analysis of the South Mountains was conducted as presented in Chapter 5 of the Draft and Final Environmental Impact Statements and concluded avoidance to the direct use of the resource was not feasible and prudent. In support of this response and given the concerns about the South Mountains, consider the following comment from the U.S. Department of the Interior on the Draft Environmental Impact Statement: "Following our review of the Section 4(f) Evaluation, we concur that there is no feasible or prudent alternative to the Preferred Alternative selected in the document, and that all measures have been taken to minimize harm to these resources." The complete letter can be found in Appendix 7, Volume III, on page B4 of the Final Environmental Impact Statement.

Code	Comment Document
327	In addition, the DEIS fails to address the cultural and religious significance of microphylla bursera (elephant tree) also known as "uhs bakam" to Native Americans. The DEIS consequently fails to assess the value of this culturally significant plant as impacted by the proposed project. More specifically, the project proposes to destroy the Bursera Trail and the uhs bakam, used for medicinal and ceremonial purposes, is known to be associated with this particular trail. Elephant tree is a "protected" plant and its presence is rare in the United States. Muhadag (South Mountain) is known to being the plant's northernmost point of location. The more popular location of this plant is in Sonora, Mexico. Local Native Americans are well aware that the only access to harvest Elephant Tree is at Muhadag other than a few remote locations near Yuma, Arizona. The Yuma location requires access via horseback and/or all-terrain vehicle. Reference to uhs bakam must also include technical data support, avoidance and mitigation plans in order to preserve this rare and highly coveted medicine and religious resource. Destroying this particular resource and/or restricting access to it has broad yet serious implications to Native Americans and religious practitioners that rely on this sacred resource.
328	Conclusively, the DEIS has failed to identify at least three Section 4(f) resources. In addition, the DEIS incorrectly analyzes the impact to any Section 4(f) resources in the west end of SMPP. While there will not be a direct use of these trails, there will clearly be a *constructive* use of these trails. It is tragic that the solitude, peacefulness and beauty experienced on these trails (old and new) will be so dramatically diminished by the proposed action. The severe impacts should be included in a revised DEIS.
329	The Section 4(f) Evaluation is incomplete and filled with misstatements, therefore the analysis is deficient. Figure 5-6 needs to be amended to include the trails and developed measures to minimize harm. As a whole, this report needs to be amended and alternatives reevaluated to avoid impact and/or evaluate measures to minimize harm.
330	As an overall final editorial, it seems tragic that the process went out of its way to realign the proposed project to preserve other Section 4(f) resources (Hudson Farm, Barnes Dairy Farm, and Hackin Farmstead, all on private property) when it is most certain they are only being preserved to be eventually demolished by future development, yet other Section 4(f) resources such as the trails in SMPP, which will be used by thousands of people for many years to come, are discounted, devalued and dismissed as an important protected resource.
331	Many of the statements in the Section 4(f) Evaluation are clearly pre-decisional and the evaluation was not done by or with a professional who understands the SMPP, its trail system or the City of Phoenix General Plan. This leads to a misleading analysis. The public uses the DEIS as a tool for information, yet the information is not only incomplete, it is also wrong. The Section 4(f) Evaluation needs to be revised.

13

Code	Issue	Response
327	**Cultural Resources**	Adverse impacts to culturally important natural resources (plants, animals, landscapes) would be addressed through the traditional cultural property mitigation program (currently in its draft form as jointly drafted by the Arizona Department of Transportation and the Gila River Indian Community). (See Draft Environmental Impact Statement pages 4-131 and 5-27 for more discussion.) The Bursera trail is more than ¼ mile from the proposed freeway and is analyzed in the Final Environmental Impact Statement on page 5-9. The trail is within ¼ mile of the planned Chandler extension and residential development; however, these trails do not have noise-sensitive activities or viewshed characteristics that contribute to their importance as Section 4(f) recreational resources.
328	**Section 4(f) and Section 6(f)**	The newest South Mountains trails, the Bursera and the Pyramid, are more than ¼ mile from the proposed freeway and are analyzed in the Final Environmental Impact Statement on page 5-9. The trails are within ¼ mile of the planned Chandler extension and residential development; however, these trails do not have noise-sensitive activities or viewshed characteristics that contribute to their importance as Section 4(f) recreational resources. Discovery of new information not presented in a Draft Environmental Impact Statement as it is published is not failure. Review by agencies and the public of a Draft Environmental Impact Statement equates to a review of a draft report to aid the agencies in making the document more objective and defensible. In this manner, the realization of new information, if recognized as such by the federal lead agency, permits the Arizona Department of Transportation and its representatives to defensibly augment the document's content.
329	**Section 4(f) and Section 6(f)**	Trails maps have been updated, and new trails are analyzed in the Final Environmental Impact Statement because they are within ¼ mile of the Chandler Extension (not the proposed freeway) (see page 5-9). Because none of the action alternatives or options would result in direct or constructive use of the trails, no measures to minimize harm are warranted. Discovery of new information not presented in a Draft Environmental Impact Statement as it is published is not failure. Review by agencies and the public of a Draft Environmental Impact Statement equates to a review of a draft report to aid the agencies in making the document more objective and defensible. In this manner, the realization of new information, if recognized as such by the federal lead agency, permits the Arizona Department of Transportation and its representatives to defensibly augment the document's content.
330	**Section 4(f) and Section 6(f)**	The process upon which Section 4(f) resources were identified and evaluated for feasible and prudent avoidance possibilities followed the rigorous procedural requirements as set forth in Federal Highway Administration Technical Advisory T 6640.8A Guidance for Preparing and Processing Environmental and Section 4(f) Documents and related guidance. The comment suggests trails in the South Mountain Park/Preserve would be subject to direct or constructive use; however, as shown in Chapter 5 of the Draft and Final Environmental Impact Statements, such use would be avoided by the proposed freeway.

(Response 331 begins on next page)

Code	Comment Document

332

The disqualification of trails in South Mountain based on the above assessment is inaccurate, far-reaching and just plain wrong. This shows a true lack of knowledge about the SMPP, the trails, Section 4(f) resources and a defensible analysis. Finally, the assessment of the trails in relation to Native American religious practice is lacking and necessary to weigh the Section 4(f) applicability in the present matter. Thus, the trails remain subject to Section 4(f) review and protection.

333

IV. The DEIS fails to comply with the Archaeological Resources Protection Act of 1979, 16 U.S.C. 470aa-mm.

The Archaeological Resource Protection Act (the "ARPA") was enacted "...to secure, for the present and future benefit of the American people, the protection of archaeological resources and sites which are on public lands and Indian lands, and to foster increased cooperation and exchange of information between governmental authorities, the professional archaeological community, and private individuals." 16 U.S.C. 470, Sec. 2(b).

In the present case, the land affected by the Freeway project includes private, public, tribal and National Park land. ARPA governs federal projects that impact public, tribal and National Park land.[32]

The DEIS and FHWA/ADOT have failed to demonstrate compliance with the ARPA regarding permits to excavate archaeological resources on such lands, terms and conditions of the permits, compliance with the requisite qualifications of person/s to carry out the permitted activity, notification to tribes, curatorial measures and compliance, custodial arrangements for the archaeological collection, liabilities for the care and maintenance of the collection, compliance with tribal law governing archaeological excavations,[33] compliance with the Antiquities Act of 1906, 16 U.S.C. 431-433, consent of archaeological activities with Indian tribes,[34] among other provisions.

The FHWA and ADOT should become compliant with the ARPA as the Freeway project, per the DEIS, is planned to adversely impact numerous archaeological sites.

---

[32] 16 U.S.C. 470bb, Section 3 (3)(a-b) & (4).
[33] Note that the GRIC has passed resolutions and perhaps other laws that bear the public policy against desecration of the South Mountain. Archaeological excavation would certainly desecrate the South Mountain. The FHWA and ADOT's lack of compliance with ARPA is compounded by the failure to address ARPA's requirement to observe tribal law for the same.
[34] *See* 16 U.S.C. 470bb, Section 5 which states, "[a]ny exchange or ultimate disposition under such regulation of archaeological resources excavated or removed from Indian lands shall be subject to the consent of the Indian or Indian tribe which owns or has jurisdiction over such lands. Following promulgation of regulations under this section, notwithstanding any other provision of law, such regulations shall govern the disposition of archaeological resources removed from public lands and Indian lands pursuant to this Act."

Code	Issue	Response
331	**Section 4(f) and Section 6(f)**	The Section 4(f) evaluation in its entirety represents an exhaustive, comprehensive, objective, and meaningful effort in accordance with requirements of the law and is in no way misleading. Evaluation of each resource included active engagement of resource owners to clarify resource importance and use (extensive interaction with owner/operators of Section 4(f) resources is well documented in the Appendices of the Draft and Final Environmental Impact Statement). The U.S. Department of the Interior [the agency with direct oversight of Section 4(f)] review of the Draft Environmental Impact Statement noted: "Following our review of the Section 4(f) Evaluation, we concur that there is no feasible or prudent alternative to the Preferred Alternative selected in the document, and that all measures have been taken to minimize harm to these resources" The complete letter can be found in Appendix 7, Volume III, on page B4 of the Final Environmental Impact Statement. The Section 4(f) evaluation was thorough and complete.
332	**Section 4(f) and Section 6(f)**	The Federal Highway Administration recommended the Native American trails within the project area as eligible for listing in the National Register of Historic Places under Criterion D as archaeological sites. Based on review of the traditional cultural property technical summary, the Bureau of Indian Affairs, City of Phoenix, State Historic Preservation Office, Cocopah Tribe, Colorado River Indian Tribes, Fort McDowell Yavapai Nation, Gila River Indian Community, Hopi Tribe, Navajo Nation, San Carlos Apache Tribe, Tonto Apache Tribe, and White Mountain Apache Tribe, the Gila River Indian Community Tribal Historic Preservation Officer and Arizona State Historic Preservation Office concurred with these recommendations. Trails within Phoenix South Mountain Park/Preserve were not disqualified from Section 4(f) evaluation; they are solely recreational. The City of Phoenix-owned trails within Phoenix South Mountain Park/Preserve were considered collectively as part of the City-owned park/preserve because the analysis indicated that there would be no direct or constructive use of the trails.
333	**Cultural Resources**	The Draft Environmental Impact Statement complies with the Archaeological Resources Protection Act of 1979, 16 United States Code 470aa-mm. Implementing regulations found at 43 Code of Federal Regulations Section 7.1(a) provide regulations to implement provisions of the Archaeological Resources Protection Act by establishing the uniform definitions, standards, and procedures to be followed by all Federal land managers in providing protection for archaeological resources, located on public lands and Indian lands of the United States; therefore, the Archaeological Resources Protection Act applies only to projects on federal or tribal land. The proposed freeway would not be constructed on tribal land and the involvement of federal land would be limited to a parcel owned by the Bureau of Land Management, which is discussed on page 4-14 of the Final Environmental Impact Statement. As discussed on page 4-159 of the Final Environmental Impact Statement, a programmatic agreement was developed for the project to establish a process for consultation, review, and compliance with federal and state preservation laws as the effects of the project on historic properties become known. The programmatic agreement states that any data recovery on federal lands necessitated by the project must be permitted under the Archaeological Resources Protection Act in accordance with the federal land-holding agency and that in the event any data recovery for the project should take place on tribal lands, all applicable permits would be obtained. Because the project is proposed, a programmatic agreement is in place to address data recovery on federal and tribal lands, and no excavations have yet occurred.

334

V. **The DEIS results in a clear violation of the Religious Freedom Restoration Act of 1993, 42 USC § 2000bb, (the "RFRA") and the Religious Land Use and Institutionalized Persons Act, 42 U.S.C. § 2000cc et seq. (the "RLUIPA").**

In general under the RFRA, the Government shall not substantially burden a person's exercise of religion even if the burden results from a rule of general applicability, except as provided in subsection (b) of this section. The Government may substantially burden a person's exercise of religion only if it demonstrates that application of the burden to the person— **(1)** is in furtherance of a compelling governmental interest; and **(2)** is the least restrictive means of furthering that compelling governmental interest.

The RLUIPA corrects the shortcomings of RFRA by prohibiting the imposition of burdens on the ability of prisoners to worship as they please and gives churches and other religious institutions a way to avoid burdensome zoning law restrictions on their property use.

Both RFRA and RLUIPA apply in the present case. The FHWA and ADOT, despite noting substantial findings and a lengthy record of the impact of the Freeway project upon the cultural, traditional and religious practice of Native Americans, the FHWA has not argued nor demonstrated a compelling governmental interest that is the least restrictive means to further such a compelling government interest. Instead, FHWA and ADOT suggest that they originated 30 or more design alternatives yet made unsubstantiated claims that 29 of the alternatives were not prudent or feasible. FHWA and ADOT through its DEIS proposes the EI Alternative that is (a) a substantial burden to the exercise of religion upon the Native Americans and tribes that have attached a religious connection with the proposed project's footprint and cultural resources, (b) that FHWA and ADOT intends, through its DEIS to further what it believes is a compelling government interest, and (c) is doing so by electing the most restrictive means upon religious freedom. Therefore, the E1 Alternative for the Freeway project violates RFRA and the project as proposed by the DEIS should not proceed.

335

VI. **The United States, through FHWA and ADOT, failed to honor, observe and uphold the United Nations Declaration on the Rights of Indigenous Peoples (the "UNDRIP") when it issued an insufficient DEIS that does not assure all indigenous people the rights that are afforded them under the Declaration.**

The 2007 United Nations Declaration of the Rights of Indigenous Peoples (UNDRIP) affirms that Indigenous people have the right to be who they are, that they have the right to exist as distinct peoples, and that they have the right to "maintain, protect and develop the past, present and future manifestations of their cultures." Further, Indigenous Peoples have the right to "practice and revitalize" their sacred cultural traditions and customs. The UNDRIP affirms the rights of indigenous peoples to "manifest, practice, develop and teach their spiritual and religious traditions, customs and ceremonies," and "to maintain, protect, and have access in privacy to their religious and cultural sites." The UNDRIP further

Code	Issue	Response
334	**Cultural Resources**	The Religious Land Use and Institutionalized Persons Act, by its terms, has no application here. The Draft Environmental Impact Statement describes a proposed action that, after consultation and coordination efforts, would accommodate and preserve (to the fullest extent possible from the available alternatives) access to the South Mountains for religious practices. A very small portion of the mountain would be impacted by the proposed freeway (less than 0.03 percent of the total area). Although the Draft Environmental Impact Statement describes the impact on the South Mountains as adverse, Native Americans would not be kept from practicing their beliefs, access to the mountain would be maintained, and mitigation measures would be implemented based on input from members of the Gila River Indian Community. Even if a substantial burden existed, the construction of roads to meet regional transportation needs is a central and compelling function of government, and the project is designed to accomplish that compelling function with the least impact possible under the circumstances. The Arizona Department of Transportation and Federal Highway Administration have been fully attentive to concerns expressed by the Gila River Indian Community and reiterate that position in this comment; the agencies have taken these concerns into account in describing potential impacts in the Draft Environmental Impact Statement, in ensuring that access to South Mountain is preserved, and in developing and recommending the implementation of numerous mitigation measures.
335	**Cultural Resources**	The United States has confirmed that the United Nations Declaration on the Rights of Indigenous Peoples Declaration is "not legally binding or a statement of current international law" and is limited to "moral and political force." *Announcement of U.S. Support for the United Nations Declaration on the Rights of Indigenous Peoples*, U.S. State Department (December 17, 2010) (available at: state.gov/documents/organization/154782.pdf). The government's Announcement further clarified that the United States "understands [that the Declaration] calls for a process of meaningful consultation with tribal leaders, but not necessarily the agreement of those leaders, before the actions addressed in those consultations are taken." The Draft Environmental Impact Statement describes a proposed action that, after consultation and coordination efforts, would accommodate and preserve (to the fullest extent possible from the available alternatives) access to the South Mountains for religious practices. A very small portion of the mountain would be impacted by the proposed freeway (less than 0.03 percent of the total area). Although the Draft Environmental Impact Statement describes the impact on the South Mountains as adverse, Native Americans would not be kept from practicing their beliefs, access to the mountain would be maintained, and mitigation measures would be implemented based on input from members of the Gila River Indian Community.

recognizes that much of what Indigenous peoples hold sacred in this world has been taken or lost "without their free, prior and informed consent or in violation of their laws, traditions and customs," and it calls for states to provide redress "through effective mechanisms" and "through fair, transparent and effective mechanisms developed in conjunction with indigenous peoples concerned." The phrase "through effective mechanisms" appears twice in Articles 11 and 12, serving to underscore the fact that nation states should utilize the power of regulatory, legislative and other authorities to assure that the rights of Indigenous peoples to practice and worship in sacred sites and continue religious and cultural ways of living are secure. Article 8 of the UNDRIP specifically prohibits the "forced assimilation or destruction of Indigenous culture."

336

In the present case, civil rights and human rights within the UNDRIP mandate that an evaluation of the traditional cultural properties be performed with direct, informed with the Indigenous Peoples' free, prior and informed consent. Here, the Indigenous Peoples are the tribes affected by the Freeway project. Free, prior and informed consent must occur *before* any route of the proposed project can be selected. Article 7 of the UNDRIP afford Indigenous peoples the right to "decide their own priorities for the process of development as it affects their lives, beliefs, institutions and spiritual well-being and the lands they occupy or otherwise use, and to exercise control over their economic, social and cultural development". In no way does the UNDRIP sanctify or suggest validity of the FHWA's incomplete, in accurate and unfounded Section 106 process nor its finding that the proposed Freeway project is exempted from Section 4(f) protections.

337

In other words, FHWA continues to violate the rights afforded to the tribes as the affected Indigenous Peoples in the present matter by proceeding with the E1 Alternative of the Freeway project in the manner so described in the April 2013 DEIS. Further, the United States, through its FHWA in the present matter, is continuing to violate Articles 11&12 by failing to afford civil and human rights outlined in the UNDRIP.

CONCLUSION

338

The FHWA and ADOT's proposed South Mountain Freeway project does not meet the requirements of the NEPA, Section 4(f) of the Department of Transportation Act, the NHPA, the ARPA, the RFRA, the RLUIPA, and the UNDRIP. FHWA and ADOT should re-initiate the Section 106 process with reasonable and good faith efforts to consult all tribes and amend any and all technical studies identifying, assessing, evaluating and mitigating adverse impacts to cultural resources with tribal input. Further, FHWA and ADOT should eliminate alternative routes that are located near or through the South Mountain, the Gila River Indian Community and other sites considered of sacred or of cultural significance, correct the DEIS and take future action to become compliant with all applicable laws, ensure that all tribes and Indigenous Peoples are afforded their basic human and civil rights as outlined in the UNDRIP, and appropriately include counsel from air toxicology experts and the findings of the Environmental Protection Agency's Joint Air Toxic Assessment Project issued in 2005.

16

Code	Issue	Response
336	**Cultural Resources**	As described in the Draft Environmental Impact Statement, the consultation process with Native American tribes, and in particular with the Gila River Indian Community, was lengthy, repeated, and extensive. Traditional cultural properties were evaluated through consultation with affected tribes and are described in the Draft Environmental Impact Statement. Although the consent of tribal leaders is not required, as the United States made clear in its decision discussed in an earlier response, the Tribal Historic Preservation Officer concurs with the mitigation measures to be imposed in connection with the E1 Alternative affecting a small portion of the South Mountains. The quoted language in the comment attributed to Article 7 of the Declaration does not appear there. The language appears to derived from the International Labor Organization's 1989 Indigenous and Tribal Peoples Convention (Convention No. 169). Convention 169 has never been ratified by the United States, which has not agreed to align legislation, policies, and programs with the Convention as a legal requirement. Section 106 of the National Historic Preservation Act requires a government-to-government relationship between the Federal Government and Indian tribes as described beginning on page 4-140 of the Final Environmental Impact Statement Section 106 requires that federal agencies take into account the effects of their undertakings on historic properties. This process requires consultation with tribal authorities. Consultation has occurred with Gila River Indian Community government officials, the Tribal Historic Preservation Officer, the Cultural Resource Management Program, many different tribal authorities, and the State Historic Preservation Office. The consultation has resulted in concurrence from the Gila River Indian Community Tribal Historic Preservation Office and the State Historic Preservation Office on National Register of Historic Places eligibility recommendations (including traditional cultural properties), project effects, and proposed mitigation and measures to minimize harm. This consultation has been ongoing and will continue until any commitments in a record of decision are completed. A thorough feasible and prudent avoidance analysis of the South Mountains was conducted as presented in Chapter 5 of the Draft and Final Environmental Impact Statements and concluded avoidance to the direct use of the resource was not feasible and prudent. In support of this response, consider the following review from the U.S. Department of the Interior on the Draft Environmental Impact Statement: comment: "Following our review of the Section 4(f) Evaluation, we concur that there is no feasible or prudent alternative to the Preferred Alternative selected in the document, and that all measures have been taken to minimize harm to these resources." The complete letter can be found in Appendix 7, Volume III, on page B4 of the Final Environmental Impact Statement.
337	**Cultural Resources**	The Draft Environmental Impact Statement describes a proposed action that, after consultation and coordination efforts, would accommodate and preserve (to the fullest extent possible from the available alternatives) access to the South Mountains for religious practices. A very small portion of the mountain would be impacted by the proposed freeway (less than 0.03 percent of the total area). Although the Draft Environmental Impact Statement describes the impact on the South Mountains as adverse, Native Americans would not be kept from practicing their beliefs, access to the mountain would be maintained, and mitigation measures would be implemented based on input from members of the Gila River Indian Community.

(Response 338 begins on next page)

Code	Comment Document
339	Finally, the National Advisory Council on Historic Preservation should conduct a Council review in accordance with Section 106, 36 C.F.R. §800.8(c)(2) and §800.9 to fully assess the FHWA and ADOT's actions and insufficiencies under the Section 106 process. Further, the Council should have the opportunity to review the abundant record that clearly demonstrates that the agencies failed to carry out their responsibilities assigned under Section 106 and the NEPA. The Council should therefore conduct a detailed case review to improve performance under Section 106 and/or correct the Section 106 and NEPA deficiencies. *See Id.* Upon findings, the Council may consider a recommendation to issue a stop work order to the Department of Transportation until Section 106 and NEPA compliance is attained.

17

Code	Issue	Response
338	**Cultural Resources**	The Draft Environmental Impact Statement is the result of careful study and complies with the National Environmental Policy Act, Section 4(f) of the Department of Transportation Act, the National Historic Preservation Act, the Archaeological Resource Protection Act, the Religious Freedom Restoration Act, the Religious Land Use and Institutionalized Persons Act, and the United Nations Declaration on the Rights of Indigenous Peoples
339	**Cultural Resources**	As noted in the Final Environmental Impact Statement in Table 4-47 beginning on page 4-145, the National Advisory Council on Historic Preservation has been consulted. The Council declined to participate in the project twice, but encouraged development of a programmatic agreement without its involvement.

STATEMENT BY LORI RIDDLE
JULY 22, 2013

340

There were very few meetings, very little public participation. The very first invite extended was days after the DEIS was released which was April 25th, 2013. The meeting invite was on April 30th, 2013 at 3pm in GRIC at the Governance Center.

341

Present were the TTT, Governor and Lt Governor (who is Chair of the TTT), various tribal departments, a rep from ADOT (who I can't recall), a rep from MAG, Senior Engineer Bob Hazlett as well as a few of the grassroots organizers. Represented were at least organizers from 5 groups. During this meeting we were given 3 copies of the DEIS to divide among our groups. A few days prior a community member attempted to call to find out how to obtain a copy of the DEIS, she was told in order to get a hard copy she would have to pay 50.00 dollars. During the April 30th meeting they also advised us about the 50.00 dollar charge for hard copies. At this meeting they also told us that free bus service to the May 21st DEIS public comment hearing in Phoenix at the Phoenix Convention Center. Details about how the free bus rides to the hearing saying community members could catch the bus in two locations and even take the light rail, but no other details regarding the bus service. They also went through the scenario of what to expect at the hearing, how it would be set up, etc. At the beginning of the meeting the ground rules set as relayed by TTT's David White and Stephen Lewis both individuals head of the TTT. We were not allowed to speak about anything else but what the process was going to be like, at this point there wasn't any mention that the Phoenix hearing would have some differences than the community forums. It was at this meeting where GRIC Lt Gov. had to officially request that a meeting (or two) be held in GRIC for community members that couldn't make the public hearing. At this meeting the handouts "Fact sheet" and "How to participate" were distributed. That's all I can recall.

A few times I attempted to call the number provided on the handouts, which also had a recording say the they couldn't receive any more messages, the box was full, or something to that effect. I had also heard similar accounts from other people who were attempting to call the number. On the Thursday before the hearing I started to get worried because there was no further mention of free transport besides what was relayed to us during the April 30th meeting. I called the number provided and was able to have an opportunity to leave a voice message in which I said something to the effect of: Hello my name is Lori Riddle from the Gila River Indian Community and I'm trying to get some further information on bus service, passes or vouchers for my community members. How will this work? Would someone give me a call on my cell #520-610-3405, thank you.

No Response!!!!

So on the day of the Phoenix hearing May 21st, 2013 I lingered several hours. I only recognized Mr. Bob Hazlett from MAG, I approached Mr. Hazlett and asked him, "So who's in charge here"? He chuckled but didn't answer, I told him I ask because I have some concerns. I told him there's a problem with the number that's always full and can't take anymore new messages, his response, "Yes, we just found out today that it only holds so many messages (I think the number he gave me was 13)". So I told him maybe they need to empty that a few times a day? The other thing I mentioned was that I had left a

Code	Issue	Response
340	**Public Involvement**	Offers to the Gila River Indian Community Manager to host a public outreach event on the Gila River Indian Community began in summer 2012. The Gila River Indian Community first officially responded to this offer at the April 30, 2013, meeting of the Transportation Technical Team. During this meeting, the Gila River Indian Community Manager requested a Gila River Indian Community Forum be conducted on the Gila River Indian Community following the public hearing. This was the only request the Arizona Department of Transportation received from the Gila River Indian Community regarding whether the Arizona Department of Transportation could hold a public outreach event during the public comment period. The Arizona Department of Transportation agreed to do so, and a Gila River Indian Community Forum was held on June 22, 2013, at the Komatke Boys & Girls Club on the Gila River Indian Community. The Arizona Department of Transportation advertisement efforts of the public hearing and public forums are documented in Chapter 6 of the Final Environmental Impact Statement beginning on page 6-23. The Gila River Indian Community Communication and Public Affairs Office informed the Arizona Department of Transportation that all communication and distribution of informational materials on Gila River Indian Community land would be handled by the Communication and Public Affairs Office. Advertisement text regarding the project, the public comment period, the public hearing, and the various ways for the public to submit comments regarding the South Mountain Freeway Draft Environmental Impact Statement was given to the Gila River Indian Community's Public Information Officer at the Transportation Technical Team meeting on April 30, 2013. Two advertisements regarding the public hearing, information regarding the location and availability of the Draft Environmental Impact Statement, and a map of the alternatives was placed in the May 2013 monthly issue of the *Gila River Indian News*. The Arizona Department of Transportation Community Relations distributed electronic notices (e-newsletters) through the Gila River Indian Community Government Delivery system to over 12,000 constituents who voluntarily signed up for project alerts along the Interstate 10 (Papago and Maricopa freeways) and State Route 202L (Santan Freeway). These electronic notices included notice of availability of the Draft Environmental Impact Statement (distributed on April 26, 2013); public hearing (distributed on May 10, 2013); the community forums (distributed on May 29, 2013); and closing of the Draft Environmental Impact Statement public comment period (June 2013). In addition, anyone who had attended a previous meeting on the proposed action and signed in received all of this information mailed individually. On May 6, 2013, 73,564 mailers were distributed to addresses within the Study Area.
341	**Public Involvement**	As stated on page 2-8 of the Draft Environmental Impact Statement, the meetings in 2010 between the Gila River Indian Community's Transportation Technical Team, Arizona Department of Transportation, and the Federal Highway Administration were held in response to a request received from the Governor of the Gila River Indian Community and were not a part of the agency or public scoping process. The information provided to the Transportation Technical Team was used by the Team and the Public Information Office in the Gila River Indian Community's outreach effort prior to the February 2012 coordinated referendum. The referendum and the outreach effort were tribal actions and, other than providing requested information to the Gila River Indian Community, the Arizona Department of Transportation and Federal Highway Administration did not participate in these actions.

Code	Issue	Response
342	**Public Involvement**	The initial hotline capacity was 20 messages; it was expanded to 80 on May 17, 2013. Any questions that came in regarding how to participate, including any shuttle bus or transportation questions, were forwarded to one individual to address. Conversation record log sheets were kept for these efforts.
343	**Public Involvement**	For the first time in the State's history, a shuttle bus to the hearing was provided from six locations in the Phoenix area, including two on the Gila River Indian Community (Komatke Boys & Girls Club and the Governance Center in Sacaton). All advertisements regarding the public hearing provided telephone numbers and electronic contact information regarding information on the shuttle schedules and pick-up locations. Transportation to the Gila River Indian Community forum was not provided. As noted in Chapter 2 of the Final Environmental Impact Statement, efforts to involve the Gila River Indian Community in the environmental impact statement process have been extensive. Public involvement with the Gila River Indian Community was conducted as requested by the tribal government. Prior to October 2005, early efforts to involve the Gila River Indian Community included attending tribal meetings and monthly meetings with Gila River Indian Community Departments (see discussion beginning on page 2-8 of the Draft and Final Environmental Impact Statements). On October 14, 2005, the Gila River Indian Community requested that all project-related communications take place at a government-to-government level (see letter on page A152 of Appendix 1-1). This request was honored by the Arizona Department of Transportation and Federal Highway Administration. All public involvement efforts were implemented by the Gila River Indian Community's public involvement officer.

Code	Comment Document

message on the number and relayed the message I had left the week prior. After that I said so how was this supposed to work? Because we could have gotten more tribal members present. He shrugged his shoulders and said, "Well it's too late now". Also on the day of the Phoenix hearing the participants received the small booklet "SMTN Meeting Guide". This was the first time we as community members had seen this. The guide did say the community forums were going to be utilizing a different format. It also listed only 1 GRIC forum and listed it as tentative.

344 The meeting in GRIC was short notice fliers went out to the community literally days before the event. Before this event at least three weeks prior one community organizer emailed a request urging GRIC to provide transport to community members to the meeting. There is a lack of community members without vehicles. No response. Lastly a few days before organizers and community voiced their concerns over the inability to voice, in open forum, their concerns at this meeting. We additionally asked again if transport would be provided, they finally said yes, but us organizers had to provide a list of community members who needed transport. This was not expected, it was too short of notice to gather all that information. The day of the GRIC forum were dissatisfied the lack of inability to openly voice their concerns. The video was looped, as posted on ADOT's website, throughout the day.

345 Previously, in two district meetings that I had attended one in district six and the other in district four. There were concerns about ADOT not coming to present the information themselves. The one elder in district six asked who they were working for? He (the elder) stated that he felt like the TTT should not have been presenting the information but ADOT should have been the ones bringing this information to the community. That same consensus was expressed at the district four meeting.

Signed,

Lori Riddle

346

Comments on the Draft Environmental Impact Statement (DEIS) for the proposed South Mountain Freeway (SMF), July 2013

It is the job of the Maricopa Association of Governments (MAG) and the Arizona Department of Transportation (ADOT) to plan for transportation throughout the Valley of the Sun. This includes proper planning for keeping unnecessary traffic out of the valley as well as planning for the proper flow of traffic throughout the area. It also includes planning for moving people around using all modes of transportation, and it should include new and visionary ideas for handling the transportation needs of the valley.

347

Based on the MAG and ADOT mandates, the purpose and need of the South Mountain Freeway (SMF) should be well thought out and based on extensive modeling and analysis. Instead, what we see in the Draft Environmental Impact Statement (DEIS) is the perpetuation of a pre-determined idea from 30 years ago that is neither well thought out nor based on any type of valid modeling and analysis. It is just "we need more freeways," and this one has been especially designed for trucks to travel through the South Mountain corridor. The fact that the geography of the South Mountain corridor doesn't support a freeway doesn't matter. This freeway plan appears to be nothing but a political response to the desires of the trucking industry.

347 348

Purpose and Need (P&N)

In fact, the SMF was no visionary idea 30 years ago (DEIS page 1-8). From the very beginning, it was planned as a Phoenix bypass. At that time, the Phoenix metropolitan area was not as spread out as it is now. Yet MAG was supposedly looking at growth patterns and trying to plan for 30 years into the future (which is now). It should have been clear even then that the metropolitan area would spread far beyond the extent of the SMF and that a bypass should be out farther from the core of the city. Pollution was bad enough at that time that planning should have been directed at getting more vehicle pollutants out of the metropolitan area. Yet it wasn't until much more recently that SR-85 from I-10 at Buckeye to I-8 at Gila Bend to I-10 at Casa Grande was designated as a truck bypass to direct a significant source of pollution out of the city core. And even then, the truck bypass was identified only under pressure from the Environmental Protection Agency (EPA) and the Arizona Department of Environmental Quality (ADEQ). And MAG persisted with claiming a need for the SMF – no longer calling the SMF a truck bypass, but intending that nevertheless. Why should we believe that MAG can do a better job of looking at 30 years into the future now than they could 30 years ago?

349

It is clear from the DEIS, as well as from previous MAG and ADOT statements and actions, that the SMF is intended to be a truck bypass, and that it is currently being disguised as a "regional" highway, which evidently seems to mean that it would be primarily for truck traffic to and from the commercial area around 51st Avenue. The SMF would negate the current truck bypass. An analysis of truck traffic patterns, and

1

Code	Issue	Response
346		Comment noted.
347	**Purpose and Need**	Creating a truck bypass is not a goal of the proposed action. The proposed freeway is part of a transportation system developed to improve mobility in the region by increasing capacity and allowing traffic—including truck traffic—to access a segment of the "loop" system (see pages 1-21, 1-22, 3-1, and 3-3 of the Final Environmental Impact Statement) in the Phoenix metropolitan area. The proposed South Mountain Freeway would be a commuter corridor, helping to move local traffic. As with all other freeways in the region, trucks would use it for the through-transport of freight, for transport to and from distribution centers, and for transport to support local commerce. Nevertheless, the primary vehicles using the proposed freeway would be automobiles. The Maricopa Association of Governments regional travel demand model projects that truck traffic would represent approximately 10 percent of the total traffic on the proposed freeway, similar to what is currently experienced on other regional freeways such as Interstate 10, State Route 101L, and U.S. Route 60. As disclosed in the Final Environmental Impact Statement, it is expected that "true" through-truck traffic (not having to stop in the metropolitan area) would continue to use the faster, designated, and posted bypass system of Interstate 8 and State Route 85 (see page 3-64 of the Final Environmental Impact Statement).
348	**Purpose and Need**	As presented in Chapter 1, *Purpose and Need*, an objective and unbiased examination of the existing and planned future transportation network in the Study Area was undertaken to determine if the catalyst for the need for the Environmental Impact Statement (being the proposed action) was still warranted. As explained in the chapter, the examination successfully attempted to provide an answer to whether or not a transportation problem(s) exist and would continue to exist in the foreseeable future. The analysis was undertaken in accordance with the National Environmental Policy Act and Federal Highway Administration guidance and policy for implementing the National Environmental Policy Act. The results confirmed the transportation problems as framed in the region's adopted long range transportation plans (both past and present) still exist and would continue to exist in the foreseeable future. The need for action was not to implement the long range plan objectives but to correct a transportation problem in the region; a beneficial outcome in doing so was consistency with the region's long range transportation planning activities. The purpose and need criteria used to frame the transportation problem are described (see Figures 1-8, 1-9, 1-10, 1-11, 1-12, and 1-13). As summarized in the section, *Conclusions*, beginning on page 1-21 of the Draft Environmental Impact Statement, the analysis confirmed that without a major transportation facility in the Study Area, the region's transportation network (as recognized in over 25 years of transportation planning) will not be able to efficiently move goods and people throughout the region without major investments in the region.
349	**Purpose and Need**	The Maricopa Association of Governments regional travel demand model projects that truck traffic will represent approximately 10 percent of the total traffic on the proposed action. Chapter 1, *Purpose and Need*, does not have a truck bypass as a goal of the proposed action. The proposed freeway is part of a transportation system developed to improve mobility in the region by increasing capacity and allowing

(Response 349 continues on next page)

Code	Comment Document

particularly the shifting of a truck bypass from outside the metropolitan area to an area close to downtown is ignored throughout the DEIS, although such an analysis is also prescribed by the National Environmental Policy Act (NEPA).

350 At one point when funds were short for completing the SMF (early 90s), one idea that ADOT considered was allowing the highway to be built as a toll road. Then, an independent group interested in possibly building this toll road did an analysis of the cost-effectiveness of such a highway (very strongly correlated with the need for the highway). The result of their analysis was that they declined to build the freeway, a clear indication of the lack of need.

351 Rather than dropping the idea of the SMF and re-examining the real needs of the region, MAG and ADOT persisted with the SMF plan.

352 As the CANAMEX highway idea matured, it was designed to go near or through Phoenix. Unless or until I-11 is built, according the CANAMEX website, the CANAMEX would follow I-10, and truckers would certainly find the SMF "short cut" to be most appealing. But ADOT denied the intention of using the SMF for a truck bypass, so they also denied the intention of using it for the CANAMEX. ADOT officially declared that the truck bypass along SR 85 would be a part of CANAMEX. Yet this contradicts assertions on the CANAMEX web site.

Of course, truck drivers can read maps and see when a short cut exists for them, so a true analysis of the situation would show the CANAMEX traffic using the SMF, regardless of what the "official" route of the CANAMEX is designated to be. ADOT's official response to that is that they "can't help" what truckers do but they expect most of them to use the truck bypass. Really!? Isn't it a part of their job of planning to provide realistic transportation corridors that will induce the traffic to use the appropriate corridors? And to look at all possible means of transportation to satisfy the entire needs of an area? A proper analysis should definitively show where the traffic, including the truck traffic, would really go.

Recently, when ADOT improved SR 85, it became a 4-lane highway, but it was not made a freeway. One motivation for this lack of foresight was apparently because as long as it is not a freeway it cannot be designated as an interstate highway. A freeway bypass could be designated as I-10 and take all pass-through traffic away from the Phoenix metropolitan area. This would serve as a bypass for both truck and automobile traffic. Yet this has apparently never been considered. Or has it been purposely ignored? It is certainly not in the DEIS.

The DEIS states (page 5-20) that a tunnel option through South Mountain was rejected because it would limit the ability of trucks hauling hazardous materials to use the SMF. This is just another indication that the SMF is intended as a truck bypass.

2

Code	Issue	Response
349 (cont.)		traffic—including truck traffic—to access a segment of the "loop" system (see pages 1-21, 1-22, 3-1, and 3-3 of the Final Environmental Impact Statement) in the Phoenix metropolitan area. The proposed South Mountain Freeway would be a commuter corridor, helping to move local traffic. As with all other freeways in the region, trucks would use it for the through-transport of freight, for transport to and from distribution centers, and for transport to support local commerce. Commercial trucks would use the proposed action. As with all other freeways in the Maricopa Association of Governments region, trucks would use it for the through transport of freight, for transport to and from distribution centers, and for transport to support local commerce. And as with travel on all other freeways in the Maricopa Association of Governments region, the primary users of the proposed action would be automobiles. The trucking industry depends on the efficient and fast movement of freight and on travel time savings. Trucking destinations in the Phoenix metropolitan area (either distribution centers or for local commerce) would still need trucks to enter congested areas. Choosing to travel on the proposed action rather than Interstate 10 would not translate to any substantial travel time benefits. Therefore, it is expected that "true" through-truck traffic (not having to stop in the metropolitan area) would continue to use the faster, designated, and posted bypass system of Interstate 8 and State Route 85 (see page 3-64 in the Final Environmental Impact Statement).
350	**Alternatives**	In 1996, a consortium of private companies proposed to build the South Mountain Freeway as a toll road. The consortium later withdrew its proposal, saying the project was not financially feasible (see Alignment Recommendation South Mountain Corridor Loop 202, as noted on page 1-8 of the Draft Environmental Impact Statement). The determination not to construct the freeway as a toll road was not an indication that the freeway was not needed. In the executive summary to the above referenced report, the proposers state: "The Arizona Transportation Group, LLC still believes that the construction and financing of the South Mountain Portion of the Loop 202 as a toll road is feasible and looks forward to teaming with the Arizona Department of Transportation to provide this important segment of the Maricopa County's regional highway system." The reason the proposal was determined to not be financially feasible was because the public and policy-makers were not supportive of paying support tolls.
351	**Purpose and Need**	Chapter 1, *Purpose and Need*, examines the purpose and need for the proposed action in terms of defining a transportation problem. In doing so, assumptions associated with past need for the freeway were discounted as part of the environmental impact statement process. The results of the purpose and need analyses included the determination that a transportation problem (similar to the type of problem that has been represented in past Regional Transportation Plans) still exists in the area and that this problem is similar in characteristics to the transportation problem that existed in prior years. The alternatives analyses considered numerous modal alternatives, and it was concluded through a robust screening process that a road facility would best address the transportation problem defined.
352	**Trucks**	The 1995 Congressional federal definition states: "In the State of Arizona, the CANAMEX Corridor shall generally follow – (i) I-19 from Nogales to Tucson; (ii) I-10 from Tucson to Phoenix; and (iii) United States Route 93 in the vicinity of Phoenix to the Nevada Border." (*Source*: <canamex.org/canamex/federal-definition>)

Code	Comment Document

particularly the shifting of a truck bypass from outside the metropolitan area to an area close to downtown is ignored throughout the DEIS, although such an analysis is also prescribed by the National Environmental Policy Act (NEPA).

At one point when funds were short for completing the SMF (early 90s), one idea that ADOT considered was allowing the highway to be built as a toll road. Then, an independent group interested in possibly building this toll road did an analysis of the cost-effectiveness of such a highway (very strongly correlated with the need for the highway). The result of their analysis was that they declined to build the freeway, a clear indication of the lack of need.

Rather than dropping the idea of the SMF and re-examining the real needs of the region, MAG and ADOT persisted with the SMF plan.

As the CANAMEX highway idea matured, it was designed to go near or through Phoenix. Unless or until I-11 is built, according the CANAMEX website, the CANAMEX would follow I-10, and truckers would certainly find the SMF "short cut" to be most appealing. But ADOT denied the intention of using the SMF for a truck bypass, so they also denied the intention of using it for the CANAMEX. ADOT officially declared that the truck bypass along SR 85 would be a part of CANAMEX. Yet this contradicts assertions on the CANAMEX web site.

353 Of course, truck drivers can read maps and see when a short cut exists for them, so a true analysis of the situation would show the CANAMEX traffic using the SMF, regardless of what the "official" route of the CANAMEX is designated to be. ADOT's official response to that is that they "can't help" what truckers do but they expect most of them to use the truck bypass. Really!? Isn't it a part of their job of planning to provide realistic transportation corridors that will induce the traffic to use the appropriate corridors? And to look at all possible means of transportation to satisfy the entire needs of an area? A proper analysis should definitively show where the traffic, including the truck traffic, would really go.

354 Recently, when ADOT improved SR 85, it became a 4-lane highway, but it was not made a freeway. One motivation for this lack of foresight was apparently because as long as it is not a freeway it cannot be designated as an interstate highway. A freeway bypass could be designated as I-10 and take all pass-through traffic away from the Phoenix metropolitan area. This would serve as a bypass for both truck and automobile traffic. Yet this has apparently never been considered. Or has it been purposely ignored? It is certainly not in the DEIS.

355 The DEIS states (page 5-20) that a tunnel option through South Mountain was rejected because it would limit the ability of trucks hauling hazardous materials to use the SMF. This is just another indication that the SMF is intended as a truck bypass.

2

Code	Issue	Response
352 (cont.)		The definition was intentionally left broad so that local, regional, and state agencies could further define the specific routes for the corridor. In April 2001, the Maricopa Association of Governments Regional Council formally adopted the route depicted in the map on page 3-64 as the CANAMEX Corridor within Maricopa County. As noted on page 3-64 of the Draft Environmental Impact Statement, in the Maricopa County area the CANAMEX Corridor is to follow Interstate 10 from Tucson to Interstate 8 near Casa Grande, Interstate 8 west to State Route 85 near Gila Bend, State Route 85 north to Interstate 10 northwest of Buckeye, Interstate 10 west to Wickenburg Road, Wickenburg Road to Vulture Mine Road west of Wickenburg, and then connect with the planned U.S. Route 93/U.S. Route 60 Wickenburg Bypass.
353	**Trucks**	Arizona highways, as are most highways across the United States, are open to all kinds of traffic, so long as the cargo being carried is in accordance with U.S. Department of Transportation regulations for the specific type of cargo. The South Mountain Freeway, if implemented, is expected to operate under the same rules as other similar facilities in the state; truck traffic would be expected to be permissible (see text box on page 4-157 of the Final Environmental Impact Statement). The *Regional Transportation Plan* includes provisions for improving State Route 85 north of the Gila River to a freeway-type facility. There is no intention to change the designation of existing Interstate highways through Arizona. The State Route 85/Interstate 8 corridor is signed as the Phoenix bypass and will continue to provide a bypass route. The CANAMEX and Phoenix truck bypass (Interstate 8/State Route 85) routes are not mandatory for truck traffic; they are recommended. The Arizona Department of Transportation does not enforce these routes. It is not anticipated that these routes would be enforced as mandatory in the future. The reader is referred to page 3-64 of the Draft Environmental Impact Statement that elaborates on the relation of truck traffic and the proposed action.
354	**Alternatives**	The *Regional Transportation Plan* includes provisions for improving State Route 85 north of the Gila River to a freeway-type facility. There is no intention to change the designation of existing Interstate highways through Arizona. The State Route 85/Interstate 8 corridor is signed as the Phoenix bypass and will continue to provide a bypass route.
355	**Alternatives**	The noted text is but one of many factors that were used to eliminate the tunnel options through the South Mountains. The text boxes on pages 3-16 and 3-17 of the Draft Environmental Impact Statement discuss the additional factors that weighed as strong negatives for tunnel options: impacts, engineering factors, maintenance costs and issues, security, constructibility, and construction costs. The proposed freeway is part of a transportation system developed to improve mobility in the region by increasing capacity and allowing traffic—including truck traffic—to access a segment of the "loop" system (see pages 1-21, 1-22, 3-1, and 3-3 of the Final Environmental Impact Statement) in the Phoenix metropolitan area. The proposed South Mountain Freeway would be a commuter corridor, helping to move local traffic. As with all other freeways in the region, trucks would use it for the through-transport of freight, for transport to and from distribution centers, and for transport to support local commerce. Nevertheless, the primary vehicles using the proposed freeway would be automobiles. The Maricopa Association of Governments regional travel demand model projects that truck

(Response 355 continues on next page)

Code	Comment Document
356	Perhaps the original intent of the SMF truck bypass was to provide a more convenient route for trucks going in and out of the commercial area around 51st Avenue. Such thinking, however, indicates a decided lack of true regional planning. Any form of valid traffic analysis of the entire region immediately shows that in addition to the CANAMEX traffic, other interstate truck traffic would also prefer this "short cut" to the desirable (in terms of clean air) truck bypass route along SR 85. Any traffic solution that brings more truck traffic through the metropolitan area is not a viable solution. So the SMF is not a viable solution. The truck bypass must stay outside of the metropolitan area.
357	A valid and extensive analysis of the transportation needs of the South Mountain corridor has not been conducted. Such an analysis would show the true needs of local residents (as opposed to induced needs) as well as a detailed breakdown of truck traffic within and through the entire area, including CANAMEX trucks, pass-through trucks, and trucks with an origin and destination (O&D) of the commercial area near 51st Avenue. Such a valid analysis would show that any true need for regional transportation could be at least partly satisfied by modes other than automobile traffic (such as light rail). There is a need for traffic to be able to get in and out of Laveen without having to compete with trucks on the arterial streets, but this could be satisfied by a highway from Laveen to I-10 West. It is the O&D truck needs that require a freeway, but even these needs could be satisfied by a freeway spur from I-10 West to the commercial area around 51st Avenue. The South Mountain corridor is not a viable location for such truck traffic.
	To be more specific in terms of the DEIS, ADOT justifies the Purpose and Need (P&N) for the construction of the SMF in Chapter 1. There are many specific difficulties with this "justification." 1. The socio-economic data projections presented in the P&N and elsewhere in the DEIS are faulty. The socio-economic data used in the DEIS was developed by MAG using 2005 census data. When the results of the 2010 U.S. Census results became available, it was obvious that MAG's forecast of socio-economic data based on the 2005 special Census were too high by a large margin. 2. Since socio-economic data are the starting point for the MAG Travel Model, the travel-related forecasts presented in the P&N and elsewhere in the DEIS are faulty. Since MAG plans to update the socio-economic projections, why exactly did ADOT release a DEIS before the updates were ready? Because the changes will be extensive, sufficient time must be allowed for a second review of the DEIS prior to the preparation of the FEIS. 3. The forecast of vehicle miles of travel lacks credibility because it is contrary to national trends and also because the methodology used for computation is not explained clearly. Figure 1-4 in the Purpose and Need chapter of the DEIS discusses daily vehicle miles of travel (VMT) at one rate while the Regional Transportation Plan (RTP) uses different data. A further consideration is that travel surveys nationally and in the MAG region indicate
	3

Code	Issue	Response
355 (cont.)		traffic would represent approximately 10 percent of the total traffic on the proposed freeway, similar to what is currently experienced on other regional freeways such as Interstate 10, State Route 101L, and U.S. Route 60; therefore, planning must account for trucks using the proposed freeway.
356	**Trucks**	The signed truck bypass for the Phoenix metropolitan area is today and will continue to be State Route 85 and Interstate 8. The Maricopa Association of Governments regional travel demand model projects that truck traffic will represent approximately 10 percent of the total traffic on the proposed action. Chapter 1, *Purpose and Need*, does not have a truck bypass as a goal of the proposed action. The proposed freeway is part of a transportation system developed to improve mobility in the region by increasing capacity and allowing traffic—including truck traffic—to access a segment of the "loop" system (see pages 1-21, 1-22, 3-1, and 3-3 of the Final Environmental Impact Statement) in the Phoenix metropolitan area. The proposed South Mountain Freeway would be a commuter corridor, helping to move local traffic. As with all other freeways in the region, trucks would use it for the through-transport of freight, for transport to and from distribution centers, and for transport to support local commerce. Commercial trucks would use the proposed action (as noted on page 3-64 of the Draft Environmental Impact Statement). As with all other freeways in the Maricopa Association of Governments region, trucks would use it for the through transport of freight, for transport to and from distribution centers, and for transport to support local commerce. And as with travel on all other freeways in the Maricopa Association of Governments region, the primary users of the proposed action would be automobiles. The trucking industry depends on the efficient and fast movement of freight and on travel time savings. Trucking destinations in the Phoenix metropolitan area (either distribution centers or for local commerce) would still need trucks to enter congested areas. Choosing to travel on the proposed action rather than Interstate 10 would not translate to any substantial travel time benefits. Therefore, it is expected that "true" through-truck traffic (not having to stop in the metropolitan area) would continue to use the faster, designated, and posted bypass system of Interstate 8 and State Route 85.
357	**Purpose and Need, Alternatives**	As presented in Chapter 1, *Purpose and Need*, of the Draft Environmental Impact Statement, an objective and unbiased examination of the existing and planned future transportation network in the Study Area was undertaken to determine if the catalyst for the need for the Environmental Impact Statement (being the proposed action) was still warranted. As explained in the chapter, the examination successfully attempted to provide an answer to whether or not a transportation problem(s) exist and would continue to exist in the foreseeable future. The analysis was undertaken in accordance with the National Environmental Policy Act and Federal Highway Administration guidance and policy for implementing the National Environmental Policy Act. The results confirmed the transportation problems as framed in the region's adopted long range transportation plans (both past and present) still exist and would continue to exist in the foreseeable future. This problem is associated with east-west regional mobility in the southwestern region of the Phoenix metropolitan area. The traffic analysis does evaluate the applicability of alternative modes to meet the needs for regional transportation. Figure 3-14 shows that transit enhancements (such as light rail), roadway enhancements (such as more arterial street lanes), and

(Response 357 continues on next page)

Perhaps the original intent of the SMF truck bypass was to provide a more convenient route for trucks going in and out of the commercial area around 51st Avenue. Such thinking, however, indicates a decided lack of true regional planning. Any form of valid traffic analysis of the entire region immediately shows that in addition to the CANAMEX traffic, other interstate truck traffic would also prefer this "short cut" to the desirable (in terms of clean air) truck bypass route along SR 85. Any traffic solution that brings more truck traffic through the metropolitan area is not a viable solution. So the SMF is not a viable solution. The truck bypass must stay outside of the metropolitan area.

A valid and extensive analysis of the transportation needs of the South Mountain corridor has not been conducted. Such an analysis would show the true needs of local residents (as opposed to induced needs) as well as a detailed breakdown of truck traffic within and through the entire area, including CANAMEX trucks, pass-through trucks, and trucks with an origin and destination (O&D) of the commercial area near 51st Avenue. Such a valid analysis would show that any true need for regional transportation could be at least partly satisfied by modes other than automobile traffic (such as light rail). There is a need for traffic to be able to get in and out of Laveen without having to compete with trucks on the arterial streets, but this could be satisfied by a highway from Laveen to I-10 West. It is the O&D truck needs that require a freeway, but even these needs could be satisfied by a freeway spur from I-10 West to the commercial area around 51st Avenue. The South Mountain corridor is not a viable location for such truck traffic.

358

To be more specific in terms of the DEIS, ADOT justifies the Purpose and Need (P&N) for the construction of the SMF in Chapter 1. There are many specific difficulties with this "justification."

359

1. The socio-economic data projections presented in the P&N and elsewhere in the DEIS are faulty. The socio-economic data used in the DEIS was developed by MAG using 2005 census data. When the results of the 2010 U.S. Census results became available, it was obvious that MAG's forecast of socio-economic data based on the 2005 special Census were too high by a large margin.
2. Since socio-economic data are the starting point for the MAG Travel Model, the travel-related forecasts presented in the P&N and elsewhere in the DEIS are faulty. Since MAG plans to update the socio-economic projections, why exactly did ADOT release a DEIS before the updates were ready? Because the changes will be extensive, sufficient time must be allowed for a second review of the DEIS prior to the preparation of the FEIS.

360

3. The forecast of vehicle miles of travel lacks credibility because it is contrary to national trends and also because the methodology used for computation is not explained clearly. Figure 1-4 in the Purpose and Need chapter of the DEIS discusses daily vehicle miles of travel (VMT) at one rate while the Regional Transportation Plan (RTP) uses different data. A further consideration is that travel surveys nationally and in the MAG region indicate

3

Code	Issue	Response
357 (cont.)		system management and demand management strategies could address a portion of the system-wide demand; however, even with these improvements, the proposed freeway would still be a greatly needed element of the overall transportation system. The Maricopa Association of Governments approved new population, employment, housing, and traffic projections in June 2013. The new data are presented in the Final Environmental Impact Statement beginning on page 1-11. The purpose and need and analysis of alternatives were updated and reevaluated using these new socioeconomic projections and corresponding projections related to regional traffic. While new projections based on the 2010 Census showed a lower anticipated population and vehicle miles traveled in 2035 than the previous projections, the conclusions reached in the Draft Environmental Impact Statement were validated in the Final Environmental Impact Statement (see Chapter 3, *Alternatives*). The traffic analysis demonstrated that the proposed project is needed today and will continue to be needed into the future. According to 23 Code of Federal Regulations §771.111(f)," the action evaluated in the environmental impact statement must connect logical termini and be of sufficient length to address environmental matters on a broad scope…". The proposed action should satisfy the project need and should be considered in the context of the local area socioeconomics and topography, the future travel demand, and other infrastructure improvements in the area. A partial freeway from Interstate 10 (Papago Freeway) to Laveen Village is not feasible because it would not meet the proposed freeway's identified purpose and need. For a true understanding of origins and destinations of all vehicles, including trucks, that would use the freeway, please refer to Figure 3-18, on Draft Environmental Impact Statement page 3-36. The reader is referred to page 3-64 of the Draft Environmental Impact Statement that elaborates on the relation of truck traffic and the proposed action.
358		See responses to specific comments below.
359	**Purpose and Need**	The analyses in the Draft Environmental Impact Statement used socioeconomic and traffic projections at the regional analysis zone and traffic analysis zone levels. At the time of publication of the Draft Environmental Impact Statement, Census 2010-based socioeconomic data at the regional analysis zone and traffic analysis zone levels had not been adopted by the Maricopa Association of Governments and were not available to the project team. Therefore, the data used in the Draft Environmental Impact Statement were the most appropriate information available. The Maricopa Association of Governments approved new population, employment, housing, and traffic projections in June 2013. The new data are presented in the Final Environmental Impact Statement beginning on page 1-11. The purpose and need and analysis of alternatives were updated and reevaluated using these new socioeconomic projections and corresponding projections related to regional traffic. While new projections based on the 2010 Census showed a lower anticipated population and vehicle miles traveled in 2035 than the previous projections, the conclusions reached in the Draft Environmental Impact Statement were validated in the Final Environmental Impact Statement (see Chapter 3, *Alternatives*). The traffic analysis demonstrated that the proposed project is needed today and will continue to be needed into the future.
360	**Purpose and Need**	The comment relies on national trends for travel; however, the local conditions and setting of the Phoenix metropolitan area are not consistent with areas of high-density cities in other parts of the country. In Maricopa County, daily vehicle miles

(Response 360 continues on next page)

Code	Comment Document
361	that travel statistics such as trip length, VMT per person, and VMT per household have been steady over time in recent years, contradicting both the DEIS and the RTP. 4. As presented in the DEIS, the P&N defines the need as "completing the Regional Freeway System," "adding capacity to the regional freeway and arterial system," and "serving travel needs in the Southwest area." No compelling need specifically for the SMF is presented. The P&N statement in the DEIS is very general and is focused on the need to add freeway capacity but not focused on building the SMF. The problems identified that lead to the proposed action (not direct quotes) are: a. Accommodating population and employment growth in the Phoenix Metropolitan Area. b. Completing the Regional Freeway and Highway System, that was delineated about 30 years ago. c. Providing additional freeway capacity to reduce congestion in the Urban Core. d. Serving travel needs in the Southwest portion of the Metropolitan Area. The P&N in the DEIS did not address the compelling problems and needs in the Study Area that the SMF would be intended to alleviate. Specific evaluation criteria should have been developed to assess the effectiveness of each alternative to alleviate, wholly or partially, each of the problems in the Study Area. This lack of specificity in the P&N affects the identification of alternatives and the evaluation of alternatives.
362	5. Some reasonable and feasible alternatives were eliminated early in the screening process. There is no technical or scientific rationale or justification presented as to why the project Study Area comprises the precise area it does. The impression is that these boundaries were drawn for political and procedural reasons to comport with MAG's and ADOT's previous planning efforts, rather than to allow a comprehensive, objective NEPA assessment. Specifically, this Study Area appears configured so as to exclude freeway alternatives further south or west and, thus, to deliberately avoid evaluation of other "reasonable alternatives" to the Pecos Road alignment. Although outside of MAG jurisdiction, alternatives in Pinal and Pima Counties should have been given due consideration. The DEIS was not properly scoped. 6. The Description of the Proposed Action in the Summary Chapter fails to provide details essential for informed decision-making. The action is described generally as building a freeway in compliance with the RTP. 7. Since the evaluation of alternatives is based on the travel forecasts (among other considerations), the evaluations are faulty. As stated in Item 2 above, the travel forecasts, in turn, are faulty because they are based on faulty socio-economic forecasts. 8. Some potential impacts, including impacts on the arterial street system adjoining proposed interchanges, construction impacts, and the impacts of

Code	Issue	Response
360 (cont.)		traveled levels increased by almost 2 percent between 2011 and 2012, and the 2012 daily vehicle miles traveled approached the 2007 prerecession peak. (*Source*: the Arizona Department of Transportation's Multimodal Planning Division's Highway Performance Monitoring System Data for calendar years 2012 and 2011). Even if the trend of vehicle miles traveled "per capita" decreasing were to continue, the total vehicle miles traveled in the region would still increase along with increases in total population.
361	**Purpose and Need**	Analysis of the purpose and need for the proposed action followed National Environmental Policy Act and Federal Highway Administration implementing guidance on the subject matter and used state-of-the-practice analytical tools, as pointed out in Table 1-3, "Traffic Analysis Tools," on page 1-13 of the Draft Environmental Impact Statement. The results of the analysis determined that a transportation problem does exist and that problem will continue in the foreseeable future (see section, *Conclusions*, on page 1-21). As noted on page 3-1 in the section, *Reconfirm the Purpose and Need for the Proposed Action*, a continuous validation process was undertaken throughout the environmental impact statement process to ensure past conclusions in the environmental impact statement process remained valid. The Draft Environmental Impact Statement—particularly in Chapter 1, *Purpose and Need*, and Chapter 3, *Alternatives*—thoroughly explains how the process of establishing a purpose and need for the proposed action followed nationally accepted guidance and policy. Examples of how the purpose and need analyses were appropriately applied include the: · section, *Context of Purpose and Need in the EIS Process*, on page 1-1 · sidebar, "*A proposed action's purpose and documentation should:*", on page 1-1 · sidebar, "*How are MAG data used in the DEIS?*", on page 1-4 · sidebar, "*What is the MAG regional demand model?*", on page 1-5 · sidebar, "*How will the economic downturn affect growth rates?*", on page 1-11 · section, *Need Based on Regional Transportation Demand and Existing and Projected Transportation System Capacity Deficiencies*, beginning on page 1-13 · section, *Conclusions*, on page 1-21 · section, *Reconfirm the Purpose and Need for the Proposed Action*, on page 3-1 · section, *Responsiveness of the Proposed Freeway to Purpose and Need Criteria*, beginning on page 3-27 Figure 1-8, "Average Daily Traffic Volumes on Freeways and Arterial Streets (without the Proposed Action, 2010 and 2035," illustrates the demands placed on the transportation network in the region. Figure 1-12, "Met and Unmet Demand, 2010 and 2035," summarizes demand and capacity deficiencies associated with the identified transportation problem. The reader is referred to Draft Environmental Impact Statement Chapter 3, *Alternatives*, and, specifically, the section, *Alternatives Development and Screening Process Conclusions*, beginning on page 3-26, noting "... a comprehensive set of alternatives including all modes was considered ... assurance that the screening process was an open process ... a logical, sequential, step-by-step process using data and expertise from multiple disciplines ..." to demonstrate all possibilities were considered.
362	**Purpose and Need**	The parameters for delineation of the Study Area are described in Chapter 1, *Purpose and Need*, as the area defining the transportation problem. As presented in the chapter, transportation models were used to determine where the characteristics of the transportation problem would diminish, and, generally, it is

(Response 362 continues on next page)

Code	Comment Document

that travel statistics such as trip length, VMT per person, and VMT per household have been steady over time in recent years, contradicting both the DEIS and the RTP.

4. As presented in the DEIS, the P&N defines the need as "completing the Regional Freeway System," "adding capacity to the regional freeway and arterial system," and "serving travel needs in the Southwest area." No compelling need specifically for the SMF is presented. The P&N statement in the DEIS is very general and is focused on the need to add freeway capacity but not focused on building the SMF. The problems identified that lead to the proposed action (not direct quotes) are:

    a. Accommodating population and employment growth in the Phoenix Metropolitan Area.
    b. Completing the Regional Freeway and Highway System, that was delineated about 30 years ago.
    c. Providing additional freeway capacity to reduce congestion in the Urban Core.
    d. Serving travel needs in the Southwest portion of the Metropolitan Area.

    The P&N in the DEIS did not address the compelling problems and needs in the Study Area that the SMF would be intended to alleviate. Specific evaluation criteria should have been developed to assess the effectiveness of each alternative to alleviate, wholly or partially, each of the problems in the Study Area. This lack of specificity in the P&N affects the identification of alternatives and the evaluation of alternatives.

5. Some reasonable and feasible alternatives were eliminated early in the screening process. There is no technical or scientific rationale or justification presented as to why the project Study Area comprises the precise area it does. The impression is that these boundaries were drawn for political and procedural reasons to comport with MAG's and ADOT's previous planning efforts, rather than to allow a comprehensive, objective NEPA assessment. Specifically, this Study Area appears configured so as to exclude freeway alternatives further south or west and, thus, to deliberately avoid evaluation of other "reasonable alternatives" to the Pecos Road alignment. Although outside of MAG jurisdiction, alternatives in Pinal and Pima Counties should have been given due consideration. The DEIS was not properly scoped.
6. The Description of the Proposed Action in the Summary Chapter fails to provide details essential for informed decision-making. The action is described generally as building a freeway in compliance with the RTP.
7. Since the evaluation of alternatives is based on the travel forecasts (among other considerations), the evaluations are faulty. As stated in Item 2 above, the travel forecasts, in turn, are faulty because they are based on faulty socio-economic forecasts.
8. Some potential impacts, including impacts on the arterial street system adjoining proposed interchanges, construction impacts, and the impacts of

363

364

365

Code	Issue	Response
362 (cont.)		at these locations where the definition of the Study Area took shape. This effort was coordinated with stakeholder agencies, including the U.S. Environmental Protection Agency. Alternatives considered in the Draft Environmental Impact Statement included many that were located outside of the Study Area. Examples include the Riggs Road Alternative (see page 3-9), the State Route 85/Interstate 8 Alternative (see page 3-9), the U.S. Route 60 Extension (see page 3-12), the Interstate 10 Spur (see page 3-12), and the Central Avenue Tunnel (see page 3-12).
363	**Purpose and Need**	As pointed out on page S-1, in the sidebar, "*What you will find in the Summary chapter,*" the text in the Summary is not the "final word," and readers are urged to turn to the main text when questions about Summary content arise. While proposed action is summarily defined on page 1-1 of the Draft Environmental Impact Statement as the "construction and operation of a major transportation facility," design specifics for each action alternative are found in text beginning on page 3-40 of the Final Environmental Impact Statement. Sufficient detail is provided to: ensure meaningful comparison and analyses of the alternatives in reference to operational characteristics, cost, and impacts; and to convey to sufficient information to reviewers of the characteristics of each alternative in accordance with 23 Code of Federal Regulations 771 Environmental Impact and Related Procedures or in the Federal Highway Administration Technical Advisory T 6640.8A Guidance for Preparing and Processing Environmental and Section 4(f) Documents. It is clear, as pointed out in Chapter 3, *Alternatives*, that a beneficial outcome of the alternatives screening process—a "... logical, sequential, step-by-step process using data and expertise from multiple disciplines ... (page 3-27)"—was that the mode determined to be appropriate for addressing the identified transportation problem was a highway that, in turn, was consistent with local and regional plans (as supported by stakeholder jurisdictions). But nowhere in the Draft Environmental Impact Statement is reference made that the proposed action is needed to comply with the *Regional Transportation Plan*. The analysis of the proposed action's purpose and need would have ended the environmental impact statement process at that point if a need in the form of a transportation problem had not been identified, and this is disclosed in the Draft Environmental Impact Statement.
364	**Purpose and Need**	The analyses in the Draft Environmental Impact Statement used socioeconomic and traffic projections at the regional analysis zone and traffic analysis zone levels. At the time of publication of the Draft Environmental Impact Statement, Census 2010-based socioeconomic data at the regional analysis zone and traffic analysis zone levels had not been adopted by the Maricopa Association of Governments and were not available to the project team. Therefore, the data used in the Draft Environmental Impact Statement were the most appropriate information available. The Maricopa Association of Governments approved new population, employment, housing, and traffic projections in June 2013. The new data are presented in the Final Environmental Impact Statement beginning on page 1-11. The purpose and need and analysis of alternatives were updated and reevaluated using these new socioeconomic projections and corresponding projections related to regional traffic. While new projections based on the 2010 Census showed a lower anticipated population and vehicle miles traveled in 2035 than the previous projections, the conclusions reached in the Draft Environmental Impact Statement were validated in the Final Environmental Impact Statement (see Chapter 3, *Alternatives*). The traffic analysis demonstrated that the proposed project is needed today and will continue to be needed into the future.

truck traffic are not addressed at all or are not addressed in detail sufficient for a DEIS for an Action Alternative (as opposed to a programmatic action such as the adoption of the RTP).

366 **9.** None of the Action Alternatives would alleviate the anticipated capacity deficiencies identified in the P&N. Despite the expenditure of about $3 billion to build the SMF and despite the displacement of many residences and business establishments, there would be capacity deficiencies at levels comparable to the No Action Alternative on freeways and arterials throughout the metropolitan area and on the SMF itself. While the levels of congestion may be slightly less, Level of Service E and F conditions would prevail at approximately the same levels and durations in 2035 with or without an Action Alternative.

367 **10.** Appropriate mitigation measures were not proposed to mitigate the impacts of the Action Alternatives. Assuming for discussion purposes that the Preliminarily Preferred Action Alternative is implemented, appropriate mitigation measures should have been in the EIS. Some appropriate mitigation measures would have included:

- Placement of truck weight limits on the SMF
- Restricting trucks carrying hazardous materials (hazmats) from using the SMF
- Upgrading the currently-designated CANAMEX Route via I-10/I-8/SR-85/I-10 to full freeway standards
- Development of an east-west truck route to by-pass the Phoenix metropolitan area
- Formulation and inclusion in the RTP of a plan for arterials in the Southwest area to help guide development patterns so that desirable options are not precluded

11. Based on these traffic and circulation considerations, none of the Action Alternatives should be selected as the Preliminarily Preferred Alternative.

A specific NEPA violation we found in the DEIS is that the route for the SMF has been predetermined practically since its inception. Even in the 1985 Maricopa Elections materials the "Southwest Loop" is shown with the Pecos Road and 59th Avenue alignments east and west. Since that time millions of dollars have been spent purchasing right-of-way along these alignments, yet nothing has been spent on any other alternative alignments, including the Loop 101 alignment recommended by the SMCAT (and rejected by MAG) and the 71st Avenue alignment. Both of these western alternatives are supposedly still being considered, but it is clear that they are not really considered alternatives.

Additionally, in 1998, the tribal government of the Gila River Indian Community (GRIC) approved a route for the SMF along Riggs Road on tribal land when it adopted the Gila Borderlands Regional Planning Study (Arizona Republic, *1998 plan*

Code	Issue	Response
365	**Traffic**	The proposed freeway would include improvements along arterial streets at interchange locations to facilitate the movement of traffic on, off, and across the freeway. The arterial street improvements are included within the right-of-way footprint used for the analysis of impacts.
366	**Traffic**	The traffic operational characteristics comparison between the action and No-Action alternatives is presented beginning on page 3-27 of the Final Environmental Impact Statement. The analysis shows that the action alternatives would: · reduce overall traffic on the arterial street system (see Figures 3-12 and 3-13) · optimize travel on the region's freeway system (see Figure 3-12) · reduce the capacity deficiency to levels better than experienced today (see Figures 1-12 and 3-14) · reduce the duration of level of service E or F conditions in key areas of the region's freeway system (see Figure 3-15) · improve travel times on trips within the Study Area and across the region (see Figure 3-17 and Table 3-8) · provide improved regional mobility for areas projected to experience growth in the next 25 years (see Figures 1-7 and 3-18) When all of this is considered in the realm of travel time savings for motorists in the region, the user benefits approximate $200 million per year (see Table 4-26).
367	**Hazardous Materials**	The obligation of the Arizona Department of Transportation and Federal Highway Administration, as the federal lead agency, in accordance with the National Environmental Policy Act is to assess if the proposed action and its alternatives would lead to significant adverse environmental impacts, disclose those impacts and identify mitigation to reduce the impact below a level of significance (and if such mitigation is unavailable, disclose that such an impact would occur but not be mitigated). Sufficient mitigation under these terms is presented throughout Chapters 3, 4 and 5 of the Draft Environmental Impact Statement. In terms of suggested mitigation examples in the comment, consider: · As it relates to transport of hazardous materials, Arizona highways, as are most highways across the United States, are open to all kinds of traffic, so long as the cargo being carried is in accordance with U.S. Department of Transportation regulations for the specific type of cargo. The South Mountain Freeway, if implemented, is expected to operate under the same rules as other similar facilities in the state; truck traffic would be expected to be permissible (see text box on page 4-157 of the Final Environmental Impact Statement). · Improvements to State Route 85 are included in the *Regional Transportation Plan*, and the plan is to continue to improve this corridor until it is completely access-controlled with a freeway section north of the Gila River. · The *Regional Transportation Plan* is not the primary source of funding for expansion of the arterial street system. Funding for the arterial street system generally comes from the local jurisdiction or through impact fees for development. It is anticipated that the arterial street network within the Study Area will be expanded in this same manner. The Maricopa Association of Governments regional travel demand model includes assumptions related to arterial street expansion based on local jurisdictions' general planning. In the case of the Study Area, it is assumed that most of the arterial street network would be built out by 2035.

truck traffic are not addressed at all or are not addressed in detail sufficient for a DEIS for an Action Alternative (as opposed to a programmatic action such as the adoption of the RTP).

9. None of the Action Alternatives would alleviate the anticipated capacity deficiencies identified in the P&N. Despite the expenditure of about $3 billion to build the SMF and despite the displacement of many residences and business establishments, there would be capacity deficiencies at levels comparable to the No Action Alternative on freeways and arterials throughout the metropolitan area and on the SMF itself. While the levels of congestion may be slightly less, Level of Service E and F conditions would prevail at approximately the same levels and durations in 2035 with or without an Action Alternative.
10. Appropriate mitigation measures were not proposed to mitigate the impacts of the Action Alternatives. Code	Issue	Response
368	**Alternatives**	The Arizona Department of Transportation, with concurrence from the Federal Highway Administration, has determined that the proposed freeway (as made up by the W59 and E1 Alternatives) is the preferred solution to the transportation problem identified in the Draft Environmental Impact Statement. However, all alternatives discussed in the Draft and Final Environmental Impact Statement, including the No-Action Alternative, are still under consideration. The selection of an alternative will be made in a record of decision issued by the Federal Highway Administration for the proposed project. All of the alternatives were subjected to a thorough evaluation using a multidisciplinary set of criteria in accordance with National Environmental Policy Act and federal Highway Administration guidance.
369	**Alternatives**	The comment suggests the environmental impact statement process was biased by a history of property acquisitions within the Study Area. More specifically, properties falling within the limits of the Preferred Alternative, as identified in the Final Environmental Impact Statement, were targeted for acquisition. As noted in text on page 3-54 of the Final Environmental Impact Statement, the Arizona Department of Transportation began acquiring land for the original alignment in 1988. Between 1988 and 2001, the Arizona Department of Transportation acquired approximately 293 acres. Most of this land (258 acres) is located in the Eastern Section along Pecos Road. In 2006, the Arizona Department of Transportation began protective and hardship land acquisition in the alignment right-of-way footprint for the W59 and E1 Alternatives. Between 2006 and October 2013, the Arizona Department of Transportation purchased 326 acres (303 in the Western Section and 23 in the Eastern Section). The process for hardship and advanced acquisitions is explained in text on page 4-50 of the Final Environmental Impact Statement. The comment infers that by taking such action, the objective equal consideration of the alternatives studied in detail in the Draft and Final Environmental Impact Statements is tainted. Advanced acquisitions in parallel to a National Environmental Policy Act environmental determination process is not unprecedented and is common practice. In this case, property acquisitions by the Arizona Department of Transportation for purposes of implementing the proposed action are done at risk as communicated to the agency by the Federal Highway Administration. If another action alternative were to be ultimately selected, the agency would likely have to place the acquired properties on the market for sale and purchase. The Arizona Department of Transportation attempts to balance the risk against its mission of timely delivery of transportation infrastructure to the driving public. Further, Federal Highway Administration regulations do not allow the ownership of right-of-way to be a factor in the decision regarding the selection of an alternative. While the South Mountain Citizens Advisory Team recommended the W101 Alternative, all stakeholders' input was accounted for—including regional leaders, municipalities, members of the public, and members of the South Mountain Citizens Advisory Team—before identifying the W59 Alternative as the Preferred Alternative (see Draft Environmental Impact Statement pages 3-65 and 3-68). Both Riggs Road and Queen Creek Road Alternatives were considered (see Figure 3-5 on page 3-7 of the Final Environmental Impact Statement). While these alternatives might serve regional mobility needs, particularly of those living in the Maricopa area, meeting this travel demand would not address specific planning goals for an

370	*for South Mountain Freeway passed over*, March 25, 2013). Three years later, the state moved on with its SMF plan, without considering the GRIC plan. At another time, the GRIC proposed a Queen Creek Road alignment (Arizona Republic, *Tribe Against South Mountain Freeway on land – for now*, January 20, 2010). This proposal was also rejected by ADOT. Throughout the DEIS, and throughout the time leading up to the publication of the DEIS, the inappropriate restrictions on the scoping of the study precluded the consideration of viable alternatives to the SMF. With the apparent need for a freeway that could handle considerable truck traffic, including hazmats, the natural consideration would have been the route that is currently the "Phoenix truck bypass" – SR-85 from I-10 at Buckeye to I-8 at Gila Bend to I-10 at Casa Grande. This route could become the I-10 and provide a bypass for all pass-through traffic, including the CANAMEX traffic. With appropriate access provided from the commercial area around 51st Avenue, it could also provide a main route for O&D traffic. It should at least be considered as an alternative. The planned route for I-11, looping southwest from I-10 west of downtown Phoenix, through Rainbow Valley, then rejoining I-10 near Casa Grande, should also be a considered alternative. It could accommodate all the truck traffic bypassing Phoenix with a shorter route than the current truck bypass. If the primary reason for wanting the SMF is to accommodate O&D truck traffic (although this is not stated in the DEIS, it is easy to come to this conclusion from what is stated), another alternative that should be considered is to create a freeway spur from I-10 West and/or from the real truck bypass into the commercial area around 51st Avenue. The point is that viable alternatives to the SMF exist, but the SMF is not a viable alternative itself. No amount of attempting to exclude alternatives through inappropriate scoping will make the SMF viable. If the need exists for accommodating truck traffic, several alternatives are available for consideration. ADOT should start over, state the real P&N, and produce a reasonable DEIS. This DEIS is fatally flawed, at least in part because the true P&N are disguised to try to force a non-viable solution. **Air Quality** The modeling of air pollution impacts in the DEIS do not include the issues involved with truck traffic. There are 3 specific "classes" of truck traffic that should have been considered: 1. Pass-through traffic that now uses the official truck bypass 2. CANAMEX traffic 3. Origination and Destination (O&D) traffic to/from the commercial area around 51st Avenue Many years ago, the idea of a truck bypass came up because there were chronic issues about air quality in the Phoenix metro area. The air quality was so bad and for

Code	Issue	Response
369 (cont.)		integrated regional transportation network. The *Regional Transportation Plan* identifies the proposed South Mountain Freeway as a critical link in the Regional Freeway and Highway System. These alternatives would not complete the Phoenix metropolitan area's loop system as part of State Route 202L, thereby causing substantial out-of-direction travel for motorists. Therefore, the Riggs Road and Queen Creek Road Alternatives would not meet the project's purpose and need criteria and were eliminated from further study.
370	**Trucks**	The environmental impact statement process was undertaken in accordance with National Environmental Policy Act and related legislation. As explained throughout these responses, Chapter 1, *Purpose and Need*, of the Draft Environmental Impact Statement does not have a truck bypass as a goal of the proposed action. These comments continuously and erroneously suggest that the only purpose of the proposed action is to serve truck traffic; however, none of the traffic analysis presented in the Draft and Final Environmental Impact Statements or elsewhere supports this contention. The proposed freeway is part of a transportation system developed to improve mobility in the region by increasing capacity and allowing traffic—including truck traffic—to access a segment of the "loop" system (see pages 1-21, 1-22, 3-1, and 3-3 of the Final Environmental Impact Statement) in the Phoenix metropolitan area. The proposed South Mountain Freeway would be a commuter corridor, helping to move local traffic. As with all other freeways in the region, trucks would use it for the through-transport of freight, for transport to and from distribution centers, and for transport to support local commerce. The Maricopa Association of Governments travel demand model projects trucks will represent approximately 10 percent of the total traffic on the proposed freeway (this would equate to approximately 15,000 trucks per day based on an average total daily volume of 150,000 vehicles). See Figure 3-18, on page 3-36 of the Draft Environmental Impact Statement, for information related to use of the freeway. Other existing facilities (such as State Route 85 and Interstate 8) and future facilities (such as Interstate 11) serve a specific purpose of providing a truck route. These facilities would not address the need identified for the proposed action. Therefore, they are not appropriate responses and were eliminated from consideration. The signed truck bypass for the Phoenix metropolitan area is today and will continue to be State Route 85 and Interstate 8. The Maricopa Association of Governments regional travel demand model projects that truck traffic will represent approximately 10 percent of the total traffic on the proposed action. The reader is referred to page 3-64 of the Draft Environmental Impact Statement that elaborates on the relation of truck traffic and the proposed action. According to 23 Code of Federal Regulations §771.111(f)," the action evaluated in the environmental impact statement must connect logical termini and be of sufficient length to address environmental matters on a broad scope...". The proposed action should satisfy the project need and should be considered in the context of the local area socioeconomics and topography, the future travel demand, and other infrastructure improvements in the area. A partial freeway from Interstate 10 (Papago Freeway) to Laveen Village is not feasible because it would not meet the proposed freeway's identified purpose and need.

The planned route for I-11, looping southwest from I-10 west of downtown Phoenix, through Rainbow Valley, then rejoining I-10 near Casa Grande, should also be a considered alternative. It could accommodate all the truck traffic bypassing Phoenix with a shorter route than the current truck bypass. If the primary reason for wanting the SMF is to accommodate O&D truck traffic (although this is not stated in the DEIS, it is easy to come to this conclusion from what is stated), another alternative that should be considered is to create a freeway spur from I-10 West and/or from the real truck bypass into the commercial area around 51st Avenue.

371 The point is that viable alternatives to the SMF exist, but the SMF is not a viable alternative itself. No amount of attempting to exclude alternatives through inappropriate scoping will make the SMF viable. If the need exists for accommodating truck traffic, several alternatives are available for consideration. ADOT should start over, state the real P&N, and produce a reasonable DEIS. This DEIS is fatally flawed, at least in part because the true P&N are disguised to try to force a non-viable solution.

372 **Air Quality**

The modeling of air pollution impacts in the DEIS do not include the issues involved with truck traffic. There are 3 specific "classes" of truck traffic that should have been considered:

1. Pass-through traffic that now uses the official truck bypass
2. CANAMEX traffic
3. Origination and Destination (O&D) traffic to/from the commercial area around 51st Avenue

Many years ago, the idea of a truck bypass came up because there were chronic issues about air quality in the Phoenix metro area. The air quality was so bad and for

Code	Issue	Response
370 (cont.)		For a true understanding of origins and destinations of all vehicles, including trucks, that would use the proposed freeway, please refer to Figure 3-18 on page 3-36 of the Draft Environmental Impact Statement. Public and agency scoping is discussed in Chapter 6 of the Draft Environmental Impact Statement. As discussed in Chapter 6, these scoping efforts were extensive.
371	**Purpose and Need**	The Draft Environmental Impact Statement and the environmental impact statement process it documents represent a robust, comprehensive, objective, defensible implementation of National Environmental Policy Act guidance, intent, and spirit. The Draft Environmental Impact Statement—particularly in Chapter 1, *Purpose and Need*, and Chapter 3—*Alternatives*, thoroughly explains how the process of establishing a purpose and need for the proposed action followed nationally accepted guidance and policy. Examples of how the purpose and need analyses were appropriately applied include the: · section, *Context of Purpose and Need in the EIS Process*, on page 1-1 · sidebar, "*A proposed action's purpose and documentation should:*", on page 1-1 · sidebar, "*How are MAG data used in the DEIS?*", on page 1-4 · sidebar, "*What is the MAG regional demand model?*", on page 1-5 · sidebar, "*How will the economic downturn affect growth rates?*", on page 1-11 · section, *Need Based on Regional Transportation Demand and Existing and Projected Transportation System Capacity Deficiencies*, beginning on page 1-13 · section, *Conclusions*, on page 1-21 · section, *Reconfirm the Purpose and Need for the Proposed Action*, on page 3-1 · section, *Responsiveness of the Proposed Freeway to Purpose and Need Criteria*, beginning on page 3-27 In short, assessment of the purpose and need for the proposed action and consideration of alternatives were undertaken in an objective, defensible manner in accordance with National Environmental Policy Act guidance and intent; past South Mountain Freeway-related determinations were accounted for as only criteria in a multitiered, multidisciplinary screening process (see the sections, *Conclusions*, on pages 1-21 and 3-70. Table 3-9, "Implementation of the Proposed Freeway as the Appropriate Modal Alternative to Satisfy Purpose and need Criteria, 2035," further presents information supporting the conclusion. No mention is made of the purpose and need of the proposed action being to serve as a truck bypass. Information pertaining to truck routes in the region is presented on page 3-64 of the Draft Environmental Impact Statement, in the text box, "*Trucking in the MAG Region*." The Maricopa Association of Governments approved new population, employment, housing, and traffic projections in June 2013. The new data are presented in the Final Environmental Impact Statement beginning on page 1-11. The purpose and need and analysis of alternatives were updated and reevaluated using these new socioeconomic projections and corresponding projections related to regional traffic. While new projections based on the 2010 Census showed a lower anticipated population and vehicle miles traveled in 2035 than the previous projections, the conclusions reached in the Draft Environmental Impact Statement were validated in the Final Environmental Impact Statement (see Chapter 3, *Alternatives*). The traffic analysis demonstrated that the proposed project is needed today and will continue to be needed into the future.

for South Mountain Freeway passed over, March 25, 2013). Three years later, the state moved on with its SMF plan, without considering the GRIC plan. At another time, the GRIC proposed a Queen Creek Road alignment (Arizona Republic, *Tribe Against South Mountain Freeway on land – for now*, January 20, 2010). This proposal was also rejected by ADOT.

Throughout the DEIS, and throughout the time leading up to the publication of the DEIS, the inappropriate restrictions on the scoping of the study precluded the consideration of viable alternatives to the SMF. With the apparent need for a freeway that could handle considerable truck traffic, including hazmats, the natural consideration would have been the route that is currently the "Phoenix truck bypass" – SR-85 from I-10 at Buckeye to I-8 at Gila Bend to I-10 at Casa Grande. This route could become the I-10 and provide a bypass for all pass-through traffic, including the CANAMEX traffic. With appropriate access provided from the commercial area around 51st Avenue, it could also provide a main route for O&D traffic. It should at least be considered as an alternative. The planned route for I-11, looping southwest from I-10 west of downtown Phoenix, through Rainbow Valley, then rejoining I-10 near Casa Grande, should also be a considered alternative. It could accommodate all the truck traffic bypassing Phoenix with a shorter route than the current truck bypass. If the primary reason for wanting the SMF is to accommodate O&D truck traffic (although this is not stated in the DEIS, it is easy to come to this conclusion from what is stated), another alternative that should be considered is to create a freeway spur from I-10 West and/or from the real truck bypass into the commercial area around 51st Avenue.

The point is that viable alternatives to the SMF exist, but the SMF is not a viable alternative itself. No amount of attempting to exclude alternatives through inappropriate scoping will make the SMF viable. If the need exists for accommodating truck traffic, several alternatives are available for consideration. ADOT should start over, state the real P&N, and produce a reasonable DEIS. This DEIS is fatally flawed, at least in part because the true P&N are disguised to try to force a non-viable solution.

Air Quality

The modeling of air pollution impacts in the DEIS do not include the issues involved with truck traffic. There are 3 specific "classes" of truck traffic that should have been considered:

1. Pass-through traffic that now uses the official truck bypass
2. CANAMEX traffic
3. Origination and Destination (O&D) traffic to/from the commercial area around 51st Avenue

373 Many years ago, the idea of a truck bypass came up because there were chronic issues about air quality in the Phoenix metro area. The air quality was so bad and for

Code	Issue	Response
372	**Air Quality**	The air quality assessment for impacts from carbon monoxide followed the U.S. Environmental Protection Agency guidelines in *Guideline for Modeling Carbon Monoxide from Roadway Intersections* (A-OAQPS, 1992). Inputs to the model were based on U.S. Environmental Protection Agency-recommended values or were selected to provide a conservative estimate of impacts. Modeling methodology and results were reviewed by the Federal Highway Administration, Arizona Department of Transportation, and Maricopa Association of Governments. The proposed freeway is part of a transportation system developed to improve mobility in the region by increasing capacity and allowing traffic—including truck traffic—to access a segment of the "loop" system (see pages 1-21, 1-22, 3-1, and 3-3 of the Final Environmental Impact Statement) in the Phoenix metropolitan area. The proposed South Mountain Freeway would be a commuter corridor, helping to move local traffic. As with all other freeways in the region, trucks would use it for the through-transport of freight, for transport to and from distribution centers, and for transport to support local commerce. The Maricopa Association of Governments travel demand model projects trucks will represent approximately 10 percent of the total traffic on the proposed freeway (this would equate to approximately 15,000 trucks per day based on an average total daily volume of 150,000 vehicles). See Figure 3-18, on page 3-36 of the Draft Environmental Impact Statement, for information related to use of the freeway. The air quality analyses considered the full vehicle fleet, including diesel trucks, as discussed above (see Final Environmental Impact Statement page 4-68).
373	**Trucks**	The 1995 Congressional federal definition states: "In the State of Arizona, the CANAMEX Corridor shall generally follow – (i) I-19 from Nogales to Tucson; (ii) I-10 from Tucson to Phoenix; and (iii) United States Route 60 in the vicinity of Phoenix to the Nevada Border." (Source: <canamex.org/canamex/federal-definition>) The definition was intentionally left broad so that local, regional, and state agencies could further define the specific routes for the corridor. In April 2001, the Maricopa Association of Governments Regional Council formally adopted the route depicted in the map on page 3-64 as the CANAMEX Corridor within Maricopa County. As noted on page 3-64 of the Draft Environmental Impact Statement, in the Maricopa County area the CANAMEX Corridor is to follow Interstate 10 from Tucson to Interstate 8 near Casa Grande, Interstate 8 west to State Route 85 near Gila Bend, State Route 85 north to Interstate 10 northwest of Buckeye, Interstate 10 west to Wickenburg Road, Wickenburg Road to Vulture Mine Road west of Wickenburg, and then connect with the planned U.S. Route 93/U.S. Route 60 Wickenburg Bypass.

Code	Comment Document
	so long that public policy makers suggested designating a bypass for truck traffic around the urban core as one of the strategies to reduce particulate matter from truck exhaust in urban Maricopa County. The designated truck bypass is from I-10 at Buckeye to I-8 at Gila Bend to I-10 at Casa Grande. ADOT says this bypass is also the designated route of the CANAMEX Highway, although the CANAMEX web site contradicts this assertion, saying I-10 is the designated CANAMEX route. If the SMF were built, the bypass route, which has few amenities, would be a substantially longer route, about 55-60 miles longer than the route using the SMF. There is no law that would force trucks to use the longer route, so it is entirely likely that most of these trucks would come through Phoenix, negating the whole bypass strategy, and negating a public policy decision. But the reversal of this public policy decision is never mentioned in the DEIS.
374	The DEIS does not consider the additional air pollution from truck traffic from Mexico. The DEIS briefly mentions the issue, but it claims it has no way to know what impact this would be. This is not true. We know exactly the number of trucks arriving from Mexico and their destinations in the US, so this is data that is available for the DEIS. It is also absurd to dismiss this issue by claiming the CANAMEX traffic would use the truck bypass. Since it is likely that at least most of the CANAMEX traffic would use the SMF, this issue should have been studied.
	Trucks originating in Mexico will be fueled with diesel that doesn't meet the CARB diesel standards adopted by Arizona over a decade ago. In Mexico, there is no regulation about the sulfur in diesel fuel. In Arizona, the law was changed to allow only diesel fuel to be sold that has had 98% of the sulfur removed. This was another part of the strategy to bring Maricopa County into compliance with the particulate matter standards required by the Clean Air Act (CAA). There was extensive modeling of the effect of adopting the CARB diesel standards and a discussion of this in the Arizona legislature, where it passed, so the data is in government hands.
375	The DEIS has no analysis of the current or enhanced increase in freight volume resulting from the port activity in Guyamas and Puerto Colonet and the Union Pacific rail efforts moving that freight from those ports into Tucson and then north to Phoenix. Also there is the expectation of a new Union Pacific rail yard at Picacho Peak, which would handle tens of thousands of containers originating in California and Tucson ports. This additional planned container traffic would result in a significant increase in freight flows to Phoenix, specifically to the hubs along 51st Avenue.
	Chapter 3 describes freight and trucks as pass through, but that is misleading. The freight enters Phoenix and is deposited, then is "exchanged" for loads heading in the opposite direction. So even though 70% of the freight passes through Phoenix, it is O&D traffic that terminates in Phoenix as a transfer point.
	There is also the issue of the 51st Avenue tank farm and the tanker truck traffic that the SMF would get as a result of a new shortcut for these trucks. Expectations for an

Code	Issue	Response
374	**Trucks**	Arizona highways, as are most highways across the United States, are open to all kinds of traffic, so long as the cargo being carried is in accordance with U.S. Department of Transportation regulations for the specific type of cargo. The South Mountain Freeway, if implemented, is expected to operate under the same rules as other similar facilities in the state; truck traffic would be expected to be permissible (see text box on page 4-157 of the Final Environmental Impact Statement). Trucks crossing from Mexico to Arizona are restricted to the commercial zones within 25 miles of the border. The Federal Motor Carrier Safety Administration is administering a United States-Mexico cross-border, long-haul trucking pilot program. The program tests and demonstrates the ability of Mexico-based motor carriers to operate safely in the United States beyond the municipalities and commercial zones along the United States-Mexico border (see <fmcsa.dot.gov/intl-programs/trucking/trucking-program.aspx>). Petróleos Mexicanos (better known as Pemex), the Mexican state-owned petroleum company, has guaranteed 15 parts per million in its sulfur diesel fuel in the border region (see <http://transportpolicy.net/index.php?title=Mexico:_Fuels:_Diesel_and_Gasoline>). As explained on pages 4-69 and 4-77 of the Draft and Final Environmental Impact Statements, respectively, the emissions analysis conducted for the project shows that future mobile source air toxics emissions will be lower than current levels. This analysis included projected truck traffic.
375	**Trucks**	Like other "loop" freeways in the Phoenix metropolitan area, the proposed freeway would be a commuter corridor, helping to move local traffic. As with all other freeways in the region, trucks would use it for the through-transport of freight, for transport to and from distribution centers, and for transport to support local commerce. Nevertheless, the primary vehicles on the proposed freeway would be automobiles. The Maricopa Association of Governments regional travel demand model projects that trucks would represent approximately 10 percent of the total traffic on the proposed action, similar to what is currently experienced on other regional freeways such as Interstate 10, State Route 101L, and U.S. Route 60. The road network in the Maricopa Association of Governments travel demand model includes the Interstate 8 and State Route 85 corridor. So, while the roads are not in the Study Area for the proposed action, traffic and trip distributions along the corridor are included in the traffic analysis for the proposed action. Any traffic, including trucks, that would shift from the Interstate 8 and State Route 85 corridor to the proposed action would be included in the vehicle mix considered in the analysis. The disclosure of the air quality consequences of the proposed action, beginning on page 4-65 of the Draft Environmental Impact Statement, include projected truck traffic in the analysis. The Maricopa Association of Governments approved new population, employment, housing, and traffic projections in June 2013. The new data are presented in the Final Environmental Impact Statement beginning on page 1-11. The air quality analyses were updated using the updated projections related to regional traffic (see section beginning on page 4-68 of the Final Environmental Impact Statement). No substantial differences between the conclusions of the Draft and Final Environmental Impact Statements resulted from this update.

Code	Comment Document

so long that public policy makers suggested designating a bypass for truck traffic around the urban core as one of the strategies to reduce particulate matter from truck exhaust in urban Maricopa County. The designated truck bypass is from I-10 at Buckeye to I-8 at Gila Bend to I-10 at Casa Grande. ADOT says this bypass is also the designated route of the CANAMEX Highway, although the CANAMEX web site contradicts this assertion, saying I-10 is the designated CANAMEX route. If the SMF were built, the bypass route, which has few amenities, would be a substantially longer route, about 55-60 miles longer than the route using the SMF. There is no law that would force trucks to use the longer route, so it is entirely likely that most of these trucks would come through Phoenix, negating the whole bypass strategy, and negating a public policy decision. But the reversal of this public policy decision is never mentioned in the DEIS.

The DEIS does not consider the additional air pollution from truck traffic from Mexico. The DEIS briefly mentions the issue, but it claims it has no way to know what impact this would be. This is not true. We know exactly the number of trucks arriving from Mexico and their destinations in the US, so this is data that is available for the DEIS. It is also absurd to dismiss this issue by claiming the CANAMEX traffic would use the truck bypass. Since it is likely that at least most of the CANAMEX traffic would use the SMF, this issue should have been studied.

Trucks originating in Mexico will be fueled with diesel that doesn't meet the CARB diesel standards adopted by Arizona over a decade ago. In Mexico, there is no regulation about the sulfur in diesel fuel. In Arizona, the law was changed to allow only diesel fuel to be sold that has had 98% of the sulfur removed. This was another part of the strategy to bring Maricopa County into compliance with the particulate matter standards required by the Clean Air Act (CAA). There was extensive modeling of the effect of adopting the CARB diesel standards and a discussion of this in the Arizona legislature, where it passed, so the data is in government hands.

The DEIS has no analysis of the current or enhanced increase in freight volume resulting from the port activity in Guyamas and Puerto Colonet and the Union Pacific rail efforts moving that freight from those ports into Tucson and then north to Phoenix. Also there is the expectation of a new Union Pacific rail yard at Picacho Peak, which would handle tens of thousands of containers originating in California and Tucson ports. This additional planned container traffic would result in a significant increase in freight flows to Phoenix, specifically to the hubs along 51st Avenue.

376

Chapter 3 describes freight and trucks as pass through, but that is misleading. The freight enters Phoenix and is deposited, then is "exchanged" for loads heading in the opposite direction. So even though 70% of the freight passes through Phoenix, it is O&D traffic that terminates in Phoenix as a transfer point.

There is also the issue of the 51st Avenue tank farm and the tanker truck traffic that the SMF would get as a result of a new shortcut for these trucks. Expectations for an

Code	Issue	Response
376	**Purpose and Need**	Some trucks would use the proposed freeway to avoid Interstate 10 through downtown Phoenix, but this is not the primary purpose of the proposed action. The proposed freeway is part of a transportation system developed to improve mobility in the region by increasing capacity and allowing traffic—including truck traffic—to access a segment of the "loop" system (see pages 1-21, 1-22, 3-1, and 3-3 of the Final Environmental Impact Statement) in the Phoenix metropolitan area. The proposed South Mountain Freeway would be a commuter corridor, helping to move local traffic. As with all other freeways in the region, trucks would use it for the through-transport of freight, for transport to and from distribution centers, and for transport to support local commerce. Nevertheless, the primary user vehicles of the proposed freeway would be automobiles. The Maricopa Association of Governments regional travel demand model projects that truck traffic would represent approximately 10 percent of the total traffic on the proposed action, similar to what is currently experienced on other regional freeways such as Interstate 10, State Route 101L, and U.S. Route 60. As disclosed in the Draft Environmental Impact Statement, trucking destinations in the Phoenix metropolitan area would still prompt truck drivers to enter congested areas. Choosing to travel on the proposed freeway versus Interstate 10 would not produce substantial travel-time benefits. Therefore, it is expected that "true" through-truck traffic (not having to stop in the metropolitan area) would continue to use the faster, designated, and posted bypass system of Interstate 8 and State Route 85.

Code	Comment Document
377	increase from the transmix pipeline, which would result in an increase in tanker truck traffic, should have been considered in a truck analysis. If all this additional pollution had been honestly quantified and factored in, it would likely have shown a huge net increase in air pollution from the SMF, and associated increases in asthma, heart disease, premature death, and other adverse health impacts. In 2005, there was an extensive air monitoring of certain toxic chemicals (air toxics) conducted by EPA and ADEQ in a joint effort named the Joint Air Toxics Assessment Program (JATAP). The monitoring sites included a site near St. Johns on the GRIC, and some in west Phoenix and South Phoenix. The JATAP monitoring results were reported in 2006, during a time the data for the DEIS was being gathered, and it found levels of certain toxic chemicals associated with vehicular emissions were above the standard of a one in a million chance of cancer in a lifetime of exposure in the west Phoenix, south Phoenix, and GRIC sites. The JATAP monitoring found in the high end of the monitoring levels, formaldehyde at 34 times this standard; benzene at 8 times this standard, 1,3 butadiene at 7.5 times this standard, and acetaldehyde at 3.4 times this standard. And, remember, citizens are being subjected to all of these carcinogens, not just one. Some of these chemicals are attributed to "mobile sources," or vehicular traffic burning hydrocarbons. Clearly, adding more vehicular traffic emissions by building a freeway where there had not been one would add to this toxic burden. The JATAP results are not included in the DEIS, but instead there is a mention of the uncertainty of the risk from these air toxics standards, which is not true. The cancer risk standards have been promulgated and published by EPA after extensive research and study, and they are well known. The portion of Maricopa County that is characterized as the Phoenix metro area has had problems for decades meeting the air quality standards for particulate matter (PM) and other criteria pollutants. Ozone levels are too high in the East Valley and Fountain Hills, for example. There have been several exceedances of the standards for PM set by EPA under the authorities given the agency by the Clean Air Act (CAA). The problem has been so bad over the years that every possible delay and postponement allowed under the CAA to come up with a plan to meet regulatory levels of particulate matter have now been exhausted. So, currently, EPA is examining sanctions that include blocking a billion dollars in highway funds. The Arizona Department of Environmental Quality (ADEQ) has tried to explain away the several exceedances of the PM standards in the last year or so by blaming it on dust storms and weather-related problems. But these were not all related to weather. Almost every one of these PM exceedances have been detected at the air quality monitor at 43rd Avenue and Broadway Road. The placement of a freeway about a mile upwind from a monitor that has had all these high levels seems foolish and short sighted. And the impacts and risks of this were not examined in the DEIS. Nor 8

Code	Issue	Response
377	**Air Quality, Health Risk Assessment**	The carbon monoxide analysis was updated in the Final Environmental Impact Statement. Although a qualitative analysis of particulate matter (PM_{10}) was presented in the Draft Environmental Impact Statement, a quantitative project-level particulate matter (PM_{10}) hot-spot analysis is included in the Final Environmental Impact Statement. The results of the air quality updates are summarized in the prologue to the Final Environmental Impact Statement (page xiii) and are more fully described beginning on page 4-68 of the Final Environmental Impact Statement. The carbon monoxide and particulate matter (PM_{10}) analyses demonstrated that the proposed freeway would not contribute to any new localized violations, increase the frequency or severity of any existing violation, or delay timely attainment of the National Ambient Air Quality Standards or any required interim emissions reductions or other milestones. The emission modeling developed for the proposed action showed that for the mobile source air toxics study area, there would be little difference in total annual emissions of mobile source air toxics emissions between the Preferred and No-Action Alternatives (less than a 1 percent difference) in 2025 and 2035. With the Preferred Alternative in 2035, modeled mobile source air toxics emissions would decrease by 57 percent to more than 90 percent, depending on the pollutant, despite a 47 percent increase in vehicle miles traveled in the Study Area compared with 2012 conditions (see discussion beginning on page 4-77 of the Final Environmental Impact Statement). **The Role of Health Risk Assessment in a National Environmental Policy Act Context** The Federal Highway Administration's National Environmental Policy Act documents are developed under two guiding regulations: the Council on Environmental Quality's National Environmental Policy Act regulations applicable to all federal agencies (40 Code of Federal Regulations Parts 1500–1508) and the Federal Highway Administration's implementing regulations governing Federal Highway Administration National Environmental Policy Act documents (23 Code of Federal Regulations Part 771). In its mobile source air toxics guidance, the Federal Highway Administration discusses 40 Code of Federal Regulations Part 1502.22 and acknowledges that while much work has been done to assess the overall health risk of mobile source air toxics, analytical tools and techniques for assessing project-specific health outcomes as a result of lifetime exposures to mobile source air toxics remain limited. These limitations impede the ability to evaluate the potential health risks attributable to exposure to mobile source air toxics as part of the decision-making process in the National Environmental Policy Act context. However, as with any analysis that the Federal Highway Administration conducts for National Environmental Policy Act purposes, the Federal Highway Administration's approach for mobile source air toxic analysis in National Environmental Policy Act documents is informed not just by 40 Code of Federal Regulations Part 1502.22, but by all applicable Council on Environmental Quality requirements. Summary information about the findings of the Joint Air Toxics Assessment Project study is provided as background information in the Draft and Final Environmental Impact Statements, but the study itself is not relevant to the type of analysis done pursuant to the Federal Highway Administration's mobile source air toxics guidance, which is an emissions analysis. Monitored ambient concentrations of mobile source air toxics (the focus of the Joint Air Toxics Assessment Project) do not inform this type of analysis. While monitoring data can be useful for defining

(Response 377 continues on next page)

Code	Comment Document

Code	Issue	Response
377 (cont.)		current conditions in the affected environment (to the extent that the monitoring data are current),they don't tell us anything about future conditions, or the impacts of the project itself, which is why an emissions analysis was performed. The mobile source air toxic analysis presented beginning on page 4-77 of the Final Environmental Impact Statement is an estimated inventory of mobile source air toxic emissions for the entire Study Area for 2025 and 2035. This approach was used because the inventory estimate accounts for changes in traffic and emissions on all roadways affected by a proposed project, and would, therefore, be a more reliable predictor of changes in exposure to mobile source air toxics. The appropriateness of air toxics health risk assessment as an analysis method for National Environmental Policy Act documents is discussed below, in the context of Council on Environmental Quality requirements for these documents. In addition to the 40 Code of Federal Regulations Part 1502.22 provisions regarding uncertainty and limitations discussed in the Federal Highway Administration's MSAT Interim Guidance Appendix C, three other provisions of the Council on Environmental Quality regulations are particularly relevant to the topic of health risk assessment: *40 Code of Federal Regulations § 1500.1(b): NEPA procedures must insure that environmental information is available to public officials and citizens before decisions are made and before actions are taken. The information must be of high quality. Accurate scientific analysis, expert agency comments, and public scrutiny are essential to implementing NEPA. Most important, NEPA documents must concentrate on the issues that are truly significant to the action in question, rather than amassing needless detail.* *40 Code of Federal Regulations § 1502.1: An environmental impact statement is more than a disclosure document. It shall be used by Federal officials in conjunction with other relevant material to plan actions and make decisions.* *40 Code of Federal Regulations § 1502.2: (a) Environmental impact statements shall be analytic rather than encyclopedic. (b) Impacts shall be discussed in proportion to their significance.(c) Environmental impact statements shall be kept concise and shall be no longer than absolutely necessary to comply with NEPA and with these regulations.* Section 1500.1(b) states that information for decision making must be of high quality and based on accurate scientific analysis. Air toxics health risk assessments can involve large uncertainties. The mobile source air toxic health risk assessment uncertainty builds on itself—each step of the analysis involves uncertainties, including modeling traffic and then modeling emissions, and using this estimated output to model dispersion/concentrations, which provide information for estimating or assuming exposures to those concentrations, and finally predicting health outcomes. Major uncertainties are associated with traffic and emissions projections over a 70-year period, and dispersion models are typically held to a "factor of 2" performance standard. Health impacts of mobile source air toxics in the U.S. Environmental Protection Agency Integrated Risk Information System are based on a 70-year lifetime exposure, which introduces significant uncertainty (e.g., on average, people in the United States change residence approximately once every 8 years and change jobs once every 3). Finally, as noted above, the U.S. Environmental Protection Agency's Integrated Risk Information System provides toxicity (risk) values for various pollutants and routes of exposure; in a health risk assessment, the Federal Highway Administration would compare

(Response 377 continues on next page)

Code	Comment Document

Code	Issue	Response
377 (cont.)		calculated concentrations of mobile source air toxic pollutants to the Integrated Risk Information System values to estimate health risk. In the Integrated Risk Information System, the U.S. Environmental Protection Agency states the toxicity values are believed to be accurate to within an order of magnitude (a factor of 10). The total cumulative uncertainty involved in highway project health risk assessment is much larger than the change in emissions attributable to projects (typically a few percentage points). In this context, the information would not necessarily have a strong nexus to the requirements for high-quality information and accurate scientific analysis. Section 1500.1(b) also directs agencies to focus their National Environmental Policy Act analysis and documentation on issues that are truly significant to the action in question. In the context of mobile source air toxics, the Federal Highway Administration must consider whether changes in mobile source air toxic emissions attributable to a project have the potential for significant health risk. Using cancer risk as an example, the U.S. Environmental Protection Agency estimates that the overall risk of cancer in the United States is approximately 330,000 in a million, and that air toxics (from all sources) are responsible for a risk of approximately 50 in a million. In its most recent mobile source air toxics rule-making, the U.S. Environmental Protection Agency estimated mobile source air toxic cancer risk, after implementation of emissions controls, at approximately 5 in a million (or 0.0015 percent of overall cancer risk from any cause). For the Preferred Alternative, the mobile source air toxic emissions analysis for the Study Area found little difference in total annual emissions of mobile source air toxic emissions between the Preferred and No Action Alternatives (less than a 1 percent difference) in 2025 and 2035. With the Preferred Alternative in 2035, modeled mobile source air toxic emissions would decrease by more than 80 percent, depending on the pollutant, despite a 47 percent increase in vehicle miles traveled in the Study Area compared with 2012 conditions (see the discussion beginning on page 4-77 of the Final Environmental Impact Statement). In summary, available information from the U.S. Environmental Protection Agency indicates that mobile source air toxics are a small component of overall cancer risk, and the analysis for the Final Environmental Impact Statement indicates both that the Preferred Alternative would result in a small change in the emissions contributing to this risk and that emissions will decline by a large amount regardless of alternative.

(Response 377 continues on next page)

Code	Comment Document

Code	Issue	Response
377 (cont.)		As described above and in the air quality technical report, results from the health risk assessment would be influenced more by the uncertainty introduced into the process through assumptions and speculations rather than by genuine insight into the actual health impacts directly attributable to mobile source air toxic exposure associated with a project. Therefore, outcomes of such a health risk assessment do not provide useful information for decision makers, as required by Section 1502.1. The Federal Highway Administration emissions analysis meets the requirement to produce information that is useful for both disclosure and decision making because it allows the public and decision makers to see which alternative has less mobile source air toxic emissions, with much less uncertainty than a health risk assessment. Given the uncertainty of a mobile source air toxic health risk assessment, the Federal Highway Administration instead addresses the potential impacts of mobile source air toxics through an emissions assessment in its National Environmental Policy Act documents. For smaller projects with a lower likelihood of a meaningful impact, this discussion is qualitative. For larger projects, emissions analysis is conducted. The Federal Highway Administration approach is consistent with the Council on Environmental Quality's direction in Section 1502.2(b) to discuss impacts in proportion to their significance. The results of an emissions analysis can be summarized concisely in a National Environmental Policy Act document and provide useful information for decision makers (e.g., an alternative that has lower emissions is likely to be "better" from a mobile source air toxics health risk standpoint than one that has higher emissions). While the U.S. Environmental Protection Agency and the Federal Highway Administration both agree on the usefulness of addressing mobile source air toxics in National Environmental Policy Act documents for highway projects, the agencies disagree about the value of health risk assessment as a method for doing so.

(Response 377 continues on next page)

Code	Comment Document

Code	Issue	Response
377 (cont.)		Another consideration with respect to health impacts is that the Preferred Alternative would also reduce in-vehicle mobile source air toxics exposure as opposed to the No-Action Alternative. The U.S. Environmental Protection Agency has found that in-vehicle benzene concentrations were between 2.5 and 40 times higher than nearby ambient concentrations, based on a review of studies discussed in the Regulatory Impact Analysis for the U.S. Environmental Protection Agency's 2007 mobile source air toxics rule-making (Final Regulatory Impact Analysis, Environmental Protection Agency 420-R-07-002, 3-17 [February 2007]). Construction of the Preferred Alternative would result in a reduction in benzene exposure to drivers and passengers for two reasons: decreased travel times (motorists would spend less time in traffic to reach their destinations) and lower emissions rates (attributable to speed improvements). Reducing on-road exposure would provide a health benefit for motorists using the roadway network. Congestion relief resulting from the proposed freeway would provide localized air quality emissions reductions on area freeways and arterial streets and at interchanges, benefiting users of area highways and those living near congested roads. The Federal Highway Administration determined that a supplemental environmental impact statement is not required at this time because there were no changes to the proposed action that will result in significant environmental impacts not evaluated in the Draft Environmental Impact Statement nor is there new information relevant to environmental concerns and bearings on the proposed action or its impacts that will result in significant environmental impacts not evaluated in the Draft Environmental Impact Statement.

Code	Comment Document

increase from the transmix pipeline, which would result in an increase in tanker truck traffic, should have been considered in a truck analysis.

If all this additional pollution had been honestly quantified and factored in, it would likely have shown a huge net increase in air pollution from the SMF, and associated increases in asthma, heart disease, premature death, and other adverse health impacts.

In 2005, there was an extensive air monitoring of certain toxic chemicals (air toxics) conducted by EPA and ADEQ in a joint effort named the Joint Air Toxics Assessment Program (JATAP). The monitoring sites included a site near St. Johns on the GRIC, and some in west Phoenix and South Phoenix. The JATAP monitoring results were reported in 2006, during a time the data for the DEIS was being gathered, and it found levels of certain toxic chemicals associated with vehicular emissions were above the standard of a one in a million chance of cancer in a lifetime of exposure in the west Phoenix, south Phoenix, and GRIC sites. The JATAP monitoring found in the high end of the monitoring levels, formaldehyde at 34 times this standard; benzene at 8 times this standard, 1,3 butadiene at 7.5 times this standard, and acetaldehyde at 3.4 times this standard. And, remember, citizens are being subjected to all of these carcinogens, not just one. Some of these chemicals are attributed to "mobile sources," or vehicular traffic burning hydrocarbons. Clearly, adding more vehicular traffic emissions by building a freeway where there had not been one would add to this toxic burden.

The JATAP results are not included in the DEIS, but instead there is a mention of the uncertainty of the risk from these air toxics standards, which is not true. The cancer risk standards have been promulgated and published by EPA after extensive research and study, and they are well known.

378

The portion of Maricopa County that is characterized as the Phoenix metro area has had problems for decades meeting the air quality standards for particulate matter (PM) and other criteria pollutants. Ozone levels are too high in the East Valley and Fountain Hills, for example. 8

Code	Issue	Response
378	**Air Quality**	The Draft Environmental Impact Statement addresses the history of air quality in the region (see text beginning on page 4-68 of the Final Environmental Impact Statement). The Clean Air Act § 109(b)(1) requires the U.S. Environmental Protection Agency to promulgate primary National Ambient Air Quality Standards at levels that allow an adequate margin of safety to protect the public health. Air quality in the Phoenix metropolitan area has improved over time; Phoenix was redesignated to attainment/maintenance for carbon monoxide in 2005, and the U.S. Environmental Protection Agency recently determined that Phoenix has attained the particulate matter (PM_{10}) standard. These improvements are largely associated with cleaner fuels and lower-emission vehicles along with local controls on fugitive dust. Future emissions would also be reduced by the use of cleaner burning fuels, technological advances in automotive design (including the greater use of alternative fuel vehicles), reformulated gasoline, gas can standards, stricter enforcement of emission standards during inspections, heavy-duty diesel engine and on-highway diesel sulfur control programs, dust control programs, and others. The air quality assessment for the proposed freeway analyzed impacts from carbon monoxide and particulate matter (PM_{10}) and followed U.S. Environmental Protection Agency guidelines. For mobile source air toxics, the analysis showed that for the Study Area, constructing the freeway would have a marginal effect on annual emissions in 2025 and 2035 (less than a 1 percent difference in total annual emissions between the Preferred Alternative and No-Action Alternative). With the Preferred Alternative in 2035, modeled mobile source air toxics emissions would decrease by 57 percent to more than 90 percent, depending on the pollutant, despite a 47 percent increase in vehicle miles traveled in the Study Area compared with 2012 conditions. The air quality analyses were updated for the Final Environmental Impact Statement, including a quantitative particulate matter (PM_{10}) analysis, and are more fully described beginning on page 4-68 of the Final Environmental Impact Statement. Congestion relief resulting from the proposed freeway would provide localized air quality emissions reductions on area freeways and arterial streets and at interchanges, benefiting users of area highways and those living near congested roads. Fugitive dust and mobile source emissions from construction of the proposed freeway would be controlled by requiring the contractor to comply with the dust-control methods in the Arizona Department of Transportation's *Standard Specifications for Road and Bridge Construction* (2008) and Maricopa County Rule 310, Fugitive Dust Ordinance. Disruption to traffic, especially during peak travel periods, would be minimized by a traffic control plan to help reduce impacts of traffic congestion and associated emissions during construction. These methods are discussed on page 4-85 of the Final Environmental Impact Statement. According to the air quality analyses conducted for the proposed freeway, no violations of either the carbon monoxide or particulate matter (PM_{10}) standards were identified, even at worst-case locations along the project corridor. Thus, the carbon monoxide and particulate analyses demonstrated that the proposed freeway would not contribute to any new localized violations, increase the frequency or severity of any existing violation or delay timely attainment of the National Ambient Air Quality Standards or any required interim emissions reductions or other milestones. Therefore, no loss of federal funds would occur.

Code	Comment Document

has the DEIS examined the dust that would be kicked up during the construction phase, when thousands of tons of dirt would be moved around upwind of the monitor. The proposed path of the SMF would take it over the Salt River bed. To construct the bridges would involve extensive earthmoving. Also, blasting South Mountain would release enormous amounts of dust (PM), and the natural wind currents and prevailing wind patterns would push this PM toward the air monitor at 43rd Avenue.

The SMF could therefore be the most expensive freeway ever built. Not only the construction costs, and the more than $20 million already spent on the DEIS, but then there would be the loss of a billion dollars in highway funds. This is a gift that keeps on giving, or taking, as there would be subsequent billions lost through the years due to PM exceedances.

379

The DEIS has not considered the effects of the additional pollution caused by the SMF – particularly the truck traffic – on the school children and elderly in proximity to the freeway route. Studies have shown sharp increases in black carbon on roadways with high levels of diesel traffic. The danger zone extends to about ½ mile from the roadway. The SMF would be within ½ mile of 20 schools with over 11,000 students. There would also be many elderly residents within that range who are particularly susceptible to the effects of air pollution. All would be at risk of adverse health effects including asthma and cardiovascular illness. (Thurston, *The Adverse Human Health Effects of Air Pollution that Result from Traffic-Related Air Pollution*, July 2013)

Effective mitigation of the effects of air pollution could only be achieved by barring truck traffic from the SMF. While effective filters could be placed in homes and schools near the freeway, these filters would not only be prohibitively expensive for all the schools and residences involved, but they would also only be effective for the time the school children and residents remained inside with windows closed. People cannot be expected to live their lives inside. In fact, one of the many reasons people live in Ahwatukee Foothills is because of the weather and the possibility of participating in outdoor activities. School children need to be able to be outside to use playgrounds and sporting facilities. It is hard to imagine how air pollution effects could be mitigated for all the school children participating in and attending sporting events at the Desert Vista High School stadium, for example.

Modeling

There are fundamental problems with the modeling described in the DEIS.

The DEIS uses faulty wind speed data and methodology in doing its modeling. Wind speed is an essential part of the air shed modeling that ADOT used to determine, in part, regional stability – which relates to inversion layers and local weather patterns impacting projected freeway pollution. For example, the DEIS inputs are based on times that are not concurrent with pollution building hours. The DEIS also failed to

9

Code	Issue	Response
379	**Air Quality**	A common theme in public comments on the proposed project has been the potential impacts of the project on children's health, primarily through vehicle emissions and noise. Many commenters raised concerns about the proximity of the project to schools or other aspects of the project that may affect children. In addition, the U.S. Environmental Protection Agency requested that the Final Environmental Impact Statement address Executive Order 13045, *Protection of Children from Environmental Health Risks and Safety Risks*. Throughout the Final Environmental Impact Statement, potential impacts on and subsequent mitigation for human health are disclosed and identified, as inherent in the environmental impact statement process. The Final Environmental Impact Statement incorporates an assessment of the potential impacts of the proposed project on all populations, including children. The Final Environmental Impact Statement addresses potential impacts of the project on children in the Chapter 4 environmental consequences analyses. The U.S. Environmental Protection Agency's Toxicity and Exposure Assessments for Children's Health report (see page 4-73 of the Final Environmental Impact Statement) indicated that indoor air concentrations of benzene are usually higher than outdoor levels and that indoor air in smokers' homes is a significant contributor to children's exposures. It mentioned children when identifying the effects of acute exposure to naphthalene. The Final Environmental Impact Statement acknowledges and fully discloses public scoping comments that raised the topic of health effects on neighborhoods and adjacent schools (see page 4-31 of the Final Environmental Impact Statement). The Final Environmental Impact Statement evaluates Clean Air Act criteria air pollutant concentrations in Maricopa County and the Phoenix area (see pages 4-75 to 4-77 of the Final Environmental Impact Statement). With regard to air quality impacts, the Final Environmental Impact Statement addresses children's health impacts within the broader discussion regarding health impacts under the National Ambient Air Quality Standards. Clean Air Act Section 109(b)(1) requires the U.S. Environmental Protection Agency to promulgate primary National Ambient Air Quality Standards at levels that allow an adequate margin of safety and are requisite to protect the public health. As noted by the U.S. Environmental Protection Agency in its 2013 rulemaking for particulate matter, Clean Air Act Section 109's legislative history demonstrates that the primary standards are "to be set at the maximum permissible ambient air level... which will protect the health of any [sensitive] group of the population" (78 *Federal Register* 3086 and 3090) (quoting S. Rep. No. 91-1196, 91st Cong., 2 Sess. 10 [1970]) (alterations in original). Accordingly, the Final Environmental Impact Statement National Ambient Air Quality Standards-based evaluation of criteria air pollutants includes a health-based review of sensitive populations, including children, given the National Ambient Air Quality Standards inherent consideration of those factors. Furthermore, the National Ambient Air Quality Standards-based assessment ensures adequate consideration of health-based issues as "[t]he requirement that primary standards provide an adequate margin of safety was intended to address uncertainties associated with inconclusive scientific and technical information ... and to protect against hazards that research has not yet identified" (78 *Federal Register* 3090). Sensitive receivers for air and noise are already included in the air quality and noise analyses in accordance with State and federal guidance. Both sections, *Air Quality* and *Noise*, beginning on Final Environmental Impact Statement pages 4-68 and 4-88, respectively, have addressed requirements under the National Environmental Policy Act. As stated on page 4-89 of the Final Environmental Impact Statement, over 220 sensitive receivers were evaluated at exterior locations from a traffic noise perspective. All of the receivers represent noise-sensitive land uses in proximity to the proposed project, including homes, schools, and parks, and these receivers would have higher noise levels than similar facilities more distant from the proposed action.

has the DEIS examined the dust that would be kicked up during the construction phase, when thousands of tons of dirt would be moved around upwind of the monitor. The proposed path of the SMF would take it over the Salt River bed. To construct the bridges would involve extensive earthmoving. Also, blasting South Mountain would release enormous amounts of dust (PM), and the natural wind currents and prevailing wind patterns would push this PM toward the air monitor at 43rd Avenue.

The SMF could therefore be the most expensive freeway ever built. Not only the construction costs, and the more than $20 million already spent on the DEIS, but then there would be the loss of a billion dollars in highway funds. This is a gift that keeps on giving, or taking, as there would be subsequent billions lost through the years due to PM exceedances.

The DEIS has not considered the effects of the additional pollution caused by the SMF – particularly the truck traffic – on the school children and elderly in proximity to the freeway route. Studies have shown sharp increases in black carbon on roadways with high levels of diesel traffic. The danger zone extends to about ½ mile from the roadway. The SMF would be within ½ mile of 20 schools with over 11,000 students. There would also be many elderly residents within that range who are particularly susceptible to the effects of air pollution. All would be at risk of adverse health effects including asthma and cardiovascular illness. (Thurston, *The Adverse Human Health Effects of Air Pollution that Result from Traffic-Related Air Pollution*, July 2013)

380 Effective mitigation of the effects of air pollution could only be achieved by barring truck traffic from the SMF. While effective filters could be placed in homes and schools near the freeway, these filters would not only be prohibitively expensive for all the schools and residences involved, but they would also only be effective for the time the school children and residents remained inside with windows closed. People cannot be expected to live their lives inside. In fact, one of the many reasons people live in Ahwatukee Foothills is because of the weather and the possibility of participating in outdoor activities. School children need to be able to be outside to use playgrounds and sporting facilities. It is hard to imagine how air pollution effects could be mitigated for all the school children participating in and attending sporting events at the Desert Vista High School stadium, for example.

381 **Modeling**

There are fundamental problems with the modeling described in the DEIS.

382 The DEIS uses faulty wind speed data and methodology in doing its modeling. Wind speed is an essential part of the air shed modeling that ADOT used to determine, in part, regional stability – which relates to inversion layers and local weather patterns impacting projected freeway pollution. For example, the DEIS inputs are based on times that are not concurrent with pollution building hours. The DEIS also failed to

9

Code	Issue	Response
379 (cont.)		Receptor placement met the criteria for selecting modeling locations as specified in 40 Code of Federal Regulations § 93.123(a). The carbon monoxide analysis was updated in the Final Environmental Impact Statement. Although a qualitative analysis of particulate matter (PM_{10}) was presented in the Draft Environmental Impact Statement, a quantitative project-level particulate matter (PM_{10}) hot-spot analysis is included in the Final Environmental Impact Statement. The results of the air quality updates are summarized in the prologue to the Final Environmental Impact Statement (beginning on page xiii) and are more fully described beginning on page 4-68 of the Final Environmental Impact Statement. The carbon monoxide and particulate matter (PM_{10}) analyses demonstrated that the proposed freeway would not contribute to any new localized violations, increase the frequency or severity of any existing violation, or delay timely attainment of the National Ambient Air Quality Standards or any required interim emissions reductions or other milestones. Through analysis, the Federal Highway Administration has determined that the proposed project would not produce disproportionate impacts on children. Congestion relief resulting from the proposed freeway would provide localized air quality emissions reductions on area freeways and arterial streets and at interchanges, benefiting users of area highways and those living near congested roads. Full disclosure about *Information Availability Constraints in Analyzing Project-Specific MSATs Impacts* begins on page 4-69 of the Draft Environmental Impact Statement in accordance with Council on Environmental Quality regulations [40 Code of Federal Regulations, Section 1502.22(b)] regarding incomplete or unavailable information. This section includes a basic analysis of the likely mobile source air toxics emissions impacts of the proposed action and the No-Action Alternative, but it is the Federal Highway Administration's view that information to credibly predict project-specific health impacts attributable to changes in mobile source air toxics emissions associated with a proposed set of freeway alternatives is incomplete or unavailable.
380	**Air Quality**	The air quality assessment for the proposed freeway analyzed impacts from carbon monoxide and particulate matter (PM_{10}) and followed U.S. Environmental Protection Agency guidelines. For mobile source air toxics, the analysis showed that for the Study Area, constructing the freeway would have a marginal effect on annual emissions in 2025 and 2035 (less than a 1 percent difference in total annual emissions between the Preferred Alternative and No-Action Alternative). With the Preferred Alternative in 2035, modeled mobile source air toxics emissions would decrease by 57 percent to more than 90 percent, depending on the pollutant, despite a 47 percent increase in vehicle miles traveled in the Study Area compared with 2012 conditions. The air quality analyses were updated for the Final Environmental Impact Statement, including a quantitative particulate matter (PM_{10}) analysis, and are more fully described beginning on page 4-68 of the Final Environmental Impact Statement. According to the air quality analyses conducted for the proposed freeway, no violations of either the carbon monoxide or particulate matter (PM_{10}) standards were identified, even at worst-case locations along the project corridor. Thus, the carbon monoxide and particulate analyses demonstrated that the proposed freeway would not contribute to any new localized violations, increase the frequency or severity of any existing violation or delay timely attainment of the National Ambient Air Quality Standards or any required interim emissions reductions or other milestones. Therefore, no mitigation of these effects is required.
381		Specific comments are addressed below.

(Response 382 begins on next page)

Code	Comment Document
	correlate the morning traffic hours 0500 to 1100 with the build up of tail pipe emissions during an aid shed inversion. The ability to determine CO and particulate concentrations needs accurate wind data measurements during periods expected to have high pollutant concentrations.
383	The South Mountain Transportation Corridor Study (SMTC) – a scoping document/component of the DEIS – confirmed that South Mountain greatly influences the local air shed movement. According to the SMTC, down slopes bring cooler air in the evenings. The SMTC and the DEIS, however, failed to indicate that this process intensifies the morning desert inversion, exacerbating pollutant concentrations. Air quality would worsen by the influence of the mountain and any build option. The mountain creates its own small air shed, which was not evaluated by the DEIS. All reporting data used valley wide components for stated results.
384	The sampling and stability data relied on by the SMTC and the DEIS is inaccurate. ADOT relies on air data taken at the Phoenix airport in the middle of the Valley without terrain conditions that proximate the region impacted by the SMF. Even based on the airport data, however, ADOT finds E and F stability 57% of the time. The actual SMF stability would be much worse, compounding Phoenix airport conditions by stronger temperature inversions because of the mountain's location and size. More pollutants from the freeway next to the ground would be trapped more quickly with significantly higher expected pollutant concentrations in the Ahwatukee Foothills community.
	The DEIS did not use MCAQD DELTA Temperature instruments for calculating inversion conditions to determine accurate pollutant concentration projections. DEIS technical documents clearly show that Maricopa County Air Quality delta T systems data was not used for actual ground level measurements of temperature inversions. Without this data of actual inversion strength, which shows how quickly pollutant concentrations will increase, any modeling cannot accurately reflect the population exposure to those pollutants. Stability and Air Quality modeling conducted by ADOT as set forth in the DEIS provided no useful data and must not be used to determine potential air pollution concentrations of the SMF.
385	ADOT used Aircraft Communications Addressing and Reporting System (ACARS) for vertical temperatures and wind profiles. This method does not correlate to ground level inversion strength for population exposure and is not a scientific method to derive accurate results. Data used does not have any quality assurance or quality control measurements. This means the equipment used does not have proven repeatability to produce the same temperature or wind speed for any given measurement. Moreover, no standard heights were used for correlating air shed temperatures. For example, one data point is measured at 2000 feet, the next is at 3000 feet, separated by miles and not at the same time of day. These random numbers fill air quality modeling functions without actually representing true results.

Code	Issue	Response
382	**Air Quality**	The air quality assessment for impacts from carbon monoxide followed the U.S. Environmental Protection Agency guidelines in *Guideline for Modeling Carbon Monoxide from Roadway Intersections* (A-OAQPS, 1992). Inputs to the model were based on U.S. Environmental Protection Agency-recommended values or were selected to provide a conservative estimate of impacts. Modeling methodology and results were reviewed by the Federal Highway Administration, Arizona Department of Transportation, and Maricopa Association of Governments. Increases in traffic volumes attributable to a project do not necessarily result in an increase in emissions over time because the U.S. Environmental Protection Agency's emissions control regulations and fleet turnover also play a role. In the U.S. Environmental Protection Agency's MOVES model, emissions rates for mobile source air toxics drop by 80 to 90 percent between 2012 and 2025, and MOBILE6.2 estimated a similar reduction. The effects of this are apparent from the mobile source air toxics analysis conducted for the Final Environmental Impact Statement; in the mobile source air toxics study area, total mobile source air toxics emissions would decline by 57 to more than 90 percent even though traffic is expected to increase by 47 percent (Final Environmental Impact Statement Table 4-36 on page 4-82).
383	**Air Quality**	According to the 2013 Arizona Department of Transportation *Air Quality Assessment South Mountain Freeway 202L Draft Report*, review of wind data from the Gila River Indian Community monitoring site at St. Johns suggests that during the morning hours and associated with mountain-drainage air flows and stable atmospheric conditions, wind flows are from the southeast and follow the Gila River channel to the north. Locations to the east of St. Johns experience flow from the east to the lower elevations along the Gila River. During the warmer hours' improved mixing, flows typically follow the river channel and come from the north and northwest. Likewise, during a 1-month-long meteorological monitoring period (November 20, 2006, through December 21, 2006) at Pecos Road and 40th Street and a second 1-month-long monitoring period at Pecos Road and 24th and 40th streets (April 19, 2007, through May 21, 2007), winds during the morning hours typically were from the northeast. During the warmer hours, and with improved mixing, winds typically were from the west.
384	**Air Quality**	At the request of (then) Arizona State Senator John Huppenthal, short-term monitoring of meteorological conditions at Pecos Road and 24th and 40th streets was conducted during 2006 and 2007. Results of this sampling and data from various Maricopa County Air Quality Department monitoring sites were included in the technical report for informational purposes only.
385	**Air Quality**	The Aircraft Communications Addressing and Reporting System data were not used for modeling; they were included for informational purposes only.

Code	Comment Document
385	Any results derived from the ACARS data are incomplete, not relevant, and mislead the community with technical jargon trying to show justification of expected air quality concentrations for each build and no build situation. Not only is the data not taken from the freeway project area, the data is randomly gathered at different heights, locations, and times.
386	Notwithstanding that this NEPA process has taken over 12 years, ADOT has not conducted any studies on atmospheric and/or ambient quality/conditions in the Ahwatukee Foothills area. As a result, there is no valid baseline data to input into air quality models that predict how bad the pollution in the area would be. Sites listed for reference to determine air quality for the citizens are nowhere near the impacted area and should not be used to determine air quality north of the Pecos Road alignment. Similarly, there are no temperature soundings for accurate air shed profiling. There are no air toxics measurements taken to understand the current components of the ambient air quality, and there are no wind speed and direction instruments installed as necessary to apply good science for modeling. These wind speed and direction monitors should have been installed north of the Pecos Road alignment east and west throughout the Ahwatukee Foothills community and near South Mountain to show how the Ahwatukee Foothills air shed does not remove tail pipe emissions from the freeway, but actually washes pollutants to the west in the mornings, shifting north near noon, with later winds northeasterly. This normal wintertime pattern, known to all Arizona air quality technical persons, is not shown or reflected in the DEIS.
387	Furthermore, ADOT does not compare the results of their traffic modeling against actual data after freeways are built (1-11 through 1-20). Hence, there is no validation of their use of traffic modeling. The inescapable conclusion is that there is no established validity to the modeling used in the DEIS. Without model validity, there can be no P&N or other justification to support building the SMF.
388	**Traffic Issues** Traffic congestion at the proposed 59th Ave/I-10 interchange would make a new "Broadway Curve" traffic congestion disaster, not alleviate traffic congestion. This junction of the SMF with I-10 may have been conceived many years ago, but it is just another example of how ADOT has not used effective modeling. The current situation should have been foreseen long ago. Current traffic congestion between 59th and 51st Avenues on the I-10 during morning and evening rush hours is extreme. Yet there was no mention in the DEIS of the cumulative impacts and effects of traffic congestion at that proposed interchange.
389	Just as the junction of freeways at the Broadway Curve was not properly planned for and engineered, this new interchange at the SMF and I-10 promises to have the same type of traffic congestion problems because of poor planning. Let us not forget

Code	Issue	Response
386	**Air Quality**	At the request of (then) Arizona State Senator John Huppenthal, short-term monitoring of meteorological conditions at Pecos Road and 24th and 40th streets was conducted during 2006 and 2007. Results of this sampling and data from various Maricopa County Air Quality Department monitoring sites were included in the technical report for informational purposes only.
387	**Air Quality**	The air quality assessment for impacts from carbon monoxide followed the U.S. Environmental Protection Agency guidelines in Guideline for Modeling Carbon Monoxide from Roadway Intersections (A-OAQPS, 1992). This is accepted methodology.
388	**Traffic**	Construction of the proposed freeway would include widening along Interstate 10 to facilitate entrance and egress of vehicles between the two freeways. Additional information related to the Interstate 10 modifications can be found in Figure 3-26, on page 3-49, and in Figure 3-29, on page 3-53 of the Draft Environmental Impact Statement. The design of the connection to Interstate 10 and the widening along Interstate 10 were developed in accordance with the Federal Highway Administration's Interstate System Access Informational Guide and has received an initial determination of operational and engineering acceptability from the Federal Highway Administration. Detailed microsimulation models were developed for each of the action alternatives as well as for the No-Action Alternative. The results of the analysis concluded that the action alternatives would not have adverse impacts on traffic operational characteristics along Interstate 10 and would provide as good or better performance than that which would be anticipated with the No-Action Alternative. An assessment of future traffic conditions with and without the proposed freeway is presented in the Draft Environmental Impact Statement, beginning on page 3-27. The traffic conditions presented in these sections are consistent with the environmental impact analysis for elements such for as air quality and noise, and the results of those analyses can be found in their respective sections of Chapter 4 of the Draft Environmental Impact Statement.
389	**Traffic**	Construction of the proposed freeway would include widening along Interstate 10 to facilitate entrance and egress of vehicles between the two freeways. Additional information related to the Interstate 10 modifications can be found in Figure 3-26, on page 3-49, and in Figure 3-29, on page 3-53 of the Draft Environmental Impact Statement. The design of the connection to Interstate 10 and the widening along Interstate 10 were developed in accordance with the federal Highway Administration's Interstate System Access Informational Guide and has received an initial determination of operational and engineering acceptability from the Federal Highway Administration. While the South Mountain Citizens Advisory Team recommended the W101 Alternative, all stakeholders' input was accounted for—including regional leaders, municipalities, members of the public, and members of the South Mountain Citizens Advisory Team—before identifying the W59 Alternative as the Preferred Alternative (see Draft Environmental Impact Statement pages 3-65 and 3-68). The Draft Environmental Impact Statement has detailed discussion regarding the relative merits and problems with the action alternatives evaluated in the Western Section.

Code	Comment Document

that ADOT ignored the recommendation of the SMCAT in choosing the 59th Avenue alignment. We can only expect that the new interchange at 59th Avenue also would not be properly engineered to handle all the traffic.

390 The elimination of Pecos Road in building the SMF would be disastrous for local arterial traffic in Ahwatukee Foothills. Not only would there be no interchange at 32nd Street, there would also be no frontage road along the freeway. So Chandler Boulevard would become inundated with traffic, much as it was before Pecos Road was connected to the I-10.

Also, the arterial streets north of Pecos, Liberty Lane and Lakewood Parkway, would become major East-West arterials in the area between Desert Foothills Parkway and 40th Street. Neither Liberty Lane nor Lakewood Parkway were designed for this. They provide access to 4 schools, including Desert Vista High School. Currently, the school bus traffic uses 32nd Street from Pecos Road to get to these schools. Without a SMF interchange at 32nd Street, this bus traffic would clog the already stressed arterials of Liberty Lane and Lakewood Parkway. High school traffic also includes a lot of student cars that would clog the arterials.

391 Furthermore, the elimination of the access to Pecos Road from near 27th Avenue (the road is currently called S. Chandler Boulevard) exacerbates an already difficult access problem for residents in that area. ADOT promised to pave W. Chandler Boulevard to provide residents access to Ahwatukee Foothills further east, but this by no means provides these residents with an acceptable access to/from their homes. Pecos Road currently provides their only access out of their housing area, and it is a direct connect to I-10. With the SMF, Chandler Boulevard would provide their only access out of their housing area, and it would provide a convoluted access for resident to either the SMF or I-10. Egress in case of emergency would be extremely limited.

392 The DEIS lacks a traffic study of the effect the SMF would have on local arterial streets in Ahwatukee Foothills. A study should have been done both for traffic patterns during construction of the SMF as well as patterns that would develop after the SMF would be completed.

393 The people in Laveen desperately need faster access to a freeway and they want the truck traffic off their local arterial streets. But they are currently being held hostage to the SMF, told that it is the only way they can get rid of the truck traffic on their streets and get faster access out of the area for themselves. This is not true. A spur highway to/from I-10 West could easily accomplish both of their objectives. It would also support the objective of getting faster access in/out of the 51st Avenue commercial area for the truck traffic. Yet the DEIS did not mention the consideration of this alternative. ADOT's reaction to such a suggestion has been that it "wouldn't complete the loop" and that it would not allow for O&D regional mobility. The "complete the loop" objective is absurd and the O&D objective gets to the heart of what PARC has said this freeway is all about from the beginning. Yet the truck

12

Code	Issue	Response
390	**Traffic**	The determination to not include an interchange at 32nd Street was made in coordination with the City of Phoenix (see Figure 3-8 on page 3-15 of the Final Environmental Impact Statement). The interchange would have displaced more than 100 homes and would have been located near an existing high school. The City recommended that, based on these impacts, the interchange be removed from the study. In 2006, the City of Phoenix conducted a traffic circulation study to evaluate the impacts of the proposed freeway on the local street system, including the shift of access to Foothills Reserve and Calabrea from Pecos Road to Chandler Boulevard. The City study found no adverse effects on the local street system from the freeway (see Appendix 3-1 in the Final Environmental Impact Statement). The traffic projections for Chandler Boulevard (see Figure 3-12, on page 3-29 of the Draft Environmental Impact Statement) do show a reduction with the proposed freeway when compared with conditions without the proposed freeway. The freeway construction staging plan for the area along Pecos Road would allow for keeping east–west travel open during construction. One side of the freeway would be constructed while traffic remained on Pecos Road. When complete, traffic would be shifted from Pecos Road to the new freeway. At that time, the other side of the freeway would be built. However, temporary detours may be needed during construction. (See page 3-27 of the Draft Environmental Impact Statement.)
391	**Traffic**	The determination to not include an interchange at 32nd Street was made in coordination with the City of Phoenix (see Figure 3-8 on page 3-15 of the Final Environmental Impact Statement). The interchange was evaluated but ultimately eliminated because of increased residential displacements and cost. The extension of Chandler Boulevard west of 19th Avenue is included in this project because reasonable access must be maintained to the neighborhoods at the western end of Pecos Road (see Figure 3-33, on page 3-57 in the Draft Environmental Impact Statement). Residents in this area would continue to have a direct connection to Interstate 10 by using the proposed freeway. The travel time savings as a product of using the South Mountain Freeway in comparison with use of Pecos Road would likely offset any additional travel time attributable to the shift in access to Chandler Boulevard. Emergency responders would address the construction of the proposed freeway by amending the local emergency response plan to include the facility.
392	**Traffic**	Existing traffic volumes on the City of Phoenix's streets are available at the City's Web site, <phoenix.gov/streets/traffic/volumemap>. In 2006, the City of Phoenix conducted a traffic circulation study to evaluate the impacts of the proposed freeway on the local street system, including the shift of access to Foothills Reserve and Calabrea from Pecos Road to Chandler Boulevard. The City study found no adverse effects on the local street system from the freeway (see Appendix 3-1 in the Final Environmental Impact Statement).
393	**Alternatives**	The need identified for the proposed action is to provide regional east–west mobility and to address existing and future transportation system deficiencies. While providing greater access to residents and businesses in Laveen Village to Interstate 10 (Papago Freeway) is a benefit of the proposed action, it is not a primary need identified for the proposed action. According to 23 Code of Federal Regulations §771.111(f)," the action evaluated in the environmental impact statement must connect logical termini and be of sufficient length to address environmental matters on a broad scope…". The proposed action should satisfy the project need and should be considered in the context of the local

(Response 393 continues on next page)

Code	Comment Document
	bypass objective has always been downplayed by ADOT, even in the DEIS, in an attempt to mislead the public to bolster public approval of the project. Accordingly, the DEIS has not analyzed the improved O&D regional mobility that would result from a spur highway to/from I-10 West.
394	**Hazardous Materials** The DEIS, starting on page 152, states, "AFFECTED ENVIRONMENT A hazardous materials evaluation for the construction and operation of the proposed freeway was conducted to determine whether: ➢ contaminated soils would be present near potential hazardous materials sites ➢ underground storage tanks would need removal or relocation because of freeway construction ➢ wells and dry wells would be present, providing unintended conduits for preexisting or accidental releases from the construction process to groundwater supplies ➢ during construction activities, workers could encounter soil contaminated with hazardous materials that had not previously been identified"
395	It doesn't mention the transportation of hazardous materials on the new freeway and their associated risks, or the fact that the area where the freeway would connect with I-10 West crosses a site that was identified in the 1980s as contaminated and added to the list of the state of Arizona's Water Quality Assurance Revolving Fund (WQARF), which is the state's equivalent of a Superfund Site. The site has known groundwater contamination and soil contamination. The introduction of hazardous materials and their associated risks into Ahwatukee Foothills by the proposed SMF and its truck traffic would be significant. There are no industries using and emitting toxic chemicals in Ahwatukee Foothills that have reporting requirements under either the Toxics Release Inventory of the Emergency Planning and Community Right to Know Act (EPCRA) or the reporting of fixed facility hazardous materials (chemical) inventories required under the emergency planning provisions of EPCA. The latter, Tier Two chemical inventory reports, are annually required, and are reported to the fire department of jurisdiction (Phoenix Fire Department), the local emergency planning committee (Maricopa County LEPC), and the state emergency response commission (AZSERC). (The requirement for retail gas stations to file Tier Two reports was removed many years ago as long as these stations are in compliance with their reporting under the regulations for underground storage tanks.) The Maricopa County LEPC and the AZSERC are the two emergency planning agencies tasked with developing and updating a comprehensive emergency

Code	Issue	Response
393	**Alternatives**	area socioeconomics and topography, the future travel demand, and other infrastructure improvements in the area. A partial freeway from Interstate 10 (Papago Freeway) to Laveen Village is not feasible because it would not meet the proposed freeway's identified purpose and need.
394		Comment quotes the Draft Environmental Impact Statement.
395	**Hazardous Materials**	The corridor analysis revealed sites that would need further assessment during the property acquisition phase of the project, if an action alternative were to become the Selected Alternative. The Arizona Department of Transportation employs a phased approach to site assessment that allows time for cleanup of any sites found to have hazardous waste issues. The project team concluded from the level of analysis conducted during the environmental impact statement process that the types of sites likely to be acquired contain common hazardous waste issues such as underground storage tanks, asbestos and lead paint in buildings, and other commonly found issues (see page 4-153 of the Draft Environmental Impact Statement). The Arizona Department of Transportation maintains a process for addressing these issues in accordance with all applicable environmental laws and regulations. Arizona highways, as are most highways across the United States, are open to all kinds of traffic, so long as the cargo being carried is in accordance with U.S. Department of Transportation regulations for the specific type of cargo. The Arizona Department of Transportation has a few locations in the state with hazardous cargo restrictions, but these restrictions are based on emergency response issues or roadway design limitations specific to that location. For example, the Interstate 10 Deck Park Tunnel has certain hazardous cargo transport restrictions because of the limited ability for emergency responders to address a hazardous materials incident in the tunnel. The South Mountain Freeway, if implemented, is expected to operate under the same rules as other similar facilities in the state; transport of hazardous cargo would be expected to be permissible (see text box on page 4-157 of the Final Environmental Impact Statement). The Arizona Department of Public Safety (which includes the State Highway Patrol) has primary responsibility for enforcing traffic laws. The Arizona Department of Public Safety also has primacy when calling in support for traffic accidents, including hazardous materials accidents (see text box on page 4-157 of the Final Environmental Impact Statement). The Arizona Department of Transportation maintains a list of contractors who provide emergency response services, as well as local municipalities whose fire and police departments operate in cooperation with the Arizona Department of Public Safety on incidents within their jurisdiction. Requirements for shippers are maintained by the Arizona Department of Transportation's Enforcement Compliance Division. The West Van Buren Water Quality Assurance Revolving Fund site was identified and considered during development of the Draft Environmental Impact Statement (see pages 4-97 and 4-153 of the Draft Environmental Impact Statement, and the Draft Initial Site Assessment prepared for the proposed project). These sites are primarily groundwater-impact sites, and groundwater is found at a depth of over 60 feet below the footprint of the Preferred Alternative. Given the separation distance between the adversely affected medium (groundwater) and the construction zone (near-surface in these locations), the project team determined that these sites would not pose a risk to construction or to the general public once the facility were completed. This assessment has been clarified in the Final Environmental Impact Statement on page 4-165.

Code	Comment Document

bypass objective has always been downplayed by ADOT, even in the DEIS, in an attempt to mislead the public to bolster public approval of the project. Accordingly, the DEIS has not analyzed the improved O&D regional mobility that would result from a spur highway to/from I-10 West.

Hazardous Materials

The DEIS, starting on page 152, states,
"AFFECTED ENVIRONMENT
A hazardous materials evaluation for the construction and operation of the proposed freeway was conducted to determine whether:

➢ contaminated soils would be present near potential hazardous materials sites

➢ underground storage tanks would need removal or relocation because of freeway construction

➢ wells and dry wells would be present, providing unintended conduits for preexisting or accidental releases from the construction process to groundwater supplies

➢ during construction activities, workers could encounter soil contaminated with hazardous materials that had not previously been identified"

It doesn't mention the transportation of hazardous materials on the new freeway and their associated risks, or the fact that the area where the freeway would connect with I-10 West crosses a site that was identified in the 1980s as contaminated and added to the list of the state of Arizona's Water Quality Assurance Revolving Fund (WQARF), which is the state's equivalent of a Superfund Site. The site has known groundwater contamination and soil contamination.

396

The introduction of hazardous materials and their associated risks into Ahwatukee Foothills by the proposed SMF and its truck traffic would be significant. There are no industries using and emitting toxic chemicals in Ahwatukee Foothills that have reporting requirements under either the Toxics Release Inventory of the Emergency Planning and Community Right to Know Act (EPCRA) or the reporting of fixed facility hazardous materials (chemical) inventories required under the emergency planning provisions of EPCA. The latter, Tier Two chemical inventory reports, are annually required, and are reported to the fire department of jurisdiction (Phoenix Fire Department), the local emergency planning committee (Maricopa County LEPC), and the state emergency response commission (AZSERC). (The requirement for retail gas stations to file Tier Two reports was removed many years ago as long as these stations are in compliance with their reporting under the regulations for underground storage tanks.)

The Maricopa County LEPC and the AZSERC are the two emergency planning agencies tasked with developing and updating a comprehensive emergency

Code	Issue	Response
396	**Hazardous Materials**	Arizona highways, as are most highways across the United States, are open to all kinds of traffic, so long as the cargo being carried is in accordance with U.S. Department of Transportation regulations for the specific type of cargo. The Arizona Department of Transportation has a few locations in the state with hazardous cargo restrictions, but these restrictions are based on emergency response issues or roadway design limitations specific to that location. For example, the Interstate 10 Deck Park Tunnel has certain hazardous cargo transport restrictions because of the limited ability for emergency responders to address a hazardous materials incident in the tunnel. The South Mountain Freeway, if implemented, is expected to operate under the same rules as other similar facilities in the state; transport of hazardous cargo would be expected to be permissible (see text box on page 4-157 of the Final Environmental Impact Statement). The Arizona Department of Public Safety (which includes the State Highway Patrol) has primary responsibility for enforcing traffic laws. The Arizona Department of Public Safety also has primacy when calling in support for traffic accidents, including hazardous materials accidents (see text box on page 4-157 of the Final Environmental Impact Statement). The Arizona Department of Transportation maintains a list of contractors who provide emergency response services, as well as local municipalities whose fire and police departments operate in cooperation with the Arizona Department of Public Safety on incidents within their jurisdiction. Requirements for shippers are maintained by the Arizona Department of Transportation's Enforcement Compliance Division. In the event of an incident with a hazardous materials issue on a State or federal highway, the emergency responders contact the Arizona Department of Transportation's Traffic Operations Center to report the incident. The Traffic Operations Center then contacts the Arizona Department of Transportation's Safety and Risk Management group, which responds to the accident scene and assesses needs in concert with the incident commander from the responding agency with jurisdiction. If requested, the Arizona Department of Transportation can assist cleanup activities by engaging specialty subcontractors with whom the Arizona Department of Environmental Quality has contracts for such support. The Arizona Department of Transportation's Safety and Risk Management group's charge is primarily public health protection, with cleanup support being secondary.

396

response plan for Maricopa County and the state of Arizona, respectively. The plan, by statute, requires:

"Each emergency plan shall include (but is not limited to) each of the following:

(1) Identification of facilities subject to the requirements of this subchapter that are within the emergency planning district, identification of routes likely to be used for the transportation of substances on the list of extremely hazardous substances referred to in section 11002(a) of this title, and identification of additional facilities contributing or subjected to additional risk due to their proximity to facilities subject to the requirements of this subchapter, such as hospitals or natural gas facilities.

(2) Methods and procedures to be followed by facility owners and operators and local emergency and medical personnel to respond to any release of such substances.

(3) Designation of a community emergency coordinator and facility emergency coordinators, who shall make determinations necessary to implement the plan.

(4) Procedures providing reliable, effective, and timely notification by the facility emergency coordinators and the community emergency coordinator to persons designated in the emergency plan, and to the public, that a release has occurred (consistent with the emergency notification requirements of section 11004 of this title).

(5) Methods for determining the occurrence of a release, and the area or population likely to be affected by such release.

(6) A description of emergency equipment and facilities in the community and at each facility in the community subject to the requirements of this subchapter, and an identification of the persons responsible for such equipment and facilities.

(7) Evacuation plans, including provisions for a precautionary evacuation and alternative traffic routes.

(8) Training programs, including schedules for training of local emergency response and medical personnel.

(9) Methods and schedules for exercising the emergency plan.

Due to the unique nature of Ahwatukee Foothills, which is a residential area, and not zoned for heavy industrial uses, few hazardous materials transportation issues and risks exist there because none of these chemicals, other than gasoline and diesel, are being transported into the area, other than incidentally adjacent on Interstate 10, which is east of the area. A catastrophic release of hazardous chemicals along the I-10 corridor would have only an indirect effect on Ahwatukee Foothills.

Code	Issue	Response

Code	Comment Document
397	To determine the additional risks of hazardous materials transportation, the Maricopa County LEPC and the AZSERC would also need and utilize hazardous materials commodity flow studies to determine the types and amounts of hazardous materials being transported through or within the county and/or state to meet their respective planning requirements. Of course, the AZSERC does exactly that periodically, and the data and emergency planning is updated. But that data and the relevant analysis is absent in the DEIS.
398	The planning for response to an incident involving the release into the environment of a hazardous material involves using Aereal Locations of Hazardous Atmospheres (ALOHA), RMP*Comp, and Computer Aided Management of Emergency Operations (CAMEO). All are USEPA approved and provided emergency planning screening tools. RMP*Comp is used to predict the effects of a release that would exceed the ALOHA model limit of six miles. The worst case scenario release for chlorine was the only hazardous material being transported on the highways that, in the event of a catastrophic release, would exceed the six-mile ALOHA modeling limit, so RMP*Comp is used to assess the radius of impact for the worst-case chlorine release. ALOHA, RMP*Comp, and CAMEO are all distributed by the USEPA and are software programs provided and periodically updated by USEPA to determine the distance from a release point where there would be a danger to human health and safety. ALOHA can also calculate the levels of a released chemical that could infiltrate nearby buildings, the levels of those chemicals that will likely be in these buildings, and the time it would take for the released chemical(s) to reach their maximum concentration.
	As stated in the reports of the various hazardous materials commodity flow studies conducted in Arizona, ALOHA modeling already indicates, "a catastrophic release of gasoline from a tanker truck could cause areas up to 1.0 mile away to be affected at LOC 3 (a concentration where the general population could experience severe health effects and death) and areas as far as 3.1 miles away to be affected at LOC 1 (enough to cause discomfort in the general population). Credible and catastrophic releases of sulfuric acid would create an evacuation radius of 0.5 miles from the highway and railroad." (LOC means level of concern; LOCs range from 3 down to 1.)
	Ahwatukee Foothills already has some emergency planning needs due to the transportation of gasoline into and within the area. There should already be planning for an incident involving gasoline within a mile of current arterial traffic, including Pecos Road. Schools within a mile of Pecos should have an evacuation plan.
	The proposed SMF would only add exponentially to emergency planning needs and risks as more truck traffic of this chemical and others that are potentially more dangerous in the event of a catastrophic release would be transported immediately adjacent to schools, parks, shopping areas, and other vulnerable facilities in Ahwatukee Foothills. The freeway would be the sole source of these new risks from a hazardous materials incident, thus this would be a very significant impact directly

Code	Issue	Response
397	**Hazardous Materials**	The project team is aware of the Hazardous Materials Commodity Flow Studies that the Arizona State Emergency Response Commission maintains. These studies are used by emergency response planners (such as the Arizona State Emergency Response Commission statewide and the Maricopa County Local Emergency Planning Commission for Maricopa County) as one of the elements considered when developing emergency response plans. If the plan is amended, it is made available to the Arizona Department of Transportation.
398	**Hazardous Materials**	According to 46 *Federal Register* 18026 (March 23, 1981), the environmental impact statement must discuss reasonably foreseeable actions. These are actions that are likely to occur or probable, rather than those that are merely possible. There are no requirements in 23 Code of Federal Regulations 771 Environmental Impact and Related Procedures or in the Federal Highway Administration Technical Advisory T 6640.8A Guidance for Preparing and Processing Environmental and Section 4(f) Documents to address releases of hazardous chemicals due to a transportation incident in National Environmental Policy Act documents for transportation projects like the proposed action. As discussed above, reasonably foreseeable actions are those that are likely to occur or probable, rather than those that are merely possible. If the proposed action is the Selected Alternative in the record of decision, planning for emergency situations would be initiated. If the plan is amended, it is made available to the Arizona Department of Transportation.

Code	Comment Document

caused by the freeway, and a full analysis of the risks and effects should have been examined in the NEPA process.

397

The data and calculations of risk and distance from certain chemicals carried on the highways are documented in the July 9, 2009, report, *The Hazardous Materials Commodity Flow Study Report I-19 Corridor from I-10 to Mexico Border, Arterial Highways and Railways, Pima and Santa Cruz Counties, Arizona*; the October 30, 2006 report, *Hazardous Materials Commodity Flow Study Report I-8 and I-10 Corridors, Arterial Highways and Railways, Yuma, Maricopa, Pinal, Pima and Cochise Counties, Arizona*; and the December 5, 2008 *Hazardous Material Commodity Flow Study I-10 Corridor from SR 85 to California* prepared for the AZSERC. Previous commodity flow study reports would show the same sorts of information.

399

One piece of data that is missing is the Hazardous Materials Commodity Flow Study Report for the I-10 to I-8 to SR 85 to I-10 route that was selected as a truck bypass around 2006. (Part of the idea of this particular truck bypass was to route truck traffic away from the Phoenix metro area as a measure to reduce particulate matter air pollution.) According to ADOT, this also is part of the CANAMEX highway system that has been approved via treaties with Mexico and Canada, and this truck bypass has now been officially designated as the route of the CANAMEX.

Clearly, the SMF DEIS should have studied or promulgated this data to determine the traffic of hazardous materials that could be expected to shift to the SMF. Even without this last bit of information, a close approximation should have been calculated and examined in the DEIS.

400

HDR, the contractor for ADOT in the November 26, 2008, *SPR 624 Hazardous Materials Transportation in Arizona Literature Review with Findings Report*, would have reviewed all of this information, at a minimum. HDR is also the contractor for ADOT in the NEPA process for the SMF, and should have had access to this same information. There can be no valid reason for excluding any mention or analysis of the risks and additional planning from hazardous materials transportation in the SMF DEIS other than a deliberate exclusion.

401

From the beginning of the NEPA process regarding the SMF, Ahwatukee Foothills residents and others have consistently and vociferously raised concerns about the added risks to their community from the transportation of hazardous materials on the new SMF. In doing so they have consistently voiced concerns regarding the additional problems with hazardous materials response in the affected area, as well as evacuation and shelter in place issues. There is also a risk from the consequences of a hazardous materials transportation incident to the communities on the north side of the pass at South Mountain, and Laveen would be at a particularly heightened risk also. Therefore, the same types of impacts that threaten Ahwatukee Foothills would apply to these other communities, but at least these others have alternate escape routes that the community of Ahwatukee Foothills does not have.

Code	Issue	Response
399	**Trucks**	The road network in the Maricopa Association of Governments travel demand model includes the Interstate 8 and State Route 85 corridor. So, while the roads are not in the Study Area for the proposed action, traffic and trip distributions along the corridor are included in the traffic analysis for the proposed action. Any traffic that would shift from the Interstate 8 and State Route 85 corridor to the proposed action would be included in the vehicle mix considered in the analysis. A truck driver traveling from Tucson to Los Angeles and choosing to use Interstate 10 and the proposed freeway would travel 15 miles less than one choosing to use the designated truck bypass along Interstate 8 and State Route 85. Choosing to travel on the proposed action versus Interstate 8 and State Route 85 would not translate to any substantial travel time benefits. Therefore, it is expected that "true" through-truck traffic (not having to stop in the metropolitan area) would continue to use the faster, designated, and posted bypass system of Interstate 8 and State Route 85.
400	**Hazardous Materials**	The 2008 hazardous material report referenced in the comment was prepared to assist the Arizona Department of Transportation in refining its policies and process for determining hazardous materials routing in the state. It was a preliminary document and intended to form a basis of understanding about how other states' planning processes address this issue. The report was not intended to provide specific recommendations for hazardous materials routing, but rather to provide the Arizona Department of Transportation with information to consider in making possible adjustments to its planning process. The recommendations of the report have been taken under advisement by the Arizona Department of Transportation.
401	**Hazardous Materials**	According to 46 *Federal Register* 18026 (March 23, 1981), the environmental impact statement must discuss reasonably foreseeable actions. These are actions that are likely to occur or probable, rather than those that are merely possible. There are no requirements in 23 Code of Federal Regulations 771 Environmental Impact and Related Procedures or in the Federal Highway Administration Technical Advisory T 6640.8A Guidance for Preparing and Processing Environmental and Section 4(f) Documents to address releases of hazardous chemicals due to a transportation incident in National Environmental Policy Act documents for transportation projects like the proposed action. As discussed above, reasonably foreseeable actions are those that are likely to occur or probable, rather than those that are merely possible. If the proposed action is the Selected Alternative in the record of decision, planning for emergency situations would be initiated. If the plan is amended, it is made available to the Arizona Department of Transportation.

Code	Comment Document
401	As of 2010, the 35.8 square-mile community of Ahwatukee Foothills has a population of 77,249. So if there would be a catastrophic release from a 17-ton chlorine tanker along the Pecos Road alignment, almost all of these 77,249 would be at risk of death or severe injury. In Laveen, there are 35,502 residents who would be at a similar risk. There would also be risks to the residents of the Gila River Indian Community along the Pecos alignment. All of these above mentioned communities would be forever at risk of a very terrible, certain, and quick death from a chlorine release if this freeway gets built. All of these communities would have to be forever on hair trigger alert. They, as communities, would need periodic training and drills to protect them, as well as infrastructure in the form of siren systems and other alert systems, telephone ring down systems, and much more.
402	We know that over a hundred trucks per hour would be the number at the beginning of the freeway's opening, just from localized traffic information, but when the I-10 to I-8 to SR 85 to I-10 truck bypass is negated, there will be much more truck traffic. That number can be quantified, and that is something the DEIS should have done with the millions of dollars already spent. But HDR and ADOT skirted that by claiming in the DEIS that that information is not known and the impacts are unclear. That is absurd; that is precisely the sort of data that is quite available, and must be examined, studied, and analyzed.
403	The fact that the proposed freeway would eliminate the exits from the community at 32nd Street and Pecos would only exacerbate an already difficult position that this community would be in if there were an evacuation or the need for a response to a catastrophic hazardous materials incident. Regular traffic is already voluminous at that intersection: • Pecos (west approach) - Total 22,313 veh/day (2012 count) including 11,727 westbound and 10,586 eastbound volumes. • Pecos (east approach) - Total 28,178 veh/day (2012 count) including 14,331 westbound and 13,847 eastbound volumes • 32nd Street (north approach) - Total 7,807 veh/day (2011 count) including 3,761 northbound and 4,406 southbound volumes. With that access to Pecos Road being removed by the freeway, all of that traffic would have to find another way out and further clog and congest other exit routes. Yet there was no mention or analysis of these issues in the DEIS.
404	The October 30, 2006 report, *Hazardous Materials Commodity Flow Study Report I-8 and I-10 Corridors, Arterial Highways and Railways, Yuma, Maricopa, Pinal, Pima and Cochise Counties, Arizona*, also mentions the risk from a release of chlorine gas and the risks of a catastrophic release during a transportation incident. As stated, RMP*Comp is a USEPA approved emergency planning screening tool used when ALOHA predicts the effects of a release would exceed the ALOHA model limit of six miles. The worst-case scenario release for chlorine was the only material to exceed the six-mile ALOHA limit.

402	**Trucks**	The road network in the Maricopa Association of Governments travel demand model includes the Interstate 8 and State Route 85 corridor. So, while the roads are not in the Study Area for the proposed action, traffic and trip distributions along the corridor are included in the traffic analysis for the proposed action. Any traffic that would shift from the Interstate 8 and State Route 85 corridor to the proposed action would be included in the vehicle mix considered in the analysis. A truck driver traveling from Tucson to Los Angeles and choosing to use Interstate 10 and the proposed freeway would travel 15 miles less than one choosing to use the designated truck bypass along Interstate 8 and State Route 85. Choosing to travel on the proposed action versus Interstate 8 and State Route 85 would not translate to any substantial travel time benefits. Therefore, it is expected that "true" through-truck traffic (not having to stop in the metropolitan area) would continue to use the faster, designated, and posted bypass system of Interstate 8 and State Route 85.
403	**Traffic**	The determination to not include an interchange at 32nd Street was made in coordination with the City of Phoenix (see Figure 3-8 on page 3-15 of the Draft Environmental Impact Statement). The interchange was eliminated based on undesirable residential displacements and cost. In 2006, the City of Phoenix conducted a traffic circulation study to evaluate the impacts of the proposed freeway on the local street system, including the shift of access to Foothills Reserve and Calabrea from Pecos Road to Chandler Boulevard. The City study found no adverse effects on the local street system from the freeway (see Appendix 3-1 in the Final Environmental Impact Statement).
404	**Hazardous Materials**	The project team is aware of the Hazardous Materials Commodity Flow Studies that the Arizona State Emergency Response Commission maintains. These studies are used by emergency response planners (such as the Arizona State Emergency Response Commission statewide and the Maricopa County Local Emergency Planning Commission for Maricopa County) as one of the elements considered when developing emergency response plans. If the plan is amended, it is made available to the Arizona Department of Transportation.

Code	Comment Document
405	Since Ahwatukee Foothills is not six miles wide from Pecos Road to South Mountain, it is easy to conclude that, in the event of a catastrophic release of chlorine from a 17-ton tanker of chlorine gas, all of Ahwatukee Foothills would have to either evacuate or shelter in place. Further, an ALOHA modeling indicates that buildings within two miles of the point where the chlorine release occurred would have high enough levels of chlorine gas infiltrate into them to become lethal, which means that shelter in place strategies would not work. The only option would be evacuation, but as chlorine gas flows rapidly at ground level because it is heavier than air, it is unlikely that people would survive long enough to evacuate. Depending on the size of the hole or the rupture of the tanker of chlorine, the tanker could completely empty in a minute or so. And these chlorine truck tankers are quite vulnerable to bullets and other physical trauma. For an objective examination of issues related to a catastrophic release from a chlorine tanker truck, see *Mathematical Modeling and Decision Analysis for Terrorism Defense: Assessing Chlorine Truck Attack Consequence and Countermeasure Cost Effectiveness,* Anthony Michael Barrett. It notes: "Adapting our modeling system to ruptures emptying a tank via flashing two-phase flow through an orifice [80], forming horizontal jets, indicates that such releases could result in approximately the same number of fatalities as an instantaneous release, if such a release takes 10 minutes or less. " page 42 "People in vehicles may be as well off staying where they are, turning off the air-supply fan and sealing the vents, as heading into a nearby building. It may also be dangerous for them to try to drive away, since they may unintentionally drive into higher-concentration areas."
406	"Without fast and effective defense response, release of 17 tons of chlorine from a tank truck in a generic urban area with 2.5 m/s wind and Pasquill stability class F, could result in approximately 4000 (half within ~10 minutes) to 30,000 fatalities (half within ~20 minutes), depending on dose-response model."
405	Chlorine gas in even small concentrations is harmful. A person encountering chlorine gas will have a hard time seeing as the chlorine reacts with the moisture in the eye to create hydrochloric acid. The eyes will tear up and make seeing very difficult. At high enough levels, severe scarring and blindness will result. The same formation of hydrochloric acid will occur in the throat and lungs. People won't be able to take a deep breath or breathe without choking, as mucous membranes in the respiratory system will be quite irritated and will start to weep. Lungs will blister, and the ability to pass oxygen to the blood through the lung membranes will be compromised immediately. Walking, much less running, will be very difficult. A half blinded, gasping person who cannot take a deep breath is not

Code	Issue	Response
405	**Hazardous Materials**	According to 46 *Federal Register* 18026 (March 23, 1981), the environmental impact statement must discuss reasonably foreseeable actions. These are actions that are likely to occur or probable, rather than those that are merely possible. There are no requirements in 23 Code of Federal Regulations 771 Environmental Impact and Related Procedures or in the Federal Highway Administration Technical Advisory T 6640.8A Guidance for Preparing and Processing Environmental and Section 4(f) Documents to address releases of hazardous chemicals due to a transportation incident in National Environmental Policy Act documents for transportation projects like the proposed action. As discussed above, reasonably foreseeable actions are those that are likely to occur or probable, rather than those that are merely possible. If the proposed action is the Selected Alternative in the record of decision, planning for emergency situations would be initiated. If the plan is amended, it is made available to the Arizona Department of Transportation.
406	**Hazardous Materials**	Stability data for the area are likely unavailable, but an "F" stability would probably occur only during the early morning hours and would be associated with drainage winds coming from the northeast that would carry the plume away from inhabited areas. Issues of a severe accident such as the one described exist for many portions of the Phoenix metropolitan area. Fast and effective defense response is critical in the emergency response plans prepared by emergency service providers and discussed on page 4-157 of the Final Environmental Impact Statement.

Code	Comment Document
405	going to be a match for a cloud of chlorine, and any evacuation, or rescue on any scale, after the arrival of the chlorine gas will be virtually impossible. Handicapped and elderly people, as well as children, would be at a particular disadvantage. People outside would have no place to go to for sheltering in place. Shelter in place strategies, i.e. having people shelter in a building, stop ventilation systems, and block up and seal all air flow, will have to be successful before the chlorine gas arrives. Otherwise, those sheltering will bottle themselves up with a harmful gas. ALOHA modeling indicates that certainly all buildings within a mile of the chlorine release from a 17-ton tanker truck would have such high levels of chlorine gas infiltrate into them that most people there would die, or be very severely injured. Some models put that circle of assured death at closer to two miles away. There are schools and residential areas on the north side of the Pecos Road alignment within a mile of the proposed SMF, and many more within two miles of the freeway alignment. There would be thousands of people at an extreme risk.
407	The prevailing winds push across GRIC land toward the north, toward South Mountain, and also to the west through the 51st Avenue pass. Chlorine fumes from an incident on the Pecos Road alignment will certainly be most likely to blow the cloud into all of Ahwatukee Foothills, then on to the GRIC at 51st Avenue, then into Laveen.
405	There is a pass at 51st Avenue where the proposed truck bypass/freeway is planned. If the chlorine incident happened at the 51st Avenue pass and/or Laveen, the one to two mile kill zone and six+ miles of harm would apply there with just a few minutes to take appropriate action to evacuate or shelter in place. There is the additional problem of handling the people outdoors at parks, bicycling, hiking, shopping, and other activities if such an incident occurred. Strategies would have to be determined well in advance. Law enforcement personnel and emergency responders would need to be trained, drilled, equipped properly, and otherwise prepared for this scenario. If the 17-ton tanker of chlorine empties in minutes, there won't be much the emergency responders can do to stop the leak, but patch kits are available for that purpose. A rupture or hole may be too large to patch, and that size of opening would vent all the chlorine anyway by the time any responders arrived. Limited freeway access and egress becomes a response hindrance also. One responder strategy would be to try to "knock down" the cloud of chlorine with water. To prepare for that, the freeway would have to have a hydrant system with enormous amounts of water and water pressure, as no fire truck would have enough water to last very long. All that water and chlorine would make plenty of hydrochloric acid. The hydrochloric acid would eat away and decay the responding vehicles and equipment, the concrete on the freeway, its culverts, degrade the asphalt pavement, and ruin any metal cables and metal where the acid solution washed to. The freeway would have to be designed so that such an incident would not also destroy it.

Code	Issue	Response
407	**Air Quality**	According to the 2013 Arizona Department of Transportation *Air Quality Assessment South Mountain Freeway 202L Draft Report*, review of wind data from the Gila River Indian Community monitoring site at St. Johns suggests that during the morning hours and associated with mountain-drainage air flows and stable atmospheric conditions, wind flows are from the southeast and follow the Gila River channel to the north. Locations to the east of St. Johns experience flow from the east to the lower elevations along the Gila River. During the warmer hours' improved mixing, flows typically follow the river channel and come from the north and northwest. Likewise, during a 1-month-long meteorological monitoring period (November 20, 2006, through December 21, 2006) at Pecos Road and 40th Street and a second 1-month-long monitoring period at Pecos Road and 24th and 40th streets (April 19, 2007, through May 21, 2007), winds during the morning hours typically were from the northeast. During the warmer hours, and with improved mixing, winds typically were from the west.

Code	Comment Document
408	There would also be residual effects. The January 2005 chlorine disaster in Graniteville, South Carolina illustrates some of these. Following the chlorine disaster, Avondale Mills (textile company) officials had spent more than $140 million on cleaning, repairs and damage mitigation from the textile mills machinery that was corroded so severely by the chlorine gas that it had to be replaced, only to find that new equipment brought to the plant quickly corroded because chlorine was still present and reacting with other agents. That the corrosive effects of the chlorine from such a large release would last so long needs to be taken into account in assessing the costs associated with such an incident. The chlorine reacts with moisture to form hydrochloric acid, but over time, one would expect that this would diminish. In assessing the damages from a large-scale chlorine release, emergency responders and emergency planning agencies should look for this lasting effect. The corrosive effects could harm pavement, concrete, industrial infrastructure, and even residential structures and the electrical wiring. A much more detailed decontamination, including pH samplings, should be undertaken in the recovery phase of operations to prevent such devastation. NEPA requires examination of cultural, social, and economic impacts, and the new hazardous materials traffic and risks caused by the SMF would certainly affect all of these topic areas. Despite all of this, there is nothing in the DEIS that even mentions the hazardous materials transportation and risks issue! Yet, it is evident that ADOT plans for hazardous materials being transported on this proposed highway. [Page 5-20].
409	Hazardous Materials has been mostly limited in the DEIS to a discussion of hazardous materials that might be encountered in the soils during construction. Yet, despite this alleged concern, the fact that the proposed path of the freeway crosses contaminated property near Interstate 10 and 55th Avenue is neither mentioned nor examined, much less the financial liability the taxpayers might be assuming by purchasing the contaminated property. That would certainly be an enormous economic impact. Since the 1980s, there has been well-documented groundwater contamination in the area around 51st avenue and Van Buren to 59th Avenue and Van Buren, enough so that it was added to the list of the state of Arizona's Water Quality Assurance Revolving Fund (WQARF), which is the state's equivalent of a Superfund Site. By purchasing this contaminated land for the freeway, the state of Arizona would assume the liability for the clean up of these contaminants, along with the liability for adverse health impacts suffered by workers in the area. This is a type of corporate welfare, as it would remove the liability costs from the various polluters and current property owners that have ground and groundwater pollution issues and transfer it to the people of Arizona.

Code	Issue	Response
408	**Hazardous Materials**	According to 46 *Federal Register* 18026 (March 23, 1981), the environmental impact statement must discuss reasonably foreseeable actions. These are actions that are likely to occur or probable, rather than those that are merely possible. There are no requirements in 23 Code of Federal Regulations 771 Environmental Impact and Related Procedures or in the Federal Highway Administration Technical Advisory T 6640.8A Guidance for Preparing and Processing Environmental and Section 4(f) Documents to address releases of hazardous chemicals due to a transportation incident in National Environmental Policy Act documents for transportation projects like the proposed action. As discussed above, reasonably foreseeable actions are those that are likely to occur or probable, rather than those that are merely possible. If the proposed action is the Selected Alternative in the record of decision, planning for emergency situations would be initiated. If the plan is amended, it is made available to the Arizona Department of Transportation.
409	**Hazardous Materials**	The West Van Buren Water Quality Assurance Revolving Fund site was identified and considered during development of the Draft Environmental Impact Statement (see pages 4-97 and 4-153 of the Draft Environmental Impact Statement, and the Draft Initial Site Assessment prepared for the proposed project). These sites are primarily groundwater-impact sites, and groundwater is found at a depth of over 60 feet below the footprint of the Preferred Alternative. Given the separation distance between the adversely affected medium (groundwater) and the construction zone (near-surface in these locations), the project team determined that these sites would not pose a risk to construction or to the general public once the facility were completed. This assessment has been clarified in the Final Environmental Impact Statement on page 4-165.

Code	Comment Document
410	**Noise pollution** The DEIS cited an outdated noise abatement policy and included an incomplete review of the regulations regarding noise (page 4-80). In particular, the Quiet Communities Act of 1978, promoting the development of state and local noise control programs, should have been discussed. Further, not all receptors that could be impacted by noise from the SMF were identified and impacts predicted for. For example, effects on multiple schools located within 0.5 miles of the proposed SMF were not evaluated (page 4-84). Vibration from blasting is qualitatively discussed in the Topography, Geology, and Soils section (page 4-115) of the DEIS; however, vibration from non-blasting construction activities and from operational impacts is not discussed anywhere within the DEIS. The DEIS discusses the use of noise barriers as a primary means of noise mitigation (page 4-80). The use of noise barriers as proposed in the DEIS is unacceptable. The DEIS states that barriers would not be constructed higher than 20 feet because of cost, aesthetics, and constructability. This is as it should be. Yet in some areas, a 20-foot sound barrier would not achieve acceptable noise abatement (page4-90).
411	The design of a depressed (below ground level) freeway has been rejected, in spite of the fact that this would provide substantial noise abatement. It appears that the SMF is being designed as the "Walmart of freeways" to keep the cost down, regardless of the negative impacts this would have on the communities affected. Raised freeway overpasses from a ground level freeway would propagate traffic noise and pollution at a greater distance.
412	The only other noise mitigation strategy that was considered, according to the DEIS, is the use of rubberized asphalt, which isn't even a proven strategy. Even to the extent that it works to reduce noise, it would not provide enough noise abatement to make the noise pollution levels acceptable at some locations along the proposed freeway route.
413	**Water and Soil Issues** Concerns were raised to ADOT throughout the scoping process about the destruction of supply wells located along Pecos Road if the SMF were built along that alignment. ADOT appears to be aware of these concerns, as an attempt is made to directly address them on page 4-100 of the DEIS. Yet the analysis of wells used for water supply for the Foothills golf courses make use of information that is both outdated and erroneous. This leads to an insufficient analysis that does not make use of the "best available scientific and technical information." ADOT identified that the Foothills Community Association has multiple sources of water available other than the supply well that would be lost because of the SMF. The DEIS identifies effluent, well water, and municipal water supplied by the City of Phoenix as being available. The wastewater treatment plant referenced in the DEIS

Code	Issue	Response
410	**Noise**	The noise analysis has been updated for the Final Environmental Impact Statement using most recent Federal Highway Administration and Arizona Department of Transportation policy and traffic projections provided by the Maricopa Association of Governments in August 2013. This updated analysis begins on page 4-88 of the Final Environmental Impact Statement. No substantial differences between the analyses presented in the Draft and the Final Environmental Impact Statements resulted. As stated in the Council on Environmental Quality's Regulations for Implementing the Procedural Provisions of the National Environmental Policy Act, environmental impact statements should be analytic rather than encyclopedic [40 Code of Federal Regulations Part 1502.2(a)]. Those noise regulations of direct consequence to the proposed action were discussed. There are no federal requirements directed specifically to highway traffic induced vibration. All studies the highway agencies have done to assess the impact of operational traffic induced vibrations have shown that both measured and predicted vibration levels are less than any known criteria for structural damage to buildings. The Arizona Department of Transportation Noise Abatement Policy limits noise abatement walls to 20 feet in height.
411	**Drainage**	As noted on page 3-18 of the Draft Environmental Impact Statement, drainage served as the primary design constraint for the Pecos Road segment of the E1 Alternative. Assessments were performed to determine constructibility and effectiveness in avoiding or reducing impacts and to evaluate whether a depressed profile would generate other desired or undesired outcomes. Based on the results of these assessments, further design options were developed and refined in attempts to reduce impacts on the adjacent community. The modifications incorporated alternative drainage designs, use of retaining walls, and other features to reduce right-of-way requirements.
412	**Noise**	As disclosed on page 4-90 of the Draft Environmental Impact Statement, not all noise barriers would be capable of reducing traffic noise levels to levels recommended in the Arizona Department of Transportation's Noise Abatement Policy. The Federal Highway Administration does not recognize rubberized asphalt as a noise abatement methodology; however, the Arizona Department of Transportation will use rubberized asphalt as the driving surface for the proposed freeway.
413	**Water Resources**	The comment is correct that wastewater effluent is not available as a replacement source and is not being used. The City of Phoenix did operate a wastewater reclamation facility in this area, but it was removed from service and demolished. The City of Phoenix still owns the property, but all facilities have been removed from the site. Thus, only two water sources are available for irrigation and lake supply for the Foothills Community Association: the well that would be acquired and potable water from the City of Phoenix. The discussion on page 4-100 of the Draft Environmental Impact Statement has been modified in the Final Environmental Impact Statement to reflect that reclaimed wastewater would not be available; however, the conclusion on page 4-100 is still appropriate. As stated on page 4-100 of the Draft Environmental Impact Statement, "In the event that well replacement were to be impossible, the Arizona Department of Transportation would still replace the water that would be lost through the acquisition."

Code	Comment Document

was removed by the City of Phoenix in the late 1990s. This key information, that effluent is completely unavailable, was reportedly made available to ADOT. It was not, however, used in the analysis of water supply availability.

414 The analysis of water replacement on page 4-100 is flawed in another way. The analysis is summarized as: "It is understood that finding a suitable location for a new well in this area may be difficult." This difficulty is dismissed by indicating that there are at least two other sources of water, which is erroneous. The only other source is municipal water, which would be prohibitively expensive. Further, the statement that drilling a new well may be difficult seriously downplays the importance of the wells that would be lost, the unique hydrogeology of the area, and the rarity of how productive these particular wells are.

415 In addition to being technically flawed, the analysis presented in the DEIS has been applied in an arbitrary manner. The detailed analysis focused solely on the Foothills Community Association and the potential loss of their wells. The DEIS does not analyze nearby entities that would experience the same impacts, or entities anywhere else along the freeway route. One specific example is the Lakewood Community Association. The supply wells currently used by the Lakewood community would be even more difficult to replace given their large pumping capacity.

416 The analysis of water quality is insufficient. While existing background water quality (page 4-97) is of interest, the more important concern is the potential for the proposed freeway route to impact known areas of contamination. This is not disclosed in the assessment of water resources. There are several basic and readily available data sources that should have been consulted for this analysis. At a minimum: (1) known Leaking Underground Storage Tank (LUST) sites, (2) known State WQARF or Federal CERCLA superfund sites, and (3) known or suspected landfills, either historic or active (the location along the Salt River makes this a particularly important item to assess in the DEIS).

417 There is no section within the DEIS that discussed the unique erosion issues that would be encountered when excavating South Mountain. Making deep cuts into three ridges of the mountain would create an enormous area for potential erosion of the mountain. Yet the DEIS just referenced the use of "erosion control." Erosion control for deep cuts into mountains must include special measures that not only mitigate the effects of erosion at the time the excavation occurs, but also the long-term and continuing effects of erosion. Without a plan and commitment to mitigate the continuing forces of erosion, initial efforts to control erosion will become ineffective within a relatively short time.

418 Regarding the DEIS component addressing the US Army Corps of Engineers section 404 of the Clean Water Act (page 4-112), the 401 certification by ADEQ is in jeopardy. EPA has found that ADOT has routinely failed to comply with contracts with FHWA, USACOE, ADEQ and USFS to maintain, limit or control sediment

22

Code	Issue	Response
414	**Water Resources**	Page 4-100 of the Draft Environmental Impact Statement states that finding a suitable location for a new well in this area may be difficult. Productivity of the well in bedrock formations is primarily based on intercepting fractures, and that can be very difficult to do. The Arizona Department of Transportation is aware of the difficult conditions that exist in replacing wells in this area. The procedure identified on page 4-100 of the Draft Environmental Impact Statement defines the procedure that the Arizona Department of Transportation would use to replace impacted wells, and also identifies the general costs that the Arizona Department of Transportation would incur to replace the lost water sources. Depending on whether an action alternative were the Selected Alternative, it may be possible to keep the well in its current location, but move the well controls and associated piping to outside of the right-of-way. Such an analysis would be performed later in the design process.
415	**Water Resources**	Because of the public concern expressed during the environmental impact statement process, page 4-100 of the Draft Environmental Impact Statement focuses on the Foothills Community Association to provide more details on the well acquisition, condition assessment, and replacement process used by the Arizona Department of Transportation. This information applies equally to the Lakewood Community Association or any other acquired well in the area.
416	**Hazardous Materials**	The West Van Buren Water Quality Assurance Revolving Fund site was identified and considered during development of the Draft Environmental Impact Statement (see pages 4-97 and 4-153 of the Draft Environmental Impact Statement, and the Draft Initial Site Assessment prepared for the proposed project). These sites are primarily groundwater-impact sites, and groundwater is found at a depth of over 60 feet below the footprint of the Preferred Alternative. Given the separation distance between the adversely affected medium (groundwater) and the construction zone (near-surface in these locations), the project team determined that these sites would not pose a risk to construction or to the general public once the facility were completed. This assessment has been clarified in the Final Environmental Impact Statement on page 4-165.
417	**Geology**	Information gained through geotechnical investigations would be used to design the slopes to be stable and to protect against stormwater flows and related erosion. Technical reports addressing rock cut slope designs would be prepared as part of the preliminary and final geotechnical investigations of the selected freeway alignment. Stormwater flows and related erosion from excavated areas would be addressed by implementation of a Stormwater Pollution Prevention Plan and related best practices. Stormwater Pollution Prevention Plans are required on Arizona Department of Transportation construction projects to control and mitigate erosion and loss of soil from the project and off-site movement of eroded sediments. During construction, off-site impacts to soil from erosion related to the freeway construction project are not expected. Implementation of the Stormwater Pollution Prevention Plan and related best practices would keep eroded sediments on site for collection and replacement as appropriate. After construction, grading and drainage and landscape design components of the freeway system would act to control and mitigate erosion.

(Response 418 begins on next page)

Code	Comment Document

discharges into jurisdictional waters of the US. The Gila and Salt Rivers are waters of the US inside this planned project. EPA actions have created an environmental program inside of ADOT. This environmental program has failed to implement the most basic construction mitigations. Statewide highway construction along hillsides have created large and numerous rills (deep cuts down hillsides). These rills wash sediment into our waterways, polluting the ecosystem. ADOT management downplays environmental stewardship. ADEQ, Army Corps of Engineers, and FHWA do not conduct any inspections. Internal ADOT environmental staff does not influence ADOT management. FHWA does not provide funding for continued maintenance of hillside erosion after construction. Statewide, ADOT does not provide its maintenance highway workers funding to mitigate sediment discharges from hillside rills and failed sediment control features of the original construction best management practices. ADOT has failed to protect the environment in nearly all completed construction sites with the same terrain of the SMF. It would be expected that ADOT would not honor their own Statewide Individual Stormwater permit, allowing sediment discharges during and after construction of the freeway. (Haddow, *South Mountain Freeway 202 DEIS Comments Prepared for PARC et al*, 2013)

419

All of this points to an expected inadequate response by ADOT to water and soil issues that would arise during and after construction of the SMF. And the DEIS provides nothing to lead to a different conclusion.

420

South Mountain Preserve and Park

The DEIS proposed that the SMF would cut through a part of South Mountain Preserve and Park. The DEIS said that the eminent domain claim on the Preserve and Park would be for just a small part of the whole, so it would be of little consequence. To some extent this is a matter of opinion. However, if someone claimed that they just wanted to cut a couple of toes off the foot of the Director of ADOT, his opinion would undoubtedly be that his toes are quite important. We also object quite strongly to the desecration of South Mountain Preserve and Park! It is a living entity that should remain whole, and it should not experience painful losses that result in ugly scars.

We must ask, what part of the word "preserve" does ADOT not understand? The people of Phoenix created the Phoenix Mountain Preserves to do just what the word implies – preserve them. Further, South Mountain Park is the largest wilderness municipal park in this country – some claim in the world. The fact that it is large is what makes it a magnificent wilderness park. And since it is right in the city of Phoenix, it is readily accessible to all the residents of the Valley of the Sun. Recreation is one of the major draws bringing people to this Valley, both to vacation and to live. Yet ADOT indicates in the DEIS that this is of little consequence and implies that it is much more important for trucks to get to their destinations as directly as possible, in spite of any amount of damage they may do to our precious resources, including South Mountain.

Code	Issue	Response
418	**Water Resources and Waters of the United States**	Controlling and treating runoff is a normal function of the Arizona Department of Transportation projects. No evidence is offered to substantiate such statements. The U.S. Army Corps of Engineers, as a cooperating agency, has participated and contributed in each step of the environmental process. The agency has found the logical sequence of decision making to be sound and in line with National Environmental Policy Act requirements. The Arizona Department of Environmental Quality has also contributed to the process. Both agencies as referenced in the comment have oversight roles in project permitting as established in the Clean Water Act (Sections 401, 402, and 404). Extensive mitigation in accordance with the permitting requirements can be found in the *Water Resources* and *Waters of the United States* sections of Chapter 4 of the Final Environmental Impact Statement. The Arizona Department of Transportation is fully obligated and committed to implementation and adherence to those mitigation strategies.
419	**Mitigation**	If an action alternative is the Selected Alternative, the record of decision issued for the project will contain all mitigation measures to be implemented for the project. The Federal Highway Administration and Arizona Department of Transportation will commit to implementation of all mitigation measures in the record of decision.
420	**Section 4(f) and Section 6(f)**	The acreage of parkland to be converted to a transportation use is reported on Draft Environmental Impact Statement page 5-14 in the section, *Direct Use*. Additional text on that page focuses on other concerns associated with the direct use of the park/preserve (see the sidebar on page 5-14, "*The South Mountains in Phoenix's Sonoran Preserve System*") as well as describing the importance of the park in the region. City of Phoenix planning efforts since the mid-1980s illustrate an awareness of the potential for the proposed freeway to affect Phoenix South Mountain Park/ Preserve. In 1989, the South Mountain Park Master Plan was adopted by the Phoenix City Council. The master plan shows the freeway alignment as adopted by the State Transportation Board in 1988. In 1990, the South Mountain Preserve Act was ratified by the Arizona Legislature. The Act did not apply to roadways through a designated mountain preserve if the roadway was in the State Highway System prior to August 15, 1990. The proposed freeway was in the State Highway System prior to 1990. Records prior to the Act suggest a primary reason for the exception was to allow the proposed freeway to go through Phoenix South Mountain Park/ Preserve (see Draft Environmental Impact Statement page 5-14). The project team examined alternatives to avoid the park, but did not identify any feasible and prudent alternatives to avoid impacts. The portion of the park that would be used for the proposed freeway would be 31.3 acres, or approximately 0.2 percent of the park's approximately 16,600 acres (see pages S-39 and 5-31 of the Draft Environmental Impact Statement). The Arizona Department of Transportation continues to work with park stakeholders to minimize impacts and address concerns. Measures to minimize harm to the park were developed (see the Draft Environmental Impact Statement, starting on page 5-23).

Code	Comment Document
421	Let us not forget that South Mountain is home to many living species. The DEIS mentioned (Chapter 4) that ADOT was aware that the desert tortoise is a threatened species and that many animals and plants would be permanently affected by the SMF, particularly in South Mountain. However, their mitigation plan is basically to be careful to destroy as few of the living species and their habitat as possible. The SMF would try to put in replacement migration routes for South Mountain animals that migrate to and from the Sierra Estrella. And that's it. The desert tortoise population (especially sensitive since it is a threatened species) would just be diminished, as would its habitat and that of all the species that inhabit the western part of South Mountain. Additional issues that the DEIS does not consider include: • The Sonoran Desert was listed in 2011 as one of the 12 most threatened landscapes in the US by the Cultural Landscape Foundation. Further fragmentation of an endangered ecosystem would have a significantly negative impact. • The increase in fire danger would further threaten a desert ecosystem that has not evolved with fire. • A highway through the ecosystem would increase the types of invasive species and increase their spread because the highway would provide a corridor for their movement. • With the increase in pollutants, there would be an increase in the hazard to humans who hike and bike in South Mountain Park, particularly on the west end. The hazard is not only that the highway would increase the pollutants in the park but also that the activities of walking and bicycling increase exposure to air pollutants. • The increased air pollutants due to the proximity of the highway would also negatively affect many plants, whether airborne or in the soil. • South Mountain contains many iconic plants, such as ironwood, saguaro, Arizona Queen of the Night, elephant tree, ocotillo. Construction kills plants. Those that are removed to be replanted, such as saguaro, historically experience a very high mortality rate. • Specialized species such as elephant tree and saguaro will respond negatively due to loss of habitat. • The western part of South Mountain Park currently has a healthier ecosystem than the eastern or central part of the park because it is a more isolated area and those who use it don't typically abuse it. It provides a sense of wilderness not experienced in any other City Preserve. A highway through the western end of the park would destroy the wilderness and make it the least healthy part of the park.

Code	Issue	Response
421	**Biology, Plants, and Wildlife**	The section, *General Impacts on Vegetation, Wildlife, and Wildlife Habitat*, beginning on page 4-125 of the Draft Environmental Impact Statement, discloses by what means the proposed action and its alternatives would affect vegetation, wildlife, and wildlife habitat. A Biological Evaluation was submitted to the U.S. Fish and Wildlife Service, Arizona Game and Fish Department, and Gila River Indian Community Department of Environmental Quality that addressed threatened, endangered, and candidate species, including the Sonoran desert tortoise. The information used to prepare the analysis in the Draft Environmental Impact Statement (page 4-122) was based on 2011 information retrieved from the Arizona Game and Fish Department (Gopherus agassizii, draft unpublished abstract compiled and edited by the Heritage Data Management System, Phoenix). Current information on threats and connectivity strategies was included in the Biological Evaluation. The U.S. Fish and Wildlife Service concurred with the species determinations in the Biological Evaluation (see Appendix 1-1 of the Final Environmental Impact Statement). Connectivity is planned to allow wildlife movement beneath the freeway in multiuse crossings (see page 4-125 of the Draft Environmental Impact Statement). The Federal Highway Administration and Arizona Department of Transportation have committed to providing mitigation by including multifunctional crossing structures designed for wildlife and for limited human use as well as culverts designed for connectivity for smaller species. Wildlife-friendly design information would be considered during the design of drainage and crossing structures for the freeway (see *Mitigation*, beginning on page 4-138 of the Final Environmental Impact Statement).
422	**Biology, Plants, and Wildlife**	The comment reflects a concern associated with the cumulative impacts of the proposed action on habitat in the region. A discussion of cumulative impacts addressing this issue can be found in the section, *Secondary and Cumulative Impacts*, beginning on page 4-167 of the Draft Environmental Impact Statement. The proposed project is located primarily adjacent to already developed areas except for at the southwest end of the South Mountains. In this area, multifunctional crossing structures are planned at locations where natural movement corridors occur along major drainages (see pages 4-125, 4-126 and Figure 3-25 on page 3-47 of the Draft Environmental Impact Statement).
423	**Biology, Plants, and Wildlife**	The comment implies that the proposed action would be directly responsible for increased fire potential. While a new road facility could increase the chance of fires originating from cigarettes tossed out windows or from vehicles catching fire on the roadside, the Arizona Department of Transportation designs urban roadside landscaping to minimize the chance of roadside fires spreading beyond the right-of-way. Fires originating on urban highways and spreading to natural preserves is not an issue on similar facilities in the Phoenix area, such as State Route 51 and State Route 101L.
424	**Biology, Plants, and Wildlife**	The Arizona Department of Transportation regularly implements mitigation measures to control and minimize the presence of invasive and noxious species on its facilities and would do the same for this project, in compliance with Executive Order 13112. This requirement is described on page 4-119 of the Draft Environmental Impact Statement. This includes identifying, controlling, and monitoring for invasive species as well as prevention of their incidence in areas where they are not presently found. The Order also includes restoration of native plant species where invasive plant species are found.

Code	Comment Document

Let us not forget that South Mountain is home to many living species. The DEIS mentioned (Chapter 4) that ADOT was aware that the desert tortoise is a threatened species and that many animals and plants would be permanently affected by the SMF, particularly in South Mountain. However, their mitigation plan is basically to be careful to destroy as few of the living species and their habitat as possible. The SMF would try to put in replacement migration routes for South Mountain animals that migrate to and from the Sierra Estrella. And that's it. The desert tortoise population (especially sensitive since it is a threatened species) would just be diminished, as would its habitat and that of all the species that inhabit the western part of South Mountain.

Additional issues that the DEIS does not consider include:

- The Sonoran Desert was listed in 2011 as one of the 12 most threatened landscapes in the US by the Cultural Landscape Foundation. Further fragmentation of an endangered ecosystem would have a significantly negative impact.
- The increase in fire danger would further threaten a desert ecosystem that has not evolved with fire.
- A highway through the ecosystem would increase the types of invasive species and increase their spread because the highway would provide a corridor for their movement.

425
- With the increase in pollutants, there would be an increase in the hazard to humans who hike and bike in South Mountain Park, particularly on the west end. The hazard is not only that the highway would increase the pollutants in the park but also that the activities of walking and bicycling increase exposure to air pollutants.

426
- The increased air pollutants due to the proximity of the highway would also negatively affect many plants, whether airborne or in the soil.

427
- South Mountain contains many iconic plants, such as ironwood, saguaro, Arizona Queen of the Night, elephant tree, ocotillo. Construction kills plants. Those that are removed to be replanted, such as saguaro, historically experience a very high mortality rate.

428
- Specialized species such as elephant tree and saguaro will respond negatively due to loss of habitat.

429
- The western part of South Mountain Park currently has a healthier ecosystem than the eastern or central part of the park because it is a more isolated area and those who use it don't typically abuse it. It provides a sense of wilderness not experienced in any other City Preserve. A highway through the western end of the park would destroy the wilderness and make it the least healthy part of the park.

Code	Issue	Response
425	**Air Quality**	The contribution of mobile sources (traffic) to air quality in the Study Area is addressed beginning on page 4-68 of the Final Environmental Impact Statement. The carbon monoxide and particulate matter (PM_{10}) analyses demonstrated that the proposed freeway would not contribute to any new localized violations, increase the frequency or severity of any existing violation, or delay timely attainment of the National Ambient Air Quality Standards or any required interim emissions reductions or other milestones.
426	**Air Quality**	The contribution of mobile sources (traffic) to air quality in the Study Area is addressed beginning on page 4-68 of the Final Environmental Impact Statement. As noted on page 4-69 of the Final Environmental Impact Statement, secondary standards are promulgated to minimize environmental and property damage. Many of the criteria pollutants do not have secondary standards. Primary and secondary standards for particulate matter (PM_{10}) are identical; no threshold is established by the U.S. Environmental Protection Agency for carbon monoxide (CO). The carbon monoxide and particulate matter (PM_{10}) analyses demonstrated that the proposed freeway would not contribute to any new localized violations, increase the frequency or severity of any existing violation, or delay timely attainment of the National Ambient Air Quality Standards or any required interim emissions reductions or other milestones (see discussion beginning on page 4-68 of the Final Environmental Impact Statement).
427	**Biology, Plants, and Wildlife**	Improved techniques and knowledge regarding the transplanting of protected native plants in Arizona have increased survival rates. The Arizona Department of Transportation has considerable experience transplanting native plants protected by the Arizona Native Plant Law and has experienced a high survival rate. The Arizona Department of Transportation has conducted studies on the best methods to use for transplanting desert species, particularly ironwood trees and saguaros, and was honored by the American Society of Landscape Architects in 2012 for this work. The research results have been incorporated in the procedures for plant salvage for Arizona Department of Transportation projects and throughout the industry. Reports on the research findings are available from the Arizona Department of Transportation Research Center at <azdot.gov/planning/research-center/research/research-reports>.
428	**Biology, Plants, and Wildlife**	Transplanting of protected native plants has been highly successful with application of proper techniques. The loss of habitat is not expected to cause individual nearby plants to respond.
429	**Biology, Plants, and Wildlife**	Information regarding the context and attributes of the South Mountains is described in the Draft and Final Environmental Impact Statements. The habitat characteristics of the Study Area, including those habitats within the park/preserve, can be found in the section, *Biological Resources*, beginning on page 4-125 of the Final Environmental Impact Statement.

Code	Comment Document

430 All these negative effects on the South Mountain Preserve are completely unacceptable to all who care about the preservation of the Phoenix mountains – and that is the majority of the population of Phoenix.

431 **Environmental Justice**

Three fundamental environmental justice principles apply to the transportation project development process:

- to avoid, minimize, or mitigate disproportionately high and adverse human health and environmental effects, including social and economic effects, on minority populations and low-income populations
- to ensure the full and fair participation by all potentially affected communities in the transportation decision-making process
- to prevent the denial of, reduction in, or significant delay in the receipt of benefits by minority and low-income populations."

432 The JATAP monitoring at the St. Johns monitoring site on the GRIC found certain air toxics attributed to "mobile sources," or vehicular traffic burning hydrocarbons. These findings of the air toxics were alarmingly high, many times the "accepted" cancer risk standard set by USEPA.

The St. Johns monitoring site's highest toxic findings:

- formaldehyde at 34 times this standard;
- benzene at 8 times this standard;
- 1,3 butadiene at 7.5 times this standard; and
- acetaldehyde at 3.4 times this standard.

The JATAP study also found that three other air toxics associated with transportation exhaust, Ethylbenzene, m,p-Xylene, and o-Xylene, were detected over 50% of the time at levels above the Maximum Daily Limit set by the state health department.

Residents of the GRIC living around and adjacent to the monitoring site are currently being subjected to all of these carcinogens, not just one. And if a freeway were to be built near this monitoring site on the GRIC, there would be more air toxics in addition to the ones detected at levels that far exceed the USEPA risk standard.

One of the JATAP's findings presented to the EPA National Air Monitoring Conference in November 2006 was, "Annual average concentrations of formaldehyde, acetaldehyde, benzene and 1,3 butadiene were on the high end of the range reported in EPA funded assessments of other US cities." This finding relates to any future proposed freeway in the JATAP study area, which includes in entirety the route of the proposed SMF. It also has huge environmental justice implications

25

Code	Issue	Response
430	**Section 4(f) and Section 6(f)**	Chapter 5, *Section 4(f) Evaluation*, and the section, *Cultural Resources*, beginning on page 4-140 of the Final Environmental Impact Statement, disclose the potential impacts on the collective resources associated with the South Mountains. Use of the mountains for the purposes of the proposed freeway represents two-tenths of one percent of the total mountain range. Since 1988, and as part of this environmental impact statement process, several measures have been undertaken and will be undertaken to further reduce effects on the mountains. These measures, including narrowing the design footprint, acquiring replacement land immediately adjacent to the mountains, and the provision of highway crossings, are outlined in the *Cultural Resources* and *Biological Resources* sections of Chapter 4 and in text beginning on page 5-23 of the Final Environmental Impact Statement.
431	**Environmental Justice and Title VI**	The section entitled *Title VI and Environmental Justice*, beginning on page 4-29 in the Draft Environmental Impact Statement, presents acceptable methods, data, and assumptions to assess the potential for disproportionately high and adverse effects from the proposed action on environmental justice populations and disparate impacts to populations protected under Title VI. Based upon the content of the section, no such effects would result from the action alternatives. In light of comments received on the Draft Environmental Impact Statement, the above-referenced conclusions were confirmed in the preparation of the Final Environmental Impact Statement. To provide further clarity, the discussions of environmental justice and Title VI were separated and additional text explaining the relationship of environmental justice and Title VI to various environmental elements was added throughout Chapter 4, *Affected Environment, Environmental Consequences, and Mitigation*, as exemplified by the inserted text on page 4-29 of the Final Environmental Impact Statement.
432	**Air Quality**	40 Code of Federal Regulations Section 1500.1(b) also directs the Federal Highway Administration to focus its National Environmental Policy Act analysis and documentation on issues that are truly significant to the action in question. In the context of mobile source air toxics, the Federal Highway Administration must consider whether changes in mobile source air toxics emissions attributable to a project have the potential for significant health risk. Using cancer risk as an example, the U.S. Environmental Protection Agency estimates that the overall risk of cancer in the United States is approximately 330,000 in a million, and that air toxics (from all sources) are responsible for a risk of approximately 50 in a million. In its most recent mobile source air toxics rule-making, the U.S. Environmental Protection Agency estimated mobile source air toxics cancer risk, after implementation of emissions controls, at approximately 5 in a million (or 0.0015 percent of overall cancer risk from any cause). For the South Mountain Freeway project, the mobile source air toxics emissions analysis for the Study Area found little difference in total annual emissions of mobile source air toxics emissions between the Preferred and No-Action Alternatives (less than a 1 percent difference) in 2025 and 2035. With the Preferred Alternative in 2035, modeled mobile source air toxics emissions would decrease by 57 percent to more than 90 percent, depending on the pollutant, despite a 47 percent increase in vehicle miles traveled in the Study Area compared with 2012 conditions (see discussion beginning on page 4-77 of the Final Environmental Impact Statement). Like most highway projects that have received a mobile source air toxics emissions analysis, the South Mountain Freeway project would result in a negligible change to a very small component of overall cancer risk, and this risk is declining regardless of alternative.

(Response 432 continues on next page)

Code	Comment Document

because, in other words, some of the worst air in the country, in terms of air toxics, was found in the JATAP study, and the high readings on the GRIC are among these highest readings.

433

So the air toxics are already worse than many other areas of the United States, and the proposed freeway would add even more. Obviously, adding more vehicular traffic emissions by building a freeway where there had not been one would add to this toxic burden. Yet despite its claims about environmental justice, these real environmental problems were not mentioned in the DEIS, nor was a plan to mitigate these impacts ever mentioned.

The JATAP also showed serious air toxics problems at the West and South Phoenix monitoring sites, and these monitoring sites are in the midst of other low-income and ethnic minority communities, mostly of Hispanic origin. These would also be exacerbated by the addition of another source of mobile toxics. The JATAP and its results mentioned "toxic hot spots near freeways" specifically because freeways cause toxic hotspots for air toxics.

It appears that ADOT and HDR would sacrifice human health and safety to accomplish their goal of building the SMF, and would rather see people on the GRIC, West and South Phoenix suffer and die from cancer than simply conduct an honest and objective NEPA process. That appears to be a violation of the civil rights of the GRIC residents near the St. Johns JATAP monitoring site, as well as the low-income and ethnic minority communities of West and South Phoenix.

434

The failure to properly analyze and/or address the air toxics information from the JATAP study is a deliberate violation of the very Environmental Justice issues that ADOT and FHWA claim to be observing. One must conclude that the DEIS itself is an extreme example of environmental injustice, despite its assertions.

The GRIC areas along the proposed freeway have extremely limited access and egress. A chlorine incident and the potential consequences of that are detailed in the comments regarding the DEIS' complete failure to even mention the risks from a hazardous materials incident, much less mitigating the risks. Such an incident would certainly doom the residents of the GRIC around the 51st Avenue pass. This is another severe example of environmental injustice, as no consideration is made for the lifestyle of the Native Americans on the GRIC, and no plan or means for preparing for response to such a disaster is even mentioned in the DEIS.

There is mention in the DEIS of a myriad of organizations and tribes that were approached about the DEIS, but not one environmental justice group in South or West Phoenix, or on the GRIC, were ever contacted. That has to be a deliberate step, as some of these groups even tried to approach ADOT and were rebuffed.

26

Code	Issue	Response
432 (cont.)		Summary information about the findings of the Joint Air Toxics Assessment Project study is provided as background information in the Draft and Final Environmental Impact Statements, but the study itself is not relevant to the type of analysis done pursuant to the Federal Highway Administration's mobile source air toxics guidance, which is an emissions analysis. Monitored ambient concentrations of mobile source air toxics (the focus of the Joint Air Toxics Assessment Project) do not inform this type of analysis. While monitoring data can be useful for defining current conditions in the affected environment (to the extent that the monitoring data are current), they don't tell us anything about future conditions, or the impacts of the project itself, which is why an emissions analysis was performed. The mobile source air toxic analysis presented beginning on page 4-77 of the Final Environmental Impact Statement is an estimated inventory of mobile source air toxic emissions for the entire Study Area for 2025 and 2035. This approach was used because the inventory estimate accounts for changes in traffic and emissions on all roadways affected by a proposed project, and would, therefore, be a more reliable predictor of changes in exposure to mobile source air toxics.
433	**Title VI and Environmental Justice**	For the South Mountain Freeway project, the mobile source air toxics emissions analysis for the Study Area found little difference in total annual emissions of mobile source air toxics emissions between the Preferred and No-Action Alternatives (less than a 1 percent difference) in 2025 and 2035. With the Preferred Alternative in 2035, modeled mobile source air toxics emissions would decrease by 57 percent to more than 90 percent, depending on the pollutant, despite a 47 percent increase in vehicle miles traveled in the Study Area compared with 2012 conditions (see discussion beginning on page 4-77 of the Final Environmental Impact Statement). Like most highway projects that have received a mobile source air toxics emissions analysis, the South Mountain Freeway project would result in a negligible change to a very small component of overall cancer risk, and this risk is declining regardless of alternative.
434	**Environmental Justice and Title VI**	40 Code of Federal Regulations Section 1500.1(b) also directs the Federal Highway Administration to focus its National Environmental Policy Act analysis and documentation on issues that are truly significant to the action in question. In the context of mobile source air toxics, the Federal Highway Administration must consider whether changes in mobile source air toxics emissions attributable to a project have the potential for significant health risk. Using cancer risk as an example, the U.S. Environmental Protection Agency estimates that the overall risk of cancer in the United States is approximately 330,000 in a million, and that air toxics (from all sources) are responsible for a risk of approximately 50 in a million. In its most recent mobile source air toxics rule-making, the U.S. Environmental Protection Agency estimated mobile source air toxics cancer risk, after implementation of emissions controls, at approximately 5 in a million (or 0.0015 percent of overall cancer risk from any cause). For the South Mountain Freeway project, the mobile source air toxics emissions analysis for the Study Area found little difference in total annual emissions of mobile source air toxics emissions between the Preferred and No-Action Alternatives (less than a 1 percent difference) in 2025 and 2035. With the Preferred Alternative in 2035, modeled mobile source air toxics emissions would decrease by 57 percent to more than 90 percent, depending on the pollutant, despite a 47 percent increase in vehicle miles traveled in the Study Area compared with 2012 conditions (see discussion beginning on page 4-77 of the Final Environmental Impact Statement). Like most highway projects that have received a mobile source air toxics emissions analysis, the South Mountain Freeway project would result in a negligible change to a very small component of overall cancer risk, and this risk is declining regardless of alternative.

(Response 434 continues on next page)

Code	Comment Document

because, in other words, some of the worst air in the country, in terms of air toxics, was found in the JATAP study, and the high readings on the GRIC are among these highest readings.

So the air toxics are already worse than many other areas of the United States, and the proposed freeway would add even more. Obviously, adding more vehicular traffic emissions by building a freeway where there had not been one would add to this toxic burden. Yet despite its claims about environmental justice, these real environmental problems were not mentioned in the DEIS, nor was a plan to mitigate these impacts ever mentioned.

The JATAP also showed serious air toxics problems at the West and South Phoenix monitoring sites, and these monitoring sites are in the midst of other low-income and ethnic minority communities, mostly of Hispanic origin. These would also be exacerbated by the addition of another source of mobile toxics. The JATAP and its results mentioned "toxic hot spots near freeways" specifically because freeways cause toxic hotspots for air toxics.

It appears that ADOT and HDR would sacrifice human health and safety to accomplish their goal of building the SMF, and would rather see people on the GRIC, West and South Phoenix suffer and die from cancer than simply conduct an honest and objective NEPA process. That appears to be a violation of the civil rights of the GRIC residents near the St. Johns JATAP monitoring site, as well as the low-income and ethnic minority communities of West and South Phoenix.

The failure to properly analyze and/or address the air toxics information from the JATAP study is a deliberate violation of the very Environmental Justice issues that ADOT and FHWA claim to be observing. One must conclude that the DEIS itself is an extreme example of environmental injustice, despite its assertions.

435 The GRIC areas along the proposed freeway have extremely limited access and egress. A chlorine incident and the potential consequences of that are detailed in the comments regarding the DEIS' complete failure to even mention the risks from a hazardous materials incident, much less mitigating the risks. Such an incident would certainly doom the residents of the GRIC around the 51st Avenue pass. This is another severe example of environmental injustice, as no consideration is made for the lifestyle of the Native Americans on the GRIC, and no plan or means for preparing for response to such a disaster is even mentioned in the DEIS.

436 There is mention in the DEIS of a myriad of organizations and tribes that were approached about the DEIS, but not one environmental justice group in South or West Phoenix, or on the GRIC, were ever contacted. That has to be a deliberate step, as some of these groups even tried to approach ADOT and were rebuffed.

Code	Issue	Response
434 (cont.)		Summary information about the findings of the Joint Air Toxics Assessment Project study is provided as background information in the Draft and Final Environmental Impact Statements, but the study itself is not relevant to the type of analysis done pursuant to the Federal Highway Administration's mobile source air toxics guidance, which is an emissions analysis. Monitored ambient concentrations of mobile source air toxics (the focus of the Joint Air Toxics Assessment Project) do not inform this type of analysis. While monitoring data can be useful for defining current conditions in the affected environment (to the extent that the monitoring data are current), they don't tell us anything about future conditions, or the impacts of the project itself, which is why an emissions analysis was performed. The mobile source air toxic analysis presented beginning on page 4-77 of the Final Environmental Impact Statement is an estimated inventory of mobile source air toxic emissions for the entire Study Area for 2025 and 2035. This approach was used because the inventory estimate accounts for changes in traffic and emissions on all roadways affected by a proposed project, and would, therefore, be a more reliable predictor of changes in exposure to mobile source air toxics.
435	**Title VI and Environmental Justice**	According to 46 *Federal Register* 18026 (March 23, 1981), the environmental impact statement must discuss reasonably foreseeable actions. These are actions that are likely to occur or probable, rather than those that are merely possible. There are no requirements in 23 Code of Federal Regulations 771 Environmental Impact and Related Procedures or in the Federal Highway Administration Technical Advisory T 6640.8A Guidance for Preparing and Processing Environmental and Section 4(f) Documents to address releases of hazardous chemicals due to a transportation incident in National Environmental Policy Act documents for transportation projects like the proposed action. As discussed above, reasonably foreseeable actions are those that are likely to occur or probable, rather than those that are merely possible. If the proposed action is the Selected Alternative in the record of decision, planning for emergency situations would be initiated. If the plan is amended, it is made available to the Arizona Department of Transportation. The referenced populations are no more uniquely exposed to such an occurrence than other population segments within the Study Area.
436	**Public Involvement**	The Arizona Department of Transportation and Federal Highway Administration provided equal access to the public participation process to the Gila River Indian Community and its members. The Arizona Department of Transportation and Federal Highway Administration solicited input from the Gila River Indian Community and other Native American tribes and tribal members and considered fully the substantive input and comments that were received. Chapter 2 of the Final Environmental Impact Statement is dedicated to explaining the Gila River Indian Community outreach undertaken for the project. The Gila River Indian Community was provided the same opportunities to participate in the project as all other populations and agencies. The Arizona Department of Transportation advertisement efforts of the public hearing and public forums are documented in Chapter 6 of the Final Environmental Impact Statement beginning on page 6-23. The Gila River Indian Community Communication and Public Affairs Office informed the Arizona Department of Transportation that all communication and distribution of informational materials on Gila River Indian Community land would be handled by the Communication and Public Affairs Office. Advertisement text regarding the project, the public comment period, the public hearing, and the various ways for the public to submit comments regarding the South Mountain Freeway Draft Environmental Impact Statement was given to the Gila River Indian Community's Public Information Officer at the

437	**Religious and Racial Discrimination and Civil Rights Violations** Throughout the DEIS, it is acknowledged that the GRIC and other native American tribes hold *Muhadagi Doog* as a sacred site. From the actual language of the DEIS: "The South Mountains are highly valued and considered sacred by some Native American communities. The Community, which includes the Akimel O'odham (River Pima) and Pee Posh (Maricopa) tribes, and other Native American entities—including the Colorado River Indian Tribes and three O'odham groups: the Salt River Pima-Maricopa Indian Community, the Ak-Chin Community, and the Tohono O'odham Nation—consider the South Mountains to play a role in their cultures, identities, histories, and oral traditions." There is plenty of correspondence in the DEIS and its Appendices in which the GRIC repeatedly asserts and reminds ADOT of this, to no avail. ADOT plans to blast *Muhadagi Doog*. If we were to take a look at the same issue and frame it as a danger to a sacred site that plays a role in cultures, identities, histories, and oral traditions of a white, European-based religion, such as the Roman Catholic Church, we can illuminate how this is clearly religious discrimination, and likely racial discrimination. If Rome, Italy decided there needed to be a freeway that would go through the Vatican and take out just a very small part of the Sistine Chapel, that would be unthinkable to people of the Roman Catholic faith worldwide. Think of the outrage and outcry such a proposal would muster! So what is the difference between the Roman Catholics' beliefs, and *Muhadagi Doog* and the "Native American entities?" Aside from the obvious differences in the race and number of people who practice the religions, the Sistine Chapel is located in Vatican territory. The Vatican is a separate political entity as is the GRIC, so the Vatican can prevent Rome from putting a highway through its territory just as the GRIC can prevent ADOT from putting one through its territory. But the borders of Indian Reservations were arbitrarily determined by white men, and South Mountain didn't happen to end up on the GRIC. So the only recourse of the Gila River and other tribes is to remind ADOT that South Mountain is sacred to them. ADOT acknowledges this but it suits their purpose to say they will just "mitigate it" as they build the SMF.
438	This attitude and planned action deliberately and intentionally violates the civil rights of the "Native American entities." In a 1979 consultation on the issue, the United States commission on civil rights defined religious discrimination in relation to the civil rights guaranteed by the Fourteenth Amendment to the United States Constitution. [Section 1. All persons born or naturalized in the United States, and subject to the jurisdiction thereof, are citizens of the United States and of the State wherein they reside. No State shall make or enforce any law which shall abridge the privileges or immunities of citizens of the United States; nor shall any State deprive any person of life, liberty, or property,

436 (cont.)		Transportation Technical Team meeting on April 30, 2013. Two advertisements regarding the public hearing, information regarding the location and availability of the Draft Environmental Impact Statement, and a map of the alternatives was placed in the May 2013 monthly issue of the *Gila River Indian News*. The Arizona Department of Transportation Community Relations distributed electronic notices (e-newsletters) through the Government Delivery system to over 12,000 constituents who voluntarily signed up for project alerts along Interstate 10 (Papago, Maricopa, and Santan Freeways). These electronic notices included notice of availability of the Draft Environmental Impact Statement (distributed on April 26, 2013); date of the public hearing (distributed on May 10, 2013); dates of the community forums (distributed on May 29, 2013); and notification in June regarding the close of the Draft Environmental Impact Statement public comment period. In addition, anyone who had attended a previous meeting regarding the proposed action and signed in received all of this information mailed individually. On May 6, 2013, 73,564 mailers were distributed to addresses within the Study Area. The Arizona Department of Transportation provided vouchers for public hearing parking and for public transit to the hearing. For the first time in the State's history, a shuttle bus to the hearing was provided from six locations in the Phoenix area, including two on the Gila River Indian Community (Komatke Boys & Girls Club and the Governance Center in Sacaton). All ads provided telephone numbers and electronic contact information regarding information on the shuttle schedules and pick-up locations.
437	**Cultural Resources**	The cultural and religious places of importance, like the South Mountains, are acknowledged in the Draft Environmental Impact Statement in several locations, notably pages 4-132 and 5-26. The proposed project would accommodate and preserve (to the fullest extent possible from the available alternatives) access to the South Mountains for religious practices. A very small portion of the mountain would be impacted by the proposed freeway (less than 0.03 percent of the total area). Although the Draft Environmental Impact Statement describes the impact on the South Mountains as adverse, Native Americans would not be kept from practicing their beliefs, access to the mountain would be maintained, and mitigation measures would be implemented based on input from members of the Gila River Indian Community.
438	**Cultural Resources**	Since the beginning of the environmental impact statement process, the Federal Highway Administration and Arizona Department of Transportation have been carrying out cultural resources studies and engaging in ongoing, open consultation with the Gila River Indian Community Tribal Historic Preservation Office regarding the identification and evaluation of places of religious and cultural importance to the tribe that may be adversely affected by the proposed freeway. Such places are referred to as traditional cultural properties. As a result of these discussions and of studies conducted by the Gila River Indian Community's Cultural Resource Management Program, the Gila River Indian Community has identified traditional cultural properties that are eligible for listing in the National Register of Historic Places and that could be affected by construction of the proposed freeway. The traditional cultural properties identified are culturally important to other Native American tribes as well. For more discussion of traditional cultural properties, see the section, *Cultural Resources*, beginning on page 4-140 of the Final Environmental Impact Statement and pages 5-26 through 5-28.

(Response 438 continues on next page)

without due process of law; nor deny to any person within its jurisdiction the equal protection of the laws.]

As for racial discrimination, the equal protection clause was originally added to deal with the lack of equal protection provided by law to all in the course of administering justice in the states that had Black codes.

The United States commission on civil rights noted, "Whereas religious civil liberties, such as the right to hold or not to hold a religious belief, are essential for Freedom of Religion (in the United States secured by the First Amendment), religious discrimination occurs when someone is denied "the equal protection of the laws, equality of status under the law, equal treatment in the administration of justice, and equality of opportunity and access to employment, education, housing, public services and facilities, and public accommodation because of their exercise of their right to religious freedom."

Also, the American Indian Religious Freedom Act (AIRFA) is a US federal law and a joint resolution of Congress that was passed in 1978. It was created to protect and preserve the traditional religious rights and cultural practices of American Indians, Eskimos, Aleuts and Native Hawaiians. These rights include, but are not limited to, access of sacred sites, repatriation of sacred objects held in museums, freedom to worship through ceremonial and traditional rites, including within prisons, and use and possession of objects considered sacred. The Act required policies of all governmental agencies to eliminate interference with the free exercise of Native religion, based on the First Amendment, and to accommodate access to and use of religious sites to the extent that the use is practicable and is not inconsistent with an agency's essential functions. It also acknowledged the prior violation of that right.

Clearly, the No Build Alternative is the only viable option that does not constitute a violation of the 14th Amendment to the Constitution and a violation of the AIRFA as any freeway alternative proposed in the DEIS of the SMF requires blasting away part of *Muhadagi Doog*.

Fiscal Impacts

While the SMF would have little positive economic benefit for the state or its residents, it would have adverse economic impacts for numerous reasons, including:

- The loss of approximately one billion dollars in Federal Highway funds at least once right away, and possibly many times later on, because the increase in air pollution would cause exceedences of required standards
- The cost of constructing the SMF, which would end up being far more than the two billions dollars currently predicted by ADOT because of all the issues not properly analyzed in the DEIS
- The loss of value to State Trust Land 620
- The loss of taxes from destroyed homes
- The loss of revenue from affected HOAs

28

Code	Issue	Response
438 (cont.)		Section 106 of the National Historic Preservation Act requires a government-to-government relationship between the Federal Government and Indian tribes as described beginning on page 4-140 of the Final Environmental Impact Statement. Section 106 requires that federal agencies take into account the effects of their undertakings on historic properties. This process requires consultation with tribal authorities. Consultation has occurred with Gila River Indian Community government officials, the Tribal Historic Preservation Officer, the Cultural Resource Management Program, many different tribal authorities, and the State Historic Preservation Office. The consultation has resulted in concurrence from the Gila River Indian Community Tribal Historic Preservation Office and the State Historic Preservation Office on National Register of Historic Places eligibility recommendations (including traditional cultural properties), project effects, and proposed mitigation and measures to minimize harm. This consultation has been ongoing and will continue until any commitments in a record of decision are completed.
439	**Cultural Resources**	The American Indian Religious Freedom Act, 42 United States Code Section 1996, provides a policy statement of the United States to "protect and preserve for American Indians their inherent right of freedom to believe, express, and exercise the traditional religions of the American Indian . . . including but not limited to access to sites, use and possession of sacred objects, and the freedom to worship through ceremonials and traditional rites." The Arizona Department of Transportation and Federal Highway Administration complied with the policy stated in the American Indian Religious Freedom Act throughout the environmental impact statement process, as evidenced by consultation efforts, mitigation measures, and a discussion of cultural resources issues in the Draft Environmental Impact Statement. The study would not violate the American Indian Religious Freedom Act because, as stated above, members of the Gila River Indian Community would not be prohibited from continuing to practice their beliefs even if the project goes forward because access to the mountain would be maintained, impacts would be mitigated based on input by the Gila River Indian Community and others, and only a small fraction of the mountain would be affected.
440	**Purpose and Need**	The No-Action Alternative would not satisfy the purpose and need of this important regional transportation project. The E1 Alternative, designed to mitigate impacts as discussed in the Draft Environmental Impact Statement, would not violate the American Indian Religious Freedom Act or the Fourteenth Amendment.

without due process of law; nor deny to any person within its jurisdiction the equal protection of the laws.]

As for racial discrimination, the equal protection clause was originally added to deal with the lack of equal protection provided by law to all in the course of administering justice in the states that had Black codes.

The United States commission on civil rights noted, "Whereas religious civil liberties, such as the right to hold or not to hold a religious belief, are essential for Freedom of Religion (in the United States secured by the First Amendment), religious discrimination occurs when someone is denied "the equal protection of the laws, equality of status under the law, equal treatment in the administration of justice, and equality of opportunity and access to employment, education, housing, public services and facilities, and public accommodation because of their exercise of their right to religious freedom."

Also, the American Indian Religious Freedom Act (AIRFA) is a US federal law and a joint resolution of Congress that was passed in 1978. It was created to protect and preserve the traditional religious rights and cultural practices of American Indians, Eskimos, Aleuts and Native Hawaiians. These rights include, but are not limited to, access of sacred sites, repatriation of sacred objects held in museums, freedom to worship through ceremonial and traditional rites, including within prisons, and use and possession of objects considered sacred. The Act required policies of all governmental agencies to eliminate interference with the free exercise of Native religion, based on the First Amendment, and to accommodate access to and use of religious sites to the extent that the use is practicable and is not inconsistent with an agency's essential functions. It also acknowledged the prior violation of that right.

Clearly, the No Build Alternative is the only viable option that does not constitute a violation of the 14th Amendment to the Constitution and a violation of the AIRFA as any freeway alternative proposed in the DEIS of the SMF requires blasting away part of *Muhadagi Doog*.

Fiscal Impacts

441

While the SMF would have little positive economic benefit for the state or its residents, it would have adverse economic impacts for numerous reasons, including:

442

- The loss of approximately one billion dollars in Federal Highway funds at least once right away, and possibly many times later on, because the increase in air pollution would cause exceedences of required standards
- The cost of constructing the SMF, which would end up being far more than the two billions dollars currently predicted by ADOT because of all the issues not properly analyzed in the DEIS
- The loss of value to State Trust Land 620
- The loss of taxes from destroyed homes
- The loss of revenue from affected HOAs

28

Code	Issue	Response
441	**Economics**	In 2004, the City of Phoenix hired Crystal and Company to perform an analysis of the fiscal, economic, and social impacts of three potential alignments for the South Mountain Freeway. Relative to the Preferred Alternative (W59 and E1 Alternatives), the analysts estimated that, at build-out, the proposed freeway would create over 86,400 jobs and result in annual sales and property tax receipts in excess of $86.5 million. The study estimated that build-out would take approximately 20 years from freeway completion. The traveling public would also benefit from the proposed freeway. When considering travel time savings, this benefit averages approximately $200 million per year between 2020 and 2035 (see Table 4-27 on page 4-67 of the Final Environmental Impact Statement).
442	**Alternatives**	The contribution of mobile sources (traffic) to air quality in the Study Area is addressed beginning on page 4-58 of the Draft Environmental Impact Statement. The carbon monoxide and particulate matter (PM_{10}) analyses demonstrated that the proposed freeway would not contribute to any new localized violations,increase the frequency or severity of any existing violation, or delay timely attainment of the National Ambient Air Quality Standards or any required interim emissions reductions or other milestones; therefore, no federal funding would be jeopardized. Cost estimates for the proposed freeway, as described beginning on page 3-59 of the Draft Environmental Impact Statement, were developed in accordance with accepted engineering practices by professional engineers. The Arizona Department of Transportation, Federal Highway Administration, Maricopa Association of Governments, and their consultants have peer-reviewed the proposed project's cost estimates in terms of both the quantities and unit costs used in the estimates. In each case, the estimates were found to be reasonable and accurate. The Arizona State Land Department would be compensated for the land acquired as part of freeway construction. The remaining land would continue to be valuable and might have increased value with the improved access provided by the proposed freeway. Impacts on property and sales tax revenues are quantified in the section, *Economic Impacts*, beginning on page 4-46. These impacts would be inconsequential when considered in the context of total tax revenues the City of Phoenix now collects and anticipates collecting in the future. Homeowners associations would be compensated for property acquired for construction of the freeway in accordance with State law. The cost of relocating utilities is included in the total costs presented in the Draft Environmental Impact Statement. It is assumed the reference to the superfund site is to the West Van Buren Water Quality Assurance Revolving Fund site. This site would not be affected by construction of the freeway. The Arizona Department of Transportation is experienced with handling drainage and erosion because they are important issues on every construction project. To minimize these issues, standard practices would be employed with construction, operation, and maintenance of the proposed freeway. Maintenance costs are considered in the project development and are planned in the Arizona Department of Transportation's budget.

Code	Comment Document

- The cost of moving utilities from Pecos Road
- The cost of cleaning up one superfund site
- The cost of constantly dealing with issues related to drainage and erosion
- The cost of maintaining the freeway

443

Overall Impact on Quality of Life

The negative impact on the community of Ahwatukee Foothills cannot be overstated. The SMF would destroy the type of community that it currently is – one known for peace and quiet. The community has historically experienced a low crime rate, and this would be radically changed upward. Since Ahwatukee Foothills terrain rises away from Pecos Road, views and noise will affect homes up to one mile north of Pecos. Because of the traffic problems that would occur from forcing so much more traffic on arterial streets, response time of police and fire units would suffer significantly. Top-rated schools would very likely be downgraded because of a change in the character of the region.

444

Hundreds of people use Pecos Road for training, cycling, running, skating, etc. Pecos Road is also the site of an annual Senior Olympics Cycling event. They would all experience a loss of recreational opportunities.

445

During times of freeway accidents or maintenance, commercial vehicles, including hazmats, in addition to passenger vehicles would be routed onto adjacent neighborhood arterial streets.

Overall, the impact of the SMF would have very little positive effect on traffic, air pollution, or people in the region. It would provide the people of Laveen and the O&D trucks in the area around 51st Avenue a conduit to I-10, but this could be accomplished by just building a spur freeway from I-10 West to Laveen. On the other hand, the overall negative effects of the SMF would be extreme for the GRIC, Ahwatukee Foothills, South Mountain, and the environment. This demands a selection of the No Build option for the SMF.

Respectfully submitted,

Patricia K. Lawlis

Code	Issue	Response
443	**Alternatives**	While the E1 Alternative is adjacent to largely residential areas of Ahwatukee Foothills Village (to the north), a freeway has been planned in this location for many years (see Final Environmental Impact Statement pages 4-17 and 4-21). Where existing residential uses are adjacent to the proposed freeway, noise mitigation would be implemented according to Arizona Department of Transportation policy (see page 4-91 of the Draft Environmental Impact Statement). The proposed freeway would not adversely affect north–south access because the land immediately south of Pecos Road is Gila River Indian Community land, with no existing north–south access. (See the E1 portion of Table 4-9, on page 4-27 Draft Environmental Impact Statement.) While the City of Phoenix Police Department reported in 2005 that it did not have any statistics specific to crime adjacent to freeways, it did note that based on its experience there does not appear to be a correlation between crime rates and freeways. Average daily traffic volumes on freeways and arterial streets are projected to increase substantially in and adjacent to the Study Area between 2010 and 2035. Contrary to the statement in the comment, the Draft Environmental Impact Statement notes that the proposed freeway would avert the congestion anticipated on arterial roads. As noted in the Draft Environmental Impact Statement, "The No-Action Alternative would not alleviate projected increases in traffic volumes and congestion on the Interstate and regional freeway systems or on the local street network by the design year 2035. It would instead, lead to worsening traffic congestion and substantial related impacts" (see page S-8 of the Draft Environmental Impact Statement). There is no evidence that the proposed facility would cause people to leave the area. The regions' benefits would remain, and improved access to residences and businesses would make them more desirable.
444	**Alternatives**	The main line of the E1 Alternative would not have a bicycle route as part of the design. Continuous east–west riding would be possible in the neighborhoods adjoining the alternative and along Chandler Boulevard.
445	**Traffic**	Emergency responders would address the construction of the proposed freeway by amending the local emergency response plan to include the facility.

Code	Comment Document

- The cost of moving utilities from Pecos Road
- The cost of cleaning up one superfund site
- The cost of constantly dealing with issues related to drainage and erosion

Code	Issue	Response
446	**Alternatives**	The benefits of the proposed freeway in comparison with the No-Action Alternative are described throughout the Draft and Final Environmental Impact Statements. According to 23 Code of Federal Regulations §771.111(f)," the action evaluated in the environmental impact statement must connect logical termini and be of sufficient length to address environmental matters on a broad scope...". The proposed action should satisfy the project need and should be considered in the context of the local area socioeconomics and topography, the future travel demand, and other infrastructure improvements in the area. A partial freeway from Interstate 10 (Papago Freeway) to Laveen Village is not feasible because it would not meet the proposed freeway's identified purpose and need. The No-Action Alternative is included for detailed study in accordance with National Environmental Policy Act requirements to compare beneficial and adverse impacts of the action alternatives with those benefits and consequences (adverse impacts) of not proceeding with one of the action alternatives. (Impacts can occur through choosing to do nothing.) The No-Action Alternative would not satisfy the purpose and need of the proposed action (see page 3-40 of the Draft Environmental Impact Statement). The Arizona Department of Transportation, with concurrence from the Federal Highway Administration, identified the W59 and E1 Alternatives as the Preferred Alternative.

447	**Comment 1.** Figure 1-4 and MAG's travel projections seem to be just linear extensions of long-term trends. But trends in the last decade show stagnation in VMT growth even with population and before the economic downturn. The three figures below show the actual travel trends in Arizona and the United States since 1995. Note that stagnation in travel and declines of nearly 10% in per capita and per driver travel began before the 2008 recession. Recent data show little evidence of recovery in both total and urban travel in Arizona and show a continued decline in travel per capita. If these last decade's actual trends are projected out, there would be much slower growth in VMT in the long run. Thus, we strongly question the basic assumption upon which the entire proposed project rests – continued strong growth in vehicle travel. In fact, we must also question what data was used to develop the trend lines shown in Figure 1-4, since there has been no increase in VMT in Arizona in nearly seven years. It would appear that only the high growth years up until the mid-2000s were used, which seems highly questionable and inaccurate. With a small adjustment in projected growth, following more closely recent trends, we suspect much of the growth in congestion used to justify the project would be erased.  Source: US FHWA Highway Statistics Series, Tables VM-2, and DL-1C

Code	Issue	Response
447	**Purpose and Need**	The information presented in Figure 1-4 and the complementary Figure 1-6 are based on historic Census data and Maricopa Association of Governments socioeconomic projections. The information is for Maricopa County, not Arizona and not the United States. The historical growth in the Maricopa Association of Governments region is discussed in the Draft Environmental Impact Statement, beginning on page 1-5. The critical factors such as available land, mild climate, affordable cost of living, and employment opportunities that led to the historical growth rates in the region remain unchanged. In Maricopa County, daily vehicle miles traveled levels increased by almost 2 percent between 2011 and 2012 and the 2012 daily vehicle miles traveled is approaching the prerecession peak in 2007. (*Source*: Arizona Department of Transportation Multimodal Planning Division Highway Performance Monitoring System Data for the calendar years 2012 and 2011). The analyses in the Draft Environmental Impact Statement used socioeconomic and traffic projections at the regional analysis zone and traffic analysis zone levels. At the time of publication of the Draft Environmental Impact Statement, Census 2010-based socioeconomic data at the regional analysis zone and traffic analysis zone levels had not been adopted by the Maricopa Association of Governments and were not available to the project team. Therefore, the data used in the Draft Environmental Impact Statement were the most appropriate information available. The Maricopa Association of Governments approved new population, employment, housing, and traffic projections in June 2013. The new data are presented in the Final Environmental Impact Statement beginning on page 1-11. The purpose and need and analysis of alternatives were updated and reevaluated using these new socioeconomic projections and corresponding projections related to regional traffic. While new projections based on the 2010 Census showed a lower anticipated population and vehicle miles traveled in 2035 than the previous projections, the conclusions reached in the Draft Environmental Impact Statement were validated in the Final Environmental Impact Statement (see Chapter 3, *Alternatives*). The traffic analysis demonstrated that the proposed project is needed today and will continue to be needed into the future.

Figure 1-2 – Many of the "Existing freeways" were under construction or still in planning? (SR-202, northern parts of 101?)

449

Comment 3

Figure 1-5. Are 2035 projections for population locations/growth based on actual permitting of housing units, or just on land potentially available for development?

450

Comment 4

Figure 1-7. How do the growth projections depend on the project implementation? Meaning, without the freeway, congestion in the west valley may limit growth there. Does housing permits in the west valley assume the freeway will be built? Just because they assumed there would be congestion relief doesn't mean the freeway needs to be built. Without the freeway, growth will just happen somewhere

Code	Issue	Response
448	**Purpose and Need**	While portions of State Route 202L (Red Mountain and Santan freeways) were not completed in 2003, they would be completed prior to the start of the planning horizon for the *Regional Transportation Plan* (2006 to 2026). Therefore, they were considered existing facilities during the development of the *Regional Transportation Plan*.
449	**Purpose and Need**	The 2035 projections for population are from the Maricopa Association of Governments socioeconomic projections. These projections are adopted by the Maricopa Association of Governments Regional Council to support transportation studies such as the South Mountain Freeway Draft Environmental Impact Statement. Projections are based on regional growth control totals allocated to subregions based on planned land use and existing land use patterns. Basing 2035 population on actual permitting of housing units would not provide an accurate picture of future population for the horizon year, as permits are typically acquired at the time of construction.
450	**Purpose and Need**	Growth projections for 2035 are not predicated on specific transportation improvements; rather, they are based on future land use plans, as envisioned by their respective jurisdictions. With few exceptions, land in the Study Area is privately owned; zoning requests to develop private land are typically based on these land use plans. In Phoenix in particular, development is occurring regardless of the proposed freeway. Not building the proposed freeway would not likely cause development to go elsewhere, and congestion on the arterial street network and existing freeways would continue to worsen with the No-Action Alternative.

Code	Comment Document
	else. With the freeway, on the other hand, may induce cities to permit more housing in outlying areas, which may reduce the project's effectiveness (induced demand).
451	**Comment 5** Table 3-2. Valley Metro is reportedly studying a light rail connection from Ahwatukee to Central Phoenix via Central south to Baseline to 48th Street south. The current project site is here: http://www.valleymetro.org/projects_and_planning/project_detail/south_central This doesn't mention the extension south to Ahwatukee, but there are rumors it could eventually make that connection.
452	**Comment 6** Table 3-2 and Page 3-6. The Phoenix General Plan is being currently updated from the year-2000 general plan (the last one approved). It may include significant transit oriented land use requirements. ADOT just completed a study which showed that land use can have a very significant impact on travel. http://www.ssti.us/wp/wp-content/uploads/2012/05/AZ-LandUseandTrafficCongestion2012.pdf
453	**Comment 7** Table 3-2. The non-freeway alternatives may each alone not have a large potential, but there may be synergistic effects between them when deployed together. For instance, TDM programs, along with new transit options may reinforce each other.
454	**Comment 8** Figure 1-1 – missing outline of South Mountain park preserve.
455	**Comment 9** Page 3-34. "Time savings would be experienced during peak travel times of the day. Taken individually, savings may not appear to be substantial, but when considered in the context of the hundreds of thousands of drivers, each day, over the course of numerous years, the cumulative time savings would be substantial." Models show very small improvements in travel time for the average driver. To each driver the time savings is so small that it can hardly be called a real, measurable, benefit. The "total time savings" over the entire population is meaningless, since two people's time savings can't add up to be used for any benefit.
456	**Comment 10** The section on fiscal impacts of the project, beginning on page 4-47, discusses changes in the tax base due to the conversion of land from tax-generating to transportation right of way. Another economic

Code	Issue	Response
451	**Alternatives**	The project referenced is in study phases at Valley Metro. The project, as defined, would extend to Baseline Road.
452		Comment noted.
453	**Alternatives**	As noted in Table 3-2, "*Nonfreeway Alternatives Considered and Reasons for the Elimination from Further Study*," elimination would not preclude the use of these elements in combination with the freeway mode.
454	**Alternatives**	It is not necessary to show the outline of Phoenix South Mountain Park/Preserve in the referenced figure because the map is a depiction of the Study Area and the regional context of the project.
455	**Alternatives**	The referenced information as presented in the Draft Environmental Impact Statement is based on analytical results.
456	**Neighborhoods/ Communities**	A review of the literature reveals few detailed and comprehensive analyses of the relationship between the transportation infrastructure and residential property values (Transportation Research Record: Journal of the Transportation Research Board, No. 2174, Transportation Research Board of the National Academies, Washington, D.C., 2010, pages 138–47; "Impact of Highways on Property Values: Case Study of the Superstition Freeway Corridor"). A recent study by the California Department of Transportation concluded that freeway facilities did not substantially affect sales prices in residential areas adjacent to the facility. The study concluded that it is the visibility of the freeway that may influence selling price and not distance or noise. As a result, the researchers generally concluded that the more the visibility of a new freeway is reduced, the less it would determine the sales price of homes sold in the area.

Code	Comment Document
	impact of the freeway will be a de-valuation of residential properties near the right of way due to environmental nuisances (noise, air quality). We would like to see an estimate of this loss in property values and subsequent loss in tax base. [NOTE: ADOT could respond that there are also increases in property values due to the freeway that they are not taking into account. But, since we are interested in negative impacts, there is still a need to account for declines in property values.]

Three

Comments on DEIS Discussion of Section 4(F) of the Transportation Act

Code	Issue	Response

Code	Comment Document
457	COMMENTS ON DEIS DISCUSSION OF SECTION 4(F) OF THE TRANSPORTATION ACT The South Mountain 202 Draft EIS Section 4(f) Evaluation has not adequately analyzed Section 4(f) resources in SMPP, specifically the trails which are in the western end of the study area. It has erroneously dismissed Section 4(f) resources and has neglected the identification of other Section 4(f) resources. Improper Elimination of a Section 4(f) Resource from the DEIS The following section demonstrates how the DEIS erroneous disqualification Section 4(f) resources (trails) by applying the wrong information, having a lack of knowledge of the project area and the City of Phoenix.
458	In Appendix 5-1, on page A586, the DEIS attempts to disqualify the Section 4(f) trails in the SMPP by quoting a Goal from the Circulation Element of the General Plan: "Since approximately 40 percent of all trips are less than two mile in length, bicycling and walking can help relieve roadway congestion". The DEIS continues to state that since the General Plan indicates that pedestrian trials maintained by the City of Phoenix are used for transportation and that they are not primarily recreational. It is incorrect to select the Circulation Element to qualify if the trails are for pedestrian or recreational use. The Circulation Element refers to trail/paths on the City Circulation (streets/roads) System. The trails in South Mountain are not on roads or sidewalks and not part of the Circulation Element, they are in the park and are strictly recreational, they do not serve a transportation purpose. Thus they remain Section 4(f) resources to be analyzed for direct or constructive impacts. The DEIS than uses the Recreation Element of the General Plan to assert that the City in cooperation with private developers is working to provide trails and therefore these trail are on private land and maintained by the developers and do not adhere to Section 4(f) protection. Again, the trails in South Mountain are not on private land they are on City of Phoenix public land. The National Trail, the Maricopa Trail, the Gila Trail, and the Bursera Trail are all within the park and as such are strictly recreational hiking and biking trails and they are ON public land. Thus they remain Section 4(f) resources to be analyzed for direct or constructive impacts.
459	The last paragraph on p. A586 implies that because the City gets Transportation Enhancement Activity (TEA) Funds to build trails, that the trails in South Mountain are built with TEA funds. This again is an erroneous statement. All the trails in the park fall under the purview of South Mountain and are referenced in the Open Space Element of the 2002 General Plan (P.291). These trails do not receive TEA funds, these trails are built and maintained with City of Phoenix Parks Department funds (some of which come from citizen bonds).
457	As you can see, the disqualification of trail in South Mountain based on the above assessment is inaccurate, far-reaching and just plain wrong. This shows a true lack of knowledge about the SMPP, the trails, Section 4(f) resources and a defensible analysis. Thus they remain Section 4(f) resources to be analyzed for direct or constructive impacts.

Code	Issue	Response
457	**Section 4(f) and Section 6(f)**	The newest South Mountains trails, the Bursera and the Pyramid, are more than ¼ mile from the proposed freeway and are analyzed in the Final Environmental Impact Statement on page 5-9. The trails are within ¼ mile of the planned Chandler extension and residential development; however, these trails do not have noise-sensitive activities or viewshed characteristics that contribute to their importance as Section 4(f) recreational resources. Discovery of new information not presented in a Draft Environmental Impact Statement as it is published is not failure. Review by agencies and the public of a Draft Environmental Impact Statement equates to a review of a draft report to aid the agencies in making the document more objective and defensible. In this manner, the realization of new information, if such instances of new information are validated by the federal lead agency, permits the Arizona Department of Transportation and its representatives to defensibly embellish on the document's content.
458	**Section 4(f) and Section 6(f)**	Trails within Phoenix South Mountain Park/Preserve were not eliminated. City-owned trails within the park were considered collectively as part of the City-owned park. There are no direct or constructive uses of any trails within Phoenix South Mountain Park/Preserve (see discussion beginning on page 5-14 in the Final Environmental Impact Statement).
459	**Section 4(f) and Section 6(f)**	The comment refers to a statement on page A586 of the Appendix to the Draft Environmental Impact Statement. The statement is made in a section entitled, *City of Phoenix Trails System*, which refers to the overall trails system of the City. It is also contained in a section discussing overall eligibility of trails to protection under Section 4(f). No reference to the trails within South Mountain Park/Preserve appears in this statement and there is no attempt to exclude South Mountain Park/Preserve Trails from consideration under Section 4(f). The discussion of resources afforded protection under Section 4(f) contains an analysis of the trails of the South Mountain Park/Preserve (see discussion beginning on page 5-14 of the Final Environmental Impact Statement).

Code	Comment Document
460	Lack of Identification of Section 4(f) Resources The DEIS does not represent the existing conditions in the SMPP relative to the trails. As with many parts of the DEIS, the existing conditions and environmental consequences were authored in 2006-2008 and have not been updated. It is clear from the correspondence in the Appendix that HDR/ADOT has not revisited the study area to document the change in conditions which have occurred.
461	In 2011, the City of Phoenix constructed two new trails in the west end of SMPP. They are accessed by the future 19th Ave trailhead at the end of Chandler Blvd. The trails go west and east on the Main South Ridge. They are called the Bursera Trail and the Pyramid Trail. Additionally another trail exists in the area. It is called the Gila Trail and has been in use and recognized by the City of Phoenix for over 12 years (all identified on Google maps and Google Earth). None of these three trails are mentioned and documented in the DEIS. This is noteworthy as in Chapter 5, p 5-25 the following statement is made: "The cuts would be located in a remote portion of SMPP, not near any trail and barely visible from any of the more readily used trails."
462	Below is a picture taken from the Bursera Trail, high on the ridge, and its view onto the Main Ridge North were the proposed freeway will cut. It is obvious from the picture below that the above statement is no longer true.
463	As you can see, the DEIS has missed identifying three Section 4(f) resources, it has also incorrectly analyzed the impact to any Section 4(f) resources in the west end of SMPP. While there will not be a

Code	Issue	Response
460	**Section 4(f) and Section 6(f)**	The newest South Mountains trails, the Bursera and the Pyramid, are more than ¼ mile from the proposed freeway and are analyzed in the Final Environmental Impact Statement on page 5-9. The trails are within ¼ mile of the planned Chandler extension and residential development; however, these trails do not have noise-sensitive activities or viewshed characteristics that contribute to their importance as Section 4(f) recreational resources.
461	**Section 4(f) and Section 6(f)**	The newest Phoenix South Mountain Park/Preserve trails, the Bursera and Pyramid, have been included in an updated trails map in the Final Environmental Impact Statement. Visual analysis maintains that the cuts would be located in a remote portion of Phoenix South Mountain Park/Preserve, not near any trail and barely visible from any of the more readily used trails. City-owned trails within the park were considered collectively as part of the City-owned park. Discussions with the South Mountain Ranger indicate that the Gila Trail—although well-defined—is not a designated trail within the park. There are no direct or constructive uses of any trails within Phoenix South Mountain Park/Preserve.
462	**Visual Resources**	Visual analysis establishes that the proposed cuts would be in a remote portion of Phoenix South Mountain Park/Preserve, not near any trail, and would be barely visible from any of the more readily used trails. From the view provided, one can also see the development along 51st Avenue. The South Mountains provide views of urban Phoenix, including its freeways.
463	**Section 4(f) and Section 6(f)**	There is no constructive use of the trails within Phoenix South Mountain Park/Preserve, including the ones the comment mentions. The trails are within ¼ mile of the planned Chandler extension and residential development; however, these trails do not have noise-sensitive activities or viewshed characteristics that contribute to their importance as Section 4(f) recreational resources. Although cuts could be seen, this would not render the trail unusable for recreational purposes.

Code	Comment Document
	direct use of these trails, there will clearly be a constructive use of these trails. It is tragic that the solitude, peacefulness and beauty experienced on these trails (old and new) will be so dramatically diminished by the proposed action. This must be include in a constructive use analysis
464	The Section 4(f) Evaluation is incomplete and filled with misstatements, therefore the analysis is deficient. Figure 5-6 needs to be amended to include the trails and developed measures to minimize harm. As a whole, this report needs to be amended and alternatives reevaluated to avoid impact and/or evaluate measures to minimize harm.
465	As an overall final editorial, it seems tragic that the process went out of its way to realign the proposed project to preserve other Section 4(f) resources (Hudson Farm, Barnes Diary Farm, and Hackin Farmstead, all on private property) when it is most certain they are only being preserved to be eventually demolished by future development, yet other Section 4(f) resources such as the trails in SMPP, which will be used by thousands of people for many years to come, are discounted, devalued and dismissed as an important protected resource.
466	Many of the statements in the Section 4(f) Evaluation are clearly pre-decisional and the evaluation was not done by or with a professional who understands the SMPP, its trail system or the City of Phoenix General Plan. This leads to a misleading analysis. The public uses the DEIS as a tool for information, yet the information is not only incomplete by wrong. The Section 4(f) Evaluation needs to be revised.

Code	Issue	Response
464	**Section 4(f) and Section 6(f)**	Trails maps have been updated, and new trails are analyzed in the Final Environmental Impact Statement because they are within ¼ mile of the Chandler Extension (not the proposed freeway) (see page 5-9). Because none of the action alternatives or options would not incorporate land from the Section 4(f) resource, and would have no proximity impacts so severe that the protected activities, features, or attributes that qualifies the trails for protection under Section 4(f) are substantially impaired, no measures to minimize harm are warranted.
465	**Section 4(f) and Section 6(f)**	The process upon which Section 4(f) resources were identified and evaluated for feasible and prudent avoidance possibilities followed the rigorous procedural requirements as set forth in Federal Highway Administration Technical Advisory T 6640.8A Guidance for Preparing and Processing Environmental and Section 4(f) Documents and related guidance. The comment suggests trails in the South Mountain Park/Preserve would be subject to direct or constructive use; however, as shown in Chapter 5 of the Final Environmental Impact Statement, such use would be avoided by the proposed freeway.
466	**Section 4(f) and Section 6(f)**	Trails within Phoenix South Mountain Park/Preserve were not eliminated. City-owned trails within the park were considered collectively as part of the City-owned park. There are no direct or constructive uses of any trails within Phoenix South Mountain Park/Preserve (see discussion beginning on page 5-14 in the Final Environmental Impact Statement). Trails maps have been updated, and new trails are analyzed in the Final Environmental Impact Statement because they are within ¼ mile of the Chandler Extension (not the proposed freeway) (see page 5-9). Because none of the action alternatives or options would not incorporate land from the Section 4(f) resource, and would have no proximity impacts so severe that the protected activities, features, or attributes that qualifies the trails for protection under Section 4(f) are substantially impaired, no measures to minimize harm are warranted. The Section 4(f) evaluation in its entirety represents an exhaustive, comprehensive, objective, and meaningful effort in accordance with requirements of the law. Evaluation of each resource included active engagement of resource owners to clarify resource importance and use (extensive interaction with owner/operators of Section 4(f) resources is well documented in the Appendices of the Final Environmental Impact Statement). The U.S. Department of the Interior [the agency with direct oversight of Section 4(f)] review of the Draft Environmental Impact Statement noted: "Following our review of the Section 4(f) Evaluation, we concur that there is no feasible or prudent alternative to the Preferred Alternative selected in the document, and that all measures have been taken to minimize harm to these resources" The complete letter can be found in Appendix 7, Volume III, on page B4 of the Final Environmental Impact Statement. The Section 4(f) evaluation was thorough and complete.

Four

Reevaluate Purpose and Need Statement

Code	Issue	Response

Code	Comment Document
467	**Reevaluate Purpose and Need Statement** A Purpose and Need statement is meant to address a problem. The South Mountain 202 project is a solution looking for a problem. The 2012 Purpose and Need statement (P&N) in the South Mountain DEIS does not reflect the current problem. On p.1-1, Chapter 1 the following statement is made; "At the beginning of the EIS process, the need for a major transportation facility was reexamined to determine whether such a facility is still needed". This is a false statement as the projects need was not reevaluated under the existing and current conditions of 2010-2013. The P&N statement was developed over 8 years ago when the problem in the Valley was its cycle of rapid suburban growth and sprawl and automobile dependency and it is the same statement that is being currently used. The need for this major transportation facility has changed if the correct and current conditions/problems are reevaluated impartially without prejudice. The purported need for the South Mountain 202 is NOT based on the current need and current existing conditions/problems in the southwest Phoenix Metropolitan Area. The P&N was not adequately reevaluated to reflect the growth trends and conditions which have developed in the last 5-8 years. The conclusions; that the completion of the South Mountain 202 Loop is necessary to meet an existing need is based on an inaccurate misrepresentation of the facts. This document dictates the solution by manipulating the P&N to portray that population growth, housing projections and transportation uses from 2004-2009 are relevant and applicable to the current transportation demands and needs of the Phoenix Metropolitan area. The P&N in the DEIS is not based on most recent data. It does not reflect accurate growth projections, current social demands and economic development, and a change in transportation demand and patterns. The information used for the DEIS is based on outdated and limited information as the shifts have been dramatic in the last three years and very little primary data has been produced at this time to make accurate predictions and projections about the future growth and demands in the valley. The P&N is based on MAG data from 2005-2009 which is then used to project out to 2035. Any projection which uses data from 2005-2009 (because that is all that is available) to extrapolate growth projections does not capture and adjust accurately for what happened from 2008-till 2012. Census data from 2010 (and American Community Survey data from 2010-2011) has only limited value as a snap shot and cannot be used in comparison to the 2000 Census data. Not having access to relevant data is not a excuse for using or recycling old data and conclusions. The data used does not accurately reflect what has and what will be happening to the valley growth patterns, employment and housing development. (p.1-2, Chapter 1 Purpose and Need). It errs by simply using the *historic* data to create future projections. It also relies on what cities have "guestimated" to be their future growth in population and housing starts (much of which is not reality based, but wishful thinking). Social scientists and demographers have been studying the valley and the southwest and have many relevant observations and projections. The valley is still in a period of dramatic change in its growth and recovery and the modeling that MAG uses does not reflect the relevant socioeconomic conditions that are evolving even as we speak (foreclosed real estate market driving speculative and rental acquisitions resulting in a change in homeownership patterns, change in state immigration legislation, more transient workforce which are not tied to homeownership, increase

Code	Issue	Response
467	**Purpose and Need**	At the beginning of the environmental impact statement process, the need for a major transportation facility was reexamined to determine whether such a facility is still needed. Validation of those findings occurred throughout the entire environmental impact statement process. Analysis of the purpose and need for the proposed action followed National Environmental Policy Act and Federal Highway Administration implementing guidance on the subject matter and used state-of-the-practice analytical tools, as pointed out in Table 1-3, "Traffic Analysis Tools," on page 1-13 of the Draft Environmental Impact Statement. The results of the analysis determined that a transportation problem does exist and that problem will continue in the foreseeable future (see section, *Conclusions*, on page 1-21). As noted on page 3-1 in the section, *Reconfirm the Purpose and Need for the Proposed Action*, a continuous validation process was undertaken throughout the environmental impact statement process to ensure past conclusions in the environmental impact statement process remained valid. The analyses in the Draft Environmental Impact Statement used socioeconomic and traffic projections at the regional analysis zone and traffic analysis zone levels. At the time of publication of the Draft Environmental Impact Statement, Census 2010-based socioeconomic data at the regional analysis zone and traffic analysis zone levels had not been adopted by the Maricopa Association of Governments and were not available to the project team. Therefore, the data used in the Draft Environmental Impact Statement were the most appropriate information available. The Maricopa Association of Governments approved new population, employment, housing, and traffic projections in June 2013. The new data are presented in the Final Environmental Impact Statement beginning on page 1-11. The purpose and need and analysis of alternatives were updated and reevaluated using these new socioeconomic projections and corresponding projections related to regional traffic. While new projections based on the 2010 Census showed a lower anticipated population and vehicle miles traveled in 2035 than the previous projections, the conclusions reached in the Draft Environmental Impact Statement were validated in the Final Environmental Impact Statement (see Chapter 3, *Alternatives*). The traffic analysis demonstrated that the proposed project is needed today and will continue to be needed into the future. The Maricopa Association of Governments' control total for Maricopa County is consistent with the "ADOA—Medium Series." The National Environmental Policy Act recognizes 1) that data and projections can change throughout the process, 2) that it is important for the process to account for those changes as they become available, and 3) a reasonable person could conclude that the updated information would lead to substantially different results that could affect the decision-making attributes of the National Environmental Policy Act. This guidance permits disciplinary experts to make study recommendations based on recognized expertise without having to "overstudy everything," thus maintaining the spirit and intent of National Environmental Policy Act directives on timely completion and flexibility in the process. Validation of information has occurred throughout the duration of the environmental impact statement process; the assessment of purpose and need for the proposed action is no different, and analytical validation is part of the Final Environmental Impact Statement.

(Response 467 continues on next page)

Code	Comment Document
468	Reevaluate Purpose and Need Statement A Purpose and Need statement is meant to address a problem. The South Mountain 202 project is a solution looking for a problem. The 2012 Purpose and Need statement (P&N) in the South Mountain DEIS does not reflect the current problem. On p.1-1, Chapter 1 the following statement is made; "At the beginning of the EIS process, the need for a major transportation facility was reexamined to determine whether such a facility is still needed". This is a false statement as the projects need was not reevaluated under the existing and current conditions of 2010-2013. The P&N statement was developed over 8 years ago when the problem in the Valley was its cycle of rapid suburban growth and sprawl and automobile dependency and it is the same statement that is being currently used. The need for this major transportation facility has changed if the correct and current conditions/problems are reevaluated impartially without prejudice. The purported need for the South Mountain 202 is NOT based on the current need and current existing conditions/problems in the southwest Phoenix Metropolitan Area. The P&N was not adequately reevaluated to reflect the growth trends and conditions which have developed in the last 5-8 years. The conclusions; that the completion of the South Mountain 202 Loop is necessary to meet an existing need is based on an inaccurate misrepresentation of the facts. This document dictates the solution by manipulating the P&N to portray that population growth, housing projections and transportation uses from 2004-2009 are relevant and applicable to the current transportation demands and needs of the Phoenix Metropolitan area. The P&N in the DEIS is not based on most recent data. It does not reflect accurate growth projections, current social demands and economic development, and a change in transportation demand and patterns. The information used for the DEIS is based on outdated and limited information as the shifts have been dramatic in the last three years and very little primary data has been produced at this time to make accurate predictions and projections about the future growth and demands in the valley. The P&N is based on MAG data from 2005-2009 which is then used to project out to 2035. Any projection which uses data from 2005-2009 (because that is all that is available) to extrapolate growth projections does not capture and adjust accurately for what happened from 2008-till 2012. Census data from 2010 (and American Community Survey data from 2010-2011) has only limited value as a snap shot and cannot be used in comparison to the 2000 Census data. Not having access to relevant data is not a excuse for using or recycling old data and conclusions. The data used does not accurately reflect what has and what will be happening to the valley growth patterns, employment and housing development. (p.1-2, Chapter 1 Purpose and Need). It errs by simply using the *historic* data to create future projections. It also relies on what cities have "guestimated" to be their future growth in population and housing starts (much of which is not reality based, but wishful thinking). Social scientists and demographers have been studying the valley and the southwest and have many relevant observations and projections. The valley is still in a period of dramatic change in its growth and recovery and the modeling that MAG uses does not reflect the relevant socioeconomic conditions that are evolving even as we speak (foreclosed real estate market driving speculative and rental acquisitions resulting in a change in homeownership patterns, change in state immigration legislation, more transient workforce which are not tied to homeownership, increase

Code	Issue	Response
467 (cont.)		The reader is referred to Draft Environmental Impact Statement Chapter 3, *Alternatives*, and, specifically, the section, *Alternatives Development and Screening Process Conclusions*, beginning on page 3-26, noting "... a comprehensive set of alternatives including all modes was considered ... assurance that the screening process was an open process ... a logical, sequential, step-by-step process using data and expertise from multiple disciplines ..." to demonstrate all possibilities were considered.
468	**Purpose and Need**	The Maricopa Association of Governments approved new population, employment, housing, and traffic projections in June 2013. The new data are presented in the Final Environmental Impact Statement beginning on page 1-11. The purpose and need and analysis of alternatives were updated and reevaluated using these new socioeconomic projections and corresponding projections related to regional traffic. While new projections based on the 2010 Census showed a lower anticipated population and vehicle miles traveled in 2035 than the previous projections, the conclusions reached in the Draft Environmental Impact Statement were validated in the Final Environmental Impact Statement (see Chapter 3, *Alternatives*). The traffic analysis demonstrated that the proposed project is needed today and will continue to be needed into the future. The Federal Highway Administration and the U.S. Environmental Protection Agency approved the air quality conformity determination that includes the Maricopa Association of Governments regional travel demand model that produced the traffic projections used in the traffic analysis for the project (see page 3-27 of the Draft Environmental Impact Statement). The model projects demand for multiple modes of travel, including automobile, bus, and light rail. Key model inputs used to forecast travel demand in the Study Area included socioeconomic data (based on land use plans and population and economic forecasts), the anticipated average number of vehicle trips within the region on a daily basis, the distribution of transportation modes used by travelers in the region, the capacity of the transportation infrastructure to accommodate regional travel, and the future transportation infrastructure. The project team used the most recent and reliable data available. The Draft Environmental Impact Statement (Chapter 1, *Purpose and Need*, and Chapter 3, *Alternatives*) provides more detail on the data inputs to the modeling effort and discussions of the assumptions used. As noted in the comment, the Maricopa Association of Governments and Arizona Department of Transportation continually study the changes in travel trends and reflect these changes in their travel-generation modeling. Any new information presented in the Final Environmental Impact Statement has been evaluated as to whether it constitutes a substantial change from the information presented in the Draft Environmental Impact Statement. The Federal Highway Administration and Arizona Department of Transportation have examined the data and analysis and have determined that a supplemental environmental impact statement is not warranted.

Code	Comment Document

in gasoline prices and an increase in fuel efficiencies are creating new driving patterns, decrease in car ownership and VMT as well as an aging population resulting in less VMT, less vehicle ownership by new drivers and more multimodal usage resulting in less automobile VMT, and change in urban form and cites desire to develop a new urban communities). All of these are resulting in the increasing trend of less emphasis on freeways and moving cars and more emphasis on moving people and creating communities. This new national and regional shift is being discussed and acknowledged at all levels (including inside MAG and ADOT itself) yet this did not transfer to the P&N not the DEIS. Instead there is a recycle of the initial statement which is driven by old data and old projections and models. While traffic projections out to 2035 seem easy to conduct for transportation specialists, they are rarely based on anything but a historical perspective, and that has changed dramatically as the valley's growth has leveled off and the southwest as a whole is seeing a change in demographics. This DEIS P&N is the same statement which was introduced to the public in 2004-2005. It is no longer accurate, relevant, or timely and was not revisited thoroughly after the 2008 recession to reflect the different political and socioeconomic climate of the valley. The P&N continues to promote the same conclusions (need) "Build it so we can build more," and "We need freeways for economic development." This no longer reflects the conditions of a valley which began to constrict 4 years ago and is experiencing a change in its development and transportation needs.

469 Because the DEIS P&N is based on outdated and misrepresentational data, the analysis and the recommendations are inaccurate and misleading and reach improper conclusions.

470 While there are multiple problems to be fixed in the Valley metropolitan area: am and pm traffic congestion, reduction of pollution to meet federal air quality standards, need for efficient transportation systems, building a $2.1 billion freeway is NOT the solution to these problems. The solution is through regional planning, focused transportation solutions which respond to community needs, and alleviate of traffic congestion by reducing the induced traffic syndrome.

471 As a final commentary on the P&N: the RTP is a plan which should not be used to codify any ONE transportation project (p.1-2, Chapter 1 Purpose and Need). Residents approved the *plan* NOT one specific *project*. Plans can and should change to reflect the every changing needs of a community. Projects created over 25 years ago, are rarely if ever relevant and salient 30 years later. ADOT cannot justify building the South Mountain 202 by claiming it is in the plan, while they systematically transfer money away from other freeways that are in the plan (and thus NOT building projects that are in the RTP) as a means to build the 202.

472 The DEIS P&N needs to be meaningfully reevaluated as it claims in the opening pages in Chapter 1. This project needs to be reevaluated if there is a need for this project given the pertinent and relevant issues which the southwest valley is facing in this changing transportation environment.

Code	Issue	Response
469	**Purpose and Need**	The Federal Highway Administration and the U.S. Environmental Protection Agency approved the air quality conformity determination that includes the Maricopa Association of Governments regional travel demand model that produced the traffic projections used in the traffic analysis for the project (see page 3-27 of the Draft Environmental Impact Statement). The model projects demand for multiple modes of travel, including automobile, bus, and light rail. Key model inputs used to forecast travel demand in the Study Area included socioeconomic data (based on land use plans and population and economic forecasts), the anticipated average number of vehicle trips within the region on a daily basis, the distribution of transportation modes used by travelers in the region, the capacity of the transportation infrastructure to accommodate regional travel, and the future transportation infrastructure. The analyses in the Draft Environmental Impact Statement used socioeconomic and traffic projections at the regional analysis zone and traffic analysis zone levels. At the time of publication of the Draft Environmental Impact Statement, Census 2010-based socioeconomic data at the regional analysis zone and traffic analysis zone levels had not been adopted by the Maricopa Association of Governments and were not available to the project team. Therefore, the data used in the Draft Environmental Impact Statement were the most appropriate information available. The Maricopa Association of Governments approved new population, employment, housing, and traffic projections in June 2013. The new data are presented in the Final Environmental Impact Statement beginning on page 1-11. The purpose and need and analysis of alternatives were updated and reevaluated using these new socioeconomic projections and corresponding projections related to regional traffic. While new projections based on the 2010 Census showed a lower anticipated population and vehicle miles traveled in 2035 than the previous projections, the conclusions reached in the Draft Environmental Impact Statement were validated in the Final Environmental Impact Statement (see Chapter 3, *Alternatives*). The traffic analysis demonstrated that the proposed project is needed today and will continue to be needed into the future.
470	**Purpose and Need**	The proposed freeway is part of the *Regional Transportation Plan* for the Maricopa Association of Governments region. The *Regional Transportation Plan*, as described on pages 1-5 and 1-10 of the Final Environmental Impact Statement, addresses freeways, streets, transit, airports, bicycle and pedestrian facilities, freight, demand management, system management, and safety. The proposed freeway is only one part of the overall multimodal transportation system planned to meet the travel demand needs of the Maricopa Association of Governments region.
471	**Purpose and Need**	As stated in the subject heading referenced in the comment, the text referenced places the *Context of the Proposed Action in Current Regional Transportation Planning*; no text directly or indirectly codifies one transportation project in the *Regional Transportation Plan* as presented in the Final Environmental Impact Statement.
472	**Purpose and Need**	The analyses in the Draft Environmental Impact Statement used socioeconomic and traffic projections at the regional analysis zone and traffic analysis zone levels. At the time of publication of the Draft Environmental Impact Statement, Census 2010-based socioeconomic data at the regional analysis zone and traffic analysis zone levels had not been adopted by the Maricopa Association of Governments and were not available to the project team. Therefore, the data used in the Draft Environmental Impact Statement were the most appropriate information available.

Code	Issue	Response
472 (cont.)		The Maricopa Association of Governments approved new population, employment, housing, and traffic projections in June 2013. The new data are presented in the Final Environmental Impact Statement beginning on page 1-11. The purpose and need and analysis of alternatives were updated and reevaluated using these new socioeconomic projections and corresponding projections related to regional traffic. While new projections based on the 2010 Census showed a lower anticipated population and vehicle miles traveled in 2035 than the previous projections, the conclusions reached in the Draft Environmental Impact Statement were validated in the Final Environmental Impact Statement (see Chapter 3, *Alternatives*). The traffic analysis demonstrated that the proposed project is needed today and will continue to be needed into the future. The National Environmental Policy Act recognizes 1) that data and projections can change throughout the process, 2) that it is important for the process to account for those changes as they become available, and 3) a reasonable person could conclude that the updated information would lead to substantially different results that could affect the decision-making attributes of the National Environmental Policy Act. This guidance permits disciplinary experts to make study recommendations based on recognized expertise without having to "overstudy everything," thus maintaining the spirit and intent of National Environmental Policy Act directives on timely completion and flexibility in the process. Validation of information has occurred throughout the duration of the environmental impact statement process; the assessment of purpose and need for the proposed action is no different, and analytical validation is part of the Final Environmental Impact Statement.

LAKEWOOD COMMUNITY ASSOCIATION'S CONCERNS & RESPONSE TO DEIS FOR LOOP 202
(SOUTH MOUNTAIN FREEWAY)

Prepared for

Protect Arizona's Resources and Children (PARC), et al.
Phoenix, Arizona

by
Lakewood Community Association Board of Directors
July 20, 2013

Code	Issue	Response

Code	Comment Document
473	**Lakewood HOA's South Mountain Freeway Concerns:** **1. Loss of Water from Community Water Wells:** The lakes are a centerpiece of the Lakewood community, losing the existing groundwater well supply will have a significant negative impact on the entire community, which consists of approximately 2,800 units. With respect to the Foothills Community Association, the DEIS makes the statement that "It is assumed that a new well location could be found that would produce water comparable in quality and quantity to the acquired well, and that no change in the existing groundwater right would result." The Lakewood Community Association has an even greater dependence on water than the Foothills, and the DEIS statement ignores the significant difficulty that was originally encountered in finding a source of water when Lakewood was incorporated. It is unclear whether or not the loss of the existing well even could be replaced, regardless of costs. With the state of Arizona currently restricting or disallowing man-made lakes in new property development, it is also unclear whether or not municipal water could be used as a source. As a result of the loss of the lakes, the property values in Lakewood would be negatively impacted with grave consequences to the entire community.
474	In addition to financial impacts, there are environmental as well, migratory birds would no longer have Lakewood as a possible stopping point along their migration route, and the destruction of the natural riparian area south of Pecos will be a detriment to the wildlife in the area.
475	**2. Home Valuation** A. Reduction in property values based health/environmental impacts such as air and noise pollution.
476	B. Substantial reduction in property values if access to water is hindered which could endanger the existence of the Lakes. The whole community is based on the existence and proximity to the Lakes. Current property values are based on a lake community and lifestyle. C. Substantial reduction in property values for lake-front homes if Lakes are compromised by water access. D. Ability to resell a Lakewood home would be deleteriously impacted due to air and noise pollution. E. Freeway would disrupt a quiet and clean Lakewood environment which would drive property values lower. F. Lost revenue to HOA from Lakewood home displacements would decrease community facilities and amenities causing downward pressure on property values. G. Freeway would have negative lifestyle impacts which would reduce the value of living in Lakewood and thus cause home values to fall. Lifestyle impacts include reduced access to safe recreation like cycling and roller-blading around community roads due to increased and altered traffic. Freeway noise would also impact outdoor leisure and activities such as community picnics, swimming and outdoor dining. H. Freeway could disrupt the reliable performance of the primary aquifer which supplies Lakewood with its water and thus Lakes. These disruptions could include deviations to surface and ground water flows which feed the aquifer. As this reliable source of water is endangered, the reliability of the Lakes and irrigation of community vegetation would be endangered. This would lead to negative impacts to lake recreation and appearance of the community. Ultimately, the existence of the Lakes themselves could be threatened. This would make Lakewood a much less attractive place to live and substantially decrease home and property valuation.

Code	Issue	Response
473	**Water Resources**	Because of the public concern expressed during the environmental impact statement process, page 4-100 of the Draft Environmental Impact Statement, focuses on the Foothills Community Association to provide more details on the well acquisition, condition assessment, and replacement process used by the Arizona Department of Transportation. The Arizona Department of Transportation understands, and states on page 4-100 of the Draft Environmental Impact Statement, respectively, that finding a suitable location for a new well in this area may be difficult. Depending on whether an action alternative were to become the Selected Alternative, it may be possible to keep certain wells in their current location, but move the well controls and associated piping to outside of the right-of-way. Such an analysis would be performed later in the design process.
474	**Water Resources**	The project would not adversely affect any of the artificial lakes and ponds along Pecos Road and, therefore, would not affect migratory birds using those water features. There are no natural riparian areas or riparian vegetation adjacent to Pecos Road; the vegetation growing along the drainage ditch on the southern side of Pecos Road would not be removed.
475	**Neighborhoods/ Communities**	The reader is referred to the section, *Social Conditions*, beginning on Final Environmental Impact Statement page 4-20, to learn about criteria applied when considering impacts on social conditions and what mitigation is under consideration. Mitigation measures proposed can be found throughout Chapter 4. These have direct application to the reduction of impacts that could affect certain definitions of quality of life. As to property values and the effects of proximity of freeway, numerous studies have been done on the subject and in general, results have varied but with an underlying consensus that many variables contribute to property values. A review of the literature reveals few detailed and comprehensive analyses of the relationship between the transportation infrastructure and residential property values (Transportation Research Record: Journal of the Transportation Research Board, No. 2174, Transportation Research Board of the National Academies, Washington, D.C., 2010, pages 138–47; "Impact of Highways on Property Values: Case Study of the Superstition Freeway Corridor"). A recent study by the California Department of Transportation concluded that freeway facilities did not substantially affect sales prices in residential areas adjacent to the facility. The study concluded that it is the visibility of the freeway that may influence selling price and not distance or noise. As a result, the researchers generally concluded that the more the visibility of a new freeway is reduced, the less it would determine the sales price of homes sold in the area.
476	**Water Resources**	The procedure identified on page 4-100 of the Draft Environmental Impact Statement, defines the procedure that the Arizona Department of Transportation would use to replace adversely affected wells, and also identifies the general costs the Arizona Department of Transportation would incur to replace the lost water sources. As noted in this discussion, if it were necessary to provide replacement water instead of a new well, the Arizona Department of Transportation would, in negotiations with the well owner, include the difference between the costs of pumping the well and the costs of the new replacement water source. Which of these outcomes would take place would become known during the final design of the Selected Alternative, should an action alternative be selected.

Lakewood HOA's South Mountain Freeway Concerns:

1. **Loss of Water from Community Water Wells:**

The lakes are a centerpiece of the Lakewood community, losing the existing groundwater well supply will have a significant negative impact on the entire community, which consists of approximately 2,800 units. With respect to the Foothills Community Association, the DEIS makes the statement that "It is assumed that a new well location could be found that would produce water comparable in quality and quantity to the acquired well, and that no change in the existing groundwater right would result." The Lakewood Community Association has an even greater dependence on water than the Foothills, and the DEIS statement ignores the significant difficulty that was originally encountered in finding a source of water when Lakewood was incorporated. It is unclear whether or not the loss of the existing well even could be replaced, regardless of costs. With the state of Arizona currently restricting or disallowing man-made lakes in new property development, it is also unclear whether or not municipal water could be used as a source. As a result of the loss of the lakes, the property values in Lakewood would be negatively impacted with grave consequences to the entire community.

In addition to financial impacts, there are environmental as well, migratory birds would no longer have Lakewood as a possible stopping point along their migration route, and the destruction of the natural riparian area south of Pecos will be a detriment to the wildlife in the area.

2. **Home Valuation**

A. Reduction in property values based health/environmental impacts such as air and noise pollution.

B. Substantial reduction in property values if access to water is hindered which could endanger the existence of the Lakes. The whole community is based on the existence and proximity to the Lakes. Current property values are based on a lake community and lifestyle.

C. Substantial reduction in property values for lake-front homes if Lakes are compromised by water access.

477

D. Ability to resell a Lakewood home would be deleteriously impacted due to air and noise pollution.

E. Freeway would disrupt a quiet and clean Lakewood environment which would drive property values lower.

F. Lost revenue to HOA from Lakewood home displacements would decrease community facilities and amenities causing downward pressure on property values.

G. Freeway would have negative lifestyle impacts which would reduce the value of living in Lakewood and thus cause home values to fall. Lifestyle impacts include reduced access to safe recreation like cycling and roller-blading around community roads due to increased and altered traffic. Freeway noise would also impact outdoor leisure and activities such as community picnics, swimming and outdoor dining.

H. Freeway could disrupt the reliable performance of the primary aquifer which supplies Lakewood with its water and thus Lakes. These disruptions could include deviations to surface and ground water flows which feed the aquifer. As this reliable source of water is endangered, the reliability of the Lakes and irrigation of community vegetation would be endangered. This would lead to negative impacts to lake recreation and appearance of the community. Ultimately, the existence of the Lakes themselves could be threatened. This would make Lakewood a much less attractive place to live and substantially decrease home and property valuation.

Code	Issue	Response
476 (cont.)		Depending on whether an action alternative were to become the Selected Alternative, it may be possible to keep certain wells in their current location, but move the well controls and associated piping to outside of the right-of-way. Such an analysis would be performed later in the design process.
477	**Noise, Air Quality**	The reader is referred to the text box, "*Freeway Awareness*," beginning on Draft Environmental Impact Statement page 4-12, and the text box, "*If My Property Would Be Affected, Can ADOT Purchase the Land in Advance?*", on page 4-43. Property acquisition is governed in accordance with the Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970. This process outlines determination of property values through the acquisition process. Environmental analyses and noise analyses conducted for and documented in the Draft Environmental Impact Statement comply with the Federal Highway Administration's regulations for implementing National Environmental Policy Act at 23 Code of Federal Regulations 771 and for conducting noise analyses at 23 Code of Federal Regulations 772. These issues are addressed in the Draft Environmental Impact Statement. Sensitive receivers for noise and air are already included in the air quality and noise analyses in accordance with State and federal guidance. The air quality assessment for the proposed freeway analyzed impacts from carbon monoxide and particulate matter (PM_{10}) and followed U.S. Environmental Protection Agency guidelines. For mobile source air toxics, the analysis showed that for the Study Area, constructing the freeway would have a marginal effect on annual emissions in 2025 and 2035 (less than a 1 percent difference in total annual emissions between the Preferred Alternative and No-Action Alternative). With the Preferred Alternative in 2035, modeled mobile source air toxics emissions would decrease by 57 percent to more than 90 percent, depending on the pollutant, despite a 47 percent increase in vehicle miles traveled in the Study Area compared with 2012 conditions. The air quality analyses were updated for the Final Environmental Impact Statement, including a quantitative particulate matter (PM_{10}) analysis, and are more fully described beginning on page 4-68 of the Final Environmental Impact Statement. According to the air quality analyses conducted for the proposed freeway, no violations of either the carbon monoxide or particulate matter (PM_{10}) standards were identified, even at worst-case locations along the project corridor. Thus, the carbon monoxide and particulate analyses demonstrated that the proposed freeway would not contribute to any new localized violations, increase the frequency or severity of any existing violation or delay timely attainment of the National Ambient Air Quality Standards or any required interim emissions reductions or other milestones; therefore, no mitigation of these effects is required. The noise analysis was also updated for the Final Environmental Impact Statement using most recent Federal Highway Administration and Arizona Department of Transportation policy and traffic projections provided by the Maricopa Association of Governments in August 2013. This updated analysis begins on page 4-88 of the Final Environmental Impact Statement. No substantial differences between the analyses presented in the Draft and the Final Environmental Impact Statements resulted.

Lakewood HOA's South Mountain Freeway Concerns:

1. **Loss of Water from Community Water Wells:**

The lakes are a centerpiece of the Lakewood community, losing the existing groundwater well supply will have a significant negative impact on the entire community, which consists of approximately 2,800 units. With respect to the Foothills Community Association, the DEIS makes the statement that "It is assumed that a new well location could be found that would produce water comparable in quality and quantity to the acquired well, and that no change in the existing groundwater right would result." The Lakewood Community Association has an even greater dependence on water than the Foothills, and the DEIS statement ignores the significant difficulty that was originally encountered in finding a source of water when Lakewood was incorporated. It is unclear whether or not the loss of the existing well even could be replaced, regardless of costs. With the state of Arizona currently restricting or disallowing man-made lakes in new property development, it is also unclear whether or not municipal water could be used as a source. As a result of the loss of the lakes, the property values in Lakewood would be negatively impacted with grave consequences to the entire community.

In addition to financial impacts, there are environmental as well, migratory birds would no longer have Lakewood as a possible stopping point along their migration route, and the destruction of the natural riparian area south of Pecos will be a detriment to the wildlife in the area.

2. **Home Valuation**

A. Reduction in property values based health/environmental impacts such as air and noise pollution.

B. Substantial reduction in property values if access to water is hindered which could endanger the existence of the Lakes. The whole community is based on the existence and proximity to the Lakes. Current property values are based on a lake community and lifestyle.

C. Substantial reduction in property values for lake-front homes if Lakes are compromised by water access.

D. Ability to resell a Lakewood home would be deleteriously impacted due to air and noise pollution.

E. Freeway would disrupt a quiet and clean Lakewood environment which would drive property values lower.

478 F. Lost revenue to HOA from Lakewood home displacements would decrease community facilities and amenities causing downward pressure on property values.

479 G. Freeway would have negative lifestyle impacts which would reduce the value of living in Lakewood and thus cause home values to fall. Lifestyle impacts include reduced access to safe recreation like cycling and roller-blading around community roads due to increased and altered traffic. Freeway noise would also impact outdoor leisure and activities such as community picnics, swimming and outdoor dining.

480 H. Freeway could disrupt the reliable performance of the primary aquifer which supplies Lakewood with its water and thus Lakes. These disruptions could include deviations to surface and ground water flows which feed the aquifer. As this reliable source of water is endangered, the reliability of the Lakes and irrigation of community vegetation would be endangered. This would lead to negative impacts to lake recreation and appearance of the community. Ultimately, the existence of the Lakes themselves could be threatened. This would make Lakewood a much less attractive place to live and substantially decrease home and property valuation.

Code	Issue	Response
477 (cont.)		A review of the literature reveals few detailed and comprehensive analyses of the relationship between the transportation infrastructure and residential property values (Transportation Research Record: Journal of the Transportation Research Board, No. 2174, Transportation Research Board of the National Academies, Washington, D.C., 2010, pages 138–47; "Impact of Highways on Property Values: Case Study of the Superstition Freeway Corridor"). A recent study by the California Department of Transportation concluded that freeway facilities did not substantially affect sales prices in residential areas adjacent to the facility. The study concluded that it is the visibility of the freeway that may influence selling price and not distance or noise. As a result, the researchers generally concluded that the more the visibility of a new freeway is reduced, the less it would determine the sales price of homes sold in the area.
478	**Acquisitions and Relocations**	Land acquisition and relocation assistance services for the project shall be available to all individuals without discrimination in accordance with the Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970, as amended (Uniform Act). The Uniform Act provides uniform, fair, and equitable treatment of people whose property is impacted or who are displaced as a result of the project, including those with special needs. Advisory assistance services and compensation practices are described in detail in the Arizona Department of Transportation's *Right-of-way Procedures Manual*, located at <azdot.gov/business/RightofWay_Properties/booklets-and-manuals>. For further discussion, see page 4-51 of the Final Environmental Impact Statement and Appendix 4-1. For questions on specific properties, contact the Arizona Department of Transportation Right-of-Way Group at (602) 712-7316. There would be no home displacements in the Lakewood community. For other communities, the compensation to the homeowners' association is dependent on how the subdivision and/or homeowners' association is legally structured.
479	**Acquisitions and Relocations**	The reader is referred to the section, *Social Conditions*, beginning on Draft Environmental Impact Statement page 4-20, to learn about criteria applied when considering impacts on social conditions and what mitigation is under consideration. Mitigation measures proposed can be found throughout Chapter 4. These have direct application to the reduction of impacts that could affect certain definitions of quality of life. As to property values and the effects of proximity of freeway, numerous studies have been done on the subject and, in general, results have varied but with an underlying consensus that many variables contribute to property values. A review of the literature reveals few detailed and comprehensive analyses of the relationship between the transportation infrastructure and residential property values (Transportation Research Record: Journal of the Transportation Research Board, No. 2174, Transportation Research Board of the National Academies, Washington, D.C., 2010, pages 138–47; "Impact of Highways on Property Values: Case Study of the Superstition Freeway Corridor"). A recent study by the California Department of Transportation concluded that freeway facilities did not substantially affect sales prices in residential areas adjacent to the facility. The study concluded that it is the visibility of the freeway that may influence selling price and not distance or noise. As a result, the researchers generally concluded that the more the visibility of a new freeway is reduced, the less it would determine the sales price of homes sold in the area.

(Response 480 begins on next page)

Code	Comment Document
478	**3. Home Displacement** A. Freeway right-of-way could encroach on existing Lakewood homes requiring destruction of several family homes. B. Local community neighborhoods within Lakewood would see a serious negative impact or cease to exist due to destruction of homes and relocation of neighbors. C. Loss of community integrity and relationships, especially for small children separated from friends who would be forced to move away due to home displacement. **4. Lost Revenue to HOA** A. Direct assessment revenue losses of $350/home per year for each home displaced. B. Further loss of assessments if vacancy rate increases due to image of Lakewood being a less attractive place to live due to deleterious lifestyle impacts of the freeway. C. Viscous cycle of revenue loss leading to reduction of community services leading to further revenue loss (as vacancy rates increase). **5. Air Quality** A. The air quality cause by increase traffic and trucks will decrease the air quality in our community and pose a serious health risk to the residents of the community. **6. Traffic Flow and Increase Congestion** A. Without access to the freeway at 32nd Street, there will be an increase in traffic flow and congestion between 24th Street and 40th Street within the Lakewood Community boundary. **7. Increase in Noise from Freeway Traffic** B. The noise level will dramatically increase due to the proximity of the freeway and the increase in traffic and trucks in and around our community. **8. Loss of Access to Property South of Pecos** A. The HOA owns land south of Pecos which the freeway will cut off any kind of access to. **9. Water Retention Issues/Concerns** A. The freeway will be changing the water run off patterns and cause water retention concerns. **10. Loss of Bike Paths on Pecos**: A. Our community members will no longer have access to the uniquely long, flat bike lane located on Pecos. **11. Additional Stress on Deteriorating Surface Streets in Community** A. The increase in traffic on the community's surface streets will only add additional stress on our already deteriorating city streets in the community.
481	

Code	Issue	Response
480	**Water Resources**	The procedure identified on page 4-100 of the Draft Environmental Impact Statement, defines the procedure that the Arizona Department of Transportation would use to replace adversely affected wells, and also identifies the general costs the Arizona Department of Transportation would incur to replace the lost water sources. As noted in this discussion, if it were necessary to provide replacement water instead of a new well, the Arizona Department of Transportation would, in negotiations with the well owner, include the difference between the costs of pumping the well and the costs of the new replacement water source. Which of these outcomes would take place would become known during the final design of the Selected Alternative, should an action alternative be selected. Depending on whether an action alternative were to become the Selected Alternative, it may be possible to keep certain wells in their current location, but move the well controls and associated piping to outside of the right-of-way. Such an analysis would be performed later in the design process.
481	**Acquisition and Relocation**	The reader is referred to the section, *Social Conditions*, beginning on page 4-20 of the Draft Environmental Impact Statement, to learn about criteria applied when considering impacts on social conditions and what mitigation is under consideration. Mitigation measures proposed can be found throughout Chapter 4. These have direct application to the reduction of impacts that could affect certain definitions of quality of life. As to property values and the effects of proximity of freeway, numerous studies have been done on the subject and, in general, results have varied but with an underlying consensus that many variables contribute to property values. A review of the literature reveals few detailed and comprehensive analyses of the relationship between the transportation infrastructure and residential property values (Transportation Research Record: Journal of the Transportation Research Board, No. 2174, Transportation Research Board of the National Academies, Washington, D.C., 2010, pages 138–47; "Impact of Highways on Property Values: Case Study of the Superstition Freeway Corridor"). A recent study by the California Department of Transportation concluded that freeway facilities did not substantially affect sales prices in residential areas adjacent to the facility. The study concluded that it is the visibility of the freeway that may influence selling price and not distance or noise. As a result, the researchers generally concluded that the more the visibility of a new freeway is reduced, the less it would determine the sales price of homes sold in the area.

	3. Home Displacement A. Freeway right-of-way could encroach on existing Lakewood homes requiring destruction of several family homes. B. Local community neighborhoods within Lakewood would see a serious negative impact or cease to exist due to destruction of homes and relocation of neighbors. C. Loss of community integrity and relationships, especially for small children separated from friends who would be forced to move away due to home displacement. 4. Lost Revenue to HOA A. Direct assessment revenue losses of $350/home per year for each home displaced. B. Further loss of assessments if vacancy rate increases due to image of Lakewood being a less attractive place to live due to deleterious lifestyle impacts of the freeway. C. Viscous cycle of revenue loss leading to reduction of community services leading to further revenue loss (as vacancy rates increase).
482	**5. Air Quality** A. The air quality cause by increase traffic and trucks will decrease the air quality in our community and pose a serious health risk to the residents of the community.
	6. Traffic Flow and Increase Congestion A. Without access to the freeway at 32nd Street, there will be an increase in traffic flow and congestion between 24th Street and 40th Street within the Lakewood Community boundary. 7. Increase in Noise from Freeway Traffic B. The noise level will dramatically increase due to the proximity of the freeway and the increase in traffic and trucks in and around our community. 8. Loss of Access to Property South of Pecos A. The HOA owns land south of Pecos which the freeway will cut off any kind of access to. 9. Water Retention Issues/Concerns A. The freeway will be changing the water run off patterns and cause water retention concerns. 10. Loss of Bike Paths on Pecos: A. Our community members will no longer have access to the uniquely long, flat bike lane located on Pecos. 11. Additional Stress on Deteriorating Surface Streets in Community A. The increase in traffic on the community's surface streets will only add additional stress on our already deteriorating city streets in the community.

Code	Issue	Response
482	**Air Quality**	Air Quality analyses conducted for and documented in the Draft and Final Environmental Impact Statements complies with the Federal Highway Administration's regulations for implementing the National Environmental Policy Act at 23 Code of Federal Regulations 771. These issues are addressed in the Draft and Final Environmental Impact Statements. Sensitive receivers for air are already included in the air quality analyses in accordance with State and federal guidance. The air quality assessment for the proposed freeway analyzed impacts from carbon monoxide and particulate matter (PM_{10}) and followed U.S. Environmental Protection Agency guidelines. The air quality analyses were updated for the Final Environmental Impact Statement, including a quantitative particulate matter (PM_{10}) analysis, and are more fully described beginning on page 4-68 of the Final Environmental Impact Statement. According to the air quality analyses conducted for the proposed freeway, no violations of either the carbon monoxide or particulate matter (PM_{10}) standards were identified, even at worst-case locations along the project corridor. Thus, the carbon monoxide and particulate analyses demonstrated that the proposed freeway would not contribute to any new localized violations, increase the frequency or severity of any existing violation or delay timely attainment of the National Ambient Air Quality Standards or any required interim emissions reductions or other milestones. 40 Code of Federal Regulations Section 1500.1(b) also directs the Federal Highway Administration to focus its National Environmental Policy Act analysis and documentation on issues that are truly significant to the action in question. In the context of mobile source air toxics, the Federal Highway Administration must consider whether changes in mobile source air toxics emissions attributable to a project have the potential for significant health risk. Using cancer risk as an example, the U.S. Environmental Protection Agency estimates that the overall risk of cancer in the United States is approximately 330,000 in a million, and that air toxics (from all sources) are responsible for a risk of approximately 50 in a million. In its most recent mobile source air toxics rule-making, the U.S. Environmental Protection Agency estimated mobile source air toxics cancer risk, after implementation of emissions controls, at approximately 5 in a million (or 0.0015 percent of overall cancer risk from any cause). For the South Mountain Freeway project, the mobile source air toxics emissions analysis for the Study Area found little difference in total annual emissions of mobile source air toxics emissions between the Preferred and No-Action Alternatives (less than a 1 percent difference) in 2025 and 2035. With the Preferred Alternative in 2035, modeled mobile source air toxics emissions would decrease by 57 percent to more than 90 percent, depending on the pollutant, despite a 47 percent increase in vehicle miles traveled in the Study Area compared with 2012 conditions (see discussion beginning on page 4-77 of the Final Environmental Impact Statement). Like most highway projects that have received a mobile source air toxics emissions analysis, the South Mountain Freeway project would result in a negligible change to a very small component of overall cancer risk, and this risk is declining regardless of alternative.

Code	Comment Document

3. Home Displacement

A. Freeway right-of-way could encroach on existing Lakewood homes requiring destruction of several family homes.

B. Local community neighborhoods within Lakewood would see a serious negative impact or cease to exist due to destruction of homes and relocation of neighbors.

C. Loss of community integrity and relationships, especially for small children separated from friends who would be forced to move away due to home displacement.

4. Lost Revenue to HOA

A. Direct assessment revenue losses of $350/home per year for each home displaced.

B. Further loss of assessments if vacancy rate increases due to image of Lakewood being a less attractive place to live due to deleterious lifestyle impacts of the freeway.

C. Viscous cycle of revenue loss leading to reduction of community services leading to further revenue loss (as vacancy rates increase).

5. Air Quality

A. The air quality cause by increase traffic and trucks will decrease the air quality in our community and pose a serious health risk to the residents of the community.

483 **6. Traffic Flow and Increase Congestion**

A. Without access to the freeway at 32nd Street, there will be an increase in traffic flow and congestion between 24th Street and 40th Street within the Lakewood Community boundary.

484 **7. Increase in Noise from Freeway Traffic**

B. The noise level will dramatically increase due to the proximity of the freeway and the increase in traffic and trucks in and around our community.

485 **8. Loss of Access to Property South of Pecos**

A. The HOA owns land south of Pecos which the freeway will cut off any kind of access to.

486 **9. Water Retention Issues/Concerns**

A. The freeway will be changing the water run off patterns and cause water retention concerns.

487 **10. Loss of Bike Paths on Pecos**:

A. Our community members will no longer have access to the uniquely long, flat bike lane located on Pecos.

488 **11. Additional Stress on Deteriorating Surface Streets in Community**

A. The increase in traffic on the community's surface streets will only add additional stress on our already deteriorating city streets in the community.

Code	Issue	Response
483	**Traffic**	The determination to not include an interchange at 32nd Street was made in coordination with the City of Phoenix (see Figure 3-8 on page 3-15 of the Final Environmental Impact Statement). The interchange would have displaced over 100 homes and would have been located near an existing high school. In 2006, the City of Phoenix conducted a traffic circulation study to evaluate the impacts of the proposed freeway on the local street system, including the shift of access to Foothills Reserve and Calabrea from Pecos Road to Chandler Boulevard. The City study found no adverse effects on the local street system from the freeway (see Appendix 3-1 in the Final Environmental Impact Statement).
484	**Noise**	Noise analyses conducted for and documented in the Draft and Final Environmental Impact Statements comply with the Federal Highway Administration's regulations for implementing the National Environmental Policy Act at 23 Code of Federal Regulations 771 and for conducting noise analyses at 23 Code of Federal Regulations 772. These issues are addressed in the Draft and Final Environmental Impact Statement. Sensitive receivers for noise are already included in the noise analysis in accordance with State and federal guidance. As stated on page 4-82 of the Draft Environmental Impact Statement, over 220 sensitive receivers were evaluated from a traffic noise perspective. All of the receivers represent noise sensitive land uses in proximity to the proposed project; therefore, these receivers would have higher noise levels than the schools more distant from the proposed action. The noise analysis was also updated for the Final Environmental Impact Statement using most recent Federal Highway Administration and Arizona Department of Transportation policy and traffic projections provided by the Maricopa Association of Governments in August 2013. This updated analysis begins on page 4-88 of the Final Environmental Impact Statement. No substantial differences between the analyses presented in the Draft and the Final Environmental Impact Statements resulted.
485	**Acquisitions and Relocations**	Access to the land south of the proposed freeway would be maintained in a similar way as the access existing today. If reasonable access could not be maintained, the property might be subject to acquisition by the Arizona Department of Transportation in accordance with State law.
486	**Design**	Pecos Road drainage is designed as a pass-through system. In other words, water is allowed to drain along its natural existing pathway underneath the freeway and to Gila River Indian Community land. If an action alternative were to become the Selected Alternative, the E1 Alternative would be constructed aboveground and the existing culverts would extend to pass drainage under the freeway. Pecos Road currently has numerous existing culvert crossings. Extending the existing culverts or upsizing the culverts would maintain or improve drainage flows. This would ensure that there would be no adverse flooding impacts to adjacent properties. (See pages 3-18, 4-98, and 4-107 of the Draft Environmental Impact Statement.)
487	**Design**	The main line of the E1 Alternative would not have a bicycle route as part of the design. Continuous east–west riding would be possible in the neighborhoods adjoining the alternative and along Chandler Boulevard.
488	**Traffic**	In 2006, the City of Phoenix conducted a traffic circulation study to evaluate the impacts of the proposed freeway on the local street system. The City study found no adverse effects on the local street system from the freeway (see Appendix 3-1 in the Final Environmental Impact Statement).

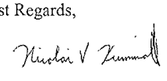
RE: Comments on Draft EIS for South Mountain Freeway (FHWA-AZ-EIS-13-01-D)

Dear South Mountain Study Team,

I am writing to comment on the draft environmental impact statement (DEIS) you released for the Loop 2002 South Mountain Freeway study. As a professional economist, a parent of young children, and a resident of Phoenix, I am deeply concerned about your DEIS. Overall, I think the DEIS reflects an unwarranted bias toward building the freeway with the Pecos Road alignment. After careful review, I cannot help but think that the DEIS systematically overstates the benefits of building the freeway and systematically understates the negative externalities on safety and environmental quality. Furthermore, the DEIS should be forthright about the fact that the precise magnitudes of both the benefits and costs are uncertain. Yet the DEIS has an asymmetric treatment of uncertainty. Economic costs, such as the public health consequences of increased air pollution in Ahwatukee, are dismissed entirely because they are uncertain. Meanwhile, economic benefits, such as the projected reductions in congestion on the I-10, are falsely presented as certain outcomes, despite the deeply uncertain nature of such projections. Finally, the DEIS falls far short of established "best practices" for the analysis of public projects as defined by the U.S. Office of Management and Budget (Circular A-4) and the U.S. Environmental Protection Agency's *Guidelines for Preparing Economic Analysis* (2010). I think it would be highly irresponsible to proceed with building the freeway without first conducting a serious economic analysis that quantifies the benefits and costs, and fully addresses uncertainty.

Please find attached 12 specific comments that explain my concerns with selected aspects of your DEIS. I look forward to seeing your responses in the final EIS. I would be glad to clarify any of the issues I raise to your staff. Feel free to contact me with questions.

Best Regards,



Nicolai V. Kuminoff
kuminoff@gmail.com

Code	Issue	Response
489	**Purpose and Need**	At the beginning of the environmental impact statement process, the need for a major transportation facility was reexamined to determine whether such a facility is still needed. Validation of those findings occurred throughout the entire environmental impact statement process. Analysis of the purpose and need for the proposed action followed National Environmental Policy Act and Federal Highway Administration implementing guidance on the subject matter and used state-of-the-practice analytical tools, as pointed out in Table 1-3, "Traffic Analysis Tools," on page 1-13 of the Draft Environmental Impact Statement. The results of the analysis determined that a transportation problem does exist and that problem will continue in the foreseeable future (see section, *Conclusions*, on page 1-21). The comment implies that the freeway condition was predetermined. As noted on page 3-1 in the section, *Reconfirm the Purpose and Need for the Proposed Action*, a continuous validation process was undertaken throughout the environmental impact statement process to ensure past conclusions in the environmental impact statement process remained valid. The social, environmental, and economic effects of all alternatives, including the No-Action Alternative, are presented in the Draft and Final Environmental Impact Statements.

Code	Comment Document
490	Comment #1: The DEIS implies that a majority of Maricopa County residents support building the proposed South Mountain Freeway without having any factual basis to support this implication. There are numerous examples of this, especially in the early chapters of the DEIS. One example is the "What do the results of Propositions 300 and 400 tell us" sidebar on page 1-9. The problem is that the proposed South Mountain Freeway was a fairly minor detail in the information provided to voters on the broader regional transportation plan. Voters have never had an opportunity to express their opinions on the South Mountain Freeway separately from other regional transportation projects that were bundled as part of these propositions and were in more immediate need of funding at the time the propositions were presented to voters. Furthermore, neither proposition provided voters with basic details on the South Mountain Freeway such as the expected construction cost and the number of lanes. Furthermore, at the time people voted on proposition 300 the town of Ahwatukee was largely undeveloped. Likewise, the regional transportation plan provided to voters as part of the Proposition 400 election of 2004 failed to anticipate the location, size, use, financial cost and social costs of building the freeway. It is also noteworthy that both votes occurred before the onset of the great recession. The bottom line is that there is no reason to expect that Maricopa county voters would support building the South Mountain Freeway, if they were given the opportunity to vote today. In addition, the question of whether or not voters liked the idea of a new freeway extension 30 years ago or 10 years ago is entirely irrelevant to the question of whether or not it makes sense to build the freeway today.
491	Comment #2: The effort to model the effect of the freeway on ambient concentrations of criteria air pollutants is inadequate and misleading. For example, the discussion of carbon monoxide (CO) in section 4-65 of the DEIS points out that impacts were modeled using information from Maricopa County's current network of air quality monitoring sites in the region. Yet the discussion fails to mention that Maricopa County does not have any air quality monitoring sites in the Ahwatukee foothills (http://alert.fcd.maricopa.gov/alert/Google/v3/air.html). This is a serious flaw in the modeling assessment because the prevailing wind patterns and foothills topography will likely cause most of the emissions of pollutants to be blown into pockets of

Code	Issue	Response
490	**Public Involvement**	The section, *Summary of Past Agency and Public Involvement Pre-EIS Process*, outlines the outreach by the Maricopa Association of Governments and others since the 1980s over the South Mountain Freeway. In that outreach, through the development of the *Regional Transportation Plan*, people were provided opportunities to express concerns over the specifics of the proposed freeway as well as learn about the costs and design of the facility through the years. Construction cost estimates are subject to constant updates just as, for reasons noted in the comment, economic conditions are subject to change. The amount of funding set aside for the proposed action in the *Regional Transportation Plan* is in line with projected costs. Regarding the sidebar on page 1-9 of the Draft Environmental Impact Statement referenced in the comment, the text makes no reference to the proposed action. The comment asserts that the page 1-9 sidebar is an example of the Draft Environmental Impact Statement "implying that a majority of Maricopa County residents supports building the proposed freeway." The sidebar referenced says 1) there is "continued public support for investment in regional transportation projects," 2) "voters in 90 percent of the county's 1,058 voting precincts voted in favor of Proposition 400 and the projects it would fund," and 3) "voters in 81 percent of the 31 voting precincts in the Study Area favored Proposition 400 and the projects it would fund."
491	**Air Quality**	The air quality assessment for impacts from carbon monoxide followed the U.S. Environmental Protection Agency guidelines in Guideline for Modeling Carbon Monoxide from Roadway Intersections (A-OAQPS, 1992). Inputs to the model were based on U.S. Environmental Protection Agency-recommended values or were selected to provide a conservative estimate of impacts. Modeling methodology and results were reviewed by the Federal Highway Administration, Arizona Department of Transportation, and Maricopa Association of Governments. As noted on page 4-65 of the Draft Environmental Impact Statement, over 700 receptors were modeled for carbon monoxide concentrations. Receptor placement met the criteria for selecting modeling locations as specified in 40 Code of Federal Regulations Part 93.123(a). The air quality analyses were updated for the Final Environmental Impact Statement, including a quantitative particulate matter (PM_{10}) analysis, and are more fully described beginning on page 4-68 of the Final Environmental Impact Statement.

Code	Comment Document
492	localized air pollution above residential neighborhoods in Ahwatukee in between the freeway and South Mountain Park. Comment #3: Failure to model the impact of the freeway on ground level ozone concentrations above residential neighborhoods in Ahwatukee is a serious problem as emissions generated by the freeway may very well exceed national standards for 8-hour ambient ozone concentrations. As noted earlier, the prevailing wind patterns and topography of the region are likely to cause most of the emissions to sit in air pockets above residential neighborhoods in Ahwatukee. Furthermore, these neighborhoods are highly populated by families with young children who are identified by the Environmental Protection Agency as being a "sensitive group" with respect to ozone (Federal Registrar, Vol. 64, No. 149, Wednesday, August 4, 1999, Rules and Regulations). Comment #4: The lack of air quality monitors in the Ahwatukee foothills area undermines the credibility of the entire air quality assessment provided in the DEIS. Air quality monitors are needed to inform the assessment of potential effects of the freeway on air quality. The current assessment does not make a serious attempt to model air quality impacts in Ahwatukee, which contains the neighborhoods that will experience the largest negative effects of increased air pollution generated by the freeway. Comment #5: The DEIS's overall conclusion that building the freeway will not cause an increase in violations of federal ambient air quality standards is misleading. This conclusion simply exploits the current placement of air quality monitors. By providing an incentive for truckers and non-local drivers to avoid traveling through central Phoneix, the South Mountain freeway will divert air pollution away from the areas that have air quality monitors and into areas that do not have air quality monitors, such as the Ahwatukee foothills. Ambient air quality will surely worsen in Ahwatukee and may very well violate federal standards for the criteria pollutants. Of course this will not cause any violations if there are no air quality monitors to measure the violations. This highlights the need for a more serious assessment of air pollution impacts from the proposed freeway, and it also highlights the need to place air quality monitors at several locations in the Ahwatukee foothills. 3

Code	Issue	Response
492	**Air Quality**	As noted on page 4-76 of the Final Environmental Impact Statement, since ozone is a regional pollutant, there is no requirement to analyze potential impacts and no possibility of localized violations of ozone to occur at the project level. The Maricopa Association of Governments is responsible for developing plans to reduce emissions of ozone precursors in the Maricopa area. The Preferred Alternative is included in the *Regional Transportation Plan* that has been determined by the U.S. Department of Transportation to conform to the State Implementation Plan on February 12, 2014. A common theme in public comments on the proposed project has been the potential impacts of the project on children's health, primarily through vehicle emissions and noise. Many commenters raised concerns about the proximity of the project to schools or other aspects of the project that may affect children. In addition, the U.S. Environmental Protection Agency requested that the Final Environmental Impact Statement address Executive Order 13045, *Protection of Children from Environmental Health Risks and Safety Risks*. Throughout the Final Environmental Impact Statement, potential impacts on and subsequent mitigation for human health are disclosed and identified, as inherent in the environmental impact statement process. The Final Environmental Impact Statement incorporates an assessment of the potential impacts of the proposed project on all populations, including children. The Final Environmental Impact Statement addresses potential impacts of the project on children in the Chapter 4 environmental consequences analyses. The U.S. Environmental Protection Agency's Toxicity and Exposure Assessments for Children's Health report (see page 4-73 of the Final Environmental Impact Statement) indicated that indoor air concentrations of benzene are usually higher than outdoor levels and that indoor air in smokers' homes is a significant contributor to children's exposures. It mentioned children when identifying the effects of acute exposure to naphthalene. The Final Environmental Impact Statement acknowledges and fully discloses public scoping comments that raised the topic of health effects on neighborhoods and adjacent schools (see page 4-31 of the Final Environmental Impact Statement). The Final Environmental Impact Statement evaluates Clean Air Act criteria air pollutant concentrations in Maricopa County and the Phoenix area (see pages 4-75 to 4-77 of the Final Environmental Impact Statement). With regard to air quality impacts, the Final Environmental Impact Statement addresses children's health impacts within the broader discussion regarding health impacts under the National Ambient Air Quality Standards. Clean Air Act Section 109(b)(1) requires the U.S. Environmental Protection Agency to promulgate primary National Ambient Air Quality Standards at levels that allow an adequate margin of safety and are requisite to protect the public health. As noted by the U.S. Environmental Protection Agency in its 2013 rulemaking for particulate matter, Clean Air Act Section 109's legislative history demonstrates that the primary standards are "to be set at the maximum permissible ambient air level... which will protect the health of any [sensitive] group of the population" (78 *Federal Register* 3086 and 3090) (quoting S. Rep. No. 91-1196, 91st Cong., 2 Sess. 10 [1970]) (alterations in original). Accordingly, the Final Environmental Impact Statement National Ambient Air Quality Standards-based evaluation of criteria air pollutants includes a health-based review of sensitive populations, including children, given the National Ambient Air Quality Standards inherent consideration

localized air pollution above residential neighborhoods in Ahwatukee in between the freeway and South Mountain Park.

Comment #3: Failure to model the impact of the freeway on ground level ozone concentrations above residential neighborhoods in Ahwatukee is a serious problem as emissions generated by the freeway may very well exceed national standards for 8-hour ambient ozone concentrations. As noted earlier, the prevailing wind patterns and topography of the region are likely to cause most of the emissions to sit in air pockets above residential neighborhoods in Ahwatukee. Furthermore, these neighborhoods are highly populated by families with young children who are identified by the Environmental Protection Agency as being a "sensitive group" with respect to ozone (Federal Registrar, Vol. 64, No. 149, Wednesday, August 4, 1999, Rules and Regulations).

493

Comment #4: The lack of air quality monitors in the Ahwatukee foothills area undermines the credibility of the entire air quality assessment provided in the DEIS. Air quality monitors are needed to inform the assessment of potential effects of the freeway on air quality. The current assessment does not make a serious attempt to model air quality impacts in Ahwatukee, which contains the neighborhoods that will experience the largest negative effects of increased air pollution generated by the freeway.

494 493

Comment #5: The DEIS's overall conclusion that building the freeway will not cause an increase in violations of federal ambient air quality standards is misleading. This conclusion simply exploits the current placement of air quality monitors. By providing an incentive for truckers and non-local drivers to avoid traveling through central Phoneix, the South Mountain freeway will divert air pollution away from the areas that have air quality monitors and into areas that do not have air quality monitors, such as the Ahwatukee foothills. Ambient air quality will surely worsen in Ahwatukee and may very well violate federal standards for the criteria pollutants. Of course this will not cause any violations if there are no air quality monitors to measure the violations. This highlights the need for a more serious assessment of air pollution impacts from the proposed freeway, and it also highlights the need to place air quality monitors at several locations in the Ahwatukee foothills.

3

Code	Issue	Response
492 (cont.)		of those factors. Furthermore, the National Ambient Air Quality Standards-based assessment ensures adequate consideration of health-based issues as "[t]he requirement that primary standards provide an adequate margin of safety was intended to address uncertainties associated with inconclusive scientific and technical information ... and to protect against hazards that research has not yet identified" (78 *Federal Register* 3090). Sensitive receivers for air and noise are already included in the air quality and noise analyses in accordance with State and federal guidance. Both sections, *Air Quality* and *Noise*, beginning on Final Environmental Impact Statement pages 4-68 and 4-88, respectively, have addressed requirements under the National Environmental Policy Act. As stated on page 4-89 of the Final Environmental Impact Statement, over 220 sensitive receivers were evaluated at exterior locations from a traffic noise perspective. All of the receivers represent noise-sensitive land uses in proximity to the proposed project, including homes, schools, and parks, and these receivers would have higher noise levels than similar facilities more distant from the proposed action. Receptor placement met the criteria for selecting modeling locations as specified in 40 Code of Federal Regulations § 93.123(a). The carbon monoxide analysis was updated in the Final Environmental Impact Statement. Although a qualitative analysis of particulate matter (PM_{10}) was presented in the Draft Environmental Impact Statement, a quantitative project-level particulate matter (PM_{10}) hot-spot analysis is included in the Final Environmental Impact Statement. The results of the air quality updates are summarized in the prologue to the Final Environmental Impact Statement (beginning on page xiii) and are more fully described beginning on page 4-68 of the Final Environmental Impact Statement. The carbon monoxide and particulate matter (PM_{10}) analyses demonstrated that the proposed freeway would not contribute to any new localized violations, increase the frequency or severity of any existing violation, or delay timely attainment of the National Ambient Air Quality Standards or any required interim emissions reductions or other milestones. Through analysis, the Federal Highway Administration has determined that the proposed project would not produce disproportionate impacts on children.
493	**Air Quality**	Data from various Maricopa County Air Quality Department monitoring sites were used in the air quality analyses. Siting, operation, and recording information from monitoring sites are the responsibility of the Maricopa County Air Quality Department. See <maricopa.gov/aq/>. The monitoring information used in the air quality analyses is discussed in greater detail in the air quality technical report prepared for the project which is available on the project Web site at <azdot.gov/southmountainfreeway>. The results of the analyses are summarized in the Final Environmental Impact Statement.
494	**Air Quality**	The air quality assessment for impacts from carbon monoxide followed the U.S. Environmental Protection Agency guidelines in Guideline for Modeling Carbon Monoxide from Roadway Intersections (A-OAQPS, 1992). Inputs to the model were based on U.S. Environmental Protection Agency-recommended values or were selected to provide a conservative estimate of impacts. Modeling methodology and results were reviewed by the Federal Highway Administration, Arizona Department of Transportation, and Maricopa Association of Governments. Included in the analyses are data on the proposed vehicles using the proposed freeway, including heavy trucks.

(Response 494 continues on next page)

Code	Comment Document
495	Comment #6: Pages 4-69 and 4-70 provide a deeply flawed rationale for ignoring the impact of the freeway on human health outcomes. The DEIS claims that decision makers should not be provided with information on health outcomes of building the freeway because the magnitudes of those outcomes are judged by DOT to be highly uncertain. I will explain three problems with this logic: A. Ignoring uncertainty violates federal standards for evaluating public projects, as outlined by the United States Office of Management and Budget's Circular A-4 (http://www.whitehouse.gov/omb/circulars_a004_a-4) and the United States Environmental Protection Agency's *Guidelines for Preparing Economic Analysis*. For example, OMB Circular A-4 has a special section devoted to the appropriate treatment of uncertainty in the evaluation of public projects. It clearly states that uncertainty outcomes should be quantified and this information should be provided for public review and to decision makers. For example, it instructs analysts involved in the preparation of impact statements that "*the important uncertainties connected with your regulatory decisions need to be analyzed and presented as part of the overall regulatory analysis*" and that "*by assessing the sources of uncertainty and the way in which benefit and cost estimates may be affected under plausible assumptions, you can shape your analysis to inform decision makers and the public about the effects and the uncertainties of alternative regulatory actions*" and that "*wherever possible, you should use appropriate statistical techniques to determine a probability distribution of the relevant outcome.*" It also states that "*when uncertainty has significant effects on the final conclusion about net benefits, your agency should consider additional research prior to rulemaking. The cost of being wrong may outweigh the benefits of a faster decision. This is true especially for cases with irreversible or large upfront investments.*" B. The South Mountain Freeway is likely to have large negative health effects. The large impacts of air pollution on morbidity and mortality are well documented as is the fact 4

Code	Issue	Response
494 (cont.)		As noted on page 4-65 of the Draft Environmental Impact Statement, over 700 receptors were modeled for carbon monoxide concentrations. Receptor placement met the criteria for selecting modeling locations as specified in 40 Code of Federal Regulations Part 93.123(a). The carbon monoxide analysis was updated in the Final Environmental Impact Statement. Although a qualitative analysis of particulate matter (PM_{10}) was presented in the Draft Environmental Impact Statement, a quantitative project-level particulate matter (PM_{10}) hot-spot analysis is included in the Final Environmental Impact Statement. The results of the air quality updates are summarized in the prologue to the Final Environmental Impact Statement (page xiii) and are more fully described beginning on page 4-68 of the Final Environmental Impact Statement.
495	**Air Quality, Health Risk Assessment**	The carbon monoxide analysis was updated in the Final Environmental Impact Statement. Although a qualitative analysis of particulate matter (PM_{10}) was presented in the Draft Environmental Impact Statement, a quantitative project-level particulate matter (PM_{10}) hot-spot analysis is included in the Final Environmental Impact Statement. The results of the air quality updates are summarized in the prologue to the Final Environmental Impact Statement (page xiii) and are more fully described beginning on page 4-68 of the Final Environmental Impact Statement. The carbon monoxide and particulate matter (PM_{10}) analyses demonstrated that the proposed freeway would not contribute to any new localized violations, increase the frequency or severity of any existing violation, or delay timely attainment of the National Ambient Air Quality Standards or any required interim emissions reductions or other milestones. The emission modeling developed for the proposed action showed that for the mobile source air toxics study area, there would be little difference in total annual emissions of mobile source air toxics emissions between the Preferred and No-Action Alternatives (less than a 1 percent difference) in 2025 and 2035. With the Preferred Alternative in 2035, modeled mobile source air toxics emissions would decrease by 57 percent to more than 90 percent, depending on the pollutant, despite a 47 percent increase in vehicle miles traveled in the Study Area compared with 2012 conditions (see discussion beginning on page 4-77 of the Final Environmental Impact Statement). **The Role of Health Risk Assessment in a National Environmental Policy Act Context** The Federal Highway Administration's National Environmental Policy Act documents are developed under two guiding regulations: the Council on Environmental Quality's National Environmental Policy Act regulations applicable to all federal agencies (40 Code of Federal Regulations Parts 1500–1508) and the Federal Highway Administration's implementing regulations governing Federal Highway Administration National Environmental Policy Act documents (23 Code of Federal Regulations Part 771). In its mobile source air toxics guidance, the Federal Highway Administration discusses 40 Code of Federal Regulations Part 1502.22 and acknowledges that while much work has been done to assess the overall health risk of mobile source air toxics, analytical tools and techniques for assessing project-specific health outcomes as a result of lifetime exposures to mobile source air toxics remain limited. These limitations impede the ability to evaluate the potential health risks attributable to exposure to mobile source air toxics as part of the decision-making process in the National Environmental Policy Act context. However, as with any analysis that the Federal Highway

(Response 495 continues on next page)

Code	Comment Document

Code	Issue	Response
495 (cont.)		Administration conducts for National Environmental Policy Act purposes, the Federal Highway Administration's approach for mobile source air toxic analysis in National Environmental Policy Act documents is informed not just by 40 Code of Federal Regulations Part 1502.22, but by all applicable Council on Environmental Quality requirements. The appropriateness of air toxics health risk assessment as an analysis method for National Environmental Policy Act documents is discussed below, in the context of Council on Environmental Quality requirements for these documents. In addition to the 40 Code of Federal Regulations Part 1502.22 provisions regarding uncertainty and limitations discussed in the Federal Highway Administration's MSAT Interim Guidance Appendix C, three other provisions of the Council on Environmental Quality regulations are particularly relevant to the topic of health risk assessment: *40 Code of Federal Regulations § 1500.1(b): NEPA procedures must insure that environmental information is available to public officials and citizens before decisions are made and before actions are taken. The information must be of high quality. Accurate scientific analysis, expert agency comments, and public scrutiny are essential to implementing NEPA. Most important, NEPA documents must concentrate on the issues that are truly significant to the action in question, rather than amassing needless detail.* *40 Code of Federal Regulations § 1502.1: An environmental impact statement is more than a disclosure document. It shall be used by Federal officials in conjunction with other relevant material to plan actions and make decisions.* *40 Code of Federal Regulations § 1502.2: (a) Environmental impact statements shall be analytic rather than encyclopedic. (b) Impacts shall be discussed in proportion to their significance.(c) Environmental impact statements shall be kept concise and shall be no longer than absolutely necessary to comply with NEPA and with these regulations.* Section 1500.1(b) states that information for decision making must be of high quality and based on accurate scientific analysis. Air toxics health risk assessments can involve large uncertainties. The mobile source air toxic health risk assessment uncertainty builds on itself—each step of the analysis involves uncertainties, including modeling traffic and then modeling emissions, and using this estimated output to model dispersion/concentrations, which provide information for estimating or assuming exposures to those concentrations, and finally predicting health outcomes. Major uncertainties are associated with traffic and emissions projections over a 70-year period, and dispersion models are typically held to a "factor of 2" performance standard. Health impacts of mobile source air toxics in the U.S. Environmental Protection Agency Integrated Risk Information System are based on a 70-year lifetime exposure, which introduces significant uncertainty (e.g., on average, people in the United States change residence approximately once every 8 years and change jobs once every 3). Finally, as noted above, the U.S. Environmental Protection Agency's Integrated Risk Information System provides toxicity (risk) values for various pollutants and routes of exposure; in a health risk assessment, the Federal Highway Administration would compare calculated

(Response 495 continues on next page)

Code	Comment Document

Code	Issue	Response
495 (cont.)		concentrations of mobile source air toxic pollutants to the Integrated Risk Information System values to estimate health risk. In the Integrated Risk Information System, the U.S. Environmental Protection Agency states the toxicity values are believed to be accurate to within an order of magnitude (a factor of 10). The total cumulative uncertainty involved in highway project health risk assessment is much larger than the change in emissions attributable to projects (typically a few percentage points). In this context, the information would not necessarily have a strong nexus to the requirements for high-quality information and accurate scientific analysis. Section 1500.1(b) also directs agencies to focus their National Environmental Policy Act analysis and documentation on issues that are truly significant to the action in question. In the context of mobile source air toxics, the Federal Highway Administration must consider whether changes in mobile source air toxic emissions attributable to a project have the potential for significant health risk. Using cancer risk as an example, the U.S. Environmental Protection Agency estimates that the overall risk of cancer in the United States is approximately 330,000 in a million, and that air toxics (from all sources) are responsible for a risk of approximately 50 in a million. In its most recent mobile source air toxics rule-making, the U.S. Environmental Protection Agency estimated mobile source air toxic cancer risk, after implementation of emissions controls, at approximately 5 in a million (or 0.0015 percent of overall cancer risk from any cause). For the Preferred Alternative, the mobile source air toxic emissions analysis for the Study Area found little difference in total annual emissions of mobile source air toxic emissions between the Preferred and No Action Alternatives (less than a 1 percent difference) in 2025 and 2035. With the Preferred Alternative in 2035, modeled mobile source air toxic emissions would decrease by more than 80 percent, depending on the pollutant, despite a 47 percent increase in vehicle miles traveled in the Study Area compared with 2012 conditions (see the discussion beginning on page 4-77 of the Final Environmental Impact Statement). In summary, available information from the U.S. Environmental Protection Agency indicates that mobile source air toxics are a small component of overall cancer risk, and the analysis for the Final Environmental Impact Statement indicates both that the Preferred Alternative would result in a small change in the emissions contributing to this risk and that emissions will decline by a large amount regardless of alternative.

(Response 495 continues on next page)

Code	Comment Document

Code	Issue	Response
495 (cont.)		As described above and in the air quality technical report, results from the health risk assessment would be influenced more by the uncertainty introduced into the process through assumptions and speculations rather than by genuine insight into the actual health impacts directly attributable to mobile source air toxic exposure associated with a project. Therefore, outcomes of such a health risk assessment do not provide useful information for decision makers, as required by Section 1502.1. The Federal Highway Administration emissions analysis meets the requirement to produce information that is useful for both disclosure and decision making because it allows the public and decision makers to see which alternative has less mobile source air toxic emissions, with much less uncertainty than a health risk assessment. Given the uncertainty of a mobile source air toxic health risk assessment, the Federal Highway Administration instead addresses the potential impacts of mobile source air toxics through an emissions assessment in its National Environmental Policy Act documents. For smaller projects with a lower likelihood of a meaningful impact, this discussion is qualitative. For larger projects, emissions analysis is conducted. The Federal Highway Administration approach is consistent with the Council on Environmental Quality's direction in Section 1502.2(b) to discuss impacts in proportion to their significance. The results of an emissions analysis can be summarized concisely in a National Environmental Policy Act document and provide useful information for decision makers (e.g., an alternative that has lower emissions is likely to be "better" from a mobile source air toxics health risk standpoint than one that has higher emissions). While the U.S. Environmental Protection Agency and the Federal Highway Administration both agree on the usefulness of addressing mobile source air toxics in National Environmental Policy Act documents for highway projects, the agencies disagree about the value of health risk assessment as a method for doing so.

(Response 495 continues on next page)

Code	Comment Document

Code	Issue	Response
495 (cont.)		Another consideration with respect to health impacts is that the Preferred Alternative would also reduce in-vehicle mobile source air toxics exposure as opposed to the No Action Alternative. The U.S. Environmental Protection Agency has found that in-vehicle benzene concentrations were between 2.5 and 40 times higher than nearby ambient concentrations, based on a review of studies discussed in the Regulatory Impact Analysis for the U.S. Environmental Protection Agency's 2007 mobile source air toxics rule-making (Final Regulatory Impact Analysis, Environmental Protection Agency 420-R-07-002, 3-17 [February 2007]). Construction of the Preferred Alternative would result in a reduction in benzene exposure to drivers and passengers for two reasons: decreased travel times (motorists would spend less time in traffic to reach their destinations) and lower emissions rates (attributable to speed improvements). Reducing on-road exposure would provide a health benefit for motorists using the roadway network. Congestion relief resulting from the proposed freeway would provide localized air quality emissions reductions on area freeways and arterial streets and at interchanges, benefiting users of area highways and those living near congested roads. The Federal Highway Administration determined that a supplemental environmental impact statement is not required at this time because there were no changes to the proposed action that will result in significant environmental impacts not evaluated in the Draft Environmental Impact Statement nor is there new information relevant to environmental concerns and bearings on the proposed action or its impacts that will result in significant environmental impacts not evaluated in the Draft Environmental Impact Statement.

Code	Comment Document

Comment #6: Pages 4-69 and 4-70 provide a deeply flawed rationale for ignoring the impact of the freeway on human health outcomes. The DEIS claims that decision makers should not be provided with information on health outcomes of building the freeway because the magnitudes of those outcomes are judged by DOT to be highly uncertain. I will explain three problems with this logic:

496

A. Ignoring uncertainty violates federal standards for evaluating public projects, as outlined by the United States Office of Management and Budget's Circular A-4 (http://www.whitehouse.gov/omb/circulars_a004_a-4) and the United States Environmental Protection Agency's *Guidelines for Preparing Economic Analysis*. For example, OMB Circular A-4 has a special section devoted to the appropriate treatment of uncertainty in the evaluation of public projects. It clearly states that uncertainty outcomes should be quantified and this information should be provided for public review and to decision makers. For example, it instructs analysts involved in the preparation of impact statements that "*the important uncertainties connected with your regulatory decisions need to be analyzed and presented as part of the overall regulatory analysis*" and that "*by assessing the sources of uncertainty and the way in which benefit and cost estimates may be affected under plausible assumptions, you can shape your analysis to inform decision makers and the public about the effects and the uncertainties of alternative regulatory actions*" and that "*wherever possible, you should use appropriate statistical techniques to determine a probability distribution of the relevant outcome.*" It also states that "*when uncertainty has significant effects on the final conclusion about net benefits, your agency should consider additional research prior to rulemaking. The cost of being wrong may outweigh the benefits of a faster decision. This is true especially for cases with irreversible or large upfront investments.*"

495

B. The South Mountain Freeway is likely to have large negative health effects. The large impacts of air pollution on morbidity and mortality are well documented as is the fact

Code	Issue	Response
496	**Impacts**	Comment is duly noted. The Draft Environmental Impact Statement notes matters of uncertainty throughout the entire document. Examples include study findings in the sections, *Air Quality, Noise, Visual Resources, Land Use, Displacements and Relocations, and Cultural Resources* in Chapter 4. In Chapter 3, *Alternatives*, reference is made to continued monitoring of design and cost to account for needed updates. On page 4-1, in the text box, "*Can the Impacts Change and, If So, How?*", text is presented on how such dynamics are tracked.

Code	Comment Document

that these impacts are largest for sensitive groups such as children and seniors. This is of special concern due to the large proportion of families with young children and communities of seniors in Ahwatukee. See the EPA's (2011) *Second Prospective Study 1990-2020 of the Clean Air Act* and the associated appendices for the epidemiological consensus on health impacts and calibrated dose-response functions. The range of potential health impacts should be quantified and monetized using standard measures of the "value of a statistical life" consistent with best practices in regulatory evaluation established in the OMB and EPA guidelines. Even the lower bound on number of lives lost is likely to be sufficiently high to raise serious concerns for policy makers.

495

C. The effects of the freeway on health outcomes are no more uncertain than the effects of the freeway on commute times. Yet, there is no mention of uncertainty in commute times. Throughout the DEIS, the economic benefits of building the freeway are conveyed with a false sense of precision whereas the environmental costs are dismissed altogether because they are uncertain. This asymmetric treatment of uncertainty has the effect of biasing the DEIS in favor of building the freeway with the Pecos road alignment.

497

Comment #7: The DEIS fails to adequately address the uncertainty of benefits from building the freeway. For example, the actual reduction in commute time that would be realized if the freeway were to be build will depend on several sources of uncertainty, including but not limited to: (i) future patterns of residential development; (ii) future location choices made by firms; (iii) future residential and job location choices made by workers; (iv) future trends in telecommuting; (v) future trends in "flex-time" and the ability of workers to commute during off-peak hours; (vi) future trends in the national economy; (vii) future trends in in the international economy and trade that influence the rate of trucking through Phoenix; (viii) future trends in automobile design; (ix) the impact of building the freeway on the desirability of living in Ahwatukee; and (x) future trends in the price of gasoline, electricity, and other factors affecting commuting costs. These sources of uncertainty should be carefully analyzed and policy makers should be informed

Code	Issue	Response
497	**Environmental Analysis**	40 Code of Federal Regulations § 1500.1(b): NEPA procedures must insure that environmental information is available to public officials and citizens before decisions are made and before actions are taken. The information must be of high quality. Accurate scientific analysis, expert agency comments, and public scrutiny are essential to implementing NEPA. Most important, NEPA documents must concentrate on the issues that are truly significant to the action in question, rather than amassing needless detail. The Council on Environmental Quality regulations state information for decision making must be of high quality and based on accurate scientific analysis. The models, methods, and assumptions used throughout the Draft Environmental Impact Statement account for reasonably foreseeable future conditions and dismiss speculative considerations.

Code	Comment Document

about the statistical distribution of possible outcomes for commute times. More broadly, sources of uncertainty should be addressed throughout the discussion of benefits of building the freeway.

498

Comment #8: The DEIS systematically overstates the likely benefits of building the freeway to Phoenix commuters. The estimated benefits are based on statistics for projected future traffic patterns provided by the Maricopa Association of Governments. However, these statistics are primarily extrapolations of past trends. In other words, they are "made up". They are not derived from a consistent model of residential location choice or a realistic model of commuting choices. It is difficult to believe that many workers would make residential and job location choices that would induce them to use the new freeway. Projections for future traffic congestion also fail to incorporate future growth in the share of workers who work from home or are allowed the flexibility to commute during off-peak hours. Furthermore, estimates for the opportunity cost of time used to quantify the value of reduced commute times are not consistently linked to the actual commuters who use the freeway during peak hours, but are likely driven by high-income commuters living in places such as Scottsdale who will not use the new freeway if it is build. In addition, the models of traffic congestion in the DEIS are inadequate for estimating the impact of the freeway on commute times. The DEIS fails to provide even the most basic facts about commuting. For example, what fraction of today's metro area commuters would experience a shorter commute (in terms of physical distance) if the South Mountain Freeway were built? This information can easily be obtained from the U.S. Census Bureau's annual Public Use Microdata Sample of respondents to the *American Community Survey*, which provides information on workers' house locations, job locations, time leaving home to go to work, and travel times.

499 498

Comment #9: Throughout the DEIS, the analysis of benefits of building the freeway is based on a false premise that the demand for transportation will be the same whether or not the freeway is built. This results in overstatement of the benefits of building the freeway. In reality, building the freeway is likely to change residential development patterns which, in turn, will increase the demand for using the freeway relative to the demand if the freeway had not been built. In other words, building the freeway will increase the demand for using the freeway due to increases in

6

Code	Issue	Response
498	**Purpose and Need**	The analyses in the Draft Environmental Impact Statement used socioeconomic and traffic projections at the regional analysis zone and traffic analysis zone levels. At the time of publication of the Draft Environmental Impact Statement, Census 2010-based socioeconomic data at the regional analysis zone and traffic analysis zone levels had not been adopted by the Maricopa Association of Governments and were not available to the project team. Therefore, the data used in the Draft Environmental Impact Statement were the most appropriate information available. The Maricopa Association of Governments approved new population, employment, housing, and traffic projections in June 2013. The new data are presented in the Final Environmental Impact Statement beginning on page 1-11. While new projections based on the 2010 Census showed a lower anticipated population in 2035 than the previous projections, the need for the freeway has not changed. The traffic analysis demonstrated that the proposed project is needed today. The models, methods, and assumptions used throughout the Draft Environmental Impact Statement account for reasonably foreseeable future conditions and rightfully dismiss speculative considerations. As examples, the Maricopa Association of Governments, as the federally designated regional transportation planning agency, is nationally recognized as a leader in air quality modeling and traffic modeling and forecasting. The models used account for the assumptions made in the comment.
499	**Traffic**	The Federal Highway Administration and the U.S. Environmental Protection Agency approved the air quality conformity determination that includes the Maricopa Association of Governments regional travel demand model that produced the traffic projections used in the traffic analysis for the project (see page 3-27 of the Draft Environmental Impact Statement). The model is run with and without the proposed freeway. Traffic projections are regularly updated by the Maricopa Association of Governments based on studies of travel patterns and changes in land use conditions. The traffic projections in the Draft Environmental Impact Statement are from a model adopted in 2011.

Code	Comment Document

driving by current residents, increases in commercial traffic, and increased migration to areas near the freeway. These "feedback effects" will increase congestion on the freeway, diminishing its benefits, especially for existing residents of Phoenix. This effect is well known to transportation economists as "The Fundamental Law of Road Congestion". Yet recognition of this effect is completely missing from the transportation models throughout the DEIS. In perhaps the most comprehensive empirical study of the causal relationship between road projects and traffic congestion, Duranton and Turner (2011) concluded that adding a new road with the characteristics of the South Mountain Freeway is unlikely to relieve congestion. See: Duranton, Gilles, and Matthew A. Turner. "The Fundamental Law of Road Congestion: Evidence from US Cities." *American Economic Review*. 101 (October 2011): 2616-2652.

500

Comment #10: There is overwhelming evidence in economics journals and federal regulatory evaluations that freeways produce negative externalities that substantially diminish the quality of life for those living nearby. Some of these effects will likely be reflected in reductions (or slower growth) in property values for residential neighborhoods experiencing diminished quality of life. It is standard practice to use hedonic property value methods and contingent valuation methods to quantify these costs as part of regulatory evaluations. However, no such effort is undertaken in the draft EIS. The following impacts should be quantified and included in the EIS using best practices in methods for economic valuation of environmental impacts of public projects as outlined in EPA's Guidelines for Preparing Economic Analysis: (1) effect of air pollution on property values; (2) effect of noise pollution on property values; (3) cost of water pollution produced from freeway runoff; (4) value of lost recreation benefits to joggers and bicyclists who currently use Pecos road for recreation; (5) value of diminished recreation benefits for people using South Mountain Park due to visual disamenities, noise, dust, odors, and non-visible air pollution created by the freeway; and (6) the impact of building the freeway on crime in Ahwatukee and, in turn, the effect of increased crime on property values. This last point deserves some explanation. At present, weekly statistics from the police blotter indicate that there is virtually no violent crime or property crime in western Ahwatukee. The vast majority of Ahwatukee crimes occur in the eastern part of the town close to the I-10. The lack of crime is western Ahwatukee is likely due to the fact that, as the end of a big cul-de-sac, criminals have no

7

Code	Issue	Response
500	**General Impacts**	The study used state-of-the-practice, scientific community methods and similarly accepted methods. Methods, assumptions, and data were developed early in the environmental impact statement process and peer reviewed by the Federal Highway Administration, the Arizona Department of Transportation, and other federal, State, and local agencies. Peer reviewers concluded that the methods, assumptions, and data are appropriate. The Draft Environmental Impact Statement has sufficient technical merit, does comply with "fundamental concepts and purpose of an environmental impact statement," and does appropriately and properly inform the public. The Arizona Department of Transportation and Federal Highway Administration, in cooperation with the U.S. Army Corps of Engineers, the U.S. Bureau of Indian Affairs, and the Western Area Power Administration, prepared the Draft and Final Environmental Impact Statements and Section 4(f) Evaluation in accordance with the National Environmental Policy Act of 1969 [42 United States Code § 4332(2)(c)], Section 4(f) of the U.S. Department of Transportation Act of 1966 (49 United States Code § 303, as amended), and Section 404 of the Clean Water Act of 1977 (33 United States Code § 1251). All of these agencies are experienced in the review of National Environmental Policy Act documents and have found the logical sequence of decision making to be sound and in line with National Environmental Policy Act requirements. The Draft Environmental Impact Statement and Section 4(f) Evaluation 1) satisfies Federal Highway Administration and Arizona Department of Transportation's environmental analysis requirements; 2) provides a comparison of the social, economic, and environmental impacts that may result from implementation of the proposed action—construction and operation of a major transportation facility; and 3) identifies measures to avoid, reduce, or otherwise mitigate adverse impacts.
501	**Traffic**	Hazardous Materials Commodity Flow Studies and other information are used by emergency response planners (such as the Arizona State Emergency Response Commission statewide and the Maricopa County Local Emergency Planning Commission for Maricopa County) as one of the elements considered when developing Emergency Response Plans. If the plan were amended, it would be made available to the Arizona Department of Transportation. In 2006, the City of Phoenix conducted a traffic circulation study to evaluate the impacts of the proposed freeway on the local street system. The City study found no adverse effects on the local street system from the freeway (see Appendix 3-1 in the Final Environmental Impact Statement). The traffic projections for Chandler Boulevard (see Figure 3-12 on page 3-29 of the Draft Environmental Impact Statement) do show a reduction with the proposed freeway when compared with conditions without the proposed freeway.
502	**Health Effects**	A common theme in public comments on the proposed project has been the potential impacts of the project on children's health, primarily through vehicle emissions and noise. Many commenters raised concerns about the proximity of the project to schools or other aspects of the project that may affect children. In addition, the U.S. Environmental Protection Agency requested that the Final Environmental Impact Statement address Executive Order 13045, *Protection of Children from Environmental Health Risks and Safety Risks*. Throughout the Final Environmental Impact Statement, potential impacts on and subsequent mitigation for human health are disclosed and identified, as inherent in the environmental impact statement process. The Final Environmental Impact Statement incorporates an assessment of the potential impacts of the proposed project on all populations, including children. The Final Environmental Impact

Code	Comment Document

escape route. Building the freeway will provide such an escape route and increase the attractiveness of the area to criminals as a result. Those who argue in favor of building the freeway often claim that Ahwatukee residents should have known that these effects might eventually occur as a result of the freeway when they first purchased property in the area and that, as a result, the negative externalities are already capitalized into property values. This claim is false. The conventional wisdom of real estate agents and homebuyers in Ahwatukee is that the freeway would never be built and that the original 1985 plan to build the freeway was simply a relic of "pre-Ahwatukee" regional planning. As a result, the freeway will act as a shock to the local housing market and depress property values.

501

Comment #11: In the event of heavy traffic, road work, or accidents, drivers on the South Mountain Freeway are likely to use Chandler Blvd. as a bypass. GPS devices will mechanically divert drivers off the freeway and onto Chandler. This is especially true for the Chandler Blvd segment from S. 17th Ave to Desert Foothills Parkway because this segment has 4 lanes, a speed limit of 45mph, and no stop signs or traffic lights. This will create a serious public health hazard because the aforementioned segment of Chandler goes right through the residential neighborhood of "Club West". Joggers, bicyclists, families and children use Chandler Blvd during the morning and evening commute hours for recreation and to walk/bicycle to/from school and parks. Young children on foot or on bicycle and joggers with headphones are often seen crossing the street. The lack of stop signs and crosswalks is not currently a problem because traffic is light. However, with some freeway commuters using the Chandler Blvd corridor as a bypass, there is likely to be a surge in traffic accidents and traffic-related pedestrian deaths in this family-oriented residential neighborhood. These effects are entirely ignored in the DEIS.

502

Comment #12: The DEIS violates the spirit of Presidential Executive Order #13045 by failing to identify and assess the environmental health risks and safety risks that may disproportionately affect children as a result of the freeway. An example of the environmental health risk is the increase in ambient ozone concentrations that will affect children living in Ahwatukee, particularly those who use the numerous public schools and public parks located between South

Code	Issue	Response
502 (cont.)		Statement addresses potential impacts of the project on children in the Chapter 4 environmental consequences analyses. The U.S. Environmental Protection Agency's Toxicity and Exposure Assessments for Children's Health report (see page 4-73 of the Final Environmental Impact Statement) indicated that indoor air concentrations of benzene are usually higher than outdoor levels and that indoor air in smokers' homes is a significant contributor to children's exposures. It mentioned children when identifying the effects of acute exposure to naphthalene. The Final Environmental Impact Statement acknowledges and fully discloses public scoping comments that raised the topic of health effects on neighborhoods and adjacent schools (see page 4-31 of the Final Environmental Impact Statement). The Final Environmental Impact Statement evaluates Clean Air Act criteria air pollutant concentrations in Maricopa County and the Phoenix area (see pages 4-75 to 4-77 of the Final Environmental Impact Statement). With regard to air quality impacts, the Final Environmental Impact Statement addresses children's health impacts within the broader discussion regarding health impacts under the National Ambient Air Quality Standards. Clean Air Act Section 109(b)(1) requires the U.S. Environmental Protection Agency to promulgate primary National Ambient Air Quality Standards at levels that allow an adequate margin of safety and are requisite to protect the public health. As noted by the U.S. Environmental Protection Agency in its 2013 rulemaking for particulate matter, Clean Air Act Section 109's legislative history demonstrates that the primary standards are "to be set at the maximum permissible ambient air level... which will protect the health of any [sensitive] group of the population" (78 *Federal Register* 3086 and 3090) (quoting S. Rep. No. 91-1196, 91st Cong., 2 Sess. 10 [1970]) (alterations in original). Accordingly, the Final Environmental Impact Statement National Ambient Air Quality Standards-based evaluation of criteria air pollutants includes a health-based review of sensitive populations, including children, given the National Ambient Air Quality Standards inherent consideration of those factors. Furthermore, the National Ambient Air Quality Standards-based assessment ensures adequate consideration of health-based issues as "[t]he requirement that primary standards provide an adequate margin of safety was intended to address uncertainties associated with inconclusive scientific and technical information ... and to protect against hazards that research has not yet identified" (78 *Federal Register* 3090). Sensitive receivers for air and noise are already included in the air quality and noise analyses in accordance with State and federal guidance. Both sections, *Air Quality* and *Noise*, beginning on Final Environmental Impact Statement pages 4-68 and 4-88, respectively, have addressed requirements under the National Environmental Policy Act. As stated on page 4-89 of the Final Environmental Impact Statement, over 220 sensitive receivers were evaluated at exterior locations from a traffic noise perspective. All of the receivers represent noise-sensitive land uses in proximity to the proposed project, including homes, schools, and parks, and these receivers would have higher noise levels than similar facilities more distant from the proposed action. Each modeled school was reexamined to determine whether noise impacts would result from the proposed freeway and whether appropriate mitigation of these impacts was provided. Of the nine schools modeled in the analysis for the Final Environmental Impact Statement, all were predicted to exceed Federal Highway Administration noise abatement criteria (see Table 4-40, beginning on page 4-93). Mitigation, in the form of noise walls, was proposed for all schools. After applying this mitigation, all schools except one were mitigated according to the Arizona Department of Transportation noise policy. According to Arizona Department of Transportation policy, noise mitigation should achieve a reduction of 5 to 7 A-weighted decibels and result in a noise level of less than 64 A-weighted decibels

(Response 502 continues on next page)

Code	Comment Document

Mountain Park and the proposed Pecos Road alignment of the freeway. The EPA identifies children as a "sensitive group" for ambient ozone. An example of the safety risk is the increase in traffic on arterial streets that wind through residential neighborhoods in Ahwatukee, particular during periods of heavy traffic, road work, or freeway accidents when drivers will naturally use Chandler Blvd as a bypass. The traffic poses a safety risk because children frequently walk / bike / run / play on the streets that will experience increased traffic, such as Chandler Blvd from S. 17th Ave through Desert Foothills Parkway. This will increase the risk of accidental deaths of children.

Code	Issue	Response
502 (cont.)		for residential and similar areas. These criteria were not reached for one school (receiver 67, Santa Maria Elementary School) because the policy limits wall heights to 20 feet. A wall taller than 20 feet would be required to bring levels at this receiver down to 64 A-weighted decibels. However, a 5-A-weighted decibels reduction would be provided by the 20-foot wall proposed in this area. It is important to note that this receiver would be affected only by the W71 Alternative, which is not the Preferred Alternative. The Arizona Department of Transportation noise policy also states that noise abatement shall be considered if "substantial increases" (defined as a 15 A-weighted decibels or greater increase) are predicted. Of the nine schools modeled, substantial increases were predicted at six schools. As discussed above, however, noise walls would reduce noise levels at all schools according to the Arizona Department of Transportation noise policy, with the exception of Santa Maria Elementary School, which would be affected only by the W71 Alternative, which is not the Preferred Alternative. According to the Federal Highway Administration's 1995 Highway Traffic Noise Analysis and Abatement Policy and Guidance, in most cases, if the exterior area can be protected, the interior will also be protected. Receptor placement met the criteria for selecting modeling locations as specified in 40 Code of Federal Regulations § 93.123(a). The carbon monoxide analysis was updated in the Final Environmental Impact Statement. Although a qualitative analysis of particulate matter (PM_{10}) was presented in the Draft Environmental Impact Statement, a quantitative project-level particulate matter (PM_{10}) hot-spot analysis is included in the Final Environmental Impact Statement. The results of the air quality updates are summarized in the prologue to the Final Environmental Impact Statement (page xiii) and are more fully described beginning on page 4-68 of the Final Environmental Impact Statement. The carbon monoxide and particulate matter (PM_{10}) analyses demonstrated that the proposed freeway would not contribute to any new localized violations, increase the frequency or severity of any existing violation, or delay timely attainment of the National Ambient Air Quality Standards or any required interim emissions reductions or other milestones. Through analysis, the Federal Highway Administration has determined that the proposed project would not produce disproportionate impacts on children. Many studies have investigated the prevalence of adverse health effects in the near-road environment. Given concerns about the possibility of air pollution exposure in the near-road environment, the Health Effects Institute has dedicated a number of research efforts toward investigating this issue. In November 2007, the Health Effects Institute published Special Report #16: Mobile-Source Air Toxics: A Critical Review of the Literature on Exposure and Health Effects. This report concluded that the cancer health effects attributable to mobile sources are difficult to discern because the majority of quantitative assessments are derived from occupational cohorts with high concentration exposures and because some cancer potency estimates are derived from animal models. In January 2010, the Health Effects Institute released Special Report #17, investigating the health effects of traffic-related air pollution. The goal of the research was to synthesize available information on the effects of traffic on health. Researchers looked at linkages between: 1) traffic emissions (at the tailpipe) with ambient air pollution in general, 2) concentrations of ambient pollutants with human exposure to pollutants from traffic, 3) exposure to pollutants from traffic with human-health effects and toxicological data, and 4) toxicological data with epidemiological associations. Overall, researchers felt that there was "sufficient" evidence for causality for the exacerbation of asthma. Evidence was "suggestive but not sufficient" for health outcomes such as cardiovascular mortality and others.

(Response 502 continues on next page)

Code	Comment Document

Code	Issue	Response
502 **(cont.)**		Study authors also noted that past epidemiological studies may not provide an appropriate assessment of future health associations because vehicle emissions are decreasing over time. Finally, in 2011 three studies were published by the Health Effects Institute evaluating the potential for mobile source air toxics "hot spots." In general, the authors confirmed that while highways are a source of air toxics, they were unable to find that highways were the only source of these pollutants. They determined that near-road exposures were often no different or no higher than background (or ambient) levels of exposure and, hence, no true hot spots were identified. These reports are available from the Health Effects Institute's Web site at <healtheffects.org>. The Federal Highway Administration and U.S. Environmental Protection Agency provide financial support to the Health Effects Institute's research work. Another source of information is the U.S. Environmental Protection Agency's recently released report on Children's Health and the Environment: *The level of knowledge regarding the relationship between environmental exposures and health outcomes varies widely among the topics [presented in this report], and the inclusion of an indicator in the report does not necessarily imply a known relationship between environmental exposure and children's health effects. The report provides data for selected children's health conditions that warrant further research because the causes, including possible contributing environmental factors, are complex and not well understood at this point.* *In the case of asthma, researchers do not fully understand why children develop the condition. However, substantial evidence shows exposure to certain air pollutants, including particulate matter and ozone, can trigger symptoms in children who already have asthma. Although the report found the percentage of children reported to currently have asthma increased from 8.7 percent in 2001 to 9.4 percent in 2010 and that minority populations are particularly affected by asthma, the severity of children's asthma and respiratory symptoms has declined. The rate of emergency room visits for asthma decreased from 114 visits per 10,000 children in 1996 to 103 visits per 10,000 children in 2008. Between 1996 and 2008, hospitalizations for asthma and for all other respiratory causes decreased from 90 hospitalizations per 10,000 children to 56 hospitalizations per 10,000 children.* *The report also looks at trends in other health conditions, such as Attention-Deficit/ Hyperactivity Disorder (ADHD) and preterm births, for which rates have increased. There is no conclusive information on the role of environmental contaminants in ADHD or preterm births, and additional research is ongoing.* Finally, the Federal Highway Administration notes that while the incidence of some health effects (such as asthma, autism, and attention deficit/hyperactivity disorder) in the U.S. population appear to have been increasing, motor vehicle emissions have declined. This decline in mobile source air toxics emissions is documented in Figure 4-24 of the Final Environmental Impact Statement and for other pollutants at <epa.gov/ttn/chief/trends/>. This negative correlation between emissions trends and health effects trends illustrates the complexity of the issues.

Subject: Comments on DEIS for SMF

Dear ADOT:

503 I am a citizen and resident of Phoenix and the Ahwatukee area, and Associate Professor at Arizona State University School of Life Sciences. I am writing to ADOT regarding its draft environmental impact study (DEIS) for the South Mountain freeway (SMF). I would like to register my strong opposition to the building of the SMF. I am a member of Protecting Arizona's Resources and Children (PARC), and fully support its efforts to prevent the building of SMF. I have great concerns about the DEIS, as presented below.

504 One of my main concerns is that the DEIS greatly underestimates the impact of the SMF on the air quality for residents living nearby. The DEIS minimizes the potential pollution that will be caused by trucks burning diesel fuel, especially those coming from Mexico having fuel that is poorly regulated and high in contaminants like sulfur. The DEIS suggests that the "truck bypass" route on I-8 and SH-85 will be preferred by truckers. However, this route is substantially longer than the proposed SMF, and is thus unlikely to be viewed as economically feasible. Due to the geographic features along the E1 Pecos road corridor, concentration of the vehicle emissions is likely to compound toxicity issues in this area. The extreme proximity of several schools to the E1 route puts a huge number of children at risk of health problems due to air pollution.

505 The E1 route would require massive cuts in the ridges of South Mountain on the west side. This action is unfeasible for two main reasons. All of the Native American tribes in the area consider South Mountain to be sacred, and the proposed action would desecrate the land. Although that reason alone is enough to abandon the plan, another factor is more important to most of us: air quality. The blasting required for the SM ridge cuts (and other cuts along the E1 route) would generate huge amounts of airborne particulate matter. The fine dust generated by construction (especially PM10 particles that can be inhaled deeply) will produce respiratory problems for people in the area. Moreover, it will threaten federal funds for transportation that require control of air quality. Maricopa County has had great difficulty maintaining PM10 standards, and the construction of the SMF would certainly make it more difficult, if not impossible.

The DEIS makes dire predictions for adverse effects on the regional economy if the "no action" option is chosen. However, we must remember that the SMF plan was first proposed more than 25 years ago, when fuel was relatively cheap and few people saw any problem with continuation of the freeway transportation paradigm. Data on climate change and greenhouse gases in the atmosphere have steadily accumulated over the years, to the point that it is obvious that we need a transportation paradigm shift in order to address the problems we face. We must reallocate most of our resources away from freeway construction and invest them in technologies that will minimize adverse environmental effects. I strongly advocate light rail expansion throughout the valley. Thus, not building the SMF should not be called "no action", because there are other actions that can be funded with the resources.

I strongly urge the ADOT to abandon the SMF plan and intensify studies of other transportation options that are more environmentally friendly.

Sincerely,
Hugh S. Mason

Code	Issue	Response
503		Responses to specific comments appear below.
504	**Trucks**	The road network in the Maricopa Association of Governments travel demand model includes the Interstate 8 and State Route 85 corridor. So, while the roads are not in the Study Area for the proposed action, traffic and trip distributions along the corridor are included in the traffic analysis for the proposed action. Any traffic that would shift from the Interstate 8 and State Route 85 corridor to the proposed action would be included in the vehicle mix considered in the air quality analysis. A truck driver traveling from Tucson to Los Angeles and choosing to use Interstate 10 and the proposed freeway would travel 15 miles less than one choosing to use the designated truck bypass along Interstate 8 and State Route 85. Choosing to travel on the proposed action versus Interstate 8 and State Route 85 would not translate to any substantial travel time benefits. Therefore, it is expected that "true" through-truck traffic (not having to stop in the metropolitan area) would continue to use the faster, designated, and posted bypass system of Interstate 8 and State Route 85. Trucks crossing from Mexico to Arizona are restricted to the commercial zones within 25 miles of the border. The Federal Motor Carrier Safety Administration is administering a United States-Mexico cross-border, long-haul trucking pilot program. The program tests and demonstrates the ability of Mexico-based motor carriers to operate safely in the United States beyond the municipalities and commercial zones along the United States-Mexico border (see <fmcsa.dot.gov/intl-programs/trucking/trucking-program.aspx>). Petróleos Mexicanos (better known as Pemex), the Mexican state-owned petroleum company, has guaranteed 15 parts per million in its sulfur diesel fuel in the border region (see <http://transportpolicy.net/index.php?title=Mexico:_Fuels:_ Diesel_and_Gasoline>). As explained on pages 4-69 and 4-77 of the Draft and Final Environmental Impact Statements, respectively, the emissions analysis conducted for the project shows that future mobile source air toxics emissions will be lower than current levels. This analysis included projected truck traffic.
505	**Air Quality**	A common theme in public comments on the proposed project has been the potential impacts of the project on children's health, primarily through vehicle emissions and noise. Many commenters raised concerns about the proximity of the project to schools or other aspects of the project that may affect children. In addition, the U.S. Environmental Protection Agency requested that the Final Environmental Impact Statement address Executive Order 13045, *Protection of Children from Environmental Health Risks and Safety Risks*. Throughout the Final Environmental Impact Statement, potential impacts on and subsequent mitigation for human health are disclosed and identified, as inherent in the environmental impact statement process. The Final Environmental Impact Statement incorporates an assessment of the potential impacts of the proposed project on all populations, including children. The Final Environmental Impact Statement addresses potential impacts of the project on children in the Chapter 4 environmental consequences analyses. The U.S. Environmental Protection Agency's Toxicity and Exposure Assessments for Children's Health report (see page 4-73 of the Final Environmental Impact Statement) indicated that indoor air concentrations of benzene are usually higher than outdoor levels and that indoor air in smokers' homes is a significant contributor to children's exposures. It mentioned children when identifying the effects of acute exposure to naphthalene. The Final Environmental Impact Statement acknowledges and fully discloses public scoping comments that raised the topic of health effects on neighborhoods and adjacent schools (see page 4-31 of the Final Environmental Impact Statement). The Final Environmental Impact Statement evaluates Clean Air Act criteria air pollutant concentrations in Maricopa County and the Phoenix area (see pages 4-75 to 4-77 of the

Subject: Comments on DEIS for SMF

Dear ADOT:

I am a citizen and resident of Phoenix and the Ahwatukee area, and Associate Professor at Arizona State University School of Life Sciences. I am writing to ADOT regarding its draft environmental impact study (DEIS) for the South Mountain freeway (SMF). I would like to register my strong opposition to the building of the SMF. I am a member of Protecting Arizona's Resources and Children (PARC), and fully support its efforts to prevent the building of SMF. I have great concerns about the DEIS, as presented below.

One of my main concerns is that the DEIS greatly underestimates the impact of the SMF on the air quality for residents living nearby. The DEIS minimizes the potential pollution that will be caused by trucks burning diesel fuel, especially those coming from Mexico having fuel that is poorly regulated and high in contaminants like sulfur. The DEIS suggests that the "truck bypass" route on I-8 and SH-85 will be preferred by truckers. However, this route is substantially longer than the proposed SMF, and is thus unlikely to be viewed as economically feasible. Due to the geographic features along the E1 Pecos road corridor, concentration of the vehicle emissions is likely to compound toxicity issues in this area. The extreme proximity of several schools to the E1 route puts a huge number of children at risk of health problems due to air pollution.

506

The E1 route would require massive cuts in the ridges of South Mountain on the west side. This action is unfeasible for two main reasons. All of the Native American tribes in the area consider South Mountain to be sacred, and the proposed action would desecrate the land. Although that reason alone is enough to abandon the plan, another factor is more important to most of us: air quality. The blasting required for the SM ridge cuts (and other cuts along the E1 route) would generate huge amounts of airborne particulate matter. The fine dust generated by construction (especially PM10 particles that can be inhaled deeply) will produce respiratory problems for people in the area. Moreover, it will threaten federal funds for transportation that require control of air quality. Maricopa County has had great difficulty maintaining PM10 standards, and the construction of the SMF would certainly make it more difficult, if not impossible.

The DEIS makes dire predictions for adverse effects on the regional economy if the "no action" option is chosen. However, we must remember that the SMF plan was first proposed more than 25 years ago, when fuel was relatively cheap and few people saw any problem with continuation of the freeway transportation paradigm. Data on climate change and greenhouse gases in the atmosphere have steadily accumulated over the years, to the point that it is obvious that we need a transportation paradigm shift in order to address the problems we face. We must reallocate most of our resources away from freeway construction and invest them in technologies that will minimize adverse environmental effects. I strongly advocate light rail expansion throughout the valley. Thus, not building the SMF should not be called "no action", because there are other actions that can be funded with the resources.

I strongly urge the ADOT to abandon the SMF plan and intensify studies of other transportation options that are more environmentally friendly.

Sincerely,
Hugh S. Mason

Code	Issue	Response
505 (cont.)		Final Environmental Impact Statement). With regard to air quality impacts, the Final Environmental Impact Statement addresses children's health impacts within the broader discussion regarding health impacts under the National Ambient Air Quality Standards. Clean Air Act Section 109(b)(1) requires the U.S. Environmental Protection Agency to promulgate primary National Ambient Air Quality Standards at levels that allow an adequate margin of safety and are requisite to protect the public health. As noted by the U.S. Environmental Protection Agency in its 2013 rulemaking for particulate matter, Clean Air Act Section 109's legislative history demonstrates that the primary standards are "to be set at the maximum permissible ambient air level... which will protect the health of any [sensitive] group of the population" (78 *Federal Register* 3086 and 3090) (quoting S. Rep. No. 91-1196, 91st Cong., 2 Sess. 10 [1970]) (alterations in original). Accordingly, the Final Environmental Impact Statement National Ambient Air Quality Standards-based evaluation of criteria air pollutants includes a health-based review of sensitive populations, including children, given the National Ambient Air Quality Standards inherent consideration of those factors. Furthermore, the National Ambient Air Quality Standards-based assessment ensures adequate consideration of health-based issues as "[t]he requirement that primary standards provide an adequate margin of safety was intended to address uncertainties associated with inconclusive scientific and technical information ... and to protect against hazards that research has not yet identified" (78 *Federal Register* 3090). Sensitive receivers for air and noise are already included in the air quality and noise analyses in accordance with State and federal guidance. Both sections, *Air Quality* and *Noise*, beginning on Final Environmental Impact Statement pages 4-68 and 4-88, respectively, have addressed requirements under the National Environmental Policy Act. As stated on page 4-89 of the Final Environmental Impact Statement, over 220 sensitive receivers were evaluated at exterior locations from a traffic noise perspective. All of the receivers represent noise-sensitive land uses in proximity to the proposed project, including homes, schools, and parks, and these receivers would have higher noise levels than similar facilities more distant from the proposed action. Receptor placement met the criteria for selecting modeling locations as specified in 40 Code of Federal Regulations § 93.123(a). The carbon monoxide analysis was updated in the Final Environmental Impact Statement. Although a qualitative analysis of particulate matter (PM_{10}) was presented in the Draft Environmental Impact Statement, a quantitative project-level particulate matter (PM_{10}) hot-spot analysis is included in the Final Environmental Impact Statement. The results of the air quality updates are summarized in the prologue to the Final Environmental Impact Statement (page xiii) and are more fully described beginning on page 4-68 of the Final Environmental Impact Statement. The carbon monoxide and particulate matter (PM_{10}) analyses demonstrated that the proposed freeway would not contribute to any new localized violations, increase the frequency or severity of any existing violation, or delay timely attainment of the National Ambient Air Quality Standards or any required interim emissions reductions or other milestones. Through analysis, the Federal Highway Administration has determined that the proposed project would not produce disproportionate impacts on children.
506	**Cultural Resources**	Section 106 of the National Historic Preservation Act requires a government-to-government relationship between the Federal Government and Indian tribes as described beginning on page 4-140 of the Final Environmental Impact Statement. Section 106 requires that federal agencies take into account the effects of their undertakings on historic properties. This process requires consultation with tribal authorities. Consultation has occurred with Gila River Indian Community government officials, the Tribal Historic Preservation Officer, the Cultural Resource Management Program, many different tribal authorities, and the State Historic Preservation Office. The consultation has resulted in concurrence from the Gila River Indian Community Tribal Historic

Subject: Comments on DEIS for SMF

Dear ADOT:

I am a citizen and resident of Phoenix and the Ahwatukee area, and Associate Professor at Arizona State University School of Life Sciences. I am writing to ADOT regarding its draft environmental impact study (DEIS) for the South Mountain freeway (SMF). I would like to register my strong opposition to the building of the SMF. I am a member of Protecting Arizona's Resources and Children (PARC), and fully support its efforts to prevent the building of SMF. I have great concerns about the DEIS, as presented below.

One of my main concerns is that the DEIS greatly underestimates the impact of the SMF on the air quality for residents living nearby. The DEIS minimizes the potential pollution that will be caused by trucks burning diesel fuel, especially those coming from Mexico having fuel that is poorly regulated and high in contaminants like sulfur. The DEIS suggests that the "truck bypass" route on I-8 and SH-85 will be preferred by truckers. However, this route is substantially longer than the proposed SMF, and is thus unlikely to be viewed as economically feasible. Due to the geographic features along the E1 Pecos road corridor, concentration of the vehicle emissions is likely to compound toxicity issues in this area. The extreme proximity of several schools to the E1 route puts a huge number of children at risk of health problems due to air pollution.

The E1 route would require massive cuts in the ridges of South Mountain on the west side. This action is unfeasible for two main reasons. All of the Native American tribes in the area consider South Mountain to be sacred, and the proposed action would desecrate the land. Although that reason alone is enough to abandon the plan, another factor is more important to most of us: air quality. The blasting required for the SM ridge cuts (and other cuts along the E1 route) would generate huge amounts of airborne particulate matter. The fine dust generated by construction (especially PM10 particles that can be inhaled deeply) will produce respiratory problems for people in the area. Moreover, it will threaten federal funds for transportation that require control of air quality. Maricopa County has had great difficulty maintaining PM10 standards, and the construction of the SMF would certainly make it more difficult, if not impossible.

507

The DEIS makes dire predictions for adverse effects on the regional economy if the "no action" option is chosen. However, we must remember that the SMF plan was first proposed more than 25 years ago, when fuel was relatively cheap and few people saw any problem with continuation of the freeway transportation paradigm. Data on climate change and greenhouse gases in the atmosphere have steadily accumulated over the years, to the point that it is obvious that we need a transportation paradigm shift in order to address the problems we face. We must reallocate most of our resources away from freeway construction and invest them in technologies that will minimize adverse environmental effects. I strongly advocate light rail expansion throughout the valley. Thus, not building the SMF should not be called "no action", because there are other actions that can be funded with the resources.

508

I strongly urge the ADOT to abandon the SMF plan and intensify studies of other transportation options that are more environmentally friendly.

509

Sincerely,
Hugh S. Mason

506 (cont.)		Preservation Office and the State Historic Preservation Office on National Register of Historic Places eligibility recommendations (including traditional cultural properties), project effects, and proposed mitigation and measures to minimize harm. This consultation has been ongoing and will continue until any commitments in a record of decision are completed.
507	**Air Quality**	The Arizona Department of Transportation and Federal Highway Administration have updated the particulate matter (PM_{10}) qualitative analysis performed for the Draft Environmental Impact Statement to a quantitative analysis for the Final Environmental Impact Statement to ensure that a state-of-the-art analysis is completed for the proposed project. The results of the analysis are summarized in the prologue to the Final Environmental Impact Statement (page xiii) and are more fully described beginning on page 4-68 of the Final Environmental Impact Statement. The carbon monoxide and particulate matter (PM_{10}) analyses demonstrated that the proposed freeway would not contribute to any new localized violations, increase the frequency or severity of any existing violation, or delay timely attainment of the National Ambient Air Quality Standards or any required interim emissions reductions or other milestones. The transportation conformity rule in 40 Code of Federal Regulations § 93.123(c)(5) states that hot-spot analyses are not required to consider construction-related activities that cause temporary increases in emissions. Temporary increases are defined as those that occur only during the construction phase and last 5 years or less at any individual site. The Arizona Department of Transportation is evaluating construction delivery methods for the proposed freeway. One concept is to deliver it as a single design-build project. This method would expedite the construction duration for the entire project to around 3 to 3.5 years. Another concept would be to deliver the project in a more traditional method, breaking the 22-mile corridor into nine segments (each 1 to 3 miles long) and constructing them in phases. Each segment would be under construction for 1 to 3 years and the total construction duration for the entire corridor would be 5 to 6 years. A discussion of construction implementation is provided beginning on page 3-59 of the Final Environmental Impact Statement. Any particular area of the Preferred Alternative would not be expected to see construction activities beyond an approximate 2-year period; therefore, the construction effects described above would be temporary and would not require additional analysis.
508	**Purpose and Need**	At the beginning of the environmental impact statement process, the need for a major transportation facility was reexamined to determine whether such a facility is still needed. Validation of those findings occurred throughout the entire environmental impact statement process. Analysis of the purpose and need for the proposed action followed National Environmental Policy Act and Federal Highway Administration implementing guidance on the subject matter and used state-of-the-practice analytical tools, as pointed out in Table 1-3, "Traffic Analysis Tools," on page 1-13 of the Draft Environmental Impact Statement. The results of the analysis determined that a transportation problem does exist and that problem will continue in the foreseeable future (see section, *Conclusions*, on page 1-21). As noted on page 3-1 in the section, *Reconfirm the Purpose and Need for the Proposed Action*, a continuous validation process was undertaken throughout the environmental impact statement process to ensure past conclusions in the environmental impact statement process remained valid. The reader is referred to Draft Environmental Impact Statement Chapter 3, *Alternatives*, and, specifically, the section, *Alternatives Development and Screening Process Conclusions*, beginning on page 3-26, noting "... a comprehensive set of alternatives including all modes was considered ... assurance that the screening process was an open process ... a logical, sequential, step-by-step process using data and expertise from multiple disciplines ..." to demonstrate all possibilities were considered.

510	PMPC: May 21, 2013 **Phoenix Mountains Preservation Council** Official position on the Arizona Department of Transportation's South Mountain Freeway Draft Environmental Impact Study
511	PMPC is an organization put into place by Arizona visionaries, and for the last 40 years PMPC has continued to monitor and anticipate the impact that rapid population growth would have on our precious Mountain Preserve system.
512	**PMPC is steadfastly opposed to any alignment of the Loop 202 South Mountain Freeway that allows for trespass onto the Mountain Preserve or for any excavation into the South Mountain what so ever. These mountain preserves ensures a lifestyle that 80% of Arizona voters consistently support. The mountain preserves are unique and are for people and wildlife, not for vehicle trespass. PMPC does not agree with** many of the DEIS assumptions finding them objectionable and deficient in the following analysis areas.
513	Unexceptable Pre-Decisional Actions: ADOT has made some pre-decisional actions with the purchase of property before the Draft Environmental Impact Statement (DEIS) was released. Phoenix Mountains Preservation Council (PMPC) questions the legality of this action and the entire DEIS when it appears ADOT has already made considerable financial investment to establish the alignment for the South Mountain Freeway rather than follow the prescribed process. Dismal Wildlife Connectivity: The DEIS does not meet the minimal requirements for coordination and analysis of wildlife resources. The Arizona Game and Fish Department was consulted in 2009 during scoping. The current connection to the Estrella Mountains allows for passage of mule deer, javelina, bobcat, and mountain lion. There is no evidence of further efforts to ascertain wildlife connectivity needs or possible mitigation. The Sonoran desert tortoise provides additional evidence of inadequate cumulative analysis given its status as a U.S. Fish & Wildlife Service's candidate species. The mountain ridge area slated for demolition meets the definition for the tortoise's habitat. Unreasonable Taking of Mountain Preservation Lands: The DEIS states in Figure 5-7 Public Parkland the avoidance of taking over 30 acres of the Preserve is "not prudent and feasible". The taking of this mountainside will destroy important archeological, spiritual, cultural and recreational sites with no realistic or reasonable mitigation possible in the study. The study failed to recognize and address new two trails, Gila and Bursera Trails, created in the southwest end of the Preserve in 2010. Outdated Data Projections Used: The DEIS is based on outdated data projections that are now six to eight years old. The analysis does not acknowledge the impact the major economic downturn had and it brings into question the validity of projected growth levels put forth in the DEIS. In all the alternative studies, the DEIS does not provide one alternative analysis to the demolition of the southwest ridges of South Mountain. Furthermore, nowhere in this study is there an assessment of hazardous material truck traffic nor any mention of managing this truck traffic and the consequences of a serious hazard waste incident. Over 3 million visitors come to South Mountain Park/Preserve annually, according to City of Phoenix statistics. Destroying any part of the mountain to align a high-capacity freeway will only have a negative impact on tourism and the many unique resources the park offers. We urge ADOT to stop providing studies that do not accurately or thoroughly address the impact this freeway has on South Mountain. It's time to stop the $20 million and more in wasted tax payer's money to study the environmental impact and design for an alignment that no longer makes sense.

Code	Issue	Response
510		Responses to specific comments appear below.
511		Comment noted.
512	**Section 4(f) and Section 6(f)**	The information regarding the context and attributes of the South Mountains is described in the Draft Environmental Impact Statement. The acreage of parkland to be converted to a transportation use is reported on page 5-14 in the section, *Direct Use*. It is reported that 31.3 acres or just less than 0.2 percent of the parkland would be converted (this is a reduction in the amount of use planned for in 1988). The text goes on to point out other concerns associated with the direct use reported, and text on page 5-14 in the sidebar, "*The South Mountains in Phoenix's Sonoran Preserve System*," describes the importance of Phoenix South Mountain Park/Preserve in the region. Beginning on page 5-23 in the section, *Measures to Minimize Harm*, measures are presented to be undertaken to address the use impacts, including land replacement, on properties adjacent to the park. The section, *Cultural Resources*, beginning on page 4-128, also discloses the relation of the proposed action to the cultural resource attributes of the South Mountains. City of Phoenix planning efforts since the mid-1980s illustrate an awareness of the potential for the proposed freeway to affect Phoenix South Mountain Park/Preserve. In 1989, the South Mountain Park Master Plan was adopted by the Phoenix City Council. The master plan shows the freeway alignment as adopted by the State Transportation Board in 1988. In 1990, the South Mountain Preserve Act was ratified by the Arizona Legislature. The Act did not apply to roadways through a designated mountain preserve if the roadway was in the State Highway System prior to August 15, 1990. The proposed freeway was in the State Highway System prior to 1990. Records prior to the Act suggest a primary reason for the exception was to allow the proposed freeway to go through Phoenix South Mountain Park/Preserve (see page 5-14 of the Draft Environmental Impact Statement). The project team examined alternatives to avoid the park, but did not identify any feasible and prudent alternatives to avoid impacts. The Arizona Department of Transportation continues to work with park stakeholders to minimize impacts and address concerns. Measures to minimize harm to the park were developed (see Draft Environmental Impact Statement, starting on page 5-23).
513	**Alternatives**	The comment suggests the environmental impact statement process was biased by a history of property acquisitions within the Study Area. More specifically, properties falling within the limits of the Preferred Alternative, as identified in the Final Environmental Impact Statement, were targeted for acquisition. As noted in text on page 3-54 of the Final Environmental Impact Statement, the Arizona Department of Transportation began acquiring land for the original alignment in 1988. Between 1988 and 2001, the Arizona Department of Transportation acquired approximately 293 acres. Most of this land (258 acres) is located in the Eastern Section along Pecos Road. In 2006, the Arizona Department of Transportation began protective and hardship land acquisition in the alignment right-of-way footprint for the W59 and E1 Alternatives. Between 2006 and October 2013, the Arizona Department of Transportation purchased 326 acres (303 in the Western Section and 23 in the Eastern Section). The process for hardship and advanced acquisitions is explained in text on page 4-50 of the Final Environmental Impact Statement.

(Response 513 continues on next page)

PMPC: May 21, 2013

Phoenix Mountains Preservation Council
Official position on the Arizona Department of Transportation's
South Mountain Freeway Draft Environmental Impact Study

PMPC is an organization put into place by Arizona visionaries, and for the last 40 years PMPC has continued to monitor and anticipate the impact that rapid population growth would have on our precious Mountain Preserve system.

PMPC is steadfastly opposed to any alignment of the Loop 202 South Mountain Freeway that allows for trespass onto the Mountain Preserve or for any excavation into the South Mountain what so ever. These mountain preserves ensures a lifestyle that 80% of Arizona voters consistently support. The mountain preserves are unique and are for people and wildlife, not for vehicle trespass. PMPC does not agree with many of the DEIS assumptions finding them objectionable and deficient in the following analysis areas.

Unexceptable Pre-Decisional Actions: ADOT has made some pre-decisional actions with the purchase of property before the Draft Environmental Impact Statement (DEIS) was released. Phoenix Mountains Preservation Council (PMPC) questions the legality of this action and the entire DEIS when it appears ADOT has already made considerable financial investment to establish the alignment for the South Mountain Freeway rather than follow the prescribed process.

514 Dismal Wildlife Connectivity: The DEIS does not meet the minimal requirements for coordination and analysis of wildlife resources. The Arizona Game and Fish Department was consulted in 2009 during scoping. The current connection to the Estrella Mountains allows for passage of mule deer, javelina, bobcat, and mountain lion. There is no evidence of further efforts to ascertain wildlife connectivity needs or possible mitigation. The Sonoran desert tortoise provides additional evidence of inadequate cumulative analysis given its status as a U.S. Fish & Wildlife Service's candidate species. The mountain ridge area slated for demolition meets the definition for the tortoise's habitat.

515 Unreasonable Taking of Mountain Preservation Lands: The DEIS states in Figure 5-7 Public Parkland the avoidance of taking over 30 acres of the Preserve is "not prudent and feasible". The taking of this mountainside will destroy important archeological, spiritual, cultural and recreational sites with no realistic or reasonable mitigation possible in the study. The study failed to recognize and address new two trails, Gila and Bursera Trails, created in the southwest end of the Preserve in 2010.

Outdated Data Projections Used: The DEIS is based on outdated data projections that are now six to eight years old. The analysis does not acknowledge the impact the major economic downturn had and it brings into question the validity of projected growth levels put forth in the DEIS. In all the alternative studies, the DEIS does not provide one alternative analysis to the demolition of the southwest ridges of South Mountain. Furthermore, nowhere in this study is there an assessment of hazardous material truck traffic nor any mention of managing this truck traffic and the consequences of a serious hazard waste incident.

Over 3 million visitors come to South Mountain Park/Preserve annually, according to City of Phoenix statistics. Destroying any part of the mountain to align a high-capacity freeway will only have a negative impact on tourism and the many unique resources the park offers.

We urge ADOT to stop providing studies that do not accurately or thoroughly address the impact this freeway has on South Mountain. It's time to stop the $20 million and more in wasted tax payer's money to study the environmental impact and design for an alignment that no longer makes sense.

Code	Issue	Response
513 (cont.)		The comment infers that by taking such action, the objective equal consideration of the alternatives studied in detail in the Draft and Final Environmental Impact Statements is tainted. Advanced acquisitions in parallel to a National Environmental Policy Act environmental determination process is not unprecedented and is common practice. In this case, property acquisitions by the Arizona Department of Transportation for purposes of implementing the proposed action are done at risk as communicated to the agency by the Federal Highway Administration. If another action alternative were to be ultimately selected, the agency would likely have to place the acquired properties on the market for sale and purchase. The Arizona Department of Transportation attempts to balance the risk against its mission of timely delivery of transportation infrastructure to the driving public. Further, Federal Highway Administration regulations do not allow the ownership of right-of-way to be a factor in the decision regarding the selection of an alternative.
514	**Biology, Plants, and Wildlife**	The section, *General Impacts on Vegetation, Wildlife, and Wildlife Habitat*, beginning on page 4-125 of the Draft Environmental Impact Statement, discloses by what means the proposed action and its alternatives would affect vegetation, wildlife, and wildlife habitat. A Biological Evaluation was submitted to the U.S. Fish and Wildlife Service, Arizona Game and Fish Department, and Gila River Indian Community Department of Environmental Quality that addressed threatened, endangered, and candidate species, including the Sonoran desert tortoise. The information used to prepare the analysis in the Draft Environmental Impact Statement (page 4-122) was based on 2011 information retrieved from the Arizona Game and Fish Department (Gopherus agassizii, draft unpublished abstract compiled and edited by the Heritage Data Management System, Phoenix). Current information on threats and connectivity strategies was included in the Biological Evaluation. The U.S. Fish and Wildlife Service concurred with the species determinations in the Biological Evaluation (see Appendix 1-1 of the Final Environmental Impact Statement). Connectivity is planned to allow wildlife movement beneath the freeway in multiuse crossings (see page 4-137 of the Final Environmental Impact Statement). The Federal Highway Administration and Arizona Department of Transportation have committed to providing mitigation by including multifunctional crossing structures designed for wildlife and for limited human use as well as culverts designed for connectivity for smaller species. Wildlife-friendly design information would be considered during the design of drainage and crossing structures for the freeway (see *Mitigation*, beginning on page 4-138 of the Final Environmental Impact Statement).
515	**Section 4(f) and Section 6(f)**	The cultural and religious importance of the South Mountains is acknowledged in the Draft Environmental Impact Statement in several locations, notably pages 4-132 and 5-26. The proposed project would accommodate and preserve (to the fullest extent possible from the available alternatives) access to the South Mountains for religious practices. Section 106 of the National Historic Preservation Act requires a government-to-government relationship between the Federal Government and Indian tribes as described beginning on page 4-140 of the Final Environmental Impact Statement. Section 106 requires that federal agencies take into account the effects of their undertakings on historic properties. This process requires consultation with tribal authorities as noted in the beginning of this response. Consultation has occurred

PMPC: May 21, 2013

Phoenix Mountains Preservation Council
Official position on the Arizona Department of Transportation's
South Mountain Freeway Draft Environmental Impact Study

PMPC is an organization put into place by Arizona visionaries, and for the last 40 years PMPC has continued to monitor and anticipate the impact that rapid population growth would have on our precious Mountain Preserve system.

PMPC is steadfastly opposed to any alignment of the Loop 202 South Mountain Freeway that allows for trespass onto the Mountain Preserve or for any excavation into the South Mountain what so ever. These mountain preserves ensures a lifestyle that 80% of Arizona voters consistently support. The mountain preserves are unique and are for people and wildlife, not for vehicle trespass. PMPC does not agree with many of the DEIS assumptions finding them objectionable and deficient in the following analysis areas.

Unexceptable Pre-Decisional Actions: ADOT has made some pre-decisional actions with the purchase of property before the Draft Environmental Impact Statement (DEIS) was released. Phoenix Mountains Preservation Council (PMPC) questions the legality of this action and the entire DEIS when it appears ADOT has already made considerable financial investment to establish the alignment for the South Mountain Freeway rather than follow the prescribed process.

Dismal Wildlife Connectivity: The DEIS does not meet the minimal requirements for coordination and analysis of wildlife resources. The Arizona Game and Fish Department was consulted in 2009 during scoping. The current connection to the Estrella Mountains allows for passage of mule deer, javelina, bobcat, and mountain lion. There is no evidence of further efforts to ascertain wildlife connectivity needs or possible mitigation. The Sonoran desert tortoise provides additional evidence of inadequate cumulative analysis given its status as a U.S. Fish & Wildlife Service's candidate species. The mountain ridge area slated for demolition meets the definition for the tortoise's habitat.

Unreasonable Taking of Mountain Preservation Lands: The DEIS states in Figure 5-7 Public Parkland the avoidance of taking over 30 acres of the Preserve is "not prudent and feasible". The taking of this mountainside will destroy important archeological, spiritual, cultural and recreational sites with no realistic or reasonable mitigation possible in the study. The study failed to recognize and address new two trails, Gila and Bursera Trails, created in the southwest end of the Preserve in 2010.

516

Outdated Data Projections Used: The DEIS is based on outdated data projections that are now six to eight years old. The analysis does not acknowledge the impact the major economic downturn had and it brings into question the validity of projected growth levels put forth in the DEIS. In all the alternative studies, the DEIS does not provide one alternative analysis to the demolition of the southwest ridges of South Mountain. Furthermore, nowhere in this study is there an assessment of hazardous material truck traffic nor any mention of managing this truck traffic and the consequences of a serious hazard waste incident.

Over 3 million visitors come to South Mountain Park/Preserve annually, according to City of Phoenix statistics. Destroying any part of the mountain to align a high-capacity freeway will only have a negative impact on tourism and the many unique resources the park offers.

We urge ADOT to stop providing studies that do not accurately or thoroughly address the impact this freeway has on South Mountain. It's time to stop the $20 million and more in wasted tax payer's money to study the environmental impact and design for an alignment that no longer makes sense.

Code	Issue	Response
515 (cont.)		with Gila River Indian Community government officials, the Tribal Historic Preservation Officer, the Cultural Resource Management Program, many different tribal authorities, and the State Historic Preservation Office. The consultation has resulted in concurrence from the Gila River Indian Community Tribal Historic Preservation Office and the State Historic Preservation Office on National Register of Historic Places eligibility recommendations (including traditional cultural properties), project effects, and proposed mitigation and measures to minimize harm. This consultation has been ongoing and will continue until any commitments in a record of decision are completed. Mitigation measures were suggested in a letter from the Lieutenant Governor of the Gila River Indian Community to the Administrator, Arizona Division, Federal Highway Administration, dated June 23, 2010 (see page A372 of Appendix 2-1 of the Final Environmental Impact Statement). In this letter, the Gila River Indian Community submitted a proposal to address partial measures for the mitigation of adverse effect from the Pecos Road Alignment of the South Mountain Freeway. The Gila River Indian Community's proposal found the engineering solutions acceptable, but stated that implementation and construction of the proposed freeway would require further consultation. In committing to the evaluation of the South Mountains Traditional Cultural Property, the Arizona Department of Transportation and Federal Highway Administration also committed to the Gila River Indian Community's participation in ongoing engineering design refinements and acknowledged the importance of all plants and animals in the traditional culture of the Akimel O'odham and Pee Posh of the Gila River Indian Community. The newest South Mountains trails, the Bursera and the Pyramid, are more than ¼ mile from the proposed freeway and are analyzed in the Final Environmental Impact Statement on page 5-9. The trails are within ¼ mile of the planned Chandler extension and residential development; however, these trails do not have noise-sensitive activities or viewshed characteristics that contribute to their importance as a Section 4(f) recreational resource. Use of the mountains for the purposes of the proposed freeway represents two-tenths of one percent of the total mountain range. Since 1988, and as part of this environmental impact statement process, several measures have been undertaken and will be undertaken to further reduce effects on the mountains. These measures, including narrowing the design footprint, acquiring replacement land immediately adjacent to the mountains, and the provision of highway crossings, are outlined in text beginning on page 5-23 of the Draft Environmental Impact Statement.
516	**Purpose and Need**	The analyses in the Draft Environmental Impact Statement used socioeconomic and traffic projections at the regional analysis zone and traffic analysis zone levels. At the time of publication of the Draft Environmental Impact Statement, Census 2010-based socioeconomic data at the regional analysis zone and traffic analysis zone levels had not been adopted by the Maricopa Association of Governments and were not available to the project team. Therefore, the data used in the Draft Environmental Impact Statement were the most appropriate information available. The Maricopa Association of Governments approved new population, employment, housing, and traffic projections in June 2013. The new data are presented in the Final Environmental Impact Statement beginning on page 1-11.

PMPC: May 21, 2013

Phoenix Mountains Preservation Council
Official position on the Arizona Department of Transportation's
South Mountain Freeway Draft Environmental Impact Study

PMPC is an organization put into place by Arizona visionaries, and for the last 40 years PMPC has continued to monitor and anticipate the impact that rapid population growth would have on our precious Mountain Preserve system.

PMPC is steadfastly opposed to any alignment of the Loop 202 South Mountain Freeway that allows for trespass onto the Mountain Preserve or for any excavation into the South Mountain what so ever. These mountain preserves ensures a lifestyle that 80% of Arizona voters consistently support. The mountain preserves are unique and are for people and wildlife, not for vehicle trespass. PMPC does not agree with many of the DEIS assumptions finding them objectionable and deficient in the following analysis areas.

Unexceptable Pre-Decisional Actions: ADOT has made some pre-decisional actions with the purchase of property before the Draft Environmental Impact Statement (DEIS) was released. Phoenix Mountains Preservation Council (PMPC) questions the legality of this action and the entire DEIS when it appears ADOT has already made considerable financial investment to establish the alignment for the South Mountain Freeway rather than follow the prescribed process.

Dismal Wildlife Connectivity: The DEIS does not meet the minimal requirements for coordination and analysis of wildlife resources. The Arizona Game and Fish Department was consulted in 2009 during scoping. The current connection to the Estrella Mountains allows for passage of mule deer, javelina, bobcat, and mountain lion. There is no evidence of further efforts to ascertain wildlife connectivity needs or possible mitigation. The Sonoran desert tortoise provides additional evidence of inadequate cumulative analysis given its status as a U.S. Fish & Wildlife Service's candidate species. The mountain ridge area slated for demolition meets the definition for the tortoise's habitat.

Unreasonable Taking of Mountain Preservation Lands: The DEIS states in Figure 5-7 Public Parkland the avoidance of taking over 30 acres of the Preserve is "not prudent and feasible". The taking of this mountainside will destroy important archeological, spiritual, cultural and recreational sites with no realistic or reasonable mitigation possible in the study. The study failed to recognize and address new two trails, Gila and Bursera Trails, created in the southwest end of the Preserve in 2010.

Outdated Data Projections Used: The DEIS is based on outdated data projections that are now six to eight years old. The analysis does not acknowledge the impact the major economic downturn had and it brings into question the validity of projected growth levels put forth in the DEIS. In all the alternative studies, the DEIS does not provide one alternative analysis to the demolition of the southwest ridges of South Mountain. Furthermore, nowhere in this study is there an assessment of hazardous material truck traffic nor any mention of managing this truck traffic and the consequences of a serious hazard waste incident.

517 Over 3 million visitors come to South Mountain Park/Preserve annually, according to City of Phoenix statistics. Destroying any part of the mountain to align a high-capacity freeway will only have a negative impact on tourism and the many unique resources the park offers.

We urge ADOT to stop providing studies that do not accurately or thoroughly address the impact this freeway has on South Mountain. It's time to stop the $20 million and more in wasted tax payer's money to study the environmental impact and design for an alignment that no longer makes sense.

Code	Issue	Response
516 (cont.)		While new projections based on the 2010 Census showed a lower anticipated population in 2035 than the previous projections, the need for the freeway has not changed. The traffic analysis demonstrated that the proposed project is needed today. If the proposed action is the Selected Alternative in the record of decision, planning for emergency situations would be initiated. If the plan is amended, it is made available to the Arizona Department of Transportation. A number of alternatives that avoided the South Mountains were considered during the study (see text beginning on page 5-1 of the Draft Environmental Impact Statement). These avoidance alternatives were determined to not be prudent and were eliminated from further consideration. To support this response, here is the comment from the U.S. Department of Interior on the Draft Environmental Impact Statement: "Following our review of the Section 4(f) Evaluation, we concur that there is no feasible or prudent alternative to the Preferred Alternative selected in the document, and that all measures have been taken to minimize harm to these resources." The complete letter can be found in Appendix 7, Volume III, on page B4.
517	**Section 4(f) and Section 6(f)**	The information regarding the context and attributes of the South Mountains is described in the Draft Environmental Impact Statement. The acreage of parkland to be converted to a transportation use is reported on page 5-14 in the section, *Direct Use*. It is reported that 31.3 acres or just less than 0.2 percent of the parkland would be converted (this is a reduction in the amount of use planned for in 1988). The text goes on to point out other concerns associated with the direct use reported, and text on page 5-14 in the sidebar, "*The South Mountains in Phoenix's Sonoran Preserve System*," describes the importance of Phoenix South Mountain Park/Preserve in the region. Beginning on page 5-23 in the section, *Measures to Minimize Harm*, measures are presented to be undertaken to address the use impacts, including land replacement, on properties adjacent to the park. The section, *Cultural Resources*, beginning on page 4-128, also discloses the relation of the proposed action to the cultural resource attributes of the South Mountains. City of Phoenix planning efforts since the mid-1980s illustrate an awareness of the potential for the proposed freeway to affect Phoenix South Mountain Park/Preserve. In 1989, the South Mountain Park Master Plan was adopted by the Phoenix City Council. The master plan shows the freeway alignment as adopted by the State Transportation Board in 1988. In 1990, the South Mountain Preserve Act was ratified by the Arizona Legislature. The Act did not apply to roadways through a designated mountain preserve if the roadway was in the State Highway System prior to August 15, 1990. The proposed freeway was in the State Highway System prior to 1990. Records prior to the Act suggest a primary reason for the exception was to allow the proposed freeway to go through Phoenix South Mountain Park/Preserve (see Draft Environmental Impact Statement page 5-14). The project team examined alternatives to avoid the park, but did not identify any feasible and prudent alternatives to avoid impacts. The Arizona Department of Transportation continues to work with park stakeholders to minimize impacts and address concerns. Measures to minimize harm to the park were developed (see Draft Environmental Impact Statement, starting on page 5-23). The activities that make the park such a highly valued tourist attraction (recreational activities, interaction with the Sonoran Desert) would remain.

BROWN AND
CALDWELL

August 24, 1995

Mr. Tighue Shields, Director
Golf Course Maintenance Operations
Cobblestone Golf Group
2201 East Clubhouse Drive
Phoenix, Arizona 85048

15/2906-01

Subject: Well Feasibility/Well Siting Investigation
Foothills Golf Club, Phoenix, Arizona

Dear Mr. Shields:

Brown and Caldwell is pleased to provide Cobblestone Golf Group with this hydrogeologic study addressing the feasibility and preferable locations for a water supply well. This investigation was conducted in accordance with our agreement of August 7, 1995. Brown and Caldwell was authorized by Cobblestone Golf Group to conduct the tasks listed in the August 7, 1995 Agreement, including 1) preliminary data collection, and 2) well siting investigation.

519

BACKGROUND

The Foothills Golf Club is currently serviced by an existing well, which is supplemented during the summer months by City of Phoenix fire hydrant water. Use of City of Phoenix water for turf irrigation at the Foothills Golf Club is very expensive and, in addition, the existing well is located in the right-of-way for the proposed expansion of Pecos Road, and will need to be abandoned in the future. Therefore, a new water source is needed immediately to supplement the existing well, and to provide a future water supply for the Foothills Golf Club as a sole source.

520

BASIC DATA

The available hydrogeologic literature relating to the Foothills Golf Club area is limited. Available data were collected from the Arizona Department of Water Resources (ADWR), Cobblestone Golf Group files, and the files of Gilbert Pump Company (the pump maintenance contractor for the Foothills Golf Course well).

Code	Issue	Response
518		Comment noted.
519	**Water Resources**	Wastewater effluent is not available as a replacement source as noted on page 4-100 of the Draft Environmental Impact Statement; therefore, only two water sources are available for irrigation and lake supply for the Foothills Community Association. The well that would be acquired and potable water from the City of Phoenix. The discussion on page 4-100 of the Draft Environmental Impact Statement has been modified in the Final Environmental Impact Statement to reflect that reclaimed wastewater would not be available; however, the conclusion on page 4-100 is still appropriate. As stated on page 4-100 of the Draft Environmental Impact Statement, "In the event that well replacement were to be impossible, the Arizona Department of Transportation would still replace the water that would be lost through the acquisition." Page 4-100 of the Draft Environmental Impact Statement states that finding a suitable location for a new well in this area may be difficult. Productivity of the well in bedrock formations is primarily based on intercepting fractures, and that can be very difficult to do. The Arizona Department of Transportation is aware of the difficult conditions that exist in replacing wells in this area. The procedure identified on page 4-100 of the Draft Environmental Impact Statement, define the procedure that the Arizona Department of Transportation would use to replace affected wells, and also identifies the general costs that the Arizona Department of Transportation would incur to replace the lost water sources. Depending on whether an action alternative were the Selected Alternative, it may be possible to keep the well in its current location, but move the well controls and associated piping to outside of the right-of-way. Such an analysis would be performed later in the design process.
520		Hydrogeologic report reviewed.

Code	Comment Document

HYDROGEOLOGIC ANALYSIS

The hydrogeologic analysis of the Foothills Golf Club area includes a geologic evaluation, based on review of available literature, and limited geologic mapping by a Brown and Caldwell geologist. The hydrogeologic analysis of the study area also included an evaluation of the groundwater conditions in the study area, based on hydrologic information from ADWR files and regional published reports. Generally, the available data relating to the geology of the Foothills Golf Club area were moderate, but the data relating to the hydrology and groundwater conditions of the Foothills area were quite sparse.

Geologic Setting

The study area is located along the southern flanks of South Mountain, which is a southwest trending mountain range that was formed during the Middle Tertiary Period (20 to 25 million years before present) as a result of low angle normal faulting. The rock types that make up South Mountain, and also occur within the study area include:

Precambrian amphibolite gneiss, which is a fine-grained, dark green rock that is present along the western flank of South Mountain;

Tertiary granite and granodiorite, which is a fine-grained, pink-to-cream-colored rock that comprises the remaining portion of the range; and

dikes, which are veins of rock that result from intrusion of molten rock into older pre-existing rocks. Dikes in South Mountain have various composition, and they cross-cut the Precambrian and Tertiary rocks.

Hydrologic Setting

The data collected from ADWR were insufficient for the preparation of a groundwater elevation contour map. However, available driller's logs for nearby wells were used to construct a generalized geologic cross-section of the area (Figure 1). A video survey obtained from Gilbert Pump Company was used to determine the static water level in the Foothills Golf Club well (Figure 1). Groundwater flow through bedrock aquifers occurs along fractures (broken or cleaved zones in the rock, along which movement has occurred) and joints (closely spaced penetrative cracks in the rock that do not show evidence of movement). The overlying alluvium in this area is relatively thin, and does not appear to significantly contribute water to wells in the Foothills Golf Club area. Therefore, the alluvium was not targeted as a major groundwater resource in this investigation. Rather, the fractured bedrock material within the study area was evaluated to identify preferable locations for installation of a new water well(s) for the facility.

Code	Issue	Response

Code	Comment Document

FRACTURE TRACE ANALYSIS

The most favorable well location in a fractured bedrock aquifer is generally along major fracture systems, or at the intersection of two or more fractures. Groundwater preferentially flows along the fracture systems and thus, a greater volume of groundwater is typically produced from wells along these geologic structures. In order to characterize the fractured bedrock in the Foothills Golf Club area, Brown and Caldwell conducted a fracture trace analysis, utilizing photogeology and field mapping, to determine the orientation (strike and dip) and overall character of the fractures.

Aerial photographs of the Foothills Golf Club area were obtained and evaluated by Brown and Caldwell hydrogeologists to identify the principal geologic lineaments in the study area. Geologic lineaments include such linear features as unusually straight drainages, vegetation alignments, and alignment of discolored or weathered surfaces along outcrops. Lineaments such as these typically occur as a result of underlying geologic structures that control the weathering, vegetation, and outcrop patterns observed at the land surface. The principal geologic lineaments in the study area are presented in Figure 2. Two primary lineament orientations were identified. The dominant (primary) lineament orientation trends to the west-southwest, and the minor (secondary) lineament orientation is nearly perpendicular to the primary lineaments, trending to the southeast. The primary lineaments are more clearly defined on the aerial photographs, and are probably associated with the tectonic event that originally formed South Mountain during the Middle Tertiary Period.

The photogeologic analysis was augmented with limited geologic mapping, and field measurement of selected fracture and joint orientations in the area. The field measurement of geologic structure orientations involves the use of a Brunton compass (a specially designed compass used for measurement of geologic formations and structures) to determine the strike (horizontal direction) and dip (vertical orientation) of dikes, fractures, and joints in the area. The joint, fracture, and dike orientations are presented in Figure 2, and are also listed in Table 1. Joints that occur in the study area frequently occur in sets of two or three intersecting joint planes (Figure 2, Table 1). The orientation of the joint planes parallels the orientation of the primary and secondary lineaments determined in the photogeologic study, and provides confirmation of Brown and Caldwell's photogeologic interpretation of the Foothills Golf Club area.

FINDINGS AND RECOMMENDATIONS

Based on our fracture trace analysis, Brown and Caldwell has identified three locations that appear favorable for the installation of a water well. Each of these locations is at the intersection of at least two fracture systems, as indicated in Figure 2. A more detailed map showing the location of the proposed well sites is presented in Figure 3. The three proposed well locations have been prioritized from the most favorable (indicated as "1" in Figures 2 and 3) to least favorable

Code	Issue	Response

Code	Comment Document

(indicated as "3" in Figures 2 and 3). The prioritization is primarily based on the hydrogeologic setting, but also considers the location of the existing water distribution system.

An additional option would be the installation of a replacement well near the existing well site. The proposed location of a replacement well is designated as "R" in Figures 2 and 3. The Rules and Regulations of the ADWR stipulate that an additional well spacing/well impact analysis is required only if the replacement well is located more than 660 feet from the existing well. Therefore, if a replacement well is to be drilled, it should be located within 660 feet of the existing well, but beyond the right-of-way for the Pecos Road expansion.

Brown and Caldwell appreciates the opportunity to provide this well feasibility/well siting report to the Cobblestone Golf Group. If you have any questions regarding this report, or require additional information, please do not hesitate to call.

Very truly yours,

BROWN AND CALDWELL

Chad,

We have not and do not plan on doing any test drilling. Suncor did several test drills when they owned it and found nothing.

To: "chadblostone@cox.net" <chadblostone@cox.net>

Chad,

As you requested, copies of the well reports that were done for your group back in 1995 and 1996 are attached. In general, groundwater resources become very sparse and uncertain to the north of Pecos Road, due to the shallow bedrock. It would be technically possible to drill a directional (slanted) well near the Pecos Road alignment that dipped into the region of the alluvial basin to the south. However, I would strongly recommend against that action without first obtaining approval from the Gila River Indian Community to the south, and also the Arizona Department of Water Resources. Otherwise, you may encounter substantial legal challenges to the water rights associated with the directional well. I hope this helps to clarify the situation for you.

Best regards,

Marvin

SECTION 2.0

DRILLING AND INSTALLATION OF THE NORTH WELL

2.1 BOREHOLE DRILLING

The pilot borehole for the North Well was drilled by Arizona Beeman Drilling Company of Apache Junction, Arizona utilizing an air rotary drilling technique with drilling foam added to the fresh water drilling fluid. A Gardner-Denver 1500 rotary rig was used to perform all work associated with the drilling and installation of the well. Brown and Caldwell personnel performed field inspection and documentation of the key field operations. Drilling and well installation operations were performed during daylight hours only (7:00 a.m. to 6:00 p.m.), Monday through Friday. Sound blankets were used to prevent rig noise from being a nuisance to neighboring residences.

Drilling of the pilot hole commenced on February 6, 1996, and was completed on February 8, 1996. A 14 3/4-inch diameter borehole was drilled to 20 feet below land surface (bls). A temporary surface casing was set to 20 feet bls using 10 3/4-inch outside diameter low-carbon steel casing. After the temporary surface casing was sealed with bentonite chips, the pilot hole was drilled using a 9 7/8-inch button bit from 20 feet bls to a depth of 190 feet bls. In order to increase the drilling rate, an 8-inch downhole hammer bit was used from 190 feet bls to the total depth of 400 feet bls.

Drilled cuttings were collected at 10-foot intervals throughout the pilot borehole. The samples were preserved in 4-inch by 6-inch cloth sample bags for future reference. An additional set of the drilled cutting samples was placed in specially-designed "ice cube tray" plastic containers, and submitted to Cobblestone personnel for archival purposes.

2.2 LITHOLOGIC LOG

A detailed lithologic log of the drilled cuttings from the North Well pilot hole is presented in Appendix A and is summarized below. From the land surface to 17 feet bls, the materials penetrated by the North Well are comprised of light brown felsic sands and fine to medium gravels. From 17 feet to 400 feet bls, bedrock was encountered which was comprised of dark green to black-colored clasts including amphibole, epidote, and biotite, with minor amounts of lighter-colored feldspar and quartz minerals. Pyrite minerals are present in the drill cuttings from about 120 feet bls to 400 feet bls in varying amounts. The bedrock is considered to be an amphibolite gneiss.

2.3 WELL INSTALLATION

The well casing installation at the North Well was conducted on February 16, 1996. A record drawing of the North Well is presented in Figure 1. The temporary casing was removed and the borehole reamed with a 14 3/4-inch mill tooth bit to approximately 60 feet bls. Low-carbon steel 10 3/4-inch outside diameter casing with 0.250-inch wall thickness was installed to 60 feet bls. Below 60 feet bls, the well was completed as an open borehole with no casing or screen. The annulus

Code	Issue	Response

Code	Comment Document

between the casing and the 14 3/4-inch borehole was sealed with cement grout from 60 feet bls to approximately 3 1/2 feet bls.

SECTION 3.0

POST-CONSTRUCTION NORTH WELL ANALYSIS

3.1 PUMPING TEST

A modified step-rate discharge aquifer test was conducted at the North Well on March 12 and 13, 1996 to evaluate the production capability of the well and the optimum depth to set the permanent submersible pump. The data from the aquifer test were collected by Brown and Caldwell personnel with the pumping equipment supplied by Stewart Brothers Drilling Company of Milan, New Mexico. The pumping test data is presented in Appendix B.

The submersible pump was initially set and pumped at a shallow depth (60 feet bls), then progressively lowered and pumped at various pump-setting depths (100 feet, 200 feet and 300 feet bls) to help determine where the permanent pump can be set. A static water level of 48 feet bls was measured prior to the pumping test. At the various pump depth settings, the discharge rate varied from 45 gallons per minute (gpm) to 90 gpm. The discharge rates were calculated using a flow meter. At the pump settings of 60 feet and 100 feet, the groundwater level drawdown reached the submersible pump intake indicating the pump needed to be set at a lower depth. At a pump setting of 200 feet bls, the groundwater level drawdown in the well was 62 feet after 36 minutes of pumping at approximately 65 gpm. The pump was then lowered to 300 feet bls and pumped at a discharge rate of approximately 65 gpm. The water level drawdown after 44 minutes of pumping was approximately 68 feet.

On March 13, 1996, the pumping test resumed with the pump set at 300 feet bls. The groundwater level drawdown in the well was 66 feet after pumping at an average discharge rate of 61 gpm for 84 minutes. Throughout the test, the specific capacity of the well ranged from 0.8 gpm per foot of drawdown (gpm/ft) to 7.4 gpm/ft. A semi-log plot of the water level drawdown data for the North Well on March 13, 1996 is presented in Figure 2. Using the Cooper-Jacob method of analysis, the transmissivity of the aquifer was calculated to be approximately 380 gallons per day per foot (gpd/ft) as shown in Figure 2. At the conclusion of the pumping test, the water level drawdown recovery was recorded. A semi-log plot of the water level recovery data (Theis Recovery Plot) is presented in Figure 3. Utilizing the Theis Recovery Plot, the transmissivity value was calculated to be approximately 290 gallons per day per foot (gpd/ft) as shown in Figure 3. The calculated transmissivity values are based on a short-term pumping test and the basic assumption that the fractures are interconnected and behave as porous medium. Therefore, these values may vary after long-term pumping due to dewatering of fractures or when other hydrogeologic boundaries are encountered.

SECTION 4.0

NORTH WELL RECOMMENDATIONS

4.1 PUMP SETTING AND DISCHARGE RATE

Based on the data and analyses presented herein, Brown and Caldwell recommends that the North Well be equipped with a permanent submersible pump capable of producing up to 55 gallons per minute (gpm). The permanent pump equipment should be set at a depth no less than 300 feet bls in order to supply the minimum "net positive suction head" necessary to avoid cavitation in the submersible pump. The pumping water level should not be allowed to drop to within 40 feet above the pump intake. This value is variable and depends upon the pump equipment installed and should be verified at the time of installation. It should also be noted that the pumping test was not a long-term test and continuous long-term pumping of the well may result in greater drawdown than was recorded during the test. As a result, it is also recommended that the well be initially pumped on an 8- to 12-hour cycle to allow for additional well performance evaluation.

SECTION 5.0

DRILLING AND ABANDONMENT OF THE SOUTH WELL

5.1 BOREHOLE DRILLING

The drilling of the South Well was conducted by Stewart Brothers Drilling Company. The pilot borehole was drilled using a Gardner-Denver 1500 drill rig using the air hammer drilling method. Brown and Caldwell personnel performed field inspection and documentation of the key field operations. Drilling operations were performed during daylight hours (7:00 a.m. to 6:00 p.m.) Monday through Friday.

Drilling of the pilot hole commenced on March 26, 1996, and was completed on March 29, 1996. A 13 3/4-inch diameter pipe was driven to the top of bedrock which was approximately 50 feet bls to help stabilize the hole. A 7-inch diameter liner was installed to 50 feet bls inside the 13 3/4-inch pipe to help facilitate circulation of fluids during the drilling process. The pilot hole was then drilled using a 6 1/4-inch downhole hammer from 50 feet bls to the total depth of 400 feet bls.

Drilled cuttings were collected at 10-foot intervals throughout the pilot borehole. The samples were preserved in 4-inch by 6-inch cloth sample bags for future reference. An additional set of the drilled cutting samples was placed in specially-designed "ice cube tray" plastic containers and submitted to Cobblestone personnel for archival purposes. A detailed lithologic log of the drilled cuttings from the South Well pilot hole is presented in Appendix C. In general, from the surface to 48 feet bls, the materials penetrated by the South Well are comprised of light brown to pink felsic sands and fine gravels. From 48 feet to 400 feet bls, bedrock was encountered which was comprised of dark green to gray colored clasts including epidote, biotite, and amphibole with minor amounts of lighter-colored feldspar and quartz minerals. The bedrock is considered to be an amphibolite gneiss.

5.2 BOREHOLE ABANDONMENT

During the drilling of the pilot hole the water production of the borehole was monitored. No notable fractures yielding significant groundwater were encountered during the drilling process. At 400 feet bls, the well was developed by airlifting for approximately 1 hour with no significant improvement in groundwater production. The borehole was backfilled with drilled cuttings and abandoned per Arizona Department of Water Resources requirements (Arizona Administrative Code R12-15-816).

South Mountain Land Acquisitions - The spreadsheet was created by ADOT on June 11, 2013.0It has W in the right side if it is a parcel in the western alignment; it has an E in the right side if it is a parcel in the eastern alignment. Parcels 7-11316 and 7-10612 are two parcels in the western alignment that were not included in the spreadsheet. The parcel transmittal sheet for each is also attached.

Subject: Additional Comment on the SMF Loop 202 Freeway DEIS - Filed by PARC et al.
Date: Wednesday, July 24, 2013 2:12:06 PM
Importance: High

Addendum to the Comments Filed on July 23, 2013 By:

Protecting Arizona Resources and Children, Inc. (PARC); The Foothills Community Association; The Foothills Club West Community Association; The Lakewood Community Association; The Calabrea Community Association; Don't Waste Arizona, Inc. (DWAZ); Gila River Alliance for a Clean Environment (GRACE); Gila River Environmental Youth (GREY); Patricia Lawlis; Timothy Lank; Chad Blostone; Michael Hinz; Chris Boettcher; Phoenix Mountains Preservation Council (PMPC) - (collectively referred to herein as "Commenters").

1 1. As discussed in Commenters' previous submission, the DEIS failed to adequately consider the health impacts resulting from freeway related air pollution. Given the large number of schools, community areas, and homes within approximately one-half mile of the proposed right-of way (the "Hot Zone" for health impacts), ADOT should also have considered, *inter alia*, future health care costs and impacts on human capital in general as indirect and/or cumulative impacts under NEPA. It is likely that thousands of children living and/or going to school in this Hot Zone will suffer from, in part, inhibited lung growth and development, as well as asthma -- as a direct and proximate result of the freeway. The primary health threat from proposed freeway air pollution to adults will be increased risks of chronic cardiovascular illness, acute myocardial infarctions, and premature mortality. Given the certainty of the science at issue, future health care related costs and health related impacts in general should have been considered in the DEIS.

2. Commenters expressly incorporate herein, by this reference, any comment on the DEIS submitted by: The Sierra Club; PIRG/Arizona PIRG; the Gila River Indian Community; and any member of any of the above identified organizations/associations.

Thank you.

Code	Issue	Response
1	**Air Quality, Health Risk Assessment**	The carbon monoxide analysis was updated in the Final Environmental Impact Statement. Although a qualitative analysis of particulate matter (PM_{10}) was presented in the Draft Environmental Impact Statement, a quantitative project-level particulate matter (PM_{10}) hot-spot analysis is included in the Final Environmental Impact Statement. The results of the air quality updates are summarized in the prologue to the Final Environmental Impact Statement (page xiii) and are more fully described beginning on page 4-68 of the Final Environmental Impact Statement. The carbon monoxide and particulate matter (PM_{10}) analyses demonstrated that the proposed freeway would not contribute to any new localized violations, increase the frequency or severity of any existing violation, or delay timely attainment of the National Ambient Air Quality Standards or any required interim emissions reductions or other milestones. The emission modeling developed for the proposed action showed that for the mobile source air toxics study area, there would be little difference in total annual emissions of mobile source air toxics emissions between the Preferred and No-Action Alternatives (less than a 1 percent difference) in 2025 and 2035. With the Preferred Alternative in 2035, modeled mobile source air toxics emissions would decrease by 57 percent to more than 90 percent, depending on the pollutant, despite a 47 percent increase in vehicle miles traveled in the Study Area compared with 2012 conditions (see discussion beginning on page 4-77 of the Final Environmental Impact Statement). **The Role of Health Risk Assessment in a National Environmental Policy Act Context** The Federal Highway Administration's National Environmental Policy Act documents are developed under two guiding regulations: the Council on Environmental Quality's National Environmental Policy Act regulations applicable to all federal agencies (40 Code of Federal Regulations Parts 1500–1508) and the Federal Highway Administration's implementing regulations governing Federal Highway Administration National Environmental Policy Act documents (23 Code of Federal Regulations Part 771). In its mobile source air toxics guidance, the Federal Highway Administration discusses 40 Code of Federal Regulations Part 1502.22 and acknowledges that while much work has been done to assess the overall health risk of mobile source air toxics, analytical tools and techniques for assessing project-specific health outcomes as a result of lifetime exposures to mobile source air toxics remain limited. These limitations impede the ability to evaluate the potential health risks attributable to exposure to mobile source air toxics as part of the decision-making process in the National Environmental Policy Act context. However, as with any analysis that the Federal Highway Administration conducts for National Environmental Policy Act purposes, the Federal Highway Administration's approach for mobile source air toxic analysis in National Environmental Policy Act documents is informed not just by 40 Code of Federal Regulations Part 1502.22, but by all applicable Council on Environmental Quality requirements.

Code	Issue	Response
1 (cont.)		The appropriateness of air toxics health risk assessment as an analysis method for National Environmental Policy Act documents is discussed below, in the context of Council on Environmental Quality requirements for these documents. In addition to the 40 Code of Federal Regulations Part 1502.22 provisions regarding uncertainty and limitations discussed in the Federal Highway Administration's MSAT Interim Guidance Appendix C, three other provisions of the Council on Environmental Quality regulations are particularly relevant to the topic of health risk assessment: *40 Code of Federal Regulations § 1500.1(b): NEPA procedures must insure that environmental information is available to public officials and citizens before decisions are made and before actions are taken. The information must be of high quality. Accurate scientific analysis, expert agency comments, and public scrutiny are essential to implementing NEPA. Most important, NEPA documents must concentrate on the issues that are truly significant to the action in question, rather than amassing needless detail.* *40 Code of Federal Regulations § 1502.1: An environmental impact statement is more than a disclosure document. It shall be used by Federal officials in conjunction with other relevant material to plan actions and make decisions.* *40 Code of Federal Regulations § 1502.2: (a) Environmental impact statements shall be analytic rather than encyclopedic. (b) Impacts shall be discussed in proportion to their significance.(c) Environmental impact statements shall be kept concise and shall be no longer than absolutely necessary to comply with NEPA and with these regulations.* Section 1500.1(b) states that information for decision making must be of high quality and based on accurate scientific analysis. Air toxics health risk assessments can involve large uncertainties. The mobile source air toxic health risk assessment uncertainty builds on itself—each step of the analysis involves uncertainties, including modeling traffic and then modeling emissions, and using this estimated output to model dispersion/concentrations, which provide information for estimating or assuming exposures to those concentrations, and finally predicting health outcomes. Major uncertainties are associated with traffic and emissions projections over a 70-year period, and dispersion models are typically held to a "factor of 2" performance standard. Health impacts of mobile source air toxics in the U.S. Environmental Protection Agency Integrated Risk Information System are based on a 70-year lifetime exposure, which introduces significant uncertainty (e.g., on average, people in the United States change residence approximately once every 8 years and change jobs once every 3). Finally, as noted above, the U.S. Environmental Protection Agency's Integrated Risk Information System provides toxicity (risk) values for various pollutants and routes of exposure; in a health risk assessment, the Federal Highway Administration would compare calculated concentrations of mobile source air toxic pollutants to the Integrated Risk Information System values to estimate health risk. In the Integrated Risk Information System, the U.S. Environmental Protection Agency states the toxicity values are believed to be accurate to within an order of magnitude (a factor of 10). The total cumulative uncertainty involved in highway project health risk assessment is much larger than the change in emissions attributable to projects (typically a few percentage points). In this context, the information would not necessarily have a strong nexus to the requirements for high-quality information and accurate scientific analysis.

(Response 1 continues on next page)

Code	Comment Document

Code	Issue	Response
1 (cont.)		Section 1500.1(b) also directs agencies to focus their National Environmental Policy Act analysis and documentation on issues that are truly significant to the action in question. In the context of mobile source air toxics, the Federal Highway Administration must consider whether changes in mobile source air toxic emissions attributable to a project have the potential for significant health risk. Using cancer risk as an example, the U.S. Environmental Protection Agency estimates that the overall risk of cancer in the United States is approximately 330,000 in a million, and that air toxics (from all sources) are responsible for a risk of approximately 50 in a million. In its most recent mobile source air toxics rule-making, the U.S. Environmental Protection Agency estimated mobile source air toxic cancer risk, after implementation of emissions controls, at approximately 5 in a million (or 0.0015 percent of overall cancer risk from any cause). For the Preferred Alternative, the mobile source air toxic emissions analysis for the Study Area found little difference in total annual emissions of mobile source air toxic emissions between the Preferred and No-Action Alternatives (less than a 1 percent difference) in 2025 and 2035. With the Preferred Alternative in 2035, modeled mobile source air toxic emissions would decrease by more than 80 percent, depending on the pollutant, despite a 47 percent increase in vehicle miles traveled in the Study Area compared with 2012 conditions (see the discussion beginning on page 4-77 of the Final Environmental Impact Statement). In summary, available information from the U.S. Environmental Protection Agency indicates that mobile source air toxics are a small component of overall cancer risk, and the analysis for the Final Environmental Impact Statement indicates both that the Preferred Alternative would result in a small change in the emissions contributing to this risk and that emissions will decline by a large amount regardless of alternative. As described above and in the air quality technical report, results from the health risk assessment would be influenced more by the uncertainty introduced into the process through assumptions and speculations rather than by genuine insight into the actual health impacts directly attributable to mobile source air toxic exposure associated with a project. Therefore, outcomes of such a health risk assessment do not provide useful information for decision makers, as required by Section 1502.1. The Federal Highway Administration emissions analysis meets the requirement to produce information that is useful for both disclosure and decision making because it allows the public and decision makers to see which alternative has less mobile source air toxic emissions, with much less uncertainty than a health risk assessment.

(Response 1 continues on next page)

Code	Comment Document

Code	Issue	Response
1 (cont.)		Given the uncertainty of a mobile source air toxic health risk assessment, the Federal Highway Administration instead addresses the potential impacts of mobile source air toxics through an emissions assessment in its National Environmental Policy Act documents. For smaller projects with a lower likelihood of a meaningful impact, this discussion is qualitative. For larger projects, emissions analysis is conducted. The Federal Highway Administration approach is consistent with the Council on Environmental Quality's direction in Section 1502.2(b) to discuss impacts in proportion to their significance. The results of an emissions analysis can be summarized concisely in a National Environmental Policy Act document and provide useful information for decision makers (e.g., an alternative that has lower emissions is likely to be "better" from a mobile source air toxics health risk standpoint than one that has higher emissions). While the U.S. Environmental Protection Agency and the Federal Highway Administration both agree on the usefulness of addressing mobile source air toxics in National Environmental Policy Act documents for highway projects, the agencies disagree about the value of health risk assessment as a method for doing so.

(Response 1 continues on next page)

Code	Comment Document

Code	Issue	Response
1 (cont.)		Another consideration with respect to health impacts is that the Preferred Alternative would also reduce in-vehicle mobile source air toxics exposure as opposed to the No Action Alternative. The U.S. Environmental Protection Agency has found that in-vehicle benzene concentrations were between 2.5 and 40 times higher than nearby ambient concentrations, based on a review of studies discussed in the Regulatory Impact Analysis for the U.S. Environmental Protection Agency's 2007 mobile source air toxics rule-making (Final Regulatory Impact Analysis, Environmental Protection Agency 420-R-07-002, 3-17 [February 2007]). Construction of the Preferred Alternative would result in a reduction in benzene exposure to drivers and passengers for two reasons: decreased travel times (motorists would spend less time in traffic to reach their destinations) and lower emissions rates (attributable to speed improvements). Reducing on-road exposure would provide a health benefit for motorists using the roadway network. Congestion relief resulting from the proposed freeway would provide localized air quality emissions reductions on area freeways and arterial streets and at interchanges, benefiting users of area highways and those living near congested roads. The Federal Highway Administration determined that a supplemental environmental impact statement is not required at this time because there were no changes to the proposed action that will result in significant environmental impacts not evaluated in the Draft Environmental Impact Statement nor is there new information relevant to environmental concerns and bearings on the proposed action or its impacts that will result in significant environmental impacts not evaluated in the Draft Environmental Impact Statement.

Mr. Alan Hansen- Team Leader-PEAR
Federal Highway Administration
4000 N. Central Avenue- Suite 1500
Phoenix, AZ 85012-3500

Dear Mr. Hansen:

RE: South Mountain Freeway Meeting

1

As your schedule permits I would like to meet with you to discuss the proposed South Mountain Freeway Loop 202 and the impacts it will have on my village if it is built on Pecos Road.

My name is Jim Jochim and I am the Treasurer of PARC (Protecting Arizona Resources and Children) we are a 501 C 3 and were incorporated in 2006. I have been actively involved in the public freeway meetings for over a decade and I had the privilege of meeting Mr. Bill Vachon at the SMCAT meetings before he retired .

Enclosed are several copies of the Ahwatukee Republic dated June 14, 2013 in which I am pictured on the front page and on page four. I am also enclosing a number of PARC business cards for your distribution.

Please advise what date and time works best for your schedule and I will be there because as a retiree from AT&T I have a lot of 'flex' time.

Best regards,

Jim Jochim
1231 E. Desert Flower Lane
Phoenix, AZ 85048
T# 480-460-2535
Fax# 480460-2898
E-mail: Jochim1@cox.net

Enclosures : AFN paper and PARC business cards

Speak up now or accept the inevitable outcome

Five days — that is all the time remaining for public comments on the South Mountain Loop 202 Freeway — then it is over. Finished. The end.

So SPEAK UP now or accept the inevitable outcome — Pecos Road will turn into the South Mountain Loop 202 Freeway.

Volumes have been written about the permanent environmental damage that will impact our community if the proposed South Mountain Loop 202 Freeway is constructed on Pecos Road. This column will not restate all of the obvious environmental impacts; but will focus on the daily use of Pecos Road.

Jim Jochim

First, we can start with eliminating any thought of using Pecos Road for jogging or biking, as that will be strictly prohibited once it is part of the Interstate System.

Currently (as you will see in the accompanying map), we have six ways to access Pecos Road from the Ahwatukee Foothills Village — ranging from 40th Street on the east to 27th Avenue on the west. From my perspective, the traffic flows at a decent pace on Pecos Road and the side streets that feed into the main exit locations are not over-loaded.

The other accompanying map shows how the exit locations will look if the proposed South Mountain Loop 202 Freeway is completed. As you will quickly notice, we have decreased from six options to four. We have lost the ability to use 32nd Street and 27th Avenue.

This means the people living in the 700-plus homes in the Calabrea and Foothills Reserve HOAs will need to travel to 17th Avenue via Chandler Boulevard to get onto the South Mountain Loop 202 Freeway. In addition, all of the people who used 32nd Street will need to travel to either 40th Street or 24th Street if they want to gain access to the South Mountain Loop 202 Freeway. This will place a significant burden on Chandler Boulevard and also on interior streets like Liberty Lane and Lakewood Parkway West — especially when Desert Vista High School is in session.

So this is a crucial time to donate money to Protecting Arizona's Resources and Children (PARC), a 501(c)3 organization. We are in the process of filing a substantial opposition document with the Arizona Department of Transportation on the flaws in the Draft Environmental Impact Statement, and your tax deductible contribution will make a big difference. Please send your donation to: PARC, PO Box 50455, Phoenix, AZ 85076.

Thank you, for caring about our environment!

• Jim Jochim, treasurer of Protecting Arizona's Resources and Children (PARC), has been a resident of Ahwatukee Foothills since 1995.

Code	Issue	Response
1	**Traffic**	The main line of the E1 Alternative would not have a bicycle route as part of the design. Continuous east–west riding would be possible in the neighborhoods adjoining the alternative and along Chandler Boulevard. Please see Draft Environmental Impact Statement Figure 3-33, on page 3-57.
2	**Traffic**	The determination to not include an interchange at 32nd Street was made in coordination with the City of Phoenix (see Figure 3-8 on page 3-15 of the Final Environmental Impact Statement). The 32nd Street interchange would have required the displacement of over 100 homes and would have been located in close proximity to an existing high school. The 27th Avenue interchange was evaluated but ultimately eliminated because of increased residential displacements and cost. The extension of Chandler Boulevard west of 19th Avenue is included in this project because reasonable access must be maintained to the neighborhoods at the west end of Pecos Road. In 2006, the City of Phoenix conducted a traffic circulation study to evaluate the impacts of the proposed freeway on the local street system, including the shift of access to Foothills Reserve and Calabrea from Pecos Road to Chandler Boulevard. The City study found no adverse effects on the local street system from the freeway (see Appendix 3-1 in the Final Environmental Impact Statement). The traffic information presented in the Draft Environmental Impact Statement in Figure 3-37 on page 3-61 shows that traffic along Chandler Boulevard between 24th Street and Interstate 10 would decrease with the propose freeway in place.

Subject: SMF DEIS Comment

Attn: ADOT 202 South Mountain Freeway Project Team

This is a comment on the subject SMF DEIS.

1 I am concerned that the SMF, which has been repeatedly described as a truck
2 bypass, will have an exceptionally high percentage of heavy commercial semi
3 truck traffic on it, with attendent increased noise and air pollution issues, compared to other similar nearby freeways. On any trip out I-10 to the California border, I always observe large numbers of semis, usually running in convoys. While I have no way of knowing for sure, I suspect a high percentage of these trucks are pass-thru long distance overland that have neither originated or stopped in the Phoenix Metro area. I say this because of the number of cargo containers seen; however, I'm sure ADOT / MAG has accurate recent data on commercial cargo for Phoenix on a pass-thru, origination and destination basis, even for intra-regional trucking with origination and destination pairs in the Valley. I was surprised that very little of this specific heavy truck data found its way into the DEIS, with type of traffic vehicles apparently given equal weight, or at least not distinguished between. I would like to see more detailed analysis of the composition of the traffic, with attention to the pass-thru, origination, destination and internal regional components of heavy trucks.

4 I sat through many discussions at the SMCAT meetings where traffic modelling the number of single commuters in passenger cars that would pass through the break point between the east and west sections of the SMF daily was questioned. Since the ultimate goal of the SMF seems to have devolved into regional mobility, I was surprised that this figure of number of daily commuter trips by non-commercial vehicles through the break point between east and west Valley did not

Code	Issue	Response
1	**Traffic**	Creating a truck bypass is not a goal of the proposed action. The proposed freeway is part of a transportation system developed to improve mobility in the region by increasing capacity and allowing traffic—including truck traffic—to access a segment of the "loop" system (see pages 1-21, 1-22, 3-1, and 3-3 of the Final Environmental Impact Statement) in the Phoenix metropolitan area. The proposed South Mountain Freeway would be a commuter corridor, helping to move local traffic. As with all other freeways in the region, trucks would use it for the through-transport of freight, for transport to and from distribution centers, and for transport to support local commerce. Nevertheless, the primary users of the proposed freeway would be automobiles. The Maricopa Association of Governments regional travel model projects that truck traffic will represent approximately 10 percent of the total traffic on the proposed action, similar to what is currently experienced on other regional freeways such as Interstate 10, Loop 101, and U.S. Route 60. Trucking destinations in the Phoenix metropolitan area would still prompt trucks to enter congested areas. Choosing to travel on the proposed freeway versus Interstate 10 would not produce substantial travel time benefits. Therefore, it is expected that "true" through truck traffic (not having to stop in the metropolitan area) would continue to use the faster, designated, and posted bypass system of Interstate 8 and State Route 85. The CANAMEX and Phoenix truck bypass (Interstate 8/State Route 85) routes are not mandatory for truck traffic; they are recommended. The Arizona Department of Transportation does not enforce these routes. It is not anticipated that these routes would be enforced as mandatory in the future.
2	**Noise**	Noise levels from Pecos Road traffic were measured in 2003 and 2004 and ranged from 44 A-weighted decibels to 56 A-weighted decibels. Without noise mitigation, noise levels from the proposed freeway are predicted to range from 64 A-weighted decibels to 78 A-weighted decibels at the nearest homes, depending on the distance from the freeway. Noise mitigation was estimated to reduce those noise levels to a range of 59 A-weighted decibels to 63 A-weighted decibels for most of the areas (see Draft Environmental Impact Statement page 4-91). Because of topography, local street traffic, or other engineering constraints in a few small areas, estimated noise levels could not be reduced as much and would be as high as 64 A-weighted decibels to 70 A-weighted decibels in those areas. Noise walls would range in height from 8 feet to 20 feet tall in the Ahwatukee Foothills area. Although not recognized by the Federal Highway Administration as mitigation, rubberized asphalt would be used as the top level of paving; it is discussed on Draft Environmental Impact Statement page 4-91 and in the sidebar on page 4-92. The noise analysis was updated for the Final Environmental Impact Statement using most recent Federal Highway Administration and Arizona Department of Transportation policy and traffic projections provided by the Maricopa Association of Governments in August 2013. This updated analysis begins on page 4-88 of the Final Environmental Impact Statement. No substantial differences between the analyses presented in the Draft and the Final Environmental Impact Statements resulted.

Code	Comment Document

appear in the DEIS. I'm sure the data is available, since as a long-term employee of a large local company, I had to fill out questionaires regularly from the County on my commuting habits, including home address and destination.

Regarding the pass-thru traffic of heavy semi trucks, I have noticed small signs on I-10E near Buckeye and I-10W near Casa Grande indicating that the AZ85 / I-8 route through Gila Bend is an optional bypass around the Phoenix urban core. Having taken this route a few times, I noticed the number of traffic lights and stop signs, low speed limits, speed traps, lack of amenities, narrow lanes with few passing opportunities, scenic small downtown and difficult access to I-8 were a major disincentive for a commercial trucker to consider this alternate. I have been ensured by ADOT that this is all being remedied and AZ 85 will be an interstate caliber road by the time the SMF is completed, thus providing a much more feasible bypass alternative to the SMF. My question is if ADOT intends replace the current signage with larger, preferably overhead, signs, promoting the AZ85 / I-8 bypass in order to minimize pass-thru truck traffic on the SMF? In addition, are there any plans to require or regulate the use of the Gila Bend bypass for pass thru traffic? If so, will there be enforcement by DPS, since commercial overland drivers all are required to maintain logs and carry bills of laden indicating origin and destination?

5

1

Thank you for considering these numerous concerns and requests for more information regarding the SMF.

Regards,
Timothy R. Lank

Subject: SMF DEIS Comment

Attn: ADOT 202 South Mountain Freeway Project Team

This is a comment on the subject SMF DEIS.

I have been an East Valley resident for 33 years, and as such, I voted on both the sales tax fund raising propositions to implement the regional transportation plan. Realizing there was a possibilty the SMF could be built, I took confidence in the fact that every effort would be made to minimize the aethetic impact, air and noise pollution and the permanent disruption of neighborhoods by cut-thru traffic, which I experienced directly on a temporary basis when Chandler Blvd was widened and again when the Chandler Blvd bridge over I-10 was rebuilt (the signs prohibiting cut-thru traffic and speed bumps in the neighborhoods are still there). I looked at roads like the US60 Superstition Fwy and the more recent Loop 101 Price Fwy and saw that freeways through dense residential neighborhoods could be designed with both the users and the people adjacent to them in mind. Design features such as roadbeds far below the adjacent arterials, frequent intersections, parallel service / access roads and arterial overpasses all combine to minimize the neighborhood impact.

1

So I was shocked and enraged when I discovered that the proposed design of the SMF had none of these features on the high density eastern segment. It is the Walmart of Valley freeways going through an area on the outskirts that prides itself on a more natural, desert suburban village environment. It's not bad enough that this freeway will bring in more congestion, higher crime and eliminate the famous "worlds largest cul-de-sac". Its proposed design will negatively impact the local environment in a huge way, with attempts at mitigation that create unsightly huge walls, and raised freeway overpasses that will propagate traffic noise and pollution at a greater distance. Neighborhood cut-thru routes will become access

2

Code	Issue	Response
1	**Design**	The design of the proposed freeway would be in accordance with the Arizona Department of Transportation Roadway Design Guidelines (see page 3-54 of the Draft Environmental Impact Statement). All freeways and highways in Arizona are developed these guidelines. Each freeway is evaluated based on surrounding site conditions and the design is optimized based on a number of criteria and considerations. There is not a single design that fits every condition. The proposed freeway would include similar opportunities for aesthetic treatments and enhancements as other freeways in the Phoenix metropolitan area.
2	**General Impacts**	The study used state-of-the-practice, scientific community methods and similarly accepted methods. Methods, assumptions, and data were developed early in the environmental impact statement process and peer reviewed by the Federal Highway Administration, the Arizona Department of Transportation, and other federal, State, and local agencies. Peer reviewers concluded that the methods, assumptions, and data are appropriate. The Draft Environmental Impact Statement has sufficient technical merit, does comply with "fundamental concepts and purpose of an environmental impact statement," and does appropriately and properly inform the public. While the City of Phoenix Police Department reported in 2005 that it did not have any statistics specific to crime adjacent to freeways, the Police Department did note that, based on its experience, there does not appear to be a correlation between crime rates and freeways. See Final Environmental Impact Statement sidebar on page 4-21. The Arizona Department of Transportation and Federal Highway Administration, in cooperation with the U.S. Army Corps of Engineers, the U.S. Bureau of Indian Affairs, and the Western Area Power Administration, prepared the Draft and Final Environmental Impact Statements and Section 4(f) Evaluation in accordance with the National Environmental Policy Act of 1969 [42 United States Code § 4332(2)(c)], Section 4(f) of the U.S. Department of Transportation Act of 1966 (49 United States Code § 303, as amended), and Section 404 of the Clean Water Act of 1977 (33 United States Code § 1251). All of these agencies are experienced in the review of National Environmental Policy Act documents and have found the logical sequence of decision making to be sound and in line with National Environmental Policy Act requirements. The Draft Environmental Impact Statement and Section 4(f) Evaluation 1) satisfies Federal Highway Administration and Arizona Department of Transportation's environmental analysis requirements; 2) provides a comparison of the social, economic, and environmental impacts that may result from implementation of the proposed action—construction and operation of a major transportation facility; and 3) identifies measures to avoid, reduce, or otherwise mitigate adverse impacts.
3	**Air Quality**	The carbon monoxide analysis was updated in the Final Environmental Impact Statement. Although a qualitative analysis of particulate matter (PM_{10}) was presented in the Draft Environmental Impact Statement, a quantitative project-level particulate matter (PM_{10}) hot-spot analysis is included in the Final Environmental Impact Statement. The results of the air quality updates are summarized in the prologue to the Final Environmental Impact Statement (page xiii) and are more fully described beginning on page 4-68 of the Final Environmental Impact Statement. The carbon monoxide and particulate matter (PM_{10}) analyses demonstrated that the proposed freeway would not contribute to any new localized violations, increase the frequency or severity of any existing violation, or delay timely attainment of the National Ambient Air Quality Standards or any required interim emissions reductions or other milestones.

Code	Comment Document
	roads creating traffic on small streets where there was none. Is there some good reason the design of the SMF is so drastically different from its predecessors? Even the most recent adjacent connecting Loop 202 San Tan Fwy has arterial overpasses.
4	Specifically, the design of the SMF in the eastern segment is deficient in that at is an above grade freeway with raised freeway overpasses over arterials, necessitating very high, unsightly noise walls and propagating pollution over an area loaded with nearby schools. This aspect of the design is largely unknown by the general public, who are expecting a design similar to what they see locally.
5	The SMF in the eastern segment is replacing Pecos Rd, which will be completely removed. However, access to the SMF in the form of interchanges will only have four versus the current six. The elimination of 32St and 27Ave access will wreak havoc with local traffic patterns on arterials, collectors and neighborhood streets. It has been stated that the 32St removal was at the request of the City of Phoenix because of concern over the four schools in the immediate area. This is a patently absurd argument. The removal of access to 32St will only cause worse traffic congestion and more dangerous conditions for local schoolchildren. This decision needs to be revisited with the appropriate Phoenix representative so he can reair his concerns and hear the ramifications of his irresponsible request.
6	The elimination of 27Ave access will divert traffic to the 17Ave interchange. Between 17 and 27 Ave is the largest piece of undeveloped land in Ahwatukee. When this area is developed at usual density, the traffic at the 17Ave interchange will increase tremendously, and the development will provide cut-thru traffic routes for vehicles currently using 27Ave. The elimination of an access point to the SMF at 27 Ave is a design deficiency that should be remedied. In addition, since the land between these two access points is undeveloped, an access road would be a helpful amenity.
7	A major safety issue with an above grade freeway is the proximity of approximately 12 miles of SRP 500KV high-tension power lines parallel and immediately adjacent to the roadway. With the expected high percentage of semi trucks on this route, and especially hazmat tankers carrying gasoline from the tank farm at the western end, an accident that involved one of these power poles could cause a cascade failure of the entire 12 mile stretch between dead end towers and cause an extended and expensive outage of weeks since this line carries most of the power to the East Valley. Furthermore, this is a major line from Palo Verde NGS and a sudden dropout could have severe repercussions for this facility. A below grade freeway would greatly reduce the chances of such an accident.
8	The traffic model data by HDR at the SMCAT meetings revealed some doubt about the need for commuter regional mobility between the Southeast Valley and

Code	Issue	Response
3 (cont.)		The emission modeling developed for the proposed action showed that for the mobile source air toxics study area, there would be little difference in total annual emissions of mobile source air toxics emissions between the Preferred and No-Action Alternatives (less than a 1 percent difference) in 2025 and 2035. With the Preferred Alternative in 2035, modeled mobile source air toxics emissions would decrease by 57 percent to more than 90 percent, depending on the pollutant, despite a 47 percent increase in vehicle miles traveled in the Study Area compared with 2012 conditions (see discussion beginning on page 4-77 of the Final Environmental Impact Statement).
4	**Design**	Depressing the proposed Pecos Road sections would entail installation of pump stations to drain the main line freeway. A depressed freeway would also need a drainage channel to capture the off-site flows to prevent their entering the freeway. Pump stations were not used because of the high cost of construction and maintenance needed for their operation. The recommended freeway configuration would have the E1 Alternative aboveground and the existing culverts extending to pass the drainage under the freeway. Pecos Road currently has numerous existing culvert crossings. Depressing the freeway in this area would eliminate the existing culvert crossings and potentially have adverse flooding impacts on adjacent properties. Extending the existing culverts or upsizing the culverts would maintain or improve drainage flows. This would ensure that there would be no adverse flooding impacts on adjacent properties. (See Draft Environmental Impact Statement pages 3-15 and 3-18.) To reduce impacts by depressing the proposed freeway in the Eastern Section, the Arizona Department of Transportation would: · need to spend an additional $400 million for right-of-way acquisition and construction · displace an additional 300 residences · maintain additional pump stations and detention basins for the life of the freeway · would still have noise-related impacts requiring mitigation (i.e., noise barriers and their associated costs and visual impacts) Because the belowground option would result in substantially greater costs and residential displacements, this option was eliminated from further study. A depressed freeway option was evaluated in the Draft Environmental Impact Statement and is described on pages 3-15 and 4-91. Although depressing the freeway would reduce noise levels, noise walls would still be needed to further reduce noise to meet the Arizona Department of Transportation noise policy. Whether the freeway is built aboveground with tall walls or belowground with shorter walls, the final mitigated noise levels would be nearly the same at nearby residences. The major disadvantage of building a depressed freeway would be the increased construction cost and the possible acquisition of additional right-of-way for pump stations and retention basins. For most alignments of each of the action alternatives, the proposed freeway would be elevated above the natural grade of the surrounding land. This elevated profile would allow noise to carry farther, creating noise impacts at greater distances from the freeway. Depressing the profile of the freeway below grade might reduce traffic noise levels adjacent to depressed sections. However, it would be necessary to also construct at-grade noise barriers to achieve noise reduction goals at receiver locations adjacent to depressed freeway sections (see page 4-91 in the Draft Environmental Impact Statement). This strategy would reduce visual impacts

(Response 4 continues on next page)

Code	Comment Document
9	the Southwest Valley, especially eight lanes. What was not in doubt however, was the need for improved vehicle transportation between the Village of Laveen and the I-10 Papago Fwy. Throughout the process, many residents of Laveen commented that they didn't need the Ahwatukee segment, they just needed a better route to I-10 Papago. Many felt that future development in their area was being held hostage to a road half of which they didn't need or want. With this in mind, a spur freeway, improved arterials and / or an Arizona Parkway might be a better solution for the people of Laveen. The DEIS did not specifically cite commuter only traffic projections through the break point between the east and west segments of the SMF. This is an important piece of data.
10	Lastly, this SMF freeway is projected to cost out at $2 - 3 billion. This money could more effectively be used improving the existing city core transportation infrastructure, such as widening the Broadway Curve and I-10 Papago Fwy, putting a second level on the Black Canyon Fwy, expanding critical arterials like Baseline Road or technology projects like improving traffic light coordination on arterials all around the Valley for increased flow. However, if the current proposed abominable design for the SMF eastern segment is based on decreased sales tax revenues due to the slow economy, I would like to suggest waiting until the funds are available to built it right.
	Thank you for considering these numerous concerns and requests for more information regarding the SMF.
	Regards, Timothy R. Lank Vice President, Protecting Arizona's Resources and Children (PARC)

Code	Issue	Response
4 (cont.)		associated with high noise barriers on elevated freeways, but would entail ground-level noise barriers and their associated interference with views. Thus, with either approach to noise reduction, views of nearby mountains could be disrupted. The specific impacts would depend on the geometrics of the height of any noise barriers constructed, the intervening topography, and the distance of the barriers from the residences in question.
5	**Alternatives**	The determination to not include an interchange at 32nd Street was made in coordination with the City of Phoenix (see Figure 3-8 on page 3-15 of the Draft Environmental Impact Statement). The interchange would have required the displacement of over 100 homes and would have been located near an existing high school. The City recommended that, based on these impacts, the interchange be removed from the study. In 2006, the City of Phoenix conducted a traffic circulation study to evaluate the impacts of the proposed freeway on the local street system, including the shift of access to Foothills Reserve and Calabrea from Pecos Road to Chandler Boulevard. The City study found no adverse effects on the local street system from the freeway (see Appendix 3-1 in the Final Environmental Impact Statement).
6	**Traffic**	The determination to not include an interchange at 32nd Street was made in coordination with the City of Phoenix (see Figure 3-8 on page 3-15 of the Draft Environmental Impact Statement). The interchange was evaluated but ultimately eliminated because of increased residential displacements and cost. There are no provisions for frontage roads connecting 17th Avenue to the residential area to the west. Reasonable access is provided from 17th Avenue and the extension of Chandler Boulevard. The daily traffic volume on 17th Street in 2011 was approximately 4,500 vehicles per day just north of Pecos Road (see <http://phoenix.gov/streets/traffic/volumemap>). With the proposed freeway in place, an additional 4,000 vehicles day would use 17th Avenue to gain access to residences west of 17th Avenue. The total daily traffic would be well below the capacity of a two-lane road (approximately 15,000 vehicles per day).
7	**Design**	The clearance distance between the freeway and power lines would be in excess of any regulatory safety requirements for the power lines. There are power lines throughout the region that cross over sections of freeway. The Arizona Department of Transportation and the utility companies work together to ensure the safety of the traveling public as well as ensure reliability of power sources.

Code	Issue	Response
8	**Purpose and Need**	The Federal Highway Administration and the U.S. Environmental Protection Agency approved the air quality conformity determination that includes the Maricopa Association of Governments regional travel demand model that produced the traffic projections used in the traffic analysis for the project (see Final Environmental Impact Statement page 3-27). The model projects demand for multiple modes of travel, including automobile, bus, and light rail. Key model inputs used to forecast travel demand in the Study Area included socioeconomic data (based on land use plans and population and economic forecasts), the anticipated average number of vehicle trips within the region on a daily basis, the distribution of transportation modes used by travelers in the region, the capacity of the transportation infrastructure to accommodate regional travel, and the future transportation infrastructure. The analyses in the Draft Environmental Impact Statement used socioeconomic and traffic projections at the regional analysis zone and traffic analysis zone levels. At the time of publication of the Draft Environmental Impact Statement, Census 2010-based socioeconomic data at the regional analysis zone and traffic analysis zone levels had not been adopted by the Maricopa Association of Governments and were not available to the project team. Therefore, the data used in the Draft Environmental Impact Statement were the most appropriate information available. The Maricopa Association of Governments approved new population, employment, housing, and traffic projections in June 2013. The new data are presented in the Final Environmental Impact Statement beginning on page 1-11. While new projections based on the 2010 Census showed a lower anticipated population in 2035 than the previous projections, the need for the freeway has not changed. The traffic analysis demonstrated that the proposed project is needed today.
9	**Design**	Information related to origins and destinations of motorists that would use the proposed freeway is presented in Figure 3-18 on page 3-36 of the Final Environmental Impact Statement. The definition of freeway users considers only those motorists who travel through the South Mountains; so, motorists who begin their trips in Ahwatukee Foothills Village and travel east to Interstate 10 (Maricopa Freeway) or motorists who begin in Laveen Village and travel north to Interstate 10 (Papago Freeway) are not counted in the analysis. The analysis of origins and destinations shows that 75 percent of travelers would be involved in trips beginning or ending in the Study Area or areas immediately surrounding it. Nine percent of the trips would begin, end, or begin and end outside of the Maricopa Association of Governments region; seven percent would either begin or end in Pinal County.
10	**Purpose and Need**	The proposed freeway was identified in the 2004 *Regional Transportation Plan* as one of a host of transportation improvements to meet the projected demand for transportation in the Phoenix metropolitan area. Many suggestions such as those made in the comment are being implemented, have been evaluated, or are being considered to address transportation needs in the Phoenix metropolitan area.

Subject: SMF DEIS Comment

Attn: ADOT 202 South Mountain Freeway Project Team

This is a comment on the subject SMF DEIS.

I have been an East Valley resident for 33 years, and as such, I voted for the 20 year Proposition 300 sales tax increase to raise funds for the regional transportation plan in 1985. That was supposed to be the complete regional transportation plan, not the miniscule 20% of total miles that ultimately were completed before expiration. I know ADOT likes to point to a weak economy and reduced funds as the reason for the poor performance on this huge and expensive project. Sadly, I have read in numerous articles that a more accurate reason was misuse of funds, poor supervision and poor project management / control. Add to that private citizens making fortunes by swapping land in the right-of-way in order to drive up their selling price. You may recall that in 1985, one could drive from Jacksonville, FL to Los Angeles, CA non-stop on Interstate 10, except that only in Phoenix, one had to exit at the Durango Curve and drive out Lower Buckeye all the way to Dysart Road before I-10 started again. While this was the butt of many jokes, I came to realize that this is a perfectly normal state of affairs for Arizona transportation. I am regularly reminded of it when I drive past the failed iconic horse racing track on the far west Papago. Failed because of poor access from an incomplete I-10. As a commercial delivery driver in the New York City tri-state area previously, it is hard to comprehend the lack of responsiveness to basic transportation needs.

1

Now we are engaged in a fiasco of the opposite sort. There is extensive discussion of a freeway that is basically not needed and an almost unbelievably exorbitant waste of taxpayer dollars. The general public have been starved for decent roads and freeways for many years. They are weary of sitting in traffic jams at rush

Code	Issue	Response
1	**Purpose and Need**	At the beginning of the environmental impact statement process, the need for a major transportation facility was reexamined to determine whether such a facility is still needed. Validation of those findings occurred throughout the entire environmental impact statement process. Analysis of the purpose and need for the proposed action followed National Environmental Policy Act and Federal Highway Administration implementing guidance on the subject matter and used state-of-the-practice analytical tools, as pointed out in Table 1-3, "Traffic Analysis Tools," on page 1-13 of the Final Environmental Impact Statement. The results of the analysis determined that a transportation problem does exist and that problem will continue in the foreseeable future (see section, *Conclusions*, on page 1-21). As noted on page 3-1 in the section, *Reconfirm the Purpose and Need for the Proposed Action*, a continuous validation process was undertaken throughout the environmental impact statement process to ensure past conclusions in the environmental impact statement process remained valid. The reader is referred to Final Environmental Impact Statement Chapter 3, *Alternatives*, and, specifically, the section, *Alternatives Development and Screening Process Conclusions*, beginning on page 3-26, noting "... a comprehensive set of alternatives including all modes was considered ... assurance that the screening process was an open process ... a logical, sequential, step-by-step process using data and expertise from multiple disciplines ..." to demonstrate all possibilities were considered.

Code	Comment Document

hour. They jump at any chance for any additional roads on the pretext that the new roads might reduce their aggravation and time sitting still in their cars. Well, this South Mountain Freeway is far from the answer to their complaints. But ADOT / MAG have been playing to this need with a false picture of relief based on old data and faulty models. If this involved anything other than a government agency, it would be called a grift. And their basic rationale is that it was put there 35 years ago. It completes a loop. And it's nice and symmetrical looking on a map, just like other large cities.

2

If the SMF was completed even 25 years ago, there would have been little impact and little objection from the neighbors, since there were few people in the area at the time. In fact, our neighbors to the south, the Gila River Indian Community made several overtures expressing an interest in putting this road on their land, only to be spurned by government agencies that obviously had preplanned ideas of what this road needed to look like and where it needed to be. It is telling that of all the highways on the regional plan, the SMF was at the bottom of the list. That and the fact that this DEIS is straining so hard to try and justify it now indicate how ineffective it will be. Think what $2.5 billion dollars would do if directly applied to the Broadway Curve, Papago Freeway, Baseline Road or an Arizona Parkway from Laveen to the Papago, for people who are being held hostage to the SMF under threat of denied development, when all they really want is their half of it. Better traffic controls, like timed coordinated traffic lights on major arterials, or a decent bus system that didn't cater to just downtown workers would a better allocation of transportation resources.

Unresponsiveness to the needs of its citizen customers seems to be systemic at ADOT, the largest government agency in the state. Yet its single minded focus on ramming the misguided SMF through seems to be a dichotomy. It helps to look at some of their recent history for a better understanding of this iconoclast bureacracy.

For practically the entire 1990's, the westbound US 60 left lane merge onto the I-10E was the most hazardous location in the Valley for rear end collisions. In late afternoon, traffic backed up and stopped in the 65mph high-speed lane regularly caused major property damage and injury. An acquantance alerted me to this when her boss, the owner of a large aerospace company, became concerned for his employee's safety and asked her to request information from ADOT on the frequency of collision occurance. After much prodding and expressing fear for his job after looking at the results, an ADOT employee generated the report. The business owner wrote to ADOT asking what was planned to remedy the situation.

Code	Issue	Response
2	**Alternatives**	Tribal sovereignty is based on the inherent authority of Native American tribes to govern themselves. States have very limited authority over activities within tribal land (see Final Environmental Impact Statement page 2-1). The Arizona Department of Transportation and Federal Highway Administration do not have the authority to survey tribal land, make transportation determinations directly affecting tribal land, or condemn tribal land through an eminent domain process. While efforts to study project alternatives on Gila River Indian Community land were attempted (see Final Environmental Impact Statement Chapter 2, *Gila River Indian Community Coordination*), the Gila River Indian Community has long held a position of not allowing the proposed freeway to be located on its land. For example, a coordinated referendum of Gila River Indian Community members to favor or oppose construction of the proposed freeway on Gila River Indian Community land or to support a no-build option occurred in February 2012, and Gila River Indian Community members voted in favor of the no-build option. Moving forward, therefore, the proposed action cannot be located on the Gila River Indian Community (see Final Environmental Impact Statement page 3-25). The Gila River Indian Community's position regarding a "no-build" option was considered in the Draft and Final Environmental Impact Statement. That position is formally known as the No-Action Alternative and was evaluated in depth in assessments of the impacts of the proposed action on each resource. Whether alignments to develop on Gila River Indian Community land are ultimately identified or not, the Federal Highway Administration, Arizona Department of Transportation, and Maricopa Association of Governments will continue to coordinate with the Gila River Indian Community regarding concerns and potential mitigation for those concerns.

Code	Comment Document

This local business leader got a very unsatisfying, if not lame response. I wrote to ADOT as well, suggesting flashing signs on the median wall warning of stopped traffic ahead, which I had seen on merging California interstate highways. I was told this was just not done here. This situation went on for over ten years with millions of dollars in damage and numerous injuries before a separate lane was created that fixed the problem. Ironically, all it took was some paint to stripe the new lane, but this hazardous situation had to wait years until a new carpool flyover was built. This is what passes for responsiveness, competence and accountability.

A similar situation happened when the 101 Pima Freeway was opened. Initially, it was only four lanes with a dirt median and a two wire divider. A deadly crash occurred when a car went through the divider into oncoming traffic. This time, a direct order from the governor accelerated the necessary safety improvements. Another characteristic displayed here and on the SanTan 202 is the building of freeways in parts, a lane at a time, so to speak. The addition of another lane in each direction, then the addition of car pool HOV lanes seems designed to spread the pain out as long as possible. As an engineer and project manager, the efficiency and cost effectiveness of this process is questionable. One could also ask why the plans for the SMF call for it to have all eight lanes completed at once? What changed? Why were the previous roads built piecemeal?

3

There are numerous other misfires I'm sure ADOT would just as soon forget about. The AZ51, originally designated the Piestewa (Squaw Peak) Parkway was actually partially built with signalized intersections at Thomas Road before the public realized what they were (not) getting and the outcry forced the immediate conversion to the present freeway. So much for the efficient propagation of highway information, much like the proposed design of the SMF, with its raised overpasses and unsightly huge sound walls.
How much did the Paradise Parkway planning cost before it was quashed by Gov. Fife Symington? This road was also on the 1985 regional plan, had purpose and need, yet was quickly dropped for political reasons.
SR 153 at Sky Harbor Airport was also on the regional plan. A huge expanse of elevated concrete, it was quietly decommissioned and the signs removed after an aborted attempt to transfer responsibility for completion to the City of Phoenix. Literally, a highway to nowhere.
A question on the acquisition of ROW for the SMF. I understand there were very few takings for the 202 SanTan Fwy in Chandler and Gilbert. Yet hundreds of properties are required for the SMF. Why is there such a large difference?

4

Code	Issue	Response
3	**Design**	The determination to build all eight lanes at once was based on a desire to minimize disruption to the traveling public. The other benefit is that there are existing high-occupancy vehicle lanes at each end of the proposed freeway (along State Route 202L [Santan Freeway] and Interstate 10 [Papago Freeway] that can be connected to provide additional services for commuters and regional bus transit). The region's freeways have been implemented in phases based on available funds and traffic demand.
4	**Acquisitions and Relocations**	The number of acquisitions when dealing with a major transportation project such as the proposed freeway is dependent on a number of factors—roadway location, density of development. The Santan Freeway (State Route 202L) was completed in 2006. At that time, the areas of Chandler and Gilbert were not as developed as the Ahwatukee Foothills Village area is today. Also the cities were more successful in preserving the right-of-way by limiting development within the proposed alignments. Conversely, many residences and businesses were acquired in the construction of the Red Mountain Freeway through the city of Mesa. In making decisions about these freeways, the Arizona Department of Transportation, with concurrence from the Federal Highway Administration, attempted to balance agency responsibilities to address regional mobility needs while being fiscally responsible and sensitive to local communities and environmental conditions. The identification of the W59/E1 Alternative as the Preferred Alternative (which includes the W59 Alternative in the Western Section of the Study Area) seeks to do the same.

Code	Comment Document

Not all ADOT's misdeeds are so earthshatteringly expensive. Many just require some paint and management direction to fix. I find them interesting because they shed light on the competency of this giant bureaucracy. A running joke almost everywhere in the Valley is the fact that all the new freeways are either called 101 or 202. If I say I'm on the 101, I could be in Glendale or Chandler, miles apart. Rather than continue with the more memorable different names for each segment, or even using different numbers, ADOT has given up on the names. Even the venerable Superstition Freeway has few signs left anymore. We may be calling this highway the South Mountain Freeway, but the chances are good it will just be another 202. This makes it very complicated and confusing to give directions or navigate.

For years, there were daily jams and congestion where the 101 crosses over the Superstition Fwy. The overpass bridge was built wide enough, but the roadway constricted down to just two lanes in each direction, causing massive backups. Apparently, the Governor or some Legislator made a phone call, and someone appeared with a can of paint, added two more lanes and the backups disappeared. This begs the question whether ADOT goes back and audits its projects after completion to compare planned results with reality. The same situation currently exists on I-10E around MP165 where the freeway narrows to two lanes a few hundred meters before the off ramp for Queen Creek Rd. This is the main exit for the entire town of Maricopa and evening traffic regularly backs up to Chandler Blvd on I-10 because of it. The pavement is wide enough to add another lane, so another can of paint would fix this problem also. So much for ADOT concern for travel time and miles of congested highways. With the huge number of employees, does this organization even look for easy and cost effective improvements, or do they all take the bus and light rail?

In a similar vein, I was at an ADOT local public meeting and asked why the I-10 couldn't be easily widened by one lane in each direction between Chandler Blvd and Elliott by using the extended merge/ exit lanes. Only a few yards of new additional pavement under each overpass would be required to complete the lane. Once again, the response was that's just not done here, and besides, it would defeat the purpose of the extended merge lanes. I pointed out that similar short on-ramps were in use on the I-17 downtown, but it was wasted breath. It made me wonder about the actual priority given to commuter travel time and receptiveness to public comments. This in a town where two major arterials have had clocked reversible lanes for years and the Valley is loaded with "suicide" center turn lanes. For comparison, in Honolulu, which has similar congestion problems, major urban core highways use the paved shoulders during peak traffic periods for several hours each day. Their priorities are definitely directed at their "customers" rather than

Code	Issue	Response

Code	Comment Document

their department or jobs.

Lastly, I decided to look at the internal workings and politics of this huge ADOT bureaucracy. This was inspired by an ADOT project engineer during one of the widenings of the Superstition Fwy in Tempe. Apparently, neighbors of the freeway had successfully fought ADOT to a negotiated peace where everyone agreed not to widen the freeway to its full ROW capacity due to noise and pollution concerns. The engineer's comment was in effect- these people won't be here forever and it will get widened to the limit soon enough. He was right. So much for concern for public health of the new neighbors.
On the subject of subcontractor and project management, there were two investigative articles by Sarah Fenske of the Phoenix New Times newspaper in 2006 describing a sucessful lawsuit against ADOT by Tempe engineer Paul Braunstein, an ADOT subcontractor. The articles are quite revealing in a not very flattering way, describing cronyism and nepotism in the department in letting contracts, and organizational gyrations designed to offload accountability onto subcontractors. These articles are on the Internet at:
http://www.phoenixnewtimes.com/2006-06-01/news/friends-at-work/
http://www.phoenixnewtimes.com/2006-06-22/news/roadkill/

Although these articles are dated, there is no clear evidence that ADOT has changed. In fact, the $20 million that ADOT paid HDR Engineering for this grossly deficient SMF DEIS, strongly suggest that things remain exactly the same. In light of all these anecdotes, I question the competency and motives of a department so keen on pushing a questionable $100 million per mile road. This is especially true when the funds could be used so much more effectively practically anywhere else.

Thank you for considering these numerous concerns and requests for more information regarding the SMF.

Regards,
Timothy R. Lank
Vice President,
Protecting Arizona Resources and Children (PARC)

SAVE OUR MOUNTAINS FOUNDATION (SOMF):
Official position on the Arizona Department of Transportation's South Mountain Freeway Environmental Impact Study: May 20, 2013

SOMF is against the alignment of the South Mountain Freeway and the 202 road that cuts into South Mountain and trespasses into the South Mountain Park/Preserve (SMPP). SOMF is not against the building of the freeway, we are against the encroachment of the freeway into the Preserve and the destruction of the south west ridges of South Mountain.

1 **SOMF anticipate successful negotiations with the Native American Communities to save the scared South Mountain.**

2 • South Mountain is the heart of the Phoenix Preserve system. At 16,600 acres it is the country's largest park, later designated "Preserve" by Mayor Goddard, giving it higher protection. It is sacred to the Native American Communities, and is of significant life style value to the residents of Phoenix with over 3 million visitors each year.

3 • The growth projections both for population and pollution shown in the DEIS are out of date and no longer valid.

4 • The DEIS shows many alternate routes, but no alternative routes that would save cutting into the south west ridges of South Mountain.

5 • The citizens of Phoenix have consistently voted 80% in favour of the Preserves, but ADOT feel able to ignore their vote, under the provision that a similar design was on the books prior to 1990. It is not in fact the same design, and PMPC believes that the 'taking' of 31.5 acres of Preserve land represents a clear conflict of the wishes of 80% of Phoenix voters.

6 • SMPP is on the City of Phoenix "Historic Property Register", and is eligible for protection under the NRHP (National Register of Historic Places). The DEIS says that the CCC buildings will not be destroyed, negating this requirement. However the Sonoran Desert features that make the Preserve unique will be damaged. Cuts of 220' (the height of a 20 storey building) is massive, and the natural experience will be gravely diminished.

7 • Section 6f of the 'U.S. department of Transportation Act' paragraph 1 says "NPS **must** ensure replacement of lands of equal value, location, and usefulness are provided as conditions of approval for land conversions". It is NOT possible to replace pristine south west ridges of South Mountain, and 31.5 acres of Preserve. This provision can **not** be met.

8 • Ch 5-18 of the DEIS states that "measures to minimize harm to the South Mountain resources determined through direct co-ordination with resource owners, stake holders and users..." SOMF as a stake holder has NOT be contacted by ADOT, and in fact there is no way to "minimize harm" when you are making 220' cuts through 3 ridges of the South Mountain. There is no way that any land can compensate for the loss of 31.5 acres and the massive destruction to adjacent land.

9 • Ch 4-1 of the DEIS lists "measurable benefits" of the Freeway Loop. It is notable that the negative impact has NOT been considered.

SOMF would like to list the "Measurable detriments" of cutting 220' into SMPP with 8 lanes of traffic:

10
1. Destruction of the south west ridges of a **sacred mountain** and important tourist destination for over 3 million visitors annually.
2. A massive increase of traffic, pollution, noise and congestion within the Preserve boundary.

Code	Issue	Response
1	**Alternatives**	Tribal sovereignty is based on the inherent authority of Native American tribes to govern themselves. States have very limited authority over activities within tribal land (see Final Environmental Impact Statement page 2-1). The Arizona Department of Transportation and Federal Highway Administration do not have the authority to survey tribal land, make transportation determinations directly affecting tribal land, or condemn tribal land through an eminent domain process. While efforts to study project alternatives on Gila River Indian Community land were attempted (see Final Environmental Impact Statement Chapter 2, *Gila River Indian Community Coordination*), the Gila River Indian Community has long held a position of not allowing the proposed freeway to be located on its land. For example, a coordinated referendum of Gila River Indian Community members to favor or oppose construction of the proposed freeway on Gila River Indian Community land or to support a no-build option occurred in February 2012, and Gila River Indian Community members voted in favor of the no-build option. Moving forward, therefore, the proposed action cannot be located on the Gila River Indian Community (see Final Environmental Impact Statement page 3-25). The Gila River Indian Community's position regarding a "no-build" option was considered in the Draft and Final Environmental Impact Statement. That position is formally known as the No-Action Alternative and was evaluated in depth in assessments of the impacts of the proposed action on each resource. Whether alignments to develop on Gila River Indian Community land are ultimately identified or not, the Federal Highway Administration, Arizona Department of Transportation, and Maricopa Association of Governments will continue to coordinate with the Gila River Indian Community regarding concerns and potential mitigation for those concerns.
2	**Cultural Resources**	If feasible, avoidance of Section 4(f) resources is always the Federal Highway Administration and Arizona Department of Transportation's first option. As summarized in Figure 5-2 on page 5-4 of the Final Environmental Impact Statement, numerous alignment adjustments were made to avoid use of existing and planned Section 4(f) resources, like the South Mountains Traditional Cultural Property and Park/Preserve. As discussed on page 5-18 of the Final Environmental Impact Statement, many alternatives were examined to avoid the use of the South Mountains Traditional Cultural Property; however, none of these alternatives were deemed to be prudent and feasible by the Federal Highway Administration. The Department of the Interior reviewed the Draft Environmental Impact Statement and commented, "Following our review of the Section 4(f) Evaluation, we concur that there is no feasible or prudent alternative to the Preferred Alternative selected in the document, and that all measures have been taken to minimize harm to these resources. Please note however, that this concurrence is contingent upon successful completion of the Programmatic Agreement among the consulting parties." (See Appendix 1-1 of the Final Environmental Impact Statement.)

(Response 2 continues on next page)

Code	Comment Document
11	3. The inevitable death of wildlife, and destruction of wildlife corridors that make the Preserve unique.
12	4. South Mountain with a Freeway chopped into a corner of it, will NOT encourage companies to relocate to Phoenix, for its great life style and weather. This will be a negative to economic growth.
13	5. The Maricopa and Sun Circle Trails as a part of a larger County wide trail system, along with site specific trails will be negatively impacted by the freeway. "Having a regional trail system can be a stimulus to economic growth", as "Low impact Heritage Tourism", but not with a freeway cut through.
14	• DEIS "The commitment of resources necessary ($2-3billion) to build and operate....based on the concept that residents ....would benefit from the proposed transportation facility" SOMF proposes that spending $2-3 billion to desecrate a major tourist and recreation attraction at the heart of the Preserve system would NOT be of any benefit to the residents of Phoenix.
	Save Our Mountains Foundation is a Phoenix based non profit formed in 1973 by concerned citizens. SOMF is dedicated to facilitating the improvement of the mountain and desert preserves in Phoenix.
	We anticipate successful negotiations with the Native American Communities to save the sacred South Mountain.

Code	Issue	Response
2 (cont.)		City of Phoenix planning efforts since the mid-1980s illustrate an awareness of the potential for the proposed freeway to affect Phoenix South Mountain Park/ Preserve. In 1989, the South Mountain Park Master Plan was adopted by the Phoenix City Council. The master plan shows the freeway alignment as adopted by the State Transportation Board in 1988. In 1990, the South Mountain Preserve Act was ratified by the Arizona Legislature. The Act did not apply to roadways through a designated mountain preserve if the roadway was in the State Highway System prior to August 15, 1990. The proposed freeway was in the State Highway System prior to 1990. Records prior to the Act suggest a primary reason for the exception was to allow the proposed freeway to go through Phoenix South Mountain Park/ Preserve (see Final Environmental Impact Statement page 5-14).
3	**Traffic**	The analyses in the Draft Environmental Impact Statement used socioeconomic and traffic projections at the regional analysis zone and traffic analysis zone levels. At the time of publication of the Draft Environmental Impact Statement, Census 2010-based socioeconomic data at the regional analysis zone and traffic analysis zone levels had not been adopted by the Maricopa Association of Governments and were not available to the project team. Therefore, the data used in the Draft Environmental Impact Statement were the most appropriate information available. The Maricopa Association of Governments approved new population, employment, housing, and traffic projections in June 2013. The new data are presented in the Final Environmental Impact Statement beginning on page 1-11. The purpose and need and analysis of alternatives were updated and reevaluated using these new socioeconomic projections and corresponding projections related to regional traffic. While new projections based on the 2010 Census showed a lower anticipated population and vehicle miles traveled in 2035 than the previous projections, the conclusions reached in the Draft Environmental Impact Statement were validated in the Final Environmental Impact Statement (see Chapter 3, *Alternatives*). The traffic analysis demonstrated that the proposed project is needed today and will continue to be needed into the future. If the proposed action is the Selected Alternative in the record of decision, planning for emergency situations would be initiated.
4	**Alternatives**	Several action alternatives were subject to the alternatives development and screening process; not just the E1 Alternative and alternatives located on the Gila River Indian Community (Figure 3-6 on page 3-10 of the Final Environmental Impact Statement illustrates a representation of such alternatives). Ultimately the other alternatives were eliminated from further study in the screening process and the Gila River Indian Community decided not to give permission to study alternatives on its land (see Final Environmental Impact Statement page 3-25). Therefore, the Arizona Department of Transportation, with concurrence from Federal Highway Administration, identified the E1 Alternative as the eastern section of the Preferred Alternative (which includes the W59 Alternative in the Western Section of the Study Area). In reaching its determination, the Arizona Department of Transportation sought to balance its responsibilities to address regional mobility needs while being fiscally responsible and sensitive to local communities.
5	**Section 4(f) and Section 6(f)**	A discussion of the Phoenix Mountain Preserve Act and the proposed freeway is provided on page 5-14 of the Draft Environmental Impact Statement. The total area of impact to the South Mountain Park/Preserve has been reduced from what was proposed in 1988 (see Figure 5-14 on page 5-23 of the Draft Environmental Impact Statement).

Code	Issue	Response
6	**Section 4(f) and Section 6(f)**	Section 106 of the National Historic Preservation Act requires a government-to-government relationship between the Federal Government and Indian tribes as described beginning on page 4-140 of the Final Environmental Impact Statement. Section 106 requires that federal agencies take into account the effects of their undertakings on historic properties. This process requires consultation with tribal authorities. Consultation has occurred with Gila River Indian Community government officials, the Tribal Historic Preservation Officer, the Cultural Resource Management Program, many different tribal authorities, and the State Historic Preservation Office. The consultation has resulted in concurrence from the Gila River Indian Community Tribal Historic Preservation Office and the State Historic Preservation Office on National Register of Historic Places eligibility recommendations (including traditional cultural properties), project effects, and proposed mitigation and measures to minimize harm. This consultation has been ongoing and will continue until any commitments in a record of decision are completed. Sometimes there is no way for a needed project to proceed without harming Section 4(f) properties (such as the South Mountain Park/Preserve). As described in the Draft Environmental Impact Statement in Chapters 2, 3, and 5, the examination of possible avoidance alternatives was robust and arduous. The Draft Environmental Impact Statement acknowledges that the cuts through the South Mountains would be a substantial impact, but the activities that make the park such a highly valued tourist attraction(recreational activities, interaction with the Sonoran Desert) would remain. If feasible, avoidance of Section 4(f) resources is always the Federal Highway Administration and Arizona Department of Transportation's first option. As summarized in Figure 5-2 on page 5-4 of the Draft Environmental Impact Statement, numerous alignment adjustments were made to avoid use of existing and planned Section 4(f) resources; however, none of these alternatives were deemed to be prudent and feasible by the Federal Highway Administration. The Department of the Interior reviewed the Draft Environmental Impact Statement and commented, "Following our review of the Section 4(f) Evaluation, we concur that there is no feasible or prudent alternative to the Preferred Alternative selected in the document, and that all measures have been taken to minimize harm to these resources. Please note however, that this concurrence is contingent upon successful completion of the Programmatic Agreement among the consulting parties." (See Appendix 1-1 of the Final Environmental Impact Statement.)
7	**Section 4(f) and Section 6(f)**	Section 6(f) of the Land and Water Conservation Fund Act pertains to projects that would impact outdoor recreational property acquired with Land and Water Conservation Fund Act funds. All Section 6(f) protected areas would be avoided and therefore, this requirement would not apply. Other aspects of the South Mountains are afforded protection under Section 4(f) (see page 5-1 of the Final Environmental Impact Statement).
8	**Section 4(f) and Section 6(f)**	It is acknowledged that the Save Our Mountains Foundation was not one of the groups that has historically been solicited for feedback on potential measures to minimize harm. Every reasonable attempt is made to ensure all stakeholders are engaged; Chapter 6 details the comprehensive public and agency outreach undertaken for a project that had more news articles than most other stories in Arizona since 2001 to ensure all stakeholders would be engaged. The Draft Environmental Impact Statement comment period serves as an opportunity for all stakeholders to provide input on potential measures.

Code	Issue	Response
9	**Impacts**	Impacts of the proposed freeway are disclosed throughout the Draft Environmental Impact Statement. The *Environmental Consequences* sections in Chapter 4 describe the impacts of each action alternative studied in detail with respect to each environmental elements. In the *Summary* chapter, Table S-3 beginning on page S-10 of the Draft Environmental Impact Statement provides a tabular list of all of the impacts associated with the proposed freeway.
10	**Section 4(f) and Section 6(f)**	If feasible, avoidance of Section 4(f) resources is always the Federal Highway Administration and Arizona Department of Transportation's first option. As summarized in Figure 5-2 on page 5-4 of the Final Environmental Impact Statement, numerous alignment adjustments were made to avoid use of existing and planned Section 4(f) resources, like the South Mountains Traditional Cultural Property and Park/Preserve. The activities that make the park such a highly valued tourist attraction (recreational activities, interaction with the Sonoran Desert) would remain. As discussed on page 5-18 of the Final Environmental Impact Statement, many alternatives were examined to avoid the use of the South Mountains Traditional Cultural Property; however, none of these alternatives were deemed to be prudent and feasible by the Federal Highway Administration. The Department of the Interior reviewed the Draft Environmental Impact Statement and commented, "Following our review of the Section 4(f) Evaluation, we concur that there is no feasible or prudent alternative to the Preferred Alternative selected in the document, and that all measures have been taken to minimize harm to these resources. Please note however, that this concurrence is contingent upon successful completion of the Programmatic Agreement among the consulting parties." (See Appendix 1-1 of the Final Environmental Impact Statement.) City of Phoenix planning efforts since the mid-1980s illustrate an awareness of the potential for the proposed freeway to affect Phoenix South Mountain Park/Preserve. In 1989, the South Mountain Park Master Plan was adopted by the Phoenix City Council. The master plan shows the freeway alignment as adopted by the State Transportation Board in 1988. In 1990, the South Mountain Preserve Act was ratified by the Arizona Legislature. The Act did not apply to roadways through a designated mountain preserve if the roadway was in the State Highway System prior to August 15, 1990. Code	Issue	Response
11	**Biological Resources**	The section, *General Impacts on Vegetation, Wildlife, and Wildlife Habitat*, beginning on page 4-125 of the Draft Environmental Impact Statement, discloses by what means the proposed action and its alternatives would affect vegetation, wildlife, and wildlife habitat. A Biological Evaluation was submitted to the U.S. Fish and Wildlife Service, Arizona Game and Fish Department, and Gila River Indian Community Department of Environmental Quality that addressed threatened, endangered, and candidate species,. The information used to prepare the analysis in the Draft Environmental Impact Statement (page 4-122) was based on 2011 information retrieved from the Arizona Game and Fish Department (Gopherus agassizii, draft unpublished abstract compiled and edited by the Heritage Data Management System, Phoenix). Current information on threats and connectivity strategies was included in the Biological Evaluation. The U.S. Fish and Wildlife Service concurred with the species determinations in the Biological Evaluation (see Appendix 1-1 of the Final Environmental Impact Statement). Connectivity is planned to allow wildlife movement beneath the freeway in multiuse crossings (see page 4-125 of the Draft Environmental Impact Statement). The Federal Highway Administration and Arizona Department of Transportation have committed to providing mitigation by including multifunctional crossing structures designed for wildlife and for limited human use as well as culverts designed for connectivity for smaller species. Wildlife-friendly design information would be considered during the design of drainage and crossing structures for the freeway (see *Mitigation*, beginning on page 4-138 of the Final Environmental Impact Statement).
12	**Economic Impacts**	Comment noted.
13	**Section 4(f) and Section 6(f)**	The Maricopa County trails that would cross the freeway are noted in Figure 5-5 on page 5-9 of the Final Environmental Impact Statement. As noted in the table, the freeway would cross over each trail and no direct impacts would occur. This condition is not uncommon as there are numerous local and regional trails throughout the Phoenix metropolitan area that cross freeways. The proposed freeway would not incorporate land from the Section 4(f) resource, and would have no proximity impacts so severe that the protected activities, features, or attributes that qualifies the trails for protection under Section 4(f) are substantially impaired.
14	**Purpose and Need**	Providing a new freeway in an area where it would not be fully used would be an unwise expenditure of public funds. Of the projected 51 percent increase in population, 31 percent increase in housing units, and 69 percent increase in jobs between 2010 and 2035, nearly half of these increases are expected in areas that would be immediately served by the proposed freeway (see Final Environmental Impact Statement page 1-21). When the Arizona Department of Transportation determines whether a freeway should be built, the agency must consider numerous factors, including local and regional transportation needs, project costs, and environmental considerations. Decisions regarding freeway projects are based on the transportation needs of the entire Phoenix metropolitan area as part of a comprehensive, multimodal, regional approach. The proposed freeway is a major component in the Regional Freeway and Highway System. Additionally, the proposed freeway is an important component of past and current planning efforts. Maricopa County, Phoenix's villages (Laveen, Estrella, and Ahwatukee Foothills), Tolleson, and Avondale have all made transportation, land use, and economic planning decisions in a context of the proposed freeway operating in the Study Area. Finally, the proposed freeway would function as intended in the *Regional Transportation Plan*.

Code	Comment Document

Outdated data projections used, based on outdated date projections that are now six to eight years old. In all the studies, the DEIS provides no alternative analysis to the demolition of the southwest ridge. Over 3 million visitors come to South Mountain Park Preserve annually.

THE FACILITATOR: Excuse me, Ms. Lakin.

MS. LAKIN: Destroying any part of the mountain to allaying a high-capacity freeway will only have a negative impact on tourism, and the many unique resources. We are not against this freeway, we are against going through South Mountain Preserve. Thank you.

THE FACILITATOR: Thank you, Ms. Lakin.

We'll now proceed with the non-pre-registered folks.

One more comment before we continue. For those of you who see your name on the screen, if you're in the back parts of the room, if you want to make your way up to get people to either microphone, that will help us through the day. Feel free to move up. At this point Suzanne Rothwell.

Thank you.

MS. ROTHWELL: Good morning. Thank you for the opportunity to speak. Is this working? No.

Well, don't worry, I have a loud voice.
I represent Save Our Mountains Foundation. And I have an official statement that I've sent to you via your e-mail source. But I wanted to stand here today and say that we are opposed to any cutting through the South Mountain Park Preserve. We are opposed to any taking of the Phoenix Mountain Preserve System.
And I think perhaps the DEIS, which is a long and wordy document, is most deficient in what it doesn't say. Well, it's most obvious by what it doesn't say. And it does say that this is going to be an economic benefit to Phoenix. But what it doesn't say is that Phoenix has companies relocating here, people coming to live here because of our beautiful weather and our outdoor lifestyle. And if you take away the heart of our preserve system by chopping into the southwest reaches of South Mountain Park, we believe that will be a huge negative.
We've got the Maricopa Trail, Sun Circle Trail, and other local trails in that area. In your document you say that within a quarter of a mile it will be impacted, anything more than outside of a quarter of a mile will not be impacted. As a hiker myself, I can tell you that's not true. And who will

1	**Section 4(f) and Section 6(f)**	City of Phoenix planning efforts since the mid-1980s illustrate an awareness of the potential for the proposed freeway to affect Phoenix South Mountain Park/ Preserve. In 1989, the South Mountain Park Master Plan was adopted by the Phoenix City Council. The master plan shows the freeway alignment as adopted by the State Transportation Board in 1988. In 1990, the South Mountain Preserve Act was ratified by the Arizona Legislature. The Act did not apply to roadways through a designated mountain preserve if the roadway was in the State Highway System prior to August 15, 1990. The proposed freeway was in the State Highway System prior to 1990. Records prior to the Act suggest a primary reason for the exception was to allow the proposed freeway to go through Phoenix South Mountain Park/ Preserve (see Final Environmental Impact Statement page 5-14). The project team examined alternatives to avoid the park, but did not identify any feasible and prudent alternatives to avoid impacts. The portion of the park that would be used for the proposed freeway would be 31.3 acres, or approximately 0.2 percent of the park's approximately 16,600 acres (see Final Environmental Impact Statement pages S-39 and 5-31). The activities that make the park such a highly valued tourist attraction (recreational activities, interaction with the Sonoran Desert) would remain. The Arizona Department of Transportation continues to work with park stakeholders to minimize impacts and address concerns. Measures to minimize harm to the park were developed (see the Final Environmental Impact Statement, starting on page 5-23). Therefore, the proposed freeway is consistent with regional planning efforts.
2	**Section 4(f) and Section 6(f)**	The Maricopa County trails that would cross the freeway are noted in Figure 5-5 on page 5-9 of the Final Environmental Impact Statement. As noted in the table, the freeway would cross over each trail and no direct impacts would occur. This condition is not uncommon as there are numerous local and regional trails throughout the Phoenix metropolitan area that cross freeways. The proposed freeway would not incorporate land from the Section 4(f) resource, and would have no proximity impacts so severe that the protected activities, features, or attributes that qualifies the trails for protection under Section 4(f) are substantially impaired.

want to go hike in a park where there's a huge eight-lane freeway cut through the southwest region.

So Save Our Mountains Foundation would like to encourage you, and whoever in the state needs to make this happen, to negotiate better with the Gila River Indian community and the Indian community at large, and we hope that they will also come to the table to talk, and that we can make a freeway happen where it doesn't chop into the preserve and part of what forms a crown and glory for the City of Phoenix. We don't have oceans, we don't have beaches, but we do have a beautiful preserve system.

Thank you very, very much.

THE FACILITATOR: Thank you, Ms. Rothwell.

Michael Goodman.

MR. GOODMAN: Thank you. I'm Michael Goodman. I'm also with the Phoenix Mountains Preservation Council, and I am a member of the ADOT Citizens Advisory Team. Pretty much I agree with what has already been said, so I'll be pretty brief. I did finish reading the EIS, and with regards to the E-1 section, I was highly disappointed. I know during the so-called 12 years we've been studying this, we had a number of reports, I guess the E-1 was

Code	Comment Document

built unless there is a sidewalk or a trail for pedestrian and bike traffic next to it, so a person should be able to travel any way you can. Now is the time to make that possible.

In closing, I ask that we build the road now. 30 years is long enough and as we all know, costs have gone up substantially and will continue to rise with each day, week, month, year, or, in this case, three decades, we wait.

When first proposed, it was with the future needs in mind. Well, the future has arrived. It is time to act. We cannot wait any longer.

Thank you very much. I appreciate you listening.

THE FACILITATOR: Thank you, Mr. Mockus.

Just one note. For those of you who are, I understand it's very difficult sometimes in working with prepared notes to keep in mind the time here. So if you would, from time to time, if you are working from notes, please take time out to double-check the time. You're doing a great job and we appreciate that. Thank you.

Sandy Bahr.

MS. BAHR: Thank you. My name is Sandy Bahr. I'm the chapter director for the Sierra Club

1 here in Arizona. And we will be submitting detailed
2 written comments, but I wanted to say a few things
3 this morning.
4 First of all, we are strongly opposed to
5 construction of this freeway and support the no-build
6 option. No-build, as we've said repeatedly for many
7 years, I don't know if it's been 30, but pretty close
8 to it, no-build doesn't mean no action. We should be
9 investing in existing infrastructure, which has been
10 in dire need of it, and in more mass transit options.
11 Phoenix doesn't need another freeway.
12 As proposed, as you have heard, as you
13 know, this project would destroy a portion of South
14 Mountain Park, which is a key component of our
15 community. It would exacerbate air pollution,
16 destroy wildlife and wildlife habitat and exacerbate
17 urban sprawl. It was a bad idea 30 years ago; it's a
18 bad idea today. There are many other issues with
19 construction of this freeway. Increased traffic and
20 traffic congestion. We all know freeways give you
21 just a little bit of respite, and before you know it,
22 they're even more congested. And if it does what
23 some people said it is supposed to do and brings more
24 trucks in instead of taking 85, we'll have even more
25 congestion and more pollution in the Phoenix area,

Driver and Nix Court Reporters - (602) 266-6525
www.drivernix.com

Code	Issue	Response
1	**Purpose and Need**	As stated on page 3-40 of the Final Environmental Impact Statement, the No-Action Alternative would not satisfy the purpose and need of the proposed action because it would result in further difficulty in gaining access to adjacent land uses, increased difficulty in gaining access to Interstate and regional freeway systems from the local arterial street network, increased levels of congestion-related impacts, continued degradation in performance of regional freeway-dependent transit services, increased trip times, and higher user costs. Further, the No-Action Alternative would be inconsistent with Maricopa Association of Governments' and local jurisdictions' long-range planning and policies. The No-Action Alternative was included in the Draft and Final Environmental Impact Statements for detailed study to compare impacts of the action alternatives with the consequences of doing nothing (impacts can result from choosing to do nothing).
2	**Section 4(f) and Section 6(f)**	The proposed freeway would pass through the park's southwestern edge. Section 4(f) of the Department of Transportation Act extends protection to significant publicly owned public parks, recreation areas, and wildlife and waterfowl refuges, as well as significant historic sites, whether they are publicly or privately owned. This protection stipulates that those facilities can be used for transportation projects only if there is no prudent and feasible alternative to using the land and the project includes all possible planning to minimize harm to the land [see Final Environmental Impact Statement, Chapter 5, *Section 4(f) Evaluation*].The project team examined alternatives to avoid the Phoenix South Mountain Park/Preserve, but did not identify any feasible and prudent alternatives to avoid impacts on the park. As such, the freeway would go through the park's southwestern limits. The Arizona Department of Transportation continues to work with park stakeholders to minimize impacts and address concerns. Measures to minimize harm to the park were developed (see Final Environmental Impact Statement, starting on page 5-23). The portion of the park that would be used for the proposed freeway would be 31.3 acres, or approximately 0.2 percent of the park's approximately 16,600 acres (see Final Environmental Impact Statement pages S-39 and 5-31). Phoenix South Mountain Park/Preserve would remain the largest municipally owned park in the United States. The activities that make the park a highly valued resource (recreational activities, interaction with the Sonoran Desert) would remain. Nine-tenths of a mile of the proposed freeway would pass through the park's southwestern edge (see Final Environmental Impact Statement page 5-13).
3	**Air Quality**	The Final Environmental Impact Statement addresses the history of air quality in the region (see text beginning on page 4-68 of the Final Environmental Impact Statement). The Clean Air Act § 109(b)(1) requires the U.S. Environmental Protection Agency to promulgate primary National Ambient Air Quality Standards at levels that allow an adequate margin of safety to protect the public health. Air quality in the Phoenix metropolitan area has improved over time; Phoenix was redesignated to attainment/maintenance for carbon monoxide in 2005, and the U.S. Environmental Protection Agency recently determined that Phoenix has attained the particulate matter (PM_{10}) standard. These improvements are largely associated with cleaner fuels and lower-emission vehicles along with local controls on fugitive dust. Future emissions would also be reduced by the use of cleaner burning fuels, technological advances in automotive design (including the greater use of alternative fuel vehicles), reformulated gasoline, gas can standards, stricter enforcement of emission standards during inspections, heavy-duty diesel engine and on-highway diesel sulfur control programs, dust control programs, and others.

(Response 3 continues on next page)

Code	Comment Document

7

which already has unhealthy air for particulates and ozone. And transportation is a key component of both of those pollutants.

The other thing that I wanted to mention is that in not looking at some of these alternatives, you really have failed to evaluate the full range of reasonable alternatives. This freeway was something that ADOT has wanted to do, MAG has wanted to do, and no matter how many facts are presented, no matter how much information is presented, that it's a bad idea, that it no longer serves the purpose that it was intended to serve, you just keep pushing forward with it.

We encourage rejecting this freeway, going back to the drawing board, and looking at investing our hard-earned tax dollars in alternatives that will work for our community and for future generations of Arizonans.

So thank you very much. And we'll be presenting more detailed written comments.

THE FACILITATOR: Thank you, Ms. Bahr. David Gironda. Did I pronounce that correctly?

MR. GIRONDA: Gironda. And I do have a written statement which I can give to the recorder to

Driver and Nix Court Reporters - (602) 266-6525
www.drivernix.com

Code	Issue	Response
3 (cont.)		The air quality assessment for the proposed freeway analyzed impacts from carbon monoxide and particulate matter (PM_{10}) and followed U.S. Environmental Protection Agency guidelines. The carbon monoxide and particulate matter (PM_{10}) analyses demonstrated that the proposed freeway would not contribute to any new localized violations, increase the frequency or severity of any existing violation, or delay timely attainment of the National Ambient Air Quality Standards or any required interim emissions reductions or other milestones. For mobile source air toxics, the analysis showed that for the Study Area, constructing the freeway would have a marginal effect on annual emissions in 2025 and 2035 (less than a 1 percent difference in total annual emissions between the Preferred Alternative and No-Action Alternative). With the Preferred Alternative in 2035, modeled mobile source air toxics emissions would decrease by 57 percent to more than 90 percent, depending on the pollutant, despite a 47 percent increase in vehicle miles traveled in the Study Area compared with 2012 conditions. The air quality analyses were updated for the Final Environmental Impact Statement, including a quantitative particulate matter (PM_{10}) analysis, and are more fully described beginning on page 4-68 of the Final Environmental Impact Statement. Congestion relief resulting from the proposed freeway would provide localized air quality emissions reductions on area freeways and arterial streets and at interchanges, benefiting users of area highways and those living near congested roads.
4	**Biology, Plants, and Wildlife**	The section, *General Impacts on Vegetation, Wildlife, and Wildlife Habitat*, beginning on page 4-125 of the Draft Environmental Impact Statement, discloses by what means the proposed action and its alternatives would affect vegetation, wildlife, and wildlife habitat. A Biological Evaluation was submitted to the U.S. Fish and Wildlife Service, Arizona Game and Fish Department, and Gila River Indian Community Department of Environmental Quality that addressed threatened, endangered, and candidate species,. The information used to prepare the analysis in the Draft Environmental Impact Statement (page 4-122) was based on 2011 information retrieved from the Arizona Game and Fish Department (Gopherus agassizii, draft unpublished abstract compiled and edited by the Heritage Data Management System, Phoenix). Current information on threats and connectivity strategies was included in the Biological Evaluation. The U.S. Fish and Wildlife Service concurred with the species determinations in the Biological Evaluation (see Appendix 1-1 of the Final Environmental Impact Statement). Connectivity is planned to allow wildlife movement beneath the freeway in multiuse crossings (see page 4-137 of the Final Environmental Impact Statement). The Federal Highway Administration and Arizona Department of Transportation have committed to providing mitigation by including multifunctional crossing structures designed for wildlife and for limited human use as well as culverts designed for connectivity for smaller species. Wildlife-friendly design information would be considered during the design of drainage and crossing structures for the freeway (see *Mitigation*, beginning on page 4-138 of the Final Environmental Impact Statement).

Code	Issue	Response
5	**Urban Sprawl**	Unplanned growth is often termed "urban sprawl." Generally, this term is used in the context of rapid and uncontrolled urban growth onto previously undeveloped land—usually on the outskirts of an existing urban area. Projects like the proposed freeway are often identified as contributors to urban sprawl. Freeway projects are often cited as making land at the urban fringe more accessible and, therefore, more attractive for development. However, examination of data comparing population and land use between 1975 and 2000 suggests major transportation projects like the proposed freeway do not induce growth in the region (see Final Environmental Impact Statement pages 4-170 through 4-174). The proposed freeway would be implemented in a historically quickly urbanizing area (most noticeably in the Western Section of the Study Area, although a nationwide recession beginning in 2007 has slowed growth). In the Eastern Section of the Study Area, the proposed freeway would abut public parkland, Native American land, and a near-fully developed area—therefore, any contribution to accelerated or induced growth would be constrained. The proposed freeway would be built in an area planned for urban growth as established in local jurisdictions' land use plans for at least the last 25 years.
6	**Purpose and Need**	As noted in the Draft Environmental Impact Statement, when compared with the No-Action Alternative, the Preferred Alternative would result in less energy consumption (page 4-160), regional improvements to air quality (page 4-79) that would be expected to produce health benefits, and economic benefits of reducing regional traffic congestion (page 4-57), and would be consistent with local and regional long-range planning efforts (page 4-18).
7	**Alternatives**	Federal regulations stipulate that an environmental impact statement shall "rigorously explore and objectively evaluate all reasonable alternatives" (40 Code of Federal Regulations § 1502.14; see Final Environmental Impact Statement page 3-1). All alternatives were screened using a multidisciplinary set of criteria. Nonfreeway alternatives were considered (see Final Environmental Impact Statement pages 3-3 through 3-6). Among other things, the study took into account improving existing freeways, improving or expanding other travel modes, strategies to reduce travel demand, and various roadway configurations. This study examined not only the potential impacts from improvements, but also the consequences of building nothing, the No Action Alternative. As proposed by the Maricopa Association of Governments, the South Mountain Freeway would be part of the Regional Freeway and Highway System. Other transportation improvements such as mass transit and local roads are specified in the *Regional Transportation Plan* and were considered during the evaluation of this proposed new freeway. As noted in the Final Environmental Impact Statement (see page 3-60), the proposed freeway would provide opportunities to enhance operation of future mass transit improvements.

TO: Arizona Department of Transportation and the Federal Highway Administration

RE: Sun Circle Trail Riders – Opposition to South Mountain Freeway Construction

SCTR is an organization put into place by Arizona visionaries, and for the last 40 years SCTR has continued to ride our horses in the South Mountain Park.

SCTR is steadfastly opposed to any alignment of the Loop 202 South Mountain Freeway that allows for trespass onto the Mountain Preserve or for any excavation into the South Mountain what so ever. These mountain preserves ensures a lifestyle that 80% of Arizona voters consistently support. The mountain preserves are unique and are for people and wildlife, not for vehicle trespass. SCTR does not agree with many of the DEIS assumptions finding them objectionable and deficient in the following analysis areas.

1 Unexceptable Pre-Decisional Actions: ADOT has made some pre-decisional actions with the purchase of property before the Draft Environmental Impact Statement (DEIS) was released. Phoenix Mountains Preservation Council (SCTR) questions the legality of this action and the entire DEIS when it appears ADOT has already made considerable financial investment to establish the alignment for the South Mountain Freeway rather than follow the prescribed process.

2 Dismal Wildlife Connectivity: The DEIS does not meet the minimal requirements for coordination and analysis of wildlife resources. The Arizona Game and Fish Department was consulted in 2009 during scoping. The current connection to the Estrella Mountains allows for passage of mule deer, javelina, bobcat, and mountain lion. There is no evidence of further efforts to ascertain wildlife connectivity needs or possible mitigation. The Sonoran desert tortoise provides additional evidence of inadequate cumulative analysis given its status as a U.S. Fish & Wildlife Service's candidate species. The mountain ridge area slated for demolition meets the definition for the tortoise's habitat.

3 Unreasonable Taking of Mountain Preservation Lands: The DEIS states in Figure 5-7 Public Parkland the avoidance of taking over 30 acres of the Preserve is "not prudent and feasible". The taking of this mountainside will destroy important archeological, spiritual, cultural and recreational sites with no realistic or reasonable mitigation possible in the study. The study failed to recognize and address new two trails, Gila and Bursera Trails, created in the southwest end of the Preserve in 2010.

4

5 Outdated Data Projections Used: The DEIS is based on outdated data projections that are now six to eight years old. The analysis does not acknowledge the impact the major

Code	Issue	Response
1	**Alternatives**	The comment suggests the environmental impact statement process was biased by a history of property acquisitions within the Study Area. More specifically, properties falling within the limits of the Preferred Alternative, as identified in the Final Environmental Impact Statement, were targeted for acquisition. As noted in text on page 3-54 of the Final Environmental Impact Statement, the Arizona Department of Transportation began acquiring land for the original alignment in 1988. Between 1988 and 2001, the Arizona Department of Transportation acquired approximately 293 acres. Most of this land (258 acres) is located in the Eastern Section along Pecos Road. In 2006, the Arizona Department of Transportation began protective and hardship land acquisition in the alignment right-of-way footprint for the W59 and E1 Alternatives. Between 2006 and October 2013, the Arizona Department of Transportation purchased 326 acres (303 in the Western Section and 23 in the Eastern Section). The process for hardship and advanced acquisitions is explained in text on page 4-50 of the Final Environmental Impact Statement. The comment infers that by taking such action, the objective equal consideration of the alternatives studied in detail in the Draft and Final Environmental Impact Statements is tainted. Advanced acquisitions in parallel to a National Environmental Policy Act environmental determination process is not unprecedented and is common practice. In this case, property acquisitions by the Arizona Department of Transportation for purposes of implementing the proposed action are done at risk as communicated to the agency by the Federal Highway Administration. If another action alternative were to be ultimately selected, the agency would likely have to place the acquired properties on the market for sale and purchase. The Arizona Department of Transportation attempts to balance the risk against its mission of timely delivery of transportation infrastructure to the driving public. Further, Federal Highway Administration regulations do not allow the ownership of right-of-way to be a factor in the decision regarding the selection of an alternative.
2	**Biology, Plants, and Wildlife**	The section, *General Impacts on Vegetation, Wildlife, and Wildlife Habitat*, beginning on page 4-125 of the Draft Environmental Impact Statement, discloses by what means the proposed action and its alternatives would affect vegetation, wildlife, and wildlife habitat. A Biological Evaluation was submitted to the U.S. Fish and Wildlife Service, Arizona Game and Fish Department, and Gila River Indian Community Department of Environmental Quality that addressed threatened, endangered, and candidate species, including the Sonoran desert tortoise. The information used to prepare the analysis in the Draft Environmental Impact Statement (page 4-122) was based on 2011 information retrieved from the Arizona Game and Fish Department (Gopherus agassizii, draft unpublished abstract compiled and edited by the Heritage Data Management System, Phoenix). Current information on threats and connectivity strategies was included in the Biological Evaluation. The U.S. Fish and Wildlife Service concurred with the species determinations in the Biological Evaluation (see Appendix 1-1 of the Final Environmental Impact Statement). Connectivity is planned to allow wildlife movement beneath the freeway in multiuse crossings (see page 4-137 of the Final Environmental Impact Statement). The Federal Highway Administration and Arizona Department of Transportation have committed to providing mitigation by including multifunctional crossing structures designed for

(Response 2 continues on next page)

Code	Comment Document
6 7 8	economic downturn had and it brings into question the validity of projected growth levels put forth in the DEIS. In all the alternative studies, the DEIS does not provide one alternative analysis to the demolition of the southwest ridges of South Mountain. Furthermore, nowhere in this study is there an assessment of hazardous material truck traffic nor any mention of managing this truck traffic and the consequences of a serious hazard waste incident. Over 3 million visitors come to South Mountain Park/Preserve annually, according to City of Phoenix statistics. Destroying any part of the mountain to align a high-capacity freeway will only have a negative impact on tourism and the many unique resources the park offers. We urge ADOT to stop providing studies that do not accurately or thoroughly address the impact this freeway has on South Mountain. It's time to stop the $20 million and more in wasted tax payer's money to study the environmental impact and design for an alignment that no longer makes sense. Confidentiality and Nondisclosure Notice: This email transmission and any attachments are intended for use by the person(s)/entity(ies) named above and may contain confidential/privileged information. Code	Issue	Response
2 (cont.		wildlife and for limited human use as well as culverts designed for connectivity for smaller species. Wildlife-friendly design information would be considered during the design of drainage and crossing structures for the freeway (see *Mitigation*, beginning on page 4-138 of the Final Environmental Impact Statement).
3	**Section 4(f) and Section 6(f)**	The religious and cultural importance of the South Mountains (as exemplified in the comment's reference to the Gila River Indian Community resolution) is acknowledged in the Draft Environmental Impact Statement in several locations, notably pages 4-132 and 5-26 as well as in the Summary of the Draft Environmental Impact Statement. The description in the Draft Environmental Impact Statement is based on input received from the Gila River Indian Community and its members and other Indian Nations and their members. The Draft Environmental Impact Statement, after consultation and coordination efforts, accommodates and preserves (to the fullest extent possible from the available alternatives) access to the South Mountains for religious practices. A very small portion of the mountain would be impacted by the proposed freeway (less than 0.03 percent of the total area). Although the Draft Environmental Impact Statement describes the impact on the South Mountains as adverse, Native Americans would not be kept from practicing their beliefs, access to the mountain would be maintained, and mitigation measures would be implemented based on input from members of the Gila River Indian Community. The Final Environmental Impact Statement includes discussion on efforts to avoid use of Phoenix South Mountain Park/Preserve, starting on page 5-16. Measures to minimize harm to the park as a result of the proposed freeway start on page 5-23. The portion of the park that would be used for the proposed freeway would be 31.3 acres, or approximately 0.2 percent of the park's approximately 16,600 acres (see Final Environmental Impact Statement pages S-39 and 5-31). The activities that make the park such a highly valued resource (recreational activities, interaction with the Sonoran Desert) would remain.

Code	Issue	Response
4	**Section 4(f) and Section 6(f)**	South Mountain's newest trails are the Bursera and Pyramid Trails (see Final Environmental Impact Statement page 5-8). The E1 Alternative is approximately 1 mile south of the Pyramid Trail and even farther from the Bursera Trail; thus, it would not affect either trail. The trails have walk-in access from Chandler Boulevard and 19th Avenue, with on-street parking. This walk-in access would be north of and adjacent to the planned extension of Chandler Boulevard and, thus, would not be directly affected. The walk-in access point and the part of the Pyramid Trial at the access point are located adjacent to a residential neighborhood and the City of Phoenix's planned Chandler Boulevard Extension. These trails are typically used for high-intensity recreational activities such as running, hiking, and biking, not noise- or viewshed-sensitive activities. All proposed action alternatives would span existing and proposed trails to avoid impacts. However, during construction (if an action alternative were selected), trails that would be spanned or would be near potential freeway construction would be closed for limited times for safety reasons. Closures would necessitate that trail users detour around construction sites to rejoin the trails farther along their length. According to Phoenix South Mountain Park/Preserve rangers, the Gila Trail—although well-defined—is not a designated trail within the park. That said, the Gila Trail would not be affected by the proposed freeway or by the Chandler Boulevard Extension. The Final Environmental Impact Statement Appendix page A665 contains information directly from the Phoenix General Plan and early coordination with the City of Phoenix Parks Department. The trails in the preserve are exceptions to this statement and were always meant as such. The trails within 1/4 mile of the proposed alternatives were treated separately, as in the case of the Maricopa County Regional Trails System. Should an alternative be selected, the Arizona Department of Transportation and Federal Highway Administration would work closely with the City of Phoenix during final design to ensure the connectivity of trails is maintained, whether they are eligible as Section 4(f) resources or not.
5	**Purpose and Need**	The analyses in the Draft Environmental Impact Statement used socioeconomic and traffic projections at the regional analysis zone and traffic analysis zone levels. At the time of publication of the Draft Environmental Impact Statement, Census 2010-based socioeconomic data at the regional analysis zone and traffic analysis zone levels had not been adopted by the Maricopa Association of Governments and were not available to the project team. Therefore, the data used in the Draft Environmental Impact Statement were the most appropriate information available. The Maricopa Association of Governments approved new population, employment, housing, and traffic projections in June 2013. The new data are presented in the Final Environmental Impact Statement beginning on page 1-11. The purpose and need and analysis of alternatives were updated and reevaluated using these new socioeconomic projections and corresponding projections related to regional traffic. While new projections based on the 2010 Census showed a lower anticipated population and vehicle miles traveled in 2035 than the previous projections, the conclusions reached in the Draft Environmental Impact Statement were validated in the Final Environmental Impact Statement (see Chapter 3, *Alternatives*). The traffic analysis demonstrated that the proposed project is needed today and will continue to be needed into the future.

(Responses continue on next page)

Code	Comment Document

Code	Issue	Response
6	**Alternatives**	Several action alternatives were subject to the alternatives development and screening process; not just the E1 Alternative and alternatives located on the Gila River Indian Community (Figure 3-6 on page 3-10 of the Final Environmental Impact Statement illustrates a representation of such alternatives). Ultimately the other alternatives were eliminated from further study in the screening process and the Gila River Indian Community decided not to give permission to study alternatives on its land (see Final Environmental Impact Statement page 3-25). Therefore, the Arizona Department of Transportation, with concurrence from Federal Highway Administration, identified the E1 Alternative as the eastern section of the Preferred Alternative (which includes the W59 Alternative in the Western Section of the Study Area). In reaching its determination, the Arizona Department of Transportation sought to balance its responsibilities to address regional mobility needs while being fiscally responsible and sensitive to local communities.
7	**Hazardous Materials**	If the proposed action the Selected Alternative in the record of decision, planning for emergency situations would be initiated. If the plan is amended, it is made available to the Arizona Department of Transportation.
8	**Section 4(f) and Section 6(f)**	City of Phoenix planning efforts since the mid-1980s illustrate an awareness of the potential for the proposed freeway to affect Phoenix South Mountain Park/ Preserve. In 1989, the South Mountain Park Master Plan was adopted by the Phoenix City Council. The master plan shows the freeway alignment as adopted by the State Transportation Board in 1988. In 1990, the South Mountain Preserve Act was ratified by the Arizona Legislature. The Act did not apply to roadways through a designated mountain preserve if the roadway was in the State Highway System prior to August 15, 1990. The proposed freeway was in the State Highway System prior to 1990. Records prior to the Act suggest a primary reason for the exception was to allow the proposed freeway to go through Phoenix South Mountain Park/ Preserve (see Final Environmental Impact Statement page 5-14). The project team examined alternatives to avoid the park, but did not identify any feasible and prudent alternatives to avoid impacts. The portion of the park that would be used for the proposed freeway would be 31.3 acres, or approximately 0.2 percent of the park's approximately 16,600 acres (see Final Environmental Impact Statement pages S-39 and 5-31). The activities that make the park such a highly valued tourist attraction(recreational activities,interaction with the Sonoran Desert) would remain. The Arizona Department of Transportation continues to work with park stakeholders to minimize impacts and address concerns. Measures to minimize harm to the park were developed (see Final Environmental Impact Statement, starting on page 5-23).

THE FACILITATOR: Thank you.
If you'd like to speak and haven't registered out front, please do so.
THE FACILITATOR: Will Novak.
MR. NOVAK: This one?
THE FACILITATOR: Please.
MR. NOVAK: Hey guys, how are you doing? My name's Will Novak. I'm the president of the Phoenix Historic Neighborhoods Coalition, but I'm also the secretary of a group called the Thunderdome Neighborhood Association for Nonautomotive Mobility. I guess you can probably assume where I'm going to come down on this issue.
And it doesn't really matter what we say, because you guys are in the freeway-building business; you have been for -- since the 1970s. You're going to build this freeway, come hell or high water; it really doesn't matter what the citizens say or what makes good sense.
I just want to say how disappointed I am. You know, most cities, corrective-thinking cities around the country are tearing down freeways, like San Francisco, they got rid of the Embarcadero Freeway, while we're still building more. Phoenix was once a city there was actually a time where we

1 fought against building freeways. The Arizona
2 Republic came out and said we don't want to build any
3 more freeways; we don't want be another Los Angeles;
4 we don't want to be a sprawl and air pollution and
5 just horrible places. But thanks to, you know,
6 short-sighted planning, what we sort have become is
7 just a mini version of Los Angeles. I see in your
8 paperwork that this project is going to cost
9 $1.23 billion. How many miles of light rail do you
10 think you can build for that? How many miles of
11 commuter rail? How many trees do you think you could
12 plant for $1.23 billion? I'll bet for that much you
13 could fill up the Salt River running over to 19th
14 Avenue and extend the Tempe Town Lake and achieve the
15 original Rio Salado project vision that the city has
16 had for 60 years now. It's just a classic,
17 short-sighted Phoenix thinking, you know; we just are
18 always in a hurry to screw up and do the wrong thing
19 in this town, and it's just devastating.
20 The fact that you might cut through South
21 Mountain, the largest city-owned park in the world,
22 is disgusting. And your study is such a joke anyhow.
23 I mean, the idea that you even looked at alternatives
24 is laughable. The only alternative you really looked
25 into is the no-build scenario, which you're never

Code	Issue	Response
1	**Urban Sprawl**	Unplanned growth is often termed "urban sprawl." Generally, this term is used in the context of rapid and uncontrolled urban growth onto previously undeveloped land—usually on the outskirts of an existing urban area. Projects like the proposed freeway are often identified as contributors to urban sprawl. Freeway projects are often cited as making land at the urban fringe more accessible and, therefore, more attractive for development. However, examination of data comparing population and land use between 1975 and 2000 suggests major transportation projects like the proposed freeway do not induce growth in the region (see Final Environmental Impact Statement pages 4-170 through 4-174). The proposed freeway would be implemented in a historically quickly urbanizing area (most noticeably in the Western Section of the Study Area, although the nationwide recession which began in 2007 slowed growth).). In the Eastern Section of the Study Area, the proposed freeway would abut public parkland, Native American land, and a near-fully developed area—therefore, any contribution to accelerated or induced growth would be constrained. The proposed freeway would be built in an area planned for urban growth as established in local jurisdictions' land use plans for at least the last 25 years.
2	**Purpose and Need**	The study has considered a variety of transportation modes: transportation system management/transportation demand management, mass transit (commuter rail, light rail, expanded bus service), arterial street improvements, land use controls, new freeways, and a No-Action Alternative. Mass transit modes such as light rail were eliminated from further study because even better-than-planned performance of transit would not adequately address the projected 2035 travel demand (see Final Environmental Impact Statement page 3-4). Two high-capacity transit corridors are being considered near the western and eastern extents of the Study Area, but such extensions would not adequately address the projected 2035 travel demand. A freeway/light rail combination would integrate a freeway and light rail system into a single transportation corridor (see Final Environmental Impact Statement page 3-6). Such a freeway/light rail system is planned at two locations: along Interstate 10 (Papago Freeway) and along State Route 51 (Piestewa Freeway). These two segments would connect to the light rail system currently in operation. With these two freeway/light rail segments already in planning stages, members of the public identified a similar opportunity along the proposed freeway. Most freeway/light rail combinations, however, radiate from a central travel demand generator such as a business district or airport. No such systems are known to follow a circumferential route, as the proposed freeway would. Furthermore, the additional right-of-way needed for light rail (generally, a 50-foot-wide corridor) would have substantial community impacts such as displaced residences and businesses and parkland impacts. Therefore, the light rail alternative was eliminated from further study. The freeway mode was determined to be an appropriate response to the project's purpose and need. The analyses in the Draft Environmental Impact Statement used socioeconomic and traffic projections at the regional analysis zone and traffic analysis zone levels. At the time of publication of the Draft Environmental Impact Statement, Census 2010-based socioeconomic data at the regional analysis zone and traffic analysis zone levels had not been adopted by the Maricopa Association of Governments and were not available to the project team. Therefore, the data used in the Draft Environmental Impact Statement were the most appropriate information available. The Maricopa Association of Governments approved new population, employment, housing, and traffic projections in June 2013. The new data are presented in the

4

going to do. I mean, is this freeway even necessary when we have MAG's commuter rail plans come online; what about the West Valley light rail going out that way? You know, it doesn't even talk about induced demand. Anyone who studies transportation and planning, all you get when you build a freeway is you get more traffic. We've known this for 40 years now, that new freeways just induce new demand. All you're going to do is build a freeway, which is going to do what, it's going to create more sprawl. There's going to be a Walmart that pops up and a Kmart, and a KFC, and a Church's chicken, and all that stuff, and they're going to create more and more cars, and more and more air pollution, so you haven't done anything.

But unfortunately, the way we have things set up here is ADOT is in the highway building business, so that's a joke; you're going to build a highway, no matter what. But just -- yeah, I just would hope that you would take a more holistic approach in the future, you know, and look into what's actually good for this city and this area. Because I'm under 30 years, I've got to live here for the next 70 years, and I don't want to choke to death. And I'm just -- just tired of it. Luckily, when my generation grows up and is in charge, this

2 (cont.)		Final Environmental Impact Statement beginning on page 1-11. The purpose and need and analysis of alternatives were updated and reevaluated using these new socioeconomic projections and corresponding projections related to regional traffic. While new projections based on the 2010 Census showed a lower anticipated population and vehicle miles traveled in 2035 than the previous projections, the conclusions reached in the Draft Environmental Impact Statement were validated in the Final Environmental Impact Statement (see Chapter 3, *Alternatives*). The traffic analysis demonstrated that the proposed project is needed today and will continue to be needed into the future.
3	**Section 4(f) and Section 6(f)**	As discussed on page 5-16 of the Final Environmental Impact Statement, many alternatives were examined to avoid the use of the South Mountain Park/Preserve; however, none of these alternatives were deemed to be prudent and feasible by the Federal Highway Administration. The Department of the Interior reviewed the Draft Environmental Impact Statement and commented, "Following our review of the Section 4(f) Evaluation, we concur that there is no feasible or prudent alternative to the Preferred Alternative selected in the document, and that all measures have been taken to minimize harm to these resources. Please note, however, that this concurrence is contingent upon successful completion of the Programmatic Agreement among the consulting parties." (See Appendix 1-1 of the Final Environmental Impact Statement.) The Arizona Department of Transportation continues to work with park stakeholders to minimize impacts and address concerns. Measures to minimize harm to the park were developed (see Final Environmental Impact Statement, starting on page 5-23). The portion of the park that would be used for the proposed freeway would be 31.3 acres, or approximately 0.2 percent of the park's approximately 16,600 acres (see Final Environmental Impact Statement pages S-39 and 5-31). Phoenix South Mountain Park/Preserve would remain the largest municipally owned park in the United States. The activities that make the park a highly valued resource (recreational activities, interaction with the Sonoran Desert) would remain. Nine-tenths of a mile of the proposed freeway would pass through the park's southwestern edge (see Final Environmental Impact Statement page 5-13).
4	**Alternatives**	Several action alternatives were subject to the alternatives development and screening process; not just the E1 Alternative and alternatives located on the Gila River Indian Community (Figure 3-6 on page 3-10 of the Final Environmental Impact Statement illustrates a representation of such alternatives). Ultimately the other alternatives were eliminated from further study in the screening process and the Gila River Indian Community decided not to give permission to study alternatives on its land (see Final Environmental Impact Statement page 3-25). Therefore, the Arizona Department of Transportation, with concurrence from Federal Highway Administration, identified the E1 Alternative as the eastern section of the Preferred Alternative (which includes the W59 Alternative in the Western Section of the Study Area). In reaching its determination, the Arizona Department of Transportation sought to balance its responsibilities to address regional mobility needs while being fiscally responsible and sensitive to local communities. The analyses in the Draft Environmental Impact Statement used socioeconomic and traffic projections at the regional analysis zone and traffic analysis zone levels. At the time of publication of the Draft Environmental Impact Statement, Census 2010-based socioeconomic data at the regional analysis zone and traffic analysis zone levels had not been adopted by the Maricopa Association of Governments and were not available to the project team. Therefore, the data used in the Draft Environmental Impact Statement were the most appropriate information available. The Maricopa Association of Governments approved new population, employment,

kind of crap won't be happening anymore.
Thanks.
Thanks for typing.
THE FACILITATOR: Good afternoon. I'd like to introduce the 2:00 to 4:00 p.m. panel, with the Arizona Department of Transportation, Brock Barnhart, with the Federal Highway Administration, Director Moreno, and with the Arizona Department of Transportation, Brent Cain.
Our next speaker is Richard Tracy, Sr.
Mr. Tracy, you now can pick up the microphone.
MR. TRACY: Can I have about five minutes to catch my breath?
THE FACILITATOR: Most certainly.
MR. TRACY: It wasn't always this way, you know. I just lived here 43 years too long.
THE FACILITATOR: Welcome, Mr. Tracy, you have three minutes.
MR. TRACY: All right. Thank you very much. It was quite difficult for me to come here. It's been difficult for me to attend meetings all over the Valley and send letters, and disappointing when nobody pays any attention to it. I hope this is -- okay, as I say, it was difficult to come here.

Code	Issue	Response
4 (cont.)		housing, and traffic projections in June 2013. The new data are presented in the Final Environmental Impact Statement beginning on page 1-11. The purpose and need and analysis of alternatives were updated and reevaluated using these new socioeconomic projections and corresponding projections related to regional traffic. While new projections based on the 2010 Census showed a lower anticipated population and vehicle miles traveled in 2035 than the previous projections, the conclusions reached in the Draft Environmental Impact Statement were validated in the Final Environmental Impact Statement (see Chapter 3, *Alternatives*). The traffic analysis demonstrated that the proposed project is needed today and will continue to be needed into the future
5	**Purpose and Need**	The proposed freeway is part of the *Regional Transportation Plan* for the Maricopa Association of Governments region. The *Regional Transportation Plan*, as described on pages 1-5 and 1-10 of the Final Environmental Impact Statement, addresses freeways, streets, transit, airports, bicycle and pedestrian facilities, freight, demand management, system management, and safety. The proposed freeway is only one part of the overall multimodal transportation system planned to meet the travel demand needs of the Maricopa Association of Governments region.
6	**Air Quality**	The Final Environmental Impact Statement addresses the history of air quality in the region (see text beginning on page 4-68 of the Final Environmental Impact Statement). The Clean Air Act § 109(b)(1) requires the U.S. Environmental Protection Agency to promulgate primary National Ambient Air Quality Standards at levels that allow an adequate margin of safety to protect the public health. Air quality in the Phoenix metropolitan area has improved over time; Phoenix was redesignated to attainment/maintenance for carbon monoxide in 2005, and the U.S. Environmental Protection Agency recently determined that Phoenix has attained the particulate matter (PM_{10}) standard. These improvements are largely associated with cleaner fuels and lower-emission vehicles along with local controls on fugitive dust. Future emissions would also be reduced by the use of cleaner burning fuels, technological advances in automotive design (including the greater use of alternative fuel vehicles), reformulated gasoline, gas can standards, stricter enforcement of emission standards during inspections, heavy-duty diesel engine and on-highway diesel sulfur control programs, dust control programs, and others. The air quality assessment for the proposed freeway analyzed impacts from carbon monoxide and particulate matter (PM_{10}) and followed U.S. Environmental Protection Agency guidelines. The carbon monoxide and particulate matter (PM_{10}) analyses demonstrated that the proposed freeway would not contribute to any new localized violations, increase the frequency or severity of any existing violation, or delay timely attainment of the National Ambient Air Quality Standards or any required interim emissions reductions or other milestones. For mobile source air toxics, the analysis showed that for the Study Area, constructing the freeway would have a marginal effect on annual emissions in 2025 and 2035 (less than a 1 percent difference in total annual emissions between the Preferred Alternative and No-Action Alternative). With the Preferred Alternative in 2035, modeled mobile source air toxics emissions would decrease by 57 percent to more than 90 percent, depending on the pollutant, despite a 47 percent increase in vehicle miles traveled in the Study Area compared with 2012 conditions. The air quality analyses were updated for the Final Environmental Impact Statement, including a quantitative particulate matter (PM_{10}) analysis, and are more fully described beginning on page 4-68 of the Final Environmental Impact Statement. Congestion relief resulting from the proposed freeway would provide localized air quality emissions reductions on area freeways and arterial streets and at interchanges, benefiting users of area highways and those living near congested roads.

Code	Comment Document

The amount of money that we're spending on this freeway, 100 million per, what was it, mile, that's outrageous, not to mention the $20 million to complete this DEIS. People keep talking about cutting down on pollution, but what about the pollution in our community? Do we not matter? The air that we breathe, is our air any less important than the people of Phoenix? When are we going to actually matter? When are those considerations going to happen?

And you're blasting through sacred mountain that is religious and sacred to our people. I can't elaborate on that because my time is out, but I just want to mention that that is significant to our people.

THE FACILITATOR: Thank you, Ms. Riddle.

Our next speaker is David Martin. We welcome David Martin.

Welcome, Mr. Martin.

MR. MARTIN: Thank you.

THE FACILITATOR: You have three minutes.

MR. MARTIN: Thank you. Members of the panel, for the record, my name is David Martin, I sort of have multiple hats here today. I am the president of the Associated General Contractors, I chair an organization called We Build Arizona, and I am an Ahwatukee resident, so I sort of wear three hats.

But one of the things I want to bring to your attention is a poll that we conducted and submitted into the record, with your permission. Members of the South Mountain study team, thank you very much for the opportunity to speak today. I'm here on behalf of all the memberships that I mentioned before to talk to you about a poll that we conducted and letting you know that Valley commuters have waited in traffic jams too long. The freeway will cut traffic congestion across the metro area, it'll reduce air pollution, and save drivers time and money. Registered voters responding to a poll that our organization conducted a little more than two weeks ago happen to agree; 64.3 percent of likely voters in Maricopa County support construction of the freeway. Just 19.6 percent said they were either opposed or likely to oppose the project.

And in a separate survey, we found that 59 percent of likely voters living in Ahwatukee and Laveen support the freeway as well. As a resident of Ahwatukee for 15-plus years and a third-generation Arizonan, I know that people support the project and support the corridor for the project. Jumping onto I-10 downtown in Phoenix every morning is extraordinarily hectic. If the projections of the study come true, I might as well abandon the area of Ahwatukee and convince someone to

take my home. Honestly, I don't want to be around if a freeway is not built. This corridor is extraordinarily important to congestion and to the future of Ahwatukee.

Ladies and gentlemen of the committee, the two polls I want to submit to the record today, the voters have spoken three times on this issue: Once in 1985, one in 2004, and again with the poll that we submitted or will be submitting here today. We must bring this EIS to its conclusion; 12 years of study, this corridor flies in the face of the voters who voted this project in. There is no more important project to area commuters and workers in the southbound freeway project. We must build it now. Thank you very much.

1

THE FACILITATOR: Thank you, Mr. Martin.

I'd like to invite our next speaker, Joseph Morago.

Welcome, Mr. Morago. You have three minutes.

MR. MORAGO: For the record, it's Joseph Morago. Good afternoon, my name is Joseph Morago. I was born and raised in Arizona, I'm a Native American from Akimel AuAuthm tribe, a member of Gila River Alliance for a Clean Environment, as well as PARC. I'm here today to state my opposition for the proposed South Mountain Loop 202 freeway. After reviewing the DEIS, I was shocked to learn how little information is present in

1		Comment noted.

RESPONSES TO FREQUENTLY SUBMITTED PUBLIC COMMENTS

The Arizona Department of Transportation and Federal Highway Administration identified several recurring public comments. Comments that provided either support or opposition for the project were reviewed by the project team and responded simply with a "comment noted." Other substantive comments related to a number of topics were received. The nature of these comments is summarized below, immediately followed by a broad response to the issue. Again, the responses address issues that were commented on by multiple reviewers and address the majority of the comments submitted. Many of the responses to individual comments refer the commenter to a specific response (or responses) below for more details.

Below are examples of what the response to a frequently submitted comment looks like in the comment response document. In some instances, multiple "Issues" are combined into a single response that refers to the frequent responses. For each, the Code provides a numbered identifier that corresponds to the comment document, the Issue identifies the topic of the response, and the Response refers the commenter or reviewer to the page where the frequent responses can be located.

ISSUE: ACQUISITIONS AND RELOCATIONS

Frequent comment: *Commenters inquired about the process that would be undertaken by the Arizona Department of Transportation in the acquisition and relocation of their home or business.*

Response: Land acquisition and relocation assistance services for the project shall be available to all individuals without discrimination in accordance with the Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970, as amended, which provides uniform, fair, and equitable treatment of people whose property is affected or who are displaced as a result of the project, including those with special needs. Advisory assistance services and compensation practices are described in detail in the Arizona Department of Transportation's *Right-of-way Procedures Manual*, located at <azdot.gov/business/RightofWay_Properties/booklets-and-manuals>. For further discussion, see page 4-51 of the Final Environmental Impact Statement and Appendix 4-1. For questions on specific properties, contact the Arizona Department of Transportation Right-of-Way Group at (602) 712-7316.

ISSUE: AIR QUALITY

Frequent comment: *Commenters expressed the belief that the proposed freeway would cause an increase in air pollution and that the proposed freeway would worsen air quality.*

Response: The Final Environmental Impact Statement addresses the history of air quality in the region (see text beginning on page 4-68 of the Final Environmental Impact Statement). The Clean Air Act § 109(b)(1) requires the U.S. Environmental Protection Agency to establish primary National Ambient Air Quality Standards at levels that allow an adequate margin of safety to protect the public health. Air quality in the Phoenix metropolitan area has improved over time; Phoenix was redesignated to attainment/maintenance for carbon monoxide in 2005, and the U.S. Environmental Protection Agency determined on May 30, 2014, that Phoenix is in maintenance for the particulate matter (PM_{10}) standard. These improvements are largely associated with cleaner fuels and lower-emission vehicles along with local controls on fugitive dust. Future emissions would also be reduced by the use of cleaner-burning fuels, technological advances in automotive design (including the greater use of alternative fuel vehicles), reformulated gasoline, gas can standards, stricter enforcement of emission standards during inspections, heavy-duty diesel engine and on-highway diesel sulfur control programs, dust control programs, and others.

As noted on page 4-76 of the Final Environmental Impact Statement, since ozone is a regional pollutant, there is no requirement to analyze potential impacts and no possibility of localized violations of ozone to occur at the project level. The Maricopa Association of Governments is responsible for developing plans to reduce emissions of ozone precursors in the Maricopa area. The Preferred Alternative is included in the Regional Transportation Plan that has been determined by the U.S. Department of Transportation to conform to the State Implementation Plan on February 12, 2014.

The air quality assessment for the proposed freeway analyzed impacts from carbon monoxide and particulate matter (PM_{10}) and followed U.S. Environmental Protection Agency guidelines. The air quality analyses were updated for the Final Environmental Impact Statement, including a quantitative particulate matter (PM_{10}) analysis, and are more fully described beginning on page 4-68 of the Final Environmental Impact Statement. The carbon monoxide and particulate matter (PM_{10}) analyses demonstrated that the proposed freeway would not contribute to any new localized violations, increase the frequency or severity of any existing violation, or delay timely attainment of the National Ambient Air Quality Standards or any required interim emissions reductions or other milestones. For mobile source air toxics, the updated analysis showed that for the Study Area, constructing the freeway would have a marginal effect on annual emissions in 2025 and 2035 (less than a 1 percent difference in total annual emissions between the Preferred Alternative and No-Action Alternative). With the Preferred Alternative in 2035, modeled mobile source air toxics emissions would decrease by 57 percent to more than 90 percent, depending on the pollutant, despite a 47 percent increase in vehicle miles traveled in the Study Area compared with 2012 conditions (see discussion beginning on page 4-77 of the Final Environmental Impact Statement). Congestion relief resulting from the proposed freeway would provide localized air quality emissions reductions on area freeways, arterial streets, and at interchanges, benefiting users of area highways and those living near or using congested roads.

The project-level air quality conformity demonstration for carbon monoxide and particulate matter (PM_{10}) was conducted at the South Mountain Freeway and Interstate 10 (Papago Freeway) interchange. To ensure

that the air quality analyses addressed public comments on the Draft Environmental Impact Statement, two additional interchanges were modeled for discussion in the Final Environmental Impact Statement: the 40th Street and E1 Alternative interchange and the Broadway Road and W59 Alternative interchange. The carbon monoxide and particulate matter (PM_{10}) results for these two interchange locations are shown in Tables 4-32 and 4-33 on pages 4-76 and 4-77, respectively, of the Final Environmental Impact Statement. Modeled carbon monoxide concentrations at all receptor locations in the vicinity of the two interchange locations were well below the 1-hour and 8-hour National Ambient Air Quality Standards of 35 and 9 parts per million, respectively. Likewise, the particulate matter (PM_{10}) design values with the Preferred Alternative did not exceed the 24-hour National Ambient Air Quality Standard of 150 micrograms per cubic meter.

In addition, fugitive dust and mobile source emissions from construction of the proposed freeway would be controlled by requiring the contractor to comply with the dust-control methods in the Arizona Department of Transportation's *Standard Specifications for Road and Bridge Construction* (2008) and Maricopa County Rule 310, Fugitive Dust Ordinance. Disruption to traffic, especially during peak travel periods, would be minimized by a traffic control plan to help reduce impacts of traffic congestion and associated emissions during construction. These methods are discussed on page 4-85 of the Final Environmental Impact Statement.

ISSUE: ALTERNATIVES, W59 ALTERNATIVE VERSUS W101 ALTERNATIVE

Frequent comment: *Commenters expressed that the W101 Alternative would be a better connection point to Interstate 10 in the Western Section and expressed concerns that traffic operations along Interstate 10 would be adversely affected by the connection at 59th Avenue (W59 Alternative).*

Response: In preparing the Final Environmental Impact Statement, the Federal Highway Administration and Arizona Department of Transportation once again compared the W59 Alternative with the W101 Alternative (see Final Environmental Impact Statement beginning on page 3-68). This comparison examined overall transportation needs, consistency with regional and long-range planning goals, environmental and societal impacts, operational differences, estimated costs, and regional support and public input. The W101 Alternative would result in approximately 200 to 600 more displaced residential properties than the W59 Alternative. The W59 Alternative would have a nominal effect on the local tax base in Phoenix. The W101 Alternative would have a severe impact on the City of Tolleson's tax base and would lead to a reduction in City-provided services. Right-of-way for the W101 Alternative would eliminate a substantial portion of the remaining developable land in Tolleson. The W101 Alternative would need the partial or complete reconstruction of the State Route 101L (Agua Fria Freeway) and I-10 (Papago Freeway) interchange and additional widening improvements to State Route 101L (Agua Fria Freeway). The total cost of the W101 Alternative would be $490 million to $640 million greater than the W59 Alternative. Resolutions passed by the City/Town Councils of Avondale, Buckeye, Gila Bend, Goodyear, Litchfield Park, Phoenix, and Tolleson supported an alternative near 55th Avenue (now closely represented by the W59 Alternative) and opposed the W101 Alternative. Following this reanalysis, the Federal Highway Administration and Arizona Department of Transportation identified the W59 Alternative as the Preferred Alternative in the Western Section.

In preparing the Final Environmental Impact Statement, the Federal Highway Administration and Arizona Department of Transportation reanalyzed the Western Section action alternatives' effects on operations along Interstate 10 (see Final Environmental Impact Statement beginning on page 3-62). The analysis determined that the No-Action Alternative would result in the most sections along Interstate 10 operating at level of service E or F, and for the longest duration. The proposed connection to Interstate 10 (Papago Freeway) at 59th Avenue would include substantial improvements (widening) along Interstate 10 to provide adequate operations on Interstate 10 in the area of the junction and to allow traffic moving to and from the South Mountain Freeway to enter and exit the Interstate 10 main line (see page 3-49 of the Final Environmental Impact Statement). The design of the proposed Interstate 10 and South Mountain Freeway system traffic interchange at 59th Avenue has received preliminary acceptance from the Federal Highway Administration, subject to completion of the National Environmental Policy Act process.

ISSUE: ALTERNATIVES, E1 ALTERNATIVE

Frequent comment: *Commenters expressed a belief that other action alternatives, in addition to the E1 Alternative, should have been studied in detail in the Draft Environmental Impact Statement.*

Response: Several action alternatives were subject to the alternatives development and screening process; not just the E1 Alternative and alternatives located on the Community (Figure 3-6 on page 3-10 of the Draft Environmental Impact Statement illustrates a representation of such alternatives). Alternatives that bisected Ahwatukee Foothills Village were eliminated because of their extraordinary community impacts. Alternatives located north of the mountains to avoid the protected resource would not meet the purpose and need of the proposed action and would create impacts of extraordinary magnitude (see Table 3-5 on page 3-12 of the Final Environmental Impact Statement). Alternatives located south of the mountains would pass through Gila River Indian Community land. The Gila River Indian Community has not granted permission to develop alternatives on its land (see Final Environmental Impact Statement page 3-25). Placing an alternative even farther south of the Gila River Indian Community land would not satisfy the purpose and need of the proposed action. Therefore, there is no prudent and feasible alternative to avoid use of the mountains, and the E1 Alternative is the only action alternative available. In June 2013, the Maricopa Association of Governments approved new socioeconomic projections for Maricopa County. The purpose and need and analysis of alternatives were updated and reevaluated using these new socioeconomic projections and corresponding projections related to regional traffic. The conclusions reached in the Draft Environmental Impact Statement were reconfirmed in the Final Environmental Impact Statement (see Chapter 3, *Alternatives*). Therefore, the Arizona Department of Transportation, with concurrence from the Federal Highway Administration, identified the E1 Alternative as the eastern section of the Preferred Alternative (which includes the W59 Alternative in the western section of the Study Area). In reaching its determination, the Arizona Department of Transportation sought to balance its responsibilities to address regional mobility needs while being fiscally responsible and sensitive to local communities.

ISSUE: ALTERNATIVES, NO-ACTION (NO-BUILD) ALTERNATIVE

Frequent comment: *Commenters expressed a desire to select the No-Action (No-Build) Alternative as the Preferred Alternative.*

Response: As stated on page 3-40 of the Final Environmental Impact Statement, the No-Action Alternative would not satisfy the purpose and need of the proposed freeway because it would result in further difficulty in gaining access to adjacent land uses, increased difficulty in gaining access to Interstate and regional freeway systems from the local arterial street network, increased levels of congestion-related impacts,

continued degradation in performance of regional freeway-dependent transit services, increased trip times, and higher user costs. Further, the No-Action Alternative would be inconsistent with Maricopa Association of Governments' and local jurisdictions' long-range planning and policies. The No-Action Alternative was included in the Draft and Final Environmental Impact Statements for detailed study to compare impacts of the action alternatives with the consequences of doing nothing (as impacts can result from choosing to do nothing). The impacts associated with the No-Action Alternative are discussed in each section of Chapter 4, *Affected Environment*, *Environmental Consequences*, and *Mitigation*, in the Final Environmental Impact Statement. These impacts are also summarized in Table S-3 on page S-10 of the *Summary* chapter of the Final Environmental Impact Statement.

ISSUE: ALTERNATIVES, GILA RIVER INDIAN COMMUNITY ALIGNMENT

Frequent comment: *Commenters expressed a desire to locate the proposed freeway on Gila River Indian Community land.*

Response: Tribal sovereignty is based on the inherent authority of Native American tribes to govern themselves. States have very limited authority over activities within tribal land (see Final Environmental Impact Statement page 2-1). The Arizona Department of Transportation and Federal Highway Administration do not have the authority to survey tribal land, make transportation determinations directly affecting tribal land, or condemn tribal land through an eminent domain process.

While efforts to study project alternatives on Gila River Indian Community land were attempted (see Final Environmental Impact Statement Chapter 2, *Gila River Indian Community Coordination*), the Gila River Indian Community has long held a position of not allowing the proposed freeway to be located on its land. For example, a coordinated referendum of Gila River Indian Community members to favor or oppose construction of the proposed freeway on Gila River Indian Community land or to support a no-build option occurred in February 2012, and Gila River Indian Community members voted in favor of the no-build option. Moving forward, therefore, the proposed freeway cannot be located on the Gila River Indian Community (see Final Environmental Impact Statement page 3-25). The Gila River Indian Community's position regarding a "no-build" option was considered in the Draft and Final Environmental Impact Statements. That position is formally known as the No-Action Alternative and was evaluated in depth in assessments of the impacts of the proposed freeway on each resource. Whether alignments to develop on Gila River Indian Community land are ultimately identified or not, the Federal Highway Administration, Arizona Department of Transportation, and Maricopa Association of Governments will continue to coordinate with the Gila River Indian Community regarding concerns and potential mitigation for those concerns.

ISSUE: ALTERNATIVES, NONFREEWAY ALTERNATIVES

Frequent comment: *Commenters expressed a desire for the Arizona Department of Transportation to invest in nonfreeway travel modes.*

Response: The study has considered a variety of transportation modes: transportation system management/transportation demand management, mass transit (commuter rail, light rail, expanded bus service), arterial street improvements, land use controls, new freeways, and a No-Action Alternative. These alternatives alone or in combination would have limited effectiveness in reducing overall traffic congestion in the Study Area and, therefore, would not meet the purpose and need criteria; specifically, they would not adequately address projected capacity and mobility needs of the region. Mass transit modes such as light rail and an expanded bus system were reexamined in the Final Environmental Impact Statement and were eliminated from further study because even better-than-planned performance of transit would not adequately address the projected 2035 travel demand (see Final Environmental Impact Statement page 3-4). Two high-capacity transit corridors are being considered near the western and eastern extents of the Study Area, but such extensions would not adequately address the projected 2035 travel demand. A freeway/light rail combination would integrate a freeway and light rail system into a single transportation corridor (see Final Environmental Impact Statement page 3-6). Such a freeway/light rail system is planned at two locations: along Interstate 10 (Papago Freeway) and along State Route 51 (Piestewa Freeway). These two segments would connect to the light rail system currently in operation. With these two freeway/light rail segments already in planning stages, members of the public identified a similar opportunity along the proposed freeway. Most freeway/light rail combinations, however, radiate from a central travel demand generator such as a business district or airport. No such systems are known to follow a circumferential route, as the proposed freeway would. Furthermore, the additional right-of-way needed for light rail (generally, a 50-foot-wide corridor) would have substantial community impacts such as displaced residences and businesses and parkland impacts. Therefore, the light rail alternative and light rail and freeway combination would not be prudent and were eliminated from further study. The freeway mode was determined to be an appropriate response to the project's purpose and need.

ISSUE: BIOLOGY, PLANTS, AND WILDLIFE

Frequent comment: *Commenters expressed concerns about the impacts the proposed freeway would have on wildlife within and around the Phoenix South Mountain Park/Preserve area.*

Response: Within the context of overall vegetation, wildlife, and wildlife habitat, all action alternatives and options would result in a decrease in the amount of cover, nesting areas, and food resources for wildlife species caused by construction of the project. See the section, *General Impacts on Vegetation, Wildlife, and Wildlife Habitat*, beginning on page 4-136 of the Final Environmental Impact Statement, for additional details on potential effects on vegetation, wildlife, and wildlife habitat.

The Arizona Department of Transportation and Federal Highway Administration completed a Biological Evaluation containing analysis of the project effects on listed and candidate species under the Endangered Species Act. The Biological Evaluation was completed in May 2014 following identification of the Preferred Alternative in the Draft Environmental Impact Statement. The Biological Evaluation was sent to the U.S. Fish and Wildlife Service, the Arizona Game and Fish Department, and the Gila River Indian Community Department of Environmental Quality for technical assistance with minimizing impacts on listed and candidate species prior to completion of the Final Environmental Impact Statement. In a letter dated July 18, 2014, the Gila River Indian Community provided comments on the Biological Evaluation for the proposed freeway and expressed that the Gila River Indian Community holds all animals in the highest regard and recognizes animals as culturally important. The letter included a list of plant and animal species that are culturally important to the Gila River Indian Community. The Biological Evaluation for the proposed freeway was revised to incorporate an evaluation of the provided species (see page 4-127 of the Final Environmental Impact Statement). The Arizona Department of Transportation and Federal Highway Administration have committed to continue coordination with the Arizona Game and Fish Department, the

Gila River Indian Community Department of Environmental Quality, and U.S. Fish and Wildlife Service regarding wildlife concerns as a result of the freeway's potential implementation. The analysis of biological resources may be found beginning on page 4-125 of the Final Environmental Impact Statement. The informal consultation with the U.S. Fish and Wildlife Service resulted in "no effect" findings for all listed and candidate species except for the Tucson shovel-nosed snake, which received a "may affect, but not likely to adversely affect" finding. Mitigation measures to conduct preconstruction surveys for the Tucson shovel-nosed snake and the Sonoran desert tortoise, where appropriate and after consultation with the Arizona Game and Fish Department, were added to the Final Environmental Impact Statement (see page 4-135).

The 51st Avenue travel corridor and planned development in the area adjacent to Phoenix South Mountain Park/Preserve have and will continue to degrade the ability of wildlife to move through those areas (see the sidebar, "*Existing versus planned land use*," on page 4-3 of the Final Environmental Impact Statement). The Arizona Department of Transportation and Federal Highway Administration have committed to providing mitigation including multifunctional crossing structures designed for wildlife and for limited human use, potential fencing to guide wildlife to the crossing structures, and culverts designed for connectivity for smaller species. Wildlife-friendly design information would be considered during the design of drainage and crossing structures for the freeway (see *Mitigation*, beginning on page 4-138 of the Final Environmental Impact Statement).

ISSUE: CULTURAL RESOURCES

Frequent comment: *Commenters expressed that the South Mountains are sacred to Native American communities and should be protected from impacts from the proposed freeway.*

Response: Since the beginning of the environmental impact statement process, the Federal Highway Administration and Arizona Department of Transportation have been carrying out cultural resource studies and engaging in an ongoing, open dialogue with the Gila River Indian Community Tribal Historic Preservation Office to understand the Gila River Indian Community's way of life and to identify and evaluate places of religious, spiritual, and cultural importance to the Gila River Indian Community that may be adversely affected by the proposed freeway. Such places may be referred to as traditional cultural properties. As a result of these discussions and of studies conducted by the Gila River Indian Community's Cultural Resource Management Program, the Gila River Indian Community has identified traditional cultural properties that are eligible for listing in the National Register of Historic Places and that could be affected by construction of the proposed freeway. The religious, spiritual, and cultural importance of the South Mountains is acknowledged in the Draft Environmental Impact Statement in several locations, notably page 5-26. The proposed project would accommodate and preserve (to the fullest extent possible from the available alternatives) access to the South Mountains for religious practices. The traditional cultural properties identified are important to other Native American tribes as well. For more discussion of traditional cultural properties, see the section, *Cultural Resources*, beginning on page 4-140 of the Final Environmental Impact Statement and pages 5-26 through 5-28.

Section 106 of the National Historic Preservation Act requires a government-to-government relationship between the Federal Government and Indian tribes as described beginning on page 4-140 of the Final Environmental Impact Statement. Section 106 requires that federal agencies take into account the effects of their undertakings on historic properties. This process requires consultation with State Historic Preservation Officers and tribal authorities. Consultation has occurred with Gila River Indian Community government officials, the Tribal Historic Preservation Officer, the Cultural Resource Management Program, many different tribal authorities, and the State Historic Preservation Office. The consultation regarding all historic properties in the area of potential effects has resulted in concurrence from the Gila River Indian Community Tribal Historic Preservation Office and the State Historic Preservation Office on National Register of Historic Places eligibility recommendations (including traditional cultural properties), project effects, and proposed mitigation and measures to minimize harm. This consultation has been ongoing and will continue until any commitments made in a record of decision are completed.

ISSUE: HAZARDOUS MATERIALS

Frequent comment: *Commenters expressed concerns about the transport of hazardous materials on the proposed freeway.*

Response: Arizona highways, as are most highways across the United States, are open to all kinds of traffic, so long as the cargo being carried is in accordance with U.S. Department of Transportation regulations for the specific type of cargo. The Arizona Department of Transportation has a few locations in the state with hazardous cargo restrictions, but these restrictions are based on specific or unique emergency response issues or roadway design limitations specific to that location. For example, the Interstate 10 Deck Park Tunnel has certain hazardous cargo transport restrictions because of the limited ability for emergency responders to address a hazardous materials incident in the tunnel. The South Mountain Freeway, if implemented, is expected to operate under the same rules as other similar facilities in the state; transport of hazardous cargo would be expected to be permissible (see text box on Final Environmental Impact Statement page 4-166).

The Arizona Department of Public Safety (which includes the State Highway Patrol) has primary responsibility for enforcing traffic laws. It also has primacy when calling in support for traffic accidents, including hazardous materials accidents (see text box on Final Environmental Impact Statement page 4-166). The Arizona Department of Environmental Quality maintains a list of contractors who provide emergency response services, as well as local municipalities whose fire and police departments operate in cooperation with the Arizona Department of Public Safety on incidents within their jurisdiction. Requirements for shippers are maintained by the Arizona Department of Transportation's Enforcement Compliance Division.

In the event of an incident with a hazardous materials issue on a State or federal highway, the emergency responders contact the Arizona Department of Transportation's Traffic Operations Center to report the incident. The Traffic Operations Center then contacts the Arizona Department of Transportation's Safety and Risk Management group, which responds to the accident scene and assesses needs in concert with the Incident Commander from the responding agency with jurisdiction. If requested, the Arizona Department of Environmental Quality can assist cleanup activities by engaging specialty subcontractors with whom the Arizona Department of Environmental Quality has contracts for such support. The Arizona Department of Transportation Safety and Risk Management group's charge is primarily public health protection, with cleanup support being secondary.

ISSUE: HEALTH EFFECTS

Frequent comment: *Commenters expressed concern that the South Mountain Freeway would be located within half a mile of schools and other sensitive locations, and that exposure to emissions from the South Mountain Freeway could lead to asthma, autism, and other adverse health effects.*

Response: Under the Clean Air Act, the U.S. Environmental Protection Agency is responsible for establishing National Ambient Air Quality Standards to protect public health and the environment from adverse effects of air pollutants. Health effects from air pollutants are based on the concentration of the pollutants and the duration of exposure. Concentrations vary with distance from a roadway based on many factors, including background (or ambient) levels of pollution from all sources; the number, speed, and type of vehicles on the roadway; wind speed and direction; topography; and other factors. For the proposed freeway, modeling for carbon monoxide and particulate matter (PM_{10}) was conducted using worst-case (most congested or highest traffic) modeling locations at discrete receptor locations around each analysis location (primarily residences near the interchanges). The carbon monoxide and particulate matter (PM_{10}) analyses demonstrated that the proposed freeway would not contribute to any new localized violations, increase the frequency or severity of any existing violation, or delay timely attainment of the National Ambient Air Quality Standards or any required interim emissions reductions or other milestones (see discussion beginning on pages 4-75 and 4-76 of the Final Environmental Impact Statement, respectively).

Mobile source air toxics can also have adverse health impacts, but the U.S. Environmental Protection Agency has not established National Ambient Air Quality Standards for these pollutants. As a result, the Federal Highway Administration analyzes these pollutants using emissions analyses. The mobile source air toxics emissions analysis for the Study Area found little difference in total annual emissions of mobile source air toxics emissions between the Preferred and No-Action Alternatives (less than a 1 percent difference) in 2025 and 2035. With the Preferred Alternative in 2035, modeled mobile source air toxics emissions would decrease by 57 percent to more than 90 percent, depending on the pollutant, despite a 47 percent increase in vehicle miles traveled in the Study Area compared with 2012 conditions (see discussion beginning on page 4-77 of the Final Environmental Impact Statement).

Many studies have investigated the prevalence of adverse health effects in the near-road environment. Given concerns about the possibility of air pollution exposure in the near-road environment, the Health Effects Institute has dedicated a number of research efforts toward investigating this issue. In November 2007, the Health Effects Institute published Special Report #16: Mobile-Source Air Toxics: A Critical Review of the Literature on Exposure and Health Effects. This report concluded that the cancer health effects attributable to mobile sources are difficult to discern because the majority of quantitative assessments are derived from occupational cohorts with high concentration exposures and because some cancer potency estimates are derived from animal models. In January 2010, the Health Effects Institute released Special Report #17, investigating the health effects of traffic-related air pollution. The goal of the research was to synthesize available information on the effects of traffic on health. Researchers looked at linkages between: 1) traffic emissions (at the tailpipe) with ambient air pollution in general, 2) concentrations of ambient pollutants with human exposure to pollutants from traffic, 3) exposure to pollutants from traffic with human-health effects and toxicological data, and 4) toxicological data with epidemiological associations. Overall, researchers felt that there was "sufficient" evidence for causality for the exacerbation of asthma (see page 25 of the *Air Quality Technical Report* [2014]). Evidence was "suggestive but not sufficient" for health outcomes such as cardiovascular mortality and others. Study authors also noted that past epidemiological studies may not provide an appropriate assessment of future health associations because vehicle emissions are decreasing over time. Finally, in 2011 three studies were published by the Health Effects Institute evaluating the potential for mobile source air toxics "hot spots." In general, the authors confirmed that while highways are a source of air toxics, they were unable to find that highways were the only source of these pollutants. They determined that near-road exposures were often no different or no higher than background (or ambient) levels of exposure and, hence, no true hot spots were identified. These reports are available from the Health Effects Institute's Web site at <healtheffects.org>. The Federal Highway Administration and U.S. Environmental Protection Agency provide financial support to the Health Effects Institute's research work.

Another source of information is the U.S. Environmental Protection Agency's recently released report on Children's Health and the Environment:

> *The level of knowledge regarding the relationship between environmental exposures and health outcomes varies widely among the topics [presented in this report], and the inclusion of an indicator in the report does not necessarily imply a known relationship between environmental exposure and children's health effects. The report provides data for selected children's health conditions that warrant further research because the causes, including possible contributing environmental factors, are complex and not well understood at this point.*
>
> *In the case of asthma, researchers do not fully understand why children develop the condition. However, substantial evidence shows exposure to certain air pollutants, including particulate matter and ozone, can trigger symptoms in children who already have asthma. Although the report found the percentage of children reported to currently have asthma increased from 8.7 percent in 2001 to 9.4 percent in 2010 and that minority populations are particularly affected by asthma, the severity of children's asthma and respiratory symptoms has declined. The rate of emergency room visits for asthma decreased from 114 visits per 10,000 children in 1996 to 103 visits per 10,000 children in 2008. Between 1996 and 2008, hospitalizations for asthma and for all other respiratory causes decreased from 90 hospitalizations per 10,000 children to 56 hospitalizations per 10,000 children.*
>
> *The report also looks at trends in other health conditions, such as Attention-Deficit/Hyperactivity Disorder (ADHD) and preterm births, for which rates have increased. There is no conclusive information on the role of environmental contaminants in ADHD or preterm births, and additional research is ongoing.*

Finally, the Federal Highway Administration notes that while the incidence of some health effects (such as asthma, autism, and attention deficit/hyperactivity disorder) in the U.S. population appear to have been increasing, motor vehicle emissions have declined. This decline in mobile source air toxics emissions is documented in Figure 4-24 of the Final Environmental Impact Statement and for other pollutants at <epa.gov/ttn/chief/trends/>. This negative correlation between emissions trends and health effects trends illustrates the complexity of the issues.

ISSUE: NOISE

Frequent comment: *Commenters expressed concerns about the increase in noise from the proposed freeway alternatives.*

Response: The noise analysis conducted for and documented in the Draft and Final Environmental Impact Statements complied with the Federal Highway Administration's regulations for conducting noise analyses in 23 Code of Federal Regulations § 772. The noise analysis was updated for the Final Environmental Impact Statement using the most recent Federal Highway Administration and Arizona Department of Transportation policy and traffic projections provided by the Maricopa Association of Governments. Discussion of this updated analysis begins on page 4-88 of the Final Environmental Impact Statement. No substantial differences between the analyses presented in the Draft and the Final Environmental Impact Statements resulted. This report may also be found on the study Web site at <azdot.gov/southmountainfreeway>.

Without noise mitigation, noise levels from the proposed freeway are predicted to range from 61 A-weighted decibels to 78 A-weighted decibels at the nearest homes, depending on the distance from the freeway. Noise mitigation was estimated to reduce those noise levels to a range of 55 A-weighted decibels to 64 A-weighted decibels for most of the areas (see Final Environmental Impact Statement page 4-93). Because of topography, local street traffic, or other engineering constraints in a few areas, estimated noise levels would not be reduced as much and would be as high as 64 A-weighted decibels to 70 A-weighted decibels in those areas. Although not recognized by the Federal Highway Administration as mitigation, rubberized asphalt would be used as the top level of paving; it is discussed beginning on Final Environmental Impact Statement page 4-99.

ISSUE: PURPOSE AND NEED, OLD PLAN OR USE OF OLD DATA

Frequent comment: *Commenters expressed concerns that the project is based on a plan from the mid-1980s and that the study used older data (prior to the economic downturn) to establish the purpose and need for the proposed freeway.*

Response: The Federal Highway Administration and the U.S. Environmental Protection Agency approved the air quality conformity determination that includes the Maricopa Association of Governments regional travel demand model that produced the traffic projections used in the traffic analysis for the project. Key model inputs used to forecast travel demand included (see Table 3-7 on Final Environmental Impact Statement page 3-27):

- socioeconomic data based on the adopted general plans of Maricopa Association of Governments members, which includes projected growth in population, housing, and employment (including proposed commercial centers), along with economic forecasts and the existing and planned transportation infrastructure as identified by Maricopa Association of Governments members
- the anticipated average number of vehicle trips within the region (including those to and from the region's households) on a daily basis (this number is tracked regularly by the Maricopa Association of Governments)
- the distribution of transportation modes used by travelers in the Maricopa Association of Governments region (also tracked regularly by the Maricopa Association of Governments)
- the capacity of the transportation infrastructure to accommodate regional travel
- the future transportation infrastructure established using Regional Transportation Plan-planned projects and improvements and from known arterial street network improvements assumed to be made by the County, Cities, and private developers

The analyses in the Draft Environmental Impact Statement used socioeconomic and traffic projections at the regional analysis zone and traffic analysis zone levels. At the time of publication of the Draft Environmental Impact Statement, Census 2010-based socioeconomic data at the regional analysis zone and traffic analysis zone levels had not been adopted by the Maricopa Association of Governments and were not available to the project team. Therefore, the data used in the Draft Environmental Impact Statement was the most appropriate information available.

In June 2013, the Maricopa Association of Governments approved new socioeconomic projections for Maricopa County. The purpose and need and analysis of alternatives were updated and reevaluated using these new socioeconomic projections and corresponding projections related to regional traffic. The conclusions reached in the Draft Environmental Impact Statement were validated in the Final Environmental Impact Statement (see Chapter 3, *Alternatives*).

ISSUE: PURPOSE AND NEED, TRUCK BYPASS

Frequent comment: *Commenters expressed a belief that the proposed freeway would serve as a truck bypass.*

Response: Creating a truck bypass is not a goal of the proposed freeway. The proposed freeway is part of a transportation system developed to improve mobility in the region by increasing capacity and allowing traffic—including truck traffic—to access a segment of the "loop" system (see pages 1-21, 1-22, 3-1, and 3-3 of the Final Environmental Impact Statement) in the Phoenix metropolitan area. The proposed South Mountain Freeway would be a commuter corridor, helping to move local traffic. As with all other freeways in the region, trucks would use it for the through-transport of freight, for transport to and from distribution centers, and for transport to support local commerce. Nevertheless, the primary vehicles using the proposed freeway would be automobiles. The Maricopa Association of Governments regional travel demand model projects that truck traffic would represent approximately 10 percent of the total traffic on the proposed freeway, similar to what is currently experienced on other regional freeways such as Interstate 10, State Route 101L, and U.S. Route 60. As disclosed in the Final Environmental Impact Statement, it is expected that "true" through-truck traffic (not having to stop in the metropolitan area) would continue to use the faster, designated, and posted bypass system of Interstate 8 and State Route 85 (see page 3-64 of the Final Environmental Impact Statement).

ISSUE: PURPOSE AND NEED, LACK OF SUPPORT

Frequent comment: *Commenters expressed opposition to the proposed freeway based on a lack of need or the belief that it is not supported by local communities or that it would not be used by local travelers or regional commuters.*

Response: Providing a new freeway in an area where it would not be fully used would be an unwise expenditure of public funds. Of the projected 51 percent increase in population, 39 percent increase in housing units, and 69 percent increase in jobs between 2010 and 2035 in the Phoenix metropolitan area, nearly half of these increases are expected in areas that would be immediately served by the proposed freeway

(see Final Environmental Impact Statement page 1-21). When the Arizona Department of Transportation determines whether a freeway should be built, the agency must consider numerous factors, including local and regional transportation needs, project costs, and environmental considerations. Decisions regarding freeway projects are based on the transportation needs of the entire Phoenix metropolitan area as part of a comprehensive, multimodal, regional approach. The proposed freeway is a major component in the Regional Freeway and Highway System. Additionally, the proposed freeway is an important component of past and current planning efforts. Maricopa County, Phoenix's villages (Laveen, Estrella, and Ahwatukee Foothills), Tolleson, and Avondale have all made transportation, land use, and economic planning decisions in a context of the proposed freeway operating in the Study Area. Finally, the proposed freeway would function as intended in the *Regional Transportation Plan*.

ISSUE: SECTION 4(f) AND SECTION 6(f)

Frequent comment: *Commenters expressed concerns about the impacts the proposed freeway would have on the South Mountain Park/Preserve or expressed that the park should be protected.*

Response: City of Phoenix planning efforts since the mid-1980s illustrate an awareness of the potential for the proposed freeway to affect Phoenix South Mountain Park/Preserve. In 1989, the South Mountain Park Master Plan was adopted by the Phoenix City Council. The master plan shows the freeway alignment as adopted by the State Transportation Board in 1988. In 1990, the South Mountain Preserve Act was ratified by the Arizona Legislature. The Act did not apply to roadways through a designated mountain preserve if the roadway was in the State Highway System prior to August 15, 1990. The proposed freeway was in the State Highway System prior to 1990. Records prior to the Act suggest a primary reason for the exception was to allow the proposed freeway to go through Phoenix South Mountain Park/Preserve (see Final Environmental Impact Statement page 5-14).

The proposed freeway would pass through the park's southwestern edge. Section 4(f) of the Department of Transportation Act extends protection to significant publicly owned public parks, recreation areas, and wildlife and waterfowl refuges, as well as significant historic sites, whether they are publicly or privately owned. This protection stipulates that those facilities can be used for transportation projects only if there is no prudent and feasible alternative to using the land and the project includes all possible planning to minimize harm to the land [see Final Environmental Impact Statement, Chapter 5, *Section 4(f) Evaluation*]. The project team examined alternatives to avoid the Phoenix South Mountain Park/Preserve, but did not identify any feasible and prudent alternatives to avoid the use of the park. The portion of the park that would be used for the proposed freeway would be 31.3 acres, or approximately 0.2 percent of the park's approximately 16,600 acres (see Final Environmental Impact Statement pages S-39 and 5-31). Nine-tenths of a mile of the proposed freeway would pass through the park's southwestern edge (see Final Environmental Impact Statement page 5-13). Phoenix South Mountain Park/Preserve would remain the largest municipally owned park in the United States. The activities that make the park a highly valued resource (recreational activities, interaction with the Sonoran Desert) would remain.

Measures to minimize harm to the park were developed (see Final Environmental Impact Statement, starting on page 5-23). These measures, which were committed to by the Federal Highway Administration and the Arizona Department of Transportation, include securing replacement lands for parkland converted to a transportation use. During the design phase, the Arizona Department of Transportation would consult directly with the Phoenix City Manager's office to identify and implement other additional design measures, including aesthetic treatment of the mountain cuts, landscaping, and structures, to further reduce land needed and impacts from the proposed freeway. The City Manager's office represents its constituents, including the Sonoran Preserve Advisory Committee, Phoenix Mountains Preservation Council, Mountain Bike Association of America, Phoenix Parks and Recreation Board, and Arizona Horsemen's Association.

ISSUE: TRUCKS

Frequent comment: *Commenters expressed a belief that the proposed freeway would be the primary route for heavy trucks originating in Mexico and that this would result in air quality impacts not considered in the study.*

Response: Trucks crossing from Mexico to Arizona are restricted to the commercial zones within 25 miles of the border. The Federal Motor Carrier Safety Administration is administering a United States-Mexico cross-border, long-haul trucking pilot program. The program tests and demonstrates the ability of Mexico-based motor carriers to operate safely in the United States beyond the municipalities and commercial zones along the United States-Mexico border (see <fmcsa.dot.gov/intl-programs/trucking/trucking-program.aspx>).

Petróleos Mexicanos (better known as Pemex), the Mexican state-owned petroleum company that serves all of Mexico, provides 15 parts per million in its sulfur diesel fuel in the border region, which is consistent with the U.S. Environmental Protection Agency requirements for American diesel fuel (see <transportpolicy.net/index.php?title=Mexico:_Fuels:_Diesel_and_Gasoline>).

Arizona highways, as are most highways across the United States, are open to all kinds of traffic, so long as the cargo being carried is in accordance with U.S. Department of Transportation regulations for the specific type of cargo. The South Mountain Freeway would operate under the same rules as other similar facilities in the state; truck traffic would be permissible (see text box on Final Environmental Impact Statement page 4-166).

The CANAMEX and Phoenix truck bypass (Interstate 8/State Route 85) routes are not mandatory for truck traffic; they are recommended. The Arizona Department of Transportation does not enforce these routes. It is not anticipated that these routes would be enforced as mandatory in the future.

Because Mexican trucks are currently restricted to the border region, they are not operating in the Study Area and were not included in the air quality analyses, but the analyses included projected truck traffic. The carbon monoxide and particulate matter (PM_{10}) analyses demonstrated that the proposed freeway would not contribute to any new localized violations, increase the frequency or severity of any existing violation, or delay timely attainment of the National Ambient Air Quality Standards or any required interim emissions reductions or other milestones (see discussions beginning on pages 4-75 and 4-76 of the Final Environmental Impact Statement, respectively). Mobile source air toxics can also have adverse health impacts, but the U.S. Environmental Protection Agency has not established National Ambient Air Quality Standards for these pollutants. As a result, the Federal Highway Administration analyzes these pollutants using emissions analyses. The mobile source air toxics emissions analysis for the Study Area found little difference in total annual emissions of mobile source air toxics emissions between the Preferred and No-Action Alternatives (less than a 1 percent difference) in 2025 and 2035. With the Preferred Alternative in 2035, modeled mobile source air toxics emissions would decrease by 57 percent to more than 90 percent, depending on the pollutant, despite a 47 percent increase in vehicle miles traveled in the Study Area compared with 2012 conditions (see discussion beginning on page 4-77 of the Final Environmental Impact Statement).

Re: Intel Support for Proposed Loop 202 South Mountain Freeway

To Whom It May Concern:

1 I am writing on behalf of Intel Corporation to urge the construction of the proposed Loop 202 South Mountain Freeway. Companies rely on governments to help create the framework within which the business community can invest, create jobs and thrive. A viable transportation system is critical to the economic vitality of the greater Phoenix region. Intel began operations in Chandler in 1980. Now, with more than 11,000 employees, Intel Arizona is the company's second largest site in the U.S., and is the largest employer in Chandler as well as one of the largest in the state.

Over the years, Intel has benefitted from the vision, foresight, and commitment to enabling business growth from our government leaders. A critical factor that enables growth is transportation. Each day, tens of thousands of employees, contract workers, construction workers, suppliers and others transit the valley's roadways in activities directly related to Intel's operations. Ensuring the ability of our stakeholders to conduct their activities in a timely and safe manner is crucial to the success of our business.

Intel is committed to Arizona. Since 1996, we have invested more than $20 billion in manufacturing capacity. This places Intel as the single largest business investor in the state. As our Arizona operations work to make the business case for continued investment from Intel, we rely on our government leaders to ensure that the business climate remains conducive to our growth. We support the proposed Loop 202 South Mountain Freeway and respectfully request that this project move forward as expeditiously as possible. If you have any questions, please feel free to contact me at 480-552-6832 or via email, jason.bagley@intel.com.

Sincerely,

D. Jason Bagley

Re: Environmental Impact Statement ("EIS")
Loop 202/South Mountain Freeway

Date: July 8, 2013

The purpose of this letter is to inform you that I am a property owner in the Laveen area of Phoenix. The property I own is located at Northeast corner of Elliott and 59th Ave

1 I am supportive of the Loop 202/South Mountain freeway, with the alignment through Laveen known generally as the 59th Avenue Alignment.

I have many reasons for my support of the Loop 202 Freeway:

- **Access to the Region.** The Laveen area needs improved access to the Metro Phoenix Region. Currently, despite the recent growth in Laveen, there is no Freeway to provide access to the employment, service and entertainment centers in Downtown Phoenix, Sky Harbor Airport, the Loop 101 Corridor (West Valley), and/or the Loop 202 Corridor in the Southeast Valley. The Loop 202/South Mountain Freeway will connect the Laveen area to the Metro Phoenix Region.

- **Congestion/Bottleneck in Downtown Phoenix.** The I-10 Freeway has become a major bottleneck at many locations: in Downtown Phoenix (at the Deck Park Tunnel), on the I-10 West out to the 101 Stack, and certainly at the Broadway Curve and Superstition Freeway Interchange. The Loop 202/South Mountain Freeway will help relieve these major bottlenecks and also support future growth.

- **Long-Range Planning.** The Loop 202/South Mountain Freeway has been on all of the transportation plans from ADOT, MAG and the City of Phoenix dating back to the 1980s (or even earlier). The Loop 202 Freeway has been approved by the voters of Maricopa County on at least two separate occasions. Many long-range planning decisions have been put in place over the years based on the ultimate construction of the Loop 202 Freeway, including zoning and other land-use decisions by the City of Phoenix and property owners to provide commercial, industrial, multifamily and other appropriate land uses directly adjacent to the Loop 202 Freeway. The Loop 202 Freeway supports this approach to long-range planning.

Code	Issue	Response
1		**Comment noted.**

Code	Comment Document

- **Infrastructure/Investment.** The City of Phoenix and the private property owners have continued to work to bring the needed infrastructure to the Laveen area to support and add to the $2 Billion investment in the Loop 202 Freeway. This is a model for public/public/private partnership—again, at all levels of government and with the strong support of private property owners. The Loop 202/South Mountain Freeway will be a major stimulus to significant local government investment and private development investment.

- **Jobs.** The Loop 202/South Mountain Freeway is a fully funded $2 Billion Freeway Infrastructure project that will bring an estimated 30,000 jobs to our region. These are much-needed jobs for our community and our families.

- **Laveen Community/Services.** The Loop 202/South Mountain Freeway will allow the Laveen area to obtain the development and services that are needed to support this growing community, including retail services, healthcare services, additional educational opportunities, and certainly enhanced municipal and other government al services. The Loop 202 Freeway will bring these vital services to Laveen.

- **Air Quality.** The Loop 202/South Mountain Freeway would reduce congestion on I-10, the Broadway Curve and the Deck Park Tunnel, and keep traffic moving. This will actually improve air quality in this region. The EIS has concluded that the No-Build Alternative would not meet the State of Arizona's air quality implementation plan.

Please contact me directly at 602-957-1480 or e-mail at Fretzrealty@gmail.com if you have any questions regarding my property or my support for the Loop 202/South Mountain Freeway.

Thank you,

David Fretz

Draft Environmental Impact Statement
COMMENT FORM

Thank you for participating in the South Mountain Freeway Draft Environmental Impact Statement public comment process.

ADOT encourages all interested parties to submit written comments on any aspect of the Draft EIS. ADOT will consider all comments in preparing the Final EIS, which will include responses to all comments, final conclusions on potential impacts, and ADOT's final recommendation.

When submitting comments, please be as specific as possible and substantiate your concerns and recommendations.

It is helpful to ADOT to receive comments on:

- A particular alternative, environmental impact assessment, and/or draft mitigation.
- Any information you feel is incomplete or incorrect.
- How the proposed action would affect you.

Comments must be received or postmarked by July 24, 2013.

We own property on S. Side of Lower Buckeye, north of Elwood, west of 59TH AVE, E of 59 AVE 127 Acres. This freeway as proposed will block our ACCESS to 59TH Avenue and divides our property in half, We are opposed as this deteriorates our values, ability to develop and Creates access problems for Circulation. Re: Environmental Impact Statement ("EIS")
Loop 202/South Mountain

The purpose of this letter is to inform you that I am a property owner in Southwest Phoenix. The property I own is located at 59th Avenue and Van Buren Street.

1

I am supportive of the Loop 202/South Mountain Freeway, with the alignment through South Ahwatukee and Laveen, known generally as the 59th Avenue Alignment.

I have many reasons for my support of the Loop 202 Freeway:

Access to the Region. The Southwest Phoenix and Laveen areas need improved access to the Metro Phoenix Region. Currently, despite the recent growth in Southwest Phoenix and Laveen, there is no freeway to provide access to the employment, service and entertainment centers in Downtown Phoenix, Sky Harbor Airport, the Loop 101 Corridor (West Valley), and/or the Loop 202 Corridor in the Southeast Valley. The Loop 202/South Mountain Freeway will connect the Laveen area to the Metro Phoenix Region.

Congestion/Bottleneck in Downtown Phoenix. The I-10 Freeway has become a major bottleneck at many locations: in Downtown Phoenix (at the Deck Park Tunnel), on the I-10 west out to the 101 Stack, and certainly at the Broadway Curve and Superstition Freeway Interchange. The Loop 202/South Mountain Freeway will help relieve these major bottlenecks and also support future growth.

Long-Range Planning. The Loop 202/South Mountain Freeway has been on all of the transportation plans from ADOT, MAG and the City of Phoenix dating back to the 1980s (or even earlier). The Loop 202 Freeway has been approved by the voters of Maricopa County on at least two separate occasions. Many long-range planning decisions have been put in place over the years based on the ultimate construction of the Loop 202 Freeway, including zoning and other land-use decisions by the City of Phoenix and property owners to provide commercial, industrial, multifamily and other appropriate land uses directly adjacent to the Loop 202 Freeway. The Loop 202 Freeway supports this approach to long-range planning.

Infrastructure/Investment. The City of Phoenix and the private property owners have continued to work to bring the needed infrastructure to the Laveen area to support and add to the $2 billion investment in the Loop 202 Freeway. This is a model for public/private partnership – again, at all levels of government and with the strong support of private property owners. The Loop 202/South Mountain Freeway will be a major stimulus to significant local government investment and private development investment.

Jobs. The Loop 202/South Mountain Freeway is a fully funded $2 billion freeway infrastructure project that will bring an estimated 30,000 jobs to our region. These are much-needed jobs for our community and our families.

Laveen Community/Services. The Loop 202/South Mountain Freeway will allow the Laveen area to obtain the development and services that are needed to support this growing community, including retail services, healthcare services, additional educational opportunities, and certainly enhanced municipal and other governmental services. The Loop 202 Freeway will bring these vital services to Laveen.

Air Quality. The Loop 202/South Mountain Freeway would reduce congestion on I-10, the Broadway Curve and the Deck Park Tunnel, and keep traffic moving. This will actually improve air quality in this region. The EIS has concluded that the No-Build Alternative would not meet the State of Arizona's air quality implementation plan.

Please contact me directly at 602-279-3999 or email at tom@taitdevelopment.com if you have any questions regarding my property or my support for the Loop 202/South Mountain Freeway.

Sincerely,

Tom Tait

ADOT
Loop 202 South Mountain Freeway Study
1655 West Jackson Street
MD 126F
Phoenix, AZ 85007

Dear Sir/Madam:

1

Veolia ES Technical Solutions, L.L.C. (Veolia), formerly known as Onyx Environmental Services, L.L.C., operates a recycling facility on West Jefferson Street that has been identified as lying within the proposed W59 Alternative. As a facility that would be directly impacted by this alternative, Veolia would like to take this opportunity correct the information within the DEIS regarding our facility and to register our opposition to the W59 alternative. The following information is being provided in support of our opposition.

Chapter 4, Affected Environment, Environmental Consequences, and Mitigation includes a section on Hazardous Materials within the affected environment. On page 4-153, Onyx Environmental Services (now Veolia) is identified as a Resource Conservation and Recovery Act (RCRA) large-quantity generator within the W59 Alternative. Although correct, in that the facility is a large-quantity generator, this classification does not fully describe the facility. In addition to being a large quantity generator, the site is also a RCRA permitted hazardous/universal waste storage and recycling facility and an U.S. Environmental Protection Agency approved commercial storage facility for PCB containing equipment and wastes. Each of these permits and approvals are site specific and cannot simply be transferred to a new site. Additionally, the facility also holds a site specific zoning waiver from the City of Phoenix for these operations. Each of these permits places additional restrictions on the relocation of this business that would not be placed on a large-quantity generator.

The following is a summary of the steps that would be involved in the relocation of the Veolia facility.

Veolia ES Technical Solutions, L.L.C.
1275 Mineral Springs, Drive, Port Washington, WI 53074

1	**Acquisitions and Relocations**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix.

(Comment codes continue on next page)

Code	Comment Document

- Identify a suitable site for the relocation of the operations
  As a facility that is permitted for the storage and recycling of hazardous/universal waste, the location of a facility is a bit more complicated than simply finding a building that is of suitable size and has appropriate access. This selection process can be further complicated if any environmental justice issues are associated with the proposed location.

- Arrange for all necessary local approvals and permits.
  This would typically be completed prior to acquiring the property. It would be counterproductive to purchase a property where there may be problems obtaining local approvals or if there is significant public opposition to the siting of a hazardous/universal waste recycling facility. If the location selected would be within the City of Phoenix, the facility would need to obtain a zoning waiver.

- Prepare the permit applications and approval requests.
  While the application process for a City of Phoenix zoning waiver, ADEQ hazardous/universal waste permit and EPA PCB approval are all similar, each application has unique requirements.

- Submit the applications for review and approval.
  The hazardous waste regulations, AAC R18-01, contain licensing time frames for the various types of hazardous/universal waste facilities. As a facility permitted to store hazardous waste in containers, the time frame specified allows for an 84 day Administrative review timeframe and a 293 day Substantive review timeframe once ADEQ receives the permit application. This accounts for a possible public hearing.
  The time frame within the regulations does not include any time spent by Veolia compiling and submitting any response to comments. Under normal circumstances there will be one or more Notices of Deficiency issued by the department requesting additional information.
  The US EPA regulations governing the approval of commercial storage facilities do not contain any set time limits for processing applications for approval. Our facility is currently in the process of renewing an approval that expired in 1999.

Code	Comment Document

- Relocate business to new site and close current facility
  Once a new facility is permitted the operations currently on West Jefferson Street could be relocated. Following relocation of the operations the existing facility would need to be closed in accordance with the facility's hazardous waste permit and the US EPA PCB regulations.

Assuming a timeframe of 90 days to prepare the initial permit application and 60 days to respond to any comments, Veolia believes that the ADEQ permitting of a site for the relocation of the hazardous/universal waste storage and recycling portion of the business could be accomplished 527 days following the acquisition of a suitable site and obtaining any required local permits.

As stated above, the US EPA regulations regarding the approval of PCB commercial storage facilities do not contain a specific time frame for review and approval. Combined with our experience trying to obtain a renewal of our current approval, which has been under review for the past 14 years, we cannot provide an estimate for the time frame required to obtain a new approval. If EPA does not issue an approval in a timely manner, the relocation of the facility has the potential to have significant adverse impact on Veolia business.

In addition to the time required to permit a new facility, there is also a cost associated with obtaining new permits. In addition to employing internal resources for the preparation of the permit applications, Veolia would need to contract with environmental consultants to address specific environmental aspects of the application. There would also be the cost assessed by the governing bodies for the issuance of the permits and authorizations. The cost for obtaining the initial waiver for the site on Jefferson Street was in excess of $70,000 and the ADEQ fee schedule, contained in AAC R18-8, lists the fees associated with this type of permit as a minimum of $20,000 and a maximum of $250,000. Based on past experience, Veolia anticipates the actual cost to be in excess of $100,000. The selection of the W59 alternative with the subsequent relocation of Veolia's business from its current location on West Jefferson Street, will have a significant detrimental effect on Veolia's business. This effect includes the cost of permitting and relocating to a new facility and potentially the disruption of service to Veolia's customers. This may eventually result in Veolia no longer being able to perform these activities within the southwestern region of the United States.

2

Based on the information presented above, Veolia ES Technical Solutions L.L.C. is opposed to selection of the W59 alternative for the routing of the Loop 202 highway. We are further recommending that Chapter 4 of the DEIS be updated to properly reflect the scope of the regulations that apply to our facility located within the W59 alternative. This includes identifying the facility as a permitted hazardous/universal waste storage and recycling facility and PCB equipment and waste storage facility and that these permits will require the site to undergo closure in accordance with the hazardous waste and PCB rules if relocated.

If you have any questions regarding these comments or the regulatory aspects associated with the relocation of our facility, please contact me at 262-243-8900 or e-mail at phillip.ditter@veoliaes.com.

Sincerely,

VEOLIA ES TECHNICAL SOLUTIONS, L.L.C.

Re: Environmental Impact Statement ("EIS")
Loop 202/South Mountain Freeway

Date: June 14, 2010

1

The purpose of this letter is to inform you that I am a property owner in the Laveen area of Phoenix. The property I own is located at 59th Avenue & Dobbins Road, 63rd Avenue & Dobbins Road, 67th Avenue & Dobbins Road approximately 324 Acres. I am supportive of the Loop 202/South Mountain freeway, with the alignment through Laveen known generally as the 59th Avenue Alignment.

I have many reasons for my support of the Loop 202 Freeway:

- **Access to the Region.** The Laveen area needs improved access to the Metro Phoenix Region. Currently, despite the recent growth in Laveen, there is no Freeway to provide access to the employment, service and entertainment centers in Downtown Phoenix, Sky Harbor Airport, the Loop 101 Corridor (West Valley), and/or the Loop 202 Corridor in the Southeast Valley. The Loop 202/South Mountain Freeway will connect the Laveen area to the Metro Phoenix Region.

- **Congestion/Bottleneck in Downtown Phoenix.** The I-10 Freeway has become a major bottleneck at many locations: in Downtown Phoenix (at the Deck Park Tunnel), on the I-10 West out to the 101 Stack, and certainly at the Broadway Curve and Superstition Freeway Interchange. The Loop 202/South Mountain Freeway will help relieve these major bottlenecks and also support future growth.

- **Long-Range Planning.** The Loop 202/South Mountain Freeway has been on all of the transportation plans from ADOT, MAG and the City of Phoenix dating back to the 1980s (or even earlier). The Loop 202 Freeway has been approved by the voters of Maricopa County on at least two separate occasions. Many long-range planning decisions have been put in place over the years based on the ultimate construction of the Loop 202 Freeway, including zoning and other land-use decisions by the City of Phoenix and property owners to provide commercial, industrial, multifamily and other appropriate land uses directly adjacent to the Loop 202 Freeway. The Loop 202 Freeway supports this approach to long-range planning.

Code	Issue	Response
1		**Comment noted.**

Code	Comment Document

- **Infrastructure/Investment.** The City of Phoenix and the private property owners have continued to work to bring the needed infrastructure to the Laveen area to support and add to the $2 Billion investment in the Loop 202 Freeway. This is a model for public/public/private partnership—again, at all levels of government and with the strong support of private property owners. The Loop 202/South Mountain Freeway will be a major stimulus to significant local government investment and private development investment.

- **Jobs.** The Loop 202/South Mountain Freeway is a fully funded $2 Billion Freeway Infrastructure project that will bring an estimated 30,000 jobs to our region. These are much-needed jobs for our community and our families.

- **Laveen Community/Services.** The Loop 202/South Mountain Freeway will allow the Laveen area to obtain the development and services that are needed to support this growing community, including retail services, healthcare services, additional educational opportunities, and certainly enhanced municipal and other government al services. The Loop 202 Freeway will bring these vital services to Laveen.

- **Air Quality.** The Loop 202/South Mountain Freeway would reduce congestion on I-10, the Broadway Curve and the Deck Park Tunnel, and keep traffic moving. This will actually improve air quality in this region. The EIS has concluded that the No-Build Alternative would not meet the State of Arizona's air quality implementation plan.

Please contact me directly at 602-237-4401 or e-mail at carvermountain@gmail.com if you have any questions regarding my property or my support for the Loop 202/South Mountain Freeway.

Thank you.

Room #101 ~ Mail Drop 118A
206 South 17th Avenue
Phoenix, AZ 85007

Dear Arizona Department of Transportation representative:

I am writing to state my opposition for the proposed expansion of Loop 202/South Mountain Freeway (SMF).

(1) (2)

This project has been under consideration since 1983, when oil and fuel prices were inexpensive. At a present time when volatility of the oil industry incurs an ever-rising cost of fuel prices to consumers, the proposed project is outdated in its purpose at a critical time when transportation decisions should address the increasing temperatures of urban cities.

(3) (4) (5)

The two currently proposed routes for the freeway are less than a mile apart. Both will have the same harmful effects on the Gila River Indian Community's (GRIC) air quality, health and traditional cultural properties. The on-reservation alignment will result in a loss of approximately 600 acres of tribal land, and the forced relocation of O'odham families.

(6) (7) (8) (9)

The off-reservation alignment would gouge a 40-story high, 200-yard wide cut into South Mountain, which is sacred to all four O'odham tribes. South Mountain is also significant to the larger Phoenix area due to it being the largest city park in the United States. Laveen and Ahwatukee residents would ultimately be affected by air and noise pollution, as well as the inevitable devastation of numerous local businesses, homes and a church in the line of the proposed route.

(10) (11)

The Sierra Club Report "The Best and Worst in Transportation Investments" listed SMF as one of the worst projects in the United States based on oil, environmental, health, economic, and land use impacts. The freeway would impose on a critical wildlife corridor for various threatened desert animals and fragile ecosystems unique to both the Estrella and South Mountain ranges.

(12)

I want to advocate "No Build" as the only option that preserves the environment, health of GRIC, respects O'odham traditions, and is also beneficial for Laveen and Ahwatukee residents.

Sincerely,

Stephen U Chasse

1	**Purpose and Need, Old Plan or Use of Old Data**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix.
2	**Heat Island**	As buildings, parking lots, roads, and other infrastructure replace open land and vegetation, an urban heat island may result. The heat island effect is of a regional nature and, therefore, there is no requirement to analyze potential impacts and no possibility of determining the localized contribution at the project level to the regional heat island effect. It is likely, however, that a proposed project such as the South Mountain Freeway would be a minor contributor to the overall issue.
3	**Alternatives**	There is only one action alternative studied in detail in the Eastern Section of the Study Area in the Draft Environmental Impact Statement. While an alignment on Gila River Indian Community land was considered, it was ultimately eliminated from detailed study (see page 3-24 of the Draft Environmental Impact Statement). The Community Alignment, as depicted in Figure 3-11 on page 3-25 of the Draft Environmental Impact Statement would not result in the relocation of any residences on Gila River Indian Community land.
4	**Health Effects**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix.
5	**Cultural Resources**	
6	**Section 4(f) and Section 6(f)**	
7	**Air Quality**	
8	**Noise**	
9	**Acquisitions and Relocations**	
10	**Sierra Club Report**	The Arizona Department of Transportation and Federal Highway Administration respectfully disagree with the referenced Sierra Club Report. As noted in the Final Environmental Impact Statement, when compared with the No-Action Alternative, the Preferred Alternative would result in less energy consumption (page 4-172), regional improvements to air quality (page 4-74) that would be expected to produce health benefits, and economic benefits of reducing regional traffic congestion (page 4-65), and would be consistent with local and regional long-range planning efforts (page 4-18).
11	**Biology, Plants, and Wildlife**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix.
12	**Alternatives, No-Action (No-Build) Alternative**

ADOT Loop 202 South Mountain Freeway Study
1655 W. Jackson Street
MD126F Phoenix, AZ 85007

Dear ADOT,

Your DEIS did not include concerns I and others raised as there are many deficiencies with this DEIS. I am a member of PARC and I am concerned about the many issues not sufficiently addressed or omitted in the recent DEIS. Please have these items addressed and entered into the public comment section of the process:

1 **A) More Air Quality Issues to Increase in Foothills Reserve Community's**
The Phoenix metro area has had problems for decades meeting the air quality standards for particulate matter (PM) and other criteria pollutants. (Ozone levels are too high in the East Valley and Fountain Hills, for example.) There have been several exceedances of the standards for PM set by EPA under the authorities given the agency by the Clean Air Act (CAA). The problem has been so bad over the years that currently, EPA is examining sanctions that include blocking a billion dollars in highway funds.

2 **B) New Health Findings from Studies in Boston, MA and Los Angeles, CA 2011 – 2013 not incorporated in DEIS**
Documented proof submitted to the EPA in studies found health risks from living within 1 mile of 6 lane highways which create fine and ultrafine particulate matter. Impact of living so close to the highway causes: child hood leukemia, asthma, autism, increase of coronary disease, cancer and lung disease. This impact to thousands of nearby school children, adults and elderly needs to be studied and put in DEIS. Past studies from 2005, 2011, 2012 and 2013 facts have not been included in DEIS as requested. Impacts to the families who will remain after the highway is built in Ahwatukee's Foothills Reserve have clearly not been addressed. In addition sound decibel studies of the SMF's impact to our community and its wild life, including constant compounded sound echo's off the 2 nearby mountain ranges in this unique micro climate have not been addressed in the DEIS as requested. Facts on ultra-fine and fine particulates caused by the project have not been reported nor its health impacts reported with current scientific facts from those experts throughout the United States. All serious health impacts have to take a priority over shorter commutes and business development.

3

4 **C) Traffic Congestion Issues at West I-10 Junction**
The junction of the South Mountain Freeway on its west end with Interstate 10 may have been an idea conceived many years ago, but the traffic congestion that exists at the area between 59th and 51st Avenues on that freeway during morning and evening rush hours in 2013 is more than extreme. Yet there is no mention in the DEIS of the cumulative impacts and effects of traffic congestion at that proposed junction

5 **D) High-Sulfur Diesel and added benzene increase; Truck Bypass Negated due to added Truck Traffic from Mexico**
The modeling of air pollution impacts in the DEIS do not include the additional air pollution from truck traffic from Mexico. The DEIS briefly mentions the issue, but it claims it has no way to know what impact this would be. Patently absurd. This bypass is also now the designated route of the Canamex Highway, and it is Interstate 8 (south of Casa Grande) to State Highway 85, to Interstate 10, west of the Phoenix metro area. Further, trucks originating in Mexico will be fueled with diesel that doesn't meet the CARB diesel standards adopted by Arizona over a decade ago. In Mexico, there is no regulation about the sulfur in diesel fuel. Once this additional pollution is honestly quantified and factored in, there would be a huge net increase in air pollution from the SMF, and associated increases in asthma, heart disease, premature death, and other adverse health impacts. Truck restriction laws need to be written.

6 2 **E) Air Toxics Already a Crisis but Not Mentioned and Local Specific Data not Gathered nor Updated since 2006**
In 2005, there was an extensive air monitoring of certain toxic chemicals (air toxics) conducted by EPA and ADEQ in a joint effort named the Joint Air Toxics Assessment Program (JATAP). The monitoring sites included a site near St. Johns on the GRIC, and some in west Phoenix and South Phoenix. The JATAP monitoring results were reported in 2006, during a time the data for the DEIS was being gathered, and it found levels of certain toxic chemicals associated with vehicular emissions were above the standard of a one in a million chance of cancer in a lifetime of exposure in the west Phoenix, south Phoenix, and GRIC sites. The JATAP monitoring found in the high end of the monitoring levels, formaldehyde at 34 times this standard; benzene at 8 times this standard, 1,3 butadiene at 7.5 times this standard, acetaldehyde at 3.4 times this standard. And, remember, citizens are being subjected to all of these carcinogens, not just one. Some o chemicals are attributed to "mobile sources," or vehicular traffic burning hydrocarbons. Adding more vehicular traffic emissions by building a freeway where there had not been one would add to this toxic burden. The JATAP results are not included in the DEIS, but instead there is a strange missive about the uncertainty of the risk from these air toxics standards, which is not true. The cancer risk standards have been promulgated and published by EPA after extensive research, and are well-known. See Point B)

7 **F) Risks from Hazardous Materials Transportation Incidents Due to the SMF**
There are no industries using and emitting toxic chemicals in Ahwatukee Foothills, and no hazardous materials (hazmat) transportation issues and risks because none of these chemicals, other than gasoline and diesel, are being shipped into the area, other than incidentally adjacent on Interstate 10, which is east of the area. Since the NEPA process started, Ahwatukee Foothills residents and others have consistently raised concerns about the added risks from the transportation of hazmat on the new NEPA requires examination of cultural, social, and economic impacts, and the new hazmat traffic and risks caused by the SMF would affect all of these topic areas.

8 **G) Blasting South Mountain: Religious, Racial Discrimination of Civil Rights Violations in DEIS**
The DEIS clearly discriminates on the basis of religion and race, ADOT plans for blasting *Muhadagi Doog* (South Mountain) are ongoing civil rights violations .Throughout the DEIS, it is acknowledged that the GRIC and other native American tribes hold *Muhadagi Doog* as a sacred site. From the actual language of the DEIS: "The South Mountains are highly valued and considered sacred by some Native American communities. Building SMF will constitute a violation of the 14th Amendment to the Constitution and a violation of the American Indian Religious Freedom Act as any freeway alternative proposed in the DEIS of the South Mountain Freeway requires blasting away part of *Muhadagi Doog*. New wind patterns caused by cutting thru mountains have not been studied and will cause pollution to be trapped.

Sincerely concerned,

Resident of Foothills Reserve

Code	Issue	Response
1	**Air Quality**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix. In May 2012, the Arizona Department of Environmental Quality submitted a revised Maricopa Association of Governments 2012 Five Percent Plan for the region. On July 20, 2012, the U.S. Environmental Protection Agency made an official finding that the Maricopa Association of Governments 2012 Five Percent Plan was administratively complete. This decision ended the sanctions clocks associated with Arizona's decision to withdraw the Maricopa Association of Governments 2007 Five Percent Plan. On February 6, 2014, the U.S. Environmental Protection Agency published a notice in the *Federal Register* proposing to approve the Maricopa Association of Governments *2012 Five Percent Plan for Attainment of the PM-10 Standard* for the Maricopa County Nonattainment Area. In the same notice, the U.S. Environmental Protection Agency stated that it would concur with exceptional event (as a result of haboobs and dust storms) documentation prepared by the Arizona Department of Environmental Quality, which would give the region the 3 years of clean data needed for attainment of the particulate matter (PM_{10}) 24-hour standard. Finally on May 30, 2014, the U.S. Environmental Protection Agency approved the 2012 Five Percent Plan and found the area in attainment of the 24-hour particulate matter (PM_{10}) standard based on monitoring data for the years 2010 to 2012 (see page 4-72 of the Final Environmental Impact Statement for more information).
2	**Health Effects**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix.
3	**Noise**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix. Operation of the freeway would cause an increase in noise levels that would vary in intensity depending on factors such as amount of traffic, travel speeds, time of day, and day of the week. Nighttime noise levels would be less than daytime noise levels. Some species rely on hearing to avoid predators, communicate, and find food (Noise Pollution Clearinghouse 2004). As noted in the Final Environmental Impact Statement on page 4-136, an increase in traffic noise may affect the ability of some animals to hear at a level necessary for survival when near the proposed action. In addition, hearing loss resulting from vehicle noise has been shown to occur in some desert animals (Bondello and Brattstrom 1979). As discussed in the Noise Analysis Technical Report in support of the Final Environmental Impact Statement, the proposed South Mountain Freeway was modeled in the latest version of the Traffic Noise Model (version 2.5). This is a three-dimensional model that factors in elements of the proposed freeway using x, y, and z coordinates. The model did account for the elevations of the freeway, nearby homes that may be elevated above the road, surrounding topography, and any mitigation measures such as barriers between the homes and freeway. This is the same procedure and same model used for other freeway projects in the Phoenix metropolitan area and across the country.

4	**Alternatives, W59 Alternative Versus W101 Alternative**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix. Analysis of impacts in future conditions accounted for cumulative effects of the planned 2035 roadway network including the proposed freeway. 40 Code of Federal Regulations § 1508.7 defines cumulative impacts as "the impact on the environment which results from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions regardless of what agency or person undertakes such other actions." The future conditions with and without the proposed freeway are presented in Figure 3-40 on page 3-66 of the Final Environmental Impact Statement. As noted on page 1-13 of the Final Environmental Impact Statement, the 2035 transportation network includes all improvements from the Maricopa Association of Governments *Regional Transportation Plan* except for the proposed freeway in the Study Area. The traffic projections also included Maricopa Association of Governments' projected growth in population, housing, and employment in the Maricopa Association of Governments region, which can result from public or private actions.
5	**Trucks**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix.
6	**Air Quality**	Summary information about the findings of the Joint Air Toxics Assessment Project study is provided as background information in the Draft and Final Environmental Impact Statements, but the study itself is not relevant to the type of analysis done pursuant to the Federal Highway Administration's mobile source air toxics guidance, which is an emissions analysis. Monitored ambient concentrations of mobile source air toxics (the focus of the Joint Air Toxics Assessment Project) do not inform this type of analysis. While monitoring data can be useful for defining current conditions in the affected environment (to the extent that the monitoring data are current), they don't tell us anything about future conditions, or the impacts of the project itself, which is why an emissions analysis was performed. The mobile source air toxic analysis presented beginning on page 4-77 of the Final Environmental Impact Statement is an estimated inventory of mobile source air toxic emissions for the entire Study Area for 2025 and 2035. This approach was used because the inventory estimate accounts for changes in traffic and emissions on all roadways affected by a proposed project, and would, therefore, be a more reliable predictor of changes in exposure to mobile source air toxics. The Draft and Final Environmental Impact Statements present information and analysis about the proposed action and the enhanced conditions when compared against the No-Action Alternative and would not cause substantial adverse effects. The results of the analysis are summarized in the prologue to the Final Environmental Impact Statement (page xiii) and are more fully described beginning on page 4-68 of the Final Environmental Impact Statement. The carbon monoxide and particulate matter (PM_{10}) analyses demonstrated that the proposed freeway would not contribute to any new localized violations, increase the frequency or severity of any existing violation, or delay timely attainment of the National Ambient Air Quality Standards or any required interim emissions reductions or other milestones.

6 (cont.)		As noted above, the carbon monoxide analysis presented on page 4-65 of the Draft Environmental Impact Statement and updated on page 4-75 of the Final Environmental Impact Statement represents projected carbon monoxide concentrations along the project corridor, including those proposed interchange locations along the South Mountain Freeway corridor. The Arizona Department of Transportation also conducted a quantitative particulate matter (PM_{10}) hot-spot analysis that is discussed on page 4-76 of the Final Environmental Impact Statement. Both of these analyses demonstrate that the health-based National Ambient Air Quality Standards for carbon monoxide and particulate matter (PM_{10}) would not be exceeded at worst-case locations along the project corridor. The emission modeling developed for the proposed action showed that for the mobile source air toxics study area, there would be little difference in total annual emissions of mobile source air toxics emissions between the Preferred and No-Action Alternatives (less than a 1 percent difference) in 2025 and 2035. With the Preferred Alternative in 2035, modeled mobile source air toxics emissions would decrease by 57 percent to more than 90 percent, depending on the pollutant, despite a 47 percent increase in vehicle miles traveled in the Study Area compared with 2012 conditions (see discussion beginning on page 4-77 of the Final Environmental Impact Statement). The carbon monoxide and particulate matter (PM_{10}) analyses demonstrated that the proposed freeway would not contribute to any new localized violations, increase the frequency or severity of any existing violation, or delay timely attainment of the National Ambient Air Quality Standards or any required interim emissions reductions or other milestones.
7	**Hazardous Materials**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix.

Code	Issue	Response
8	**Environmental Justice/Lifestyle**	The cultural and religious importance of the South Mountains is acknowledged in the Draft Environmental Impact Statement in several locations, notably page 5-26. The proposed project, would accommodate and preserve (to the fullest extent possible from the available alternatives) access to the South Mountains for religious practices. Section 106 of the National Historic Preservation Act requires a government-to-government relationship between the Federal Government and Indian tribes as described beginning on page 4-140 of the Final Environmental Impact Statement. Section 106 requires federal agencies take into account the effects of their undertakings on historic properties and requires consultation with tribal authorities. Consultation has occurred with Gila River Indian Community government officials, the Tribal Historic Preservation Officer, the Cultural Resource Management Program, other tribes, and the State Historic Preservation Office and has led to concurrence from the Gila River Indian Community Tribal Historic Preservation Office and the State Historic Preservation Office on National Register of Historic Places eligibility recommendations (including traditional cultural properties like the South Mountains), project effects, and proposed mitigation and measures to minimize harm. This consultation has been ongoing and will continue until any commitments in a record of decision are completed. The section entitled *Title VI and Environmental Justice*, beginning on page 4-29 in the Draft Environmental Impact Statement, presents acceptable methods, data, and assumptions to assess the potential for disproportionately high and adverse effects from the proposed action on environmental justice populations and disparate impacts to populations protected under Title VI. Based upon the content of the section, no such effects would result from the action alternatives. In light of comments received on the Draft Environmental Impact Statement, the above-referenced conclusions were confirmed in the preparation of the Final Environmental Impact Statement. To provide further clarity, the discussions of environmental justice and Title VI were separated and additional text explaining the relationship of environmental justice and Title VI to various environmental elements was added throughout Chapter 4, *Affected Environment, Environmental Consequences, and Mitigation*, as exemplified by the inserted text on page 4-29 of the Final Environmental Impact Statement. Air quality depends on several factors such as the area itself (size and topography), the prevailing weather patterns (meteorology and climate), and the pollutants released into the air. Cuts through the South Mountains would be expected to produce microclimate differences similar to those produced by a series of buildings in a large city which produce localized wind tunnel effects. The mountain cuts, however, would not affect regional air quality or cause air to be trapped.

Subject: Comments in opposition to South Mountain Freeway
Date: Tuesday, June 18, 2013 1:33:33 PM

Jun 18, 2013

Arizona Department of Transportation South Mountain Study Team
1655 W Jackson St, MD 126F
Phoenix, AZ 85007

Dear South Mountain Study Team,

1 I am writing to express my opposition to the proposed South Mountain Freeway and to urge ADOT to select the No-Build Alternative.

2 3 The proposed freeway would cause more problems than it would solve. In addition, it would only provide short-term congestion relief. As is evident by our numerous clogged roads and freeways, many of which have recently been built or widened, building more roads is not the answer. ADOT needs to instead focus on planning for and investing in long-term transportation solutions, including mass transit. The only way to effectively reduce congestion and mobilize people is by reducing the number of vehicles utilizing our roads, not by encouraging more to use them.

4 5 South Mountain Freeway would have incredible negative impacts on our communities. Despite what the DEIS claims, air quality in the region would worsen over time, increasing public health risks. As more vehicles fill the "uncongested" areas this freeway would temporarily provide, more pollution will be spewed into the air, exacerbating asthma, cancer, and other diseases.

6 7 The freeway would also negatively effect our environment. South Mountain Park is the largest city park in our nation. It was set aside to protect resources and to benefit our communities. By blasting a freeway through a portion of this park, wildlife and habitat will be destroyed, movement corridors will be cut off, valuable public spaces will be lost, and more. This would set a terrible precedent by demolishing what should remain a protected area.

8 The freeway will also exacerbate urban sprawl and further burden Arizona's taxpayers. Its construction would continue ADOT's trend of forcing residents to remain vehicle-dependent while paying for infrastructure so that others can live farther and farther from a city center.

1 Please help protect our communities, our health, and our environment by selecting the No Action Alternative. Thank you.

Sincerely,

Mr. Ross Mckenzie
3298 E Foothills Dr
Apt C
Sierra Vista, AZ 85635-4289

Code	Issue	Response
1	**Alternatives, No-Action (No-Build) Alternative**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix.
2	**Purpose and Need, Old Plan or Use of Old Data**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix. Although the region's freeways are now congested during the peak travel period, conditions in 2035 without the proposed freeway would be substantially worse with more congested areas and congested conditions for longer periods of time (see Final Environmental Impact Statement pages 1-21 and 1-22). Congestion relief resulting from the proposed freeway would provide localized reductions on arterial streets and at interchanges. Reduced travel times would result in lower exposure to elevated concentrations of mobile source air toxics occurring in traffic. Other benefits of the proposed freeway in comparison to the No-Action Alternative are presented in Table 3-9 on page 3-38 of the Final Environmental Impact Statement.
3	**Alternatives**	Federal regulations stipulate that an environmental impact statement shall "rigorously explore and objectively evaluate all reasonable alternatives" (40 Code of Federal Regulations § 1502.14; see Final Environmental Impact Statement page 3-1). All alternatives were screened using a multidisciplinary set of criteria. Nonfreeway alternatives were considered (see Final Environmental Impact Statement pages 3-3 through 3-6). Among other things, the study took into account improving existing freeways, improving or expanding other travel modes, strategies to reduce travel demand, and various roadway configurations. This study examined not only the potential impacts from improvements, but also the consequences of building nothing, the No-Action Alternative. As proposed by the Maricopa Association of Governments, the South Mountain Freeway would be part of the Regional Freeway and Highway System. Other transportation improvements such as mass transit and local roads are specified in the *Regional Transportation Plan* and were considered during the evaluation of this proposed new freeway. As noted in the Final Environmental Impact Statement (see page 3-60), the proposed freeway would provide opportunities to enhance operation of future mass transit improvements.
4	**Air Quality**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix.

8	**Neighborhoods/ Communities**	Unplanned growth is often termed "urban sprawl." Generally, this term is used in the context of rapid and uncontrolled urban growth onto previously undeveloped land—usually on the outskirts of an existing urban area. Projects like the proposed freeway are often identified as contributors to urban sprawl. Freeway projects are often cited as making land at the urban fringe more accessible and, therefore, more attractive for development. However, examination of data comparing population and land use between 1975 and 2000 suggests major transportation projects like the proposed freeway do not induce growth in the region (see Final Environmental Impact Statement pages 4-170 through 4-174). The proposed action would be implemented in a historically quickly urbanizing area (most noticeably in the Western Section of the Study Area, although the nationwide recession which began in 2007 slowed growth). In the Eastern Section of the Study Area, the proposed freeway would abut public parkland, Native American land, and a near-fully developed area—therefore, any contribution to accelerated or induced growth would be constrained. The proposed freeway would be built in an area planned for urban growth as established in local jurisdictions' land use plans for at least the last 25 years.

ADOT Loop 202 South Mountain Freeway Study
1655 W. Jackson Street
MD126F
Phoenix, AZ 85007

Dear ADOT ,

I am a member of PARC and currently working in the health care profession in Central Phoenix. I am concerned about the many issues not sufficiently addressed or omitted in the recent DEIS and would like this entered into the public comment section of the process:

Issues not raised or not fully studied in DEIS are as follow

- *Direct impact to autism cause by highways close to kids. Recent evidence in 2013 should be added into the impact*
- *DEIS does not have accurate and up-to-date 2013 2012 asthma and autism impacts growing in metro Phoenix nor updates to impacts of highway 51 health issues we see from folks living 1 mile for freeways. DEIS need to go back and review current health impacts of existing highways air quality an EPA air violations . Then DEIS needs to model the impact of the growth projections on worsening the air and health risks. Population growth alone will estimate a sever worsening of health risks and cause air quality to be worse than EPA standards in 43 ave 51 ave zip 85045 85048 GRIC and laveen. Major flaw in such a study since it does not estimate these issues accurately for 2014 -2016 growth in toxic air and worsen health counts and health symptoms that the doctors and hospitals see now up for 2013.*
- *Must better study for impacts top current and future residents and school kids who's play area and day cares will be less than ¼ of a mile from traffic*
- *Did the study add in the additional traffic due to the building of the premium outlet mall at highway 10 and 202. This substantial increase in polluting traffic needs to be in the study. Not avoided since they exit the highway.*
- *Blasting thru south mountain will cause religious and racial discrimination and civil rights violations in SMF DEIS*
- *Is it legal to destroy burial rights and petroglyphs and Indian artifacts in the line of demolition. If DEIS does not really go on Indian land and it does not protect their adjacent artifacts is it accurate and inclusive. DEIS should study all the true direct and indirect impacts to the highway on AIRFA passed in 1978 is not being followed.*
- *Truck traffic from Mexico and high sulfur diesel and benzene levels will be worse than study portrays. The DEIA clearly does not model the additional air pollution for this traffic,*
- *This highway will not improve the air quality for phoens . DEIS does not model the future impact. Our city will be in violation of Clean air Act. Also will worsen west and south phoenix air,*
- *There is no serious discussion or consideration in the DEIS of the 2005 monitoring of toxic chemicals (present air toxins) . This 2005 study conducted by EPA and ADEQ in joint effort with JATAP showed results reported in 2006 showed emission from traffic were already (in 2006) above the standard of 1 million chance of cancer in a life time of exposure in west an south phoenix and GRIC, This need new data for 2007 2008 2009 2010 2011 2012 2013 since air and traffic are now worse. To not have DEIS study this is unethical and flawed.*
- *Jatap monitoring already found formaldehyde at 34 times the standards,*
- *Benzene at 8 times the standard, butadiene 1 and 3 7.5 times the standard, acetaldehyde at 3.4 times the standard, our residents are being exposed to these entire carcinogens not just one. DEIS must study the combined effects of these current carcinogenic mixed compounds on Health. And then study the new higher levels of all of the above thru 2013, Then model and project the added compounds of ultrafine and fine particulates.*
- *DEIS does not mention hazmat transportation issues a risk of tanked from Mexico. Must redo the study for this*
- *Ozone levels and exceeding the parts per million set by EPA and the clean air act and not considered. Postponing EPA enforcement standards must be reconsidered to do a true DEIS . Also explaining that dust storms cause all this is not accurate. Modeling of today's levels need to be updated and*
- *Congestion and future traffic counts not molded correctly and congestion on west I 10 on ramps not designed correctly to handle traffic volumes. ADOTS past modeling results have been inaccurate and realistic . We need better and realistic quality data inputs into the study. 2012 and 2013 traffic pattern data not updated in the study. Must relook at peak traffic from April 2013 as look at current air quality EPA violations.*
- *Sulfur and benzene test stations should be set up to get accurate 2013 air quality reading in laveen GRIC and 85045 85048 zip codes.*

Sincerely,

Code	Issue	Response
1	**Health Effects**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix.
2	**Traffic**	The Federal Highway Administration and the U.S. Environmental Protection Agency approved the air quality conformity determination that includes the Maricopa Association of Governments regional travel demand model that produced the traffic projections used in the traffic analysis for the project (see Draft Environmental Impact Statement page 3-27). Traffic projections are regularly updated by the Maricopa Association of Governments. The traffic projections in the Draft Environmental Impact Statement are from a model adopted in 2011. When the Maricopa Association of Governments adopts new socioeconomic projections and traffic projections, it will be reflected in the study documents. Key model inputs used to forecast travel demand included (see Table 3-7 on Draft Environmental Impact Statement page 3-27): · socioeconomic data based on the adopted general plans of Maricopa Association of Governments members, which includes projected growth in population, housing, and employment (including proposed commercial centers), along with economic forecasts and the existing and planned transportation infrastructure as identified by Maricopa Association of Governments members · the anticipated average number of vehicle trips within the region (including those to and from the region's households) on a daily basis (this number is tracked regularly by the Maricopa Association of Governments) · the distribution of transportation modes used by travelers in the Maricopa Association of Governments region (also tracked regularly by the Maricopa Association of Governments) · the capacity of the transportation infrastructure to accommodate regional travel · the future transportation infrastructure established using *Regional Transportation Plan*-planned projects and improvements and from known arterial street network improvements assumed to be made by the County, Cities, and private developers The Maricopa Association of Governments approved new socioeconomic projections in June 2013. The new data are presented in the Final Environmental Impact Statement (see page 1-11). Although slower growth in total vehicle miles traveled was noted, the need for the freeway did not change. The revised traffic analysis validated that the proposed project is needed today.

3	**Cultural Resources**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix. As discussed on page 4-147 of the Draft Environmental Impact Statement, a programmatic agreement was developed for the project to establish a process for consultation, review, and compliance with federal and State preservation laws as the effects of the project on historic properties become known. The programmatic agreement states that any data recovery on federal lands necessitated by the project must be permitted under the Archaeological Resources Protection Act in accordance with the federal land-holding agency and that, in the event any data recovery for the project should take place on tribal lands, all applicable permits would be obtained. Because the project is proposed, a programmatic agreement is in place to address data recovery on federal and tribal lands, and no excavations have yet occurred. The proposed freeway is and will continue to be in compliance with the Archaeological Resources Protection Act.
4	**Environmental Justice/Lifestyle**	The cultural and religious importance of the South Mountains is acknowledged in the Draft Environmental Impact Statement in several locations, notably page 5-26. The proposed project, would accommodate and preserve (to the fullest extent possible from the available alternatives) access to the South Mountains for religious practices. Section 106 of the National Historic Preservation Act requires a government-to-government relationship between the Federal Government and Indian tribes as described beginning on page 4-140 of the Final Environmental Impact Statement. Section 106 requires federal agencies take into account the effects of their undertakings on historic properties and requires consultation with tribal authorities. Consultation has occurred with Gila River Indian Community government officials, the Tribal Historic Preservation Officer, the Cultural Resource Management Program, other tribes, and the State Historic Preservation Office and has led to concurrence from the Gila River Indian Community Tribal Historic Preservation Office and the State Historic Preservation Office on National Register of Historic Places eligibility recommendations (including traditional cultural properties like the South Mountains), project effects, and proposed mitigation and measures to minimize harm. This consultation has been ongoing and will continue until any commitments in a record of decision are completed. The section entitled *Title VI and Environmental Justice*, beginning on page 4-29 in the Draft Environmental Impact Statement, presents acceptable methods, data, and assumptions to assess the potential for disproportionately high and adverse effects from the proposed action on environmental justice populations and disparate impacts to populations protected under Title VI. Based upon the content of the section, no such effects would result from the action alternatives. In light of comments received on the Draft Environmental Impact Statement, the above-referenced conclusions were confirmed in the preparation of the Final Environmental Impact Statement. To provide further clarity, the discussions of environmental justice and Title VI were separated and additional text explaining the relationship of environmental justice and Title VI to various environmental elements was added throughout Chapter 4, *Affected Environment, Environmental Consequences, and Mitigation*, as exemplified by the inserted text on page 4-29 of the Final Environmental Impact Statement.

5	**Trucks**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix.
6	**Air Quality**	
7	**Air Quality**	Summary information about the findings of the Joint Air Toxics Assessment Project study is provided as background information in the Draft and Final Environmental Impact Statements, but the study itself is not relevant to the type of analysis done pursuant to the Federal Highway Administration's mobile source air toxics guidance, which is an emissions analysis. Monitored ambient concentrations of mobile source air toxics (the focus of the Joint Air Toxics Assessment Project) do not inform this type of analysis. While monitoring data can be useful for defining current conditions in the affected environment (to the extent that the monitoring data are current), they don't tell us anything about future conditions, or the impacts of the project itself, which is why an emissions analysis was performed. The mobile source air toxic analysis presented beginning on page 4-77 of the Final Environmental Impact Statement is an estimated inventory of mobile source air toxic emissions for the entire Study Area for 2025 and 2035. This approach was used because the inventory estimate accounts for changes in traffic and emissions on all roadways affected by a proposed project, and would, therefore, be a more reliable predictor of changes in exposure to mobile source air toxics.The Draft and Final Environmental Impact Statements present information and analysis about the proposed action and the enhanced conditions when compared against the No-Action Alternative and would not cause substantial adverse effects. The Federal Highway Administration and Arizona Department of Transportation Draft and Final Environmental Impact Statements account for the potential effects when considering both adverse and beneficial impacts. The Draft and Final Environmental Impact Statements provide in-depth discussion of potential air quality impacts of the proposed alternatives. As noted above, the carbon monoxide analysis presented on page 4-65 of the Draft Environmental Impact Statement and updated on page 4-75 of the Final Environmental Impact Statement represents projected carbon monoxide concentrations along the project corridor, including those proposed interchange locations along the South Mountain Freeway corridor. The Arizona Department of Transportation also conducted a quantitative particulate matter (PM_{10}) hot-spot analysis that is discussed on page 4-76 of the Final Environmental Impact Statement. Both of these analyses demonstrate that the health-based National Ambient Air Quality Standards for carbon monoxide and particulate matter (PM_{10}) would not be exceeded at worst-case locations along the project corridor. The emission modeling developed for the proposed action showed that for the mobile source air toxics study area, there would be little difference in total annual emissions of mobile source air toxics emissions between the Preferred and No-Action Alternatives (less than a 1 percent difference) in 2025 and 2035. With the Preferred Alternative in 2035, modeled mobile source air toxics emissions would decrease by 57 percent to more than 90 percent, depending on the pollutant, despite a 47 percent increase in vehicle miles traveled in the Study Area compared with 2012 conditions (see discussion beginning on page 4-77 of the Final Environmental Impact Statement). The carbon monoxide and particulate matter (PM_{10}) analyses demonstrated that the proposed freeway would not contribute to any new localized violations, increase the frequency or severity of any existing violation, or delay timely attainment of the National Ambient Air Quality Standards or any required interim emissions reductions or other milestones.

Code	Issue	Response
8	**Hazardous Materials**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix.
9	**Air Quality**	As noted on page 4-76 of the Final Environmental Impact Statement, since ozone is a regional pollutant, there is no requirement to analyze potential impacts and no possibility of localized violations of ozone to occur at the project level. The Maricopa Association of Governments is responsible for developing plans to reduce emissions of ozone precursors in the Maricopa area. The Preferred Alternative is included in the *Regional Transportation Plan* that has been determined by the U.S. Department of Transportation to conform to the State Implementation Plan on February 12, 2014.
10	**Purpose and Need, Old Plan or Use of Old Data**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix.
11	**Alternatives, W59 Alternative Versus W101 Alternative**	
12	**Air Quality**	Data from various Maricopa County Air Quality Department monitoring sites were used in the air quality analyses. Siting, operation, and recording information from monitoring sites are the responsibility of the Maricopa County Air Quality Department. See <maricopa.gov/aq/>. The monitoring information used in the air quality analyses is discussed in greater detail in the air quality technical report prepared for the project which is available on the project Web site at <azdot.gov/southmountainfreeway>. The results of the analyses are summarized in the Final Environmental Impact Statement. According to U.S. Environmental Protection Agency guidance, new monitors are not necessary to analyze air quality impacts.

May 22, 2013
ADOT Loop 202 South Mountain Freeway Study
1655 W. Jackson Street
MD126F
Phoenix, AZ 85045

Dear ADOT ,

I am a member of PARC and currently working in the health care profession in Central Phoenix. I am concerned about the many issues not sufficiently addressed or omitted in the recent DEIS and would like this entered into the public comment section of the process:

Issues in DEIS I learned since the May 21 meeting

1
- *Seems to me several groups for 202 freeway were bused in to the meeting to voice opinions and were backed by trucking industry. This should be investigated as to if swift transportation in Levine area is backing these folks and or paying them to speak. Can you please investigate that since they are of record in public comments?*

2
3
- *I have also learned additional facts after my statement made that day that concern me.*
- *A longtime resident on Phoenix mentioned the study done on environmental impact after 1982 (and the one in 2005) showed that there was a negative impact due to air toxins and the study found it was not environmentally safe to proceed with the highway yet no know seems to have entered these old findings up for public review. If already decide a bad outcome why is it now a revised study with a different conclusion. Please find these studied and add to the DEIS with a section on the 2005 /2006 EPA / JATAP finding from monitoring stations. Also redo that portion again to insure the current toxin level impacting our citizens. We should have a right for this to be added in the DEIS and FEIS.*

4
- *If you do major cut thru and removal of 3 to 5 ridges of South Mountain I assume the wind tunnel and wind patterns will be dramatically different and in the future will cause the wind , dust and pollution flows to be different. May cause more sulfur diesel and benzene to flow into the air and be trapped in zip codes 85045 85048 and on GRIC. The study does not seriously look at this impact with quality findings. I also am not certain that the studied the air quality and violations of EPA standards in and on GRIC and in 85045 85048 areas in 2013. Air quality on May 20, 21 ,22 23 2013 seem to be extremely bad and may have exceeded EPA. Levels also what levels above EPA standard were exceeded in 2013 at the 43 ave EPA test monitor site.*

5
- *Detail the EPA sensor air violations thru May 2013 so we all publically know what levels and issues we have before the freeway.*

2 6
- *Dust particulate impact should be study at today's levels the construction levels and post construction levels since the natural wind tunnel with be changed due to cut thru mountain ridges and opening up air toxin portal..*
- *It has been very difficult to breathe the air in 2013 in awhatukee and south leaven due to increase pollution and benzene and certainly worse that 2012 levels.*

4
- *Updated data and study still needed and more air sampling must be done and study to wind patter changes due to cutting thru mountains*

7
- *Also the DEIS needs to study the commercial development planned on the highway route. As of 5/21 several plans and public information on development are public including local politicians and business owners intended use of land leases on GRIC and truck stops and truck depots already planned. Also swift transportation truck routs and use of this highway have not been studied since there are no laws to restrict truck traffic on this freeway. Must require that camex trucks use highway 8 bypasses but no enforcement nor acknowledgment in the study to add the new camex or other illegal truck traffic can publically use this.*

8
- *Study must calculate and consider increased truck traffic from Mexico where trucks do not meet the CARB diesel standards adopted by AZ. Ignoring and assuming they won't take this faster route is seriously flawed part of DEIS study*

Issues not raised or not fully studied in DEIS are as follow

- *Direct impact to autism cause by highways close to kids. Recent evidence in 2013 should be added into the impact*

2
- *DEIS does not have accurate and up-to-date 2013 2012 asthma and autism impacts growing in metro Phoenix nor updates to impacts of highway 51 health issues we see from folks living 1 mile for freeways. DEIS need to go back and review current health impacts of existing highways air quality an EPA air violations . Then DEIS needs to model the impact of the growth projections on worsening the air and health risks. Population growth alone will estimate a sever*

Code	Issue	Response
1	**Public Involvement**	These claims were not substantiated and no unlawful acts were identified during the public comment period.
2	**Health Effects**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix.
3	**Air Quality**	Summary information about the findings of the Joint Air Toxics Assessment Project study is provided as background information in the Draft and Final Environmental Impact Statements, but the study itself is not relevant to the type of analysis done pursuant to the Federal Highway Administration's mobile source air toxics guidance, which is an emissions analysis. Monitored ambient concentrations of mobile source air toxics (the focus of the Joint Air Toxics Assessment Project) do not inform this type of analysis. While monitoring data can be useful for defining current conditions in the affected environment (to the extent that the monitoring data are current), they don't tell us anything about future conditions, or the impacts of the project itself, which is why an emissions analysis was performed. The mobile source air toxic analysis presented beginning on page 4-77 of the Final Environmental Impact Statement is an estimated inventory of mobile source air toxic emissions for the entire Study Area for 2025 and 2035. This approach was used because the inventory estimate accounts for changes in traffic and emissions on all roadways affected by a proposed project, and would, therefore, be a more reliable predictor of changes in exposure to mobile source air toxics. The Draft and Final Environmental Impact Statements present information and analysis about the proposed action and the enhanced conditions when compared against the No-Action Alternative and would not cause substantial adverse effects. The Federal Highway Administration and Arizona Department of Transportation Draft and Final Environmental Impact Statements account for the potential effects when considering both adverse and beneficial impacts. The Draft and Final Environmental Impact Statements provide in-depth discussion of potential air quality impacts of the proposed alternatives. As noted above, the carbon monoxide analysis presented on page 4-65 of the Draft Environmental Impact Statement and updated on page 4-75 of the Final Environmental Impact Statement represents projected carbon monoxide concentrations along the project corridor, including those proposed interchange locations along the South Mountain Freeway corridor. The Arizona Department of Transportation also conducted a quantitative particulate matter (PM_{10}) hot-spot analysis that is discussed on page 4-76 of the Final Environmental Impact Statement. Both of these analyses demonstrate that the health-based National Ambient Air Quality Standards for carbon monoxide and particulate matter (PM_{10}) would not be exceeded at worst-case locations along the project corridor. The emission modeling developed for the proposed action showed that for the mobile source air toxics study area, there would be little difference in total annual emissions of mobile source air toxics emissions between the Preferred and No-Action Alternatives (less than a 1 percent difference) in 2025 and 2035. With the Preferred Alternative in 2035, modeled mobile source air toxics emissions would decrease by 57 percent to more than 90 percent, depending on the pollutant, despite a 47 percent increase in vehicle miles traveled in the Study Area compared with 2012 conditions (see discussion beginning on page 4-77 of the Final Environmental Impact Statement).

(Response 3 continues on next page)

To not have DEIS study this is unethical and flawed.* • *Jatap monitoring already found formaldehyde at 34 times the standards,*
2 3	• *Benzene at 8 times the standard, butadiene 1 and 3 7.5 times the standard, acetaldehyde at 3.4 times the standard, our residents are being exposed to these entire carcinogens not just one. DEIS must study the combined effects of these current carcinogenic mixed compounds on Health. And then study the new higher levels of all of the above thru 2013, Then model and project the added compound and impacts caused by the study which will make all the toxin levels higher* • *Health risks of JATAP have been studied and need to be updated and cancer risks have been extensively published by the EPA and are well known carcenogins hurting health. The DEIS states it's uncertain of the risk proving the DEIS study is a cover-up and inaccurate denial of the facts.*
12	• *DEIS does not mention hazmat transportation issues a risk of tanked from Mexico. Must redo the study for this*
13	• *The sharp curve designed in the highway south of 85045 zip code should be reviewed for the addition risk fo truck and car crashed since it's a steep banked curve, It is fully known that the pitch slop and angles of this curve will contribute to a truck safety issue and will increase the ricks of track accidents and hazardous material spills. This extra detail is all missing from DEIS which is designed to protect and inform the public about impacts. A study of why the flaws in the DEIS need to be independently looked at as well and the influence the trucking industry is having and adot on rushing to poor judgment in this study. Independent review must be done to answer why the above points we omitted or played down and Environmental impacts since prior and current facts differ from the DEIS.*
14	• *Ozone levels and exceeding the parts per million set by EPA and the clean air act and not considered. Postponing EPA enforcement standards must be reconsidered to do a true DEIS . Also explaining that dust storms cause all this is not accurate. Modeling of today's levels need to be updated and*
15	• *Congestion and future traffic counts not molded correctly and congestion on west I 10 on ramps not designed correctly to handle traffic volumes. ADOTS past modeling results have been inaccurate and realistic . We need better and realistic quality data inputs into the study. 2012 and 2013 traffic pattern data not updated in the study. Must relook at peak traffic from April 2013 as look at current air quality EPA violations.*
16	• *Sulfur and benzene test stations should be set up to get accurate 2013 air quality reading in laveen GRIC and 85045 85048 zip codes.*
17	• *These are just some of the concerns I have after being involved in this issue for 30days.* I am a home owner and have *Working in the AZ Health care industry for the past 5 years. Please put correct facts into the study about the children's true health impacts seen today and with the new project added in.*

Ken Lapierre
Resident Phoenix AZ
Working in the AZ Health care industry for the past 5 years

Code	Issue	Response
3 (cont.)		The carbon monoxide and particulate matter (PM_{10}) analyses demonstrated that the proposed freeway would not contribute to any new localized violations, increase the frequency or severity of any existing violation, or delay timely attainment of the National Ambient Air Quality Standards or any required interim emissions reductions or other milestones.
4	**Air Quality**	Air quality depends on several factors such as the area itself (size and topography), the prevailing weather patterns (meteorology and climate) and the pollutants released into the air. Cuts through the South Mountains would be expected to produce microclimate differences similar to those produced by a series of buildings in a large city which produce localized wind tunnel effects. The mountain cuts, however, would not affect regional air quality.
5	**Air Quality**	Data from various Maricopa County Air Quality Department monitoring sites were used in the air quality analysis. Siting, operation, and recording information from monitoring sites are the responsibility of the Maricopa County Air Quality Department. See <maricopa.gov/aq/>. The monitoring information used in the air quality analyses is discussed in greater detail in the air quality technical report prepared for the project, which is available on the project Web site at <azdot.gov/southmountainfreeway>. The results of the analyses are summarized in the Final Environmental Impact Statement. According to U.S. Environmental Protection Agency guidance, new monitors are not necessary to analyze air quality impacts.
6	**Air Quality**	Emissions from road dust and additional sources were considered in the quantitative project-level particulate matter (PM_{10}) hot-spot analysis prepared for the proposed project. The results of the analysis are summarized in the prologue to the Final Environmental Impact Statement (beginning on page xiii) and more fully described beginning on page 4-68 of the Final Environmental Impact Statement. The carbon monoxide and particulate matter (PM_{10}) analyses demonstrated that the proposed freeway would not contribute to any new localized violations, increase the frequency or severity of any existing violation, or delay timely attainment of the National Ambient Air Quality Standards or any required interim emissions reductions or other milestones.
7	**Traffic**	The Federal Highway Administration and the U.S. Environmental Protection Agency approved the air quality conformity determination that includes the Maricopa Association of Governments regional travel demand model that produced the traffic projections used in the traffic analysis for the project (see Draft Environmental Impact Statement page 3-27). Traffic projections are regularly updated by the Maricopa Association of Governments. The traffic projections in the Draft Environmental Impact Statement are from a model adopted in 2011. When the Maricopa Association of Governments adopts new socioeconomic projections and traffic projections, it will be reflected in the study documents. Key model inputs used to forecast travel demand included (see Table 3-7 on Draft Environmental Impact Statement page 3-27):

7 (cont.)		· socioeconomic data based on the adopted general plans of Maricopa Association of Governments members, which includes projected growth in population, housing, and employment (including proposed commercial centers), along with economic forecasts and the existing and planned transportation infrastructure as identified by Maricopa Association of Governments members · the anticipated average number of vehicle trips within the region (including those to and from the region's households) on a daily basis (this number is tracked regularly by the Maricopa Association of Governments) · the distribution of transportation modes used by travelers in the Maricopa Association of Governments region (also tracked regularly by the Maricopa Association of Governments · the capacity of the transportation infrastructure to accommodate regional travel · the future transportation infrastructure established using *Regional Transportation Plan*-planned projects and improvements and from known arterial street network improvements assumed to be made by the County, Cities, and private developers The Maricopa Association of Governments approved new socioeconomic projections in June 2013. The new data are presented in the Final Environmental Impact Statement (see page 1-11). Although slower growth in total vehicle miles traveled was noted, the need for the freeway did not change. The revised traffic analysis validated that the proposed project is needed today.
8	**Trucks**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix.
9	**Cultural Resources**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix. As discussed on page 4-147 of the Draft Environmental Impact Statement, a programmatic agreement was developed for the project to establish a process for consultation, review, and compliance with federal and State preservation laws as the effects of the project on historic properties become known. The programmatic agreement states that any data recovery on federal lands necessitated by the project must be permitted under the Archaeological Resources Protection Act in accordance with the federal land-holding agency and that, in the event any data recovery for the project should take place on tribal lands, all applicable permits would be obtained. Because the project is proposed, a programmatic agreement is in place to address data recovery on federal and tribal lands, and no excavations have yet occurred. The proposed freeway is and will continue to be in compliance with the Archaeological Resources Protection Act.

10	**Environmental Justice/Lifestyle**	The cultural and religious importance of the South Mountains is acknowledged in the Draft Environmental Impact Statement in several locations, notably page 5-26. The proposed project, would accommodate and preserve (to the fullest extent possible from the available alternatives) access to the South Mountains for religious practices. Section 106 of the National Historic Preservation Act requires a government-to-government relationship between the Federal Government and Indian tribes as described beginning on page 4-140 of the Final Environmental Impact Statement. Section 106 requires federal agencies take into account the effects of their undertakings on historic properties and requires consultation with tribal authorities. Consultation has occurred with Gila River Indian Community government officials, the Tribal Historic Preservation Officer, the Cultural Resource Management Program, other tribes, and the State Historic Preservation Office and has led to concurrence from the Gila River Indian Community Tribal Historic Preservation Office and the State Historic Preservation Office on National Register of Historic Places eligibility recommendations (including traditional cultural properties like the South Mountains), project effects, and proposed mitigation and measures to minimize harm. This consultation has been ongoing and will continue until any commitments in a record of decision are completed. The section entitled *Title VI and Environmental Justice*, beginning on page 4-29 in the Draft Environmental Impact Statement, presents acceptable methods, data, and assumptions to assess the potential for disproportionately high and adverse effects from the proposed action on environmental justice populations and disparate impacts to populations protected under Title VI. Based upon the content of the section, no such effects would result from the action alternatives. In light of comments received on the Draft Environmental Impact Statement, the above-referenced conclusions were confirmed in the preparation of the Final Environmental Impact Statement. To provide further clarity, the discussions of environmental justice and Title VI were separated and additional text explaining the relationship of environmental justice and Title VI to various environmental elements was added throughout Chapter 4, *Affected Environment, Environmental Consequences, and Mitigation*, as exemplified by the inserted text on page 4-29 of the Final Environmental Impact Statement.
11	**Air Quality**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix.

13	**Design**	All elements of the proposed freeway design are in accordance with the Arizona Department of Transportation *Roadway Design Guidelines* and the American Association of State Highway Officials, *A Policy on Geometric Design of Highways and Streets*. Emergency responders would address the construction of the proposed freeway by amending the local emergency response plan to include the facility. This would include emergency response on the road and alternative routes for diversion of traffic in the event that an incident occurred along the roadway. Information related to transport of hazardous materials is presented on Final Environmental Impact Statement page 4-166. The environmental impact statement process is an objective, interdisciplinary study of the proposed action and its potential impacts. The public hearing process of the environmental impact statement allows all interested members of the public or agencies to review, research, and comment on any and all aspects of the study process. All comments will be considered in the environmental impact statement process.
14	**Air Quality**	As noted on page 4-76 of the Final Environmental Impact Statement, since ozone is a regional pollutant, there is no requirement to analyze potential impacts and no possibility of localized violations of ozone to occur at the project level. The Maricopa Association of Governments is responsible for developing plans to reduce emissions of ozone precursors in the Maricopa area. The Preferred Alternative is included in the *Regional Transportation Plan* that has been determined by the U.S. Department of Transportation to conform to the State Implementation Plan on February 12, 2014.
15	**Purpose and Need, Old Plan or Use of Old Data**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix.
16	**Alternatives, W59 Alternative Versus W101 Alternative**	
17	**Air Quality**	Data from various Maricopa County Air Quality Department monitoring sites were used in the air quality analyses. Siting, operation, and recording information from monitoring sites are the responsibility of the Maricopa County Air Quality Department. See <maricopa.gov/aq/>. The monitoring information used in the air quality analyses is discussed in greater detail in the air quality technical report prepared for the project which is available on the project Web site at <azdot.gov/southmountainfreeway>. The results of the analyses are summarized in the Final Environmental Impact Statement. According to U.S. Environmental Protection Agency guidance, new monitors are not necessary to analyze air quality impacts.

ADOT Loop 202 South Mountain Freeway Study
1655 W. Jackson Street
MD126F
Phoenix, AZ 85007

Dear ADOT ,

I am a member of PARC and feel many issues not addressed or omitted in the recent DEIS. I would like the following issues entered into the public comment section:

- *This highway will not improve the air quality for phoenix . DEIS does not model the future impact accurately. Our city will be in violation of Clean air Act. Also will worsen west and south phoenix air.* (1)
- *Ozone levels today are exceeding the standard parts per million set by EPA and the clean air act and not considered to get worse in this study. Postponing EPA enforcement standards must be reconsidered to do a true DEIS . Also explaining that dust storms cause all this is not accurate.* (2)
- *Study must consider increased truck traffic from Mexico where trucks do not meet the CARB diesel standards adopted by AZ. Ignoring and assuming they won't take this faster route is seriously flawed part of DEIS study* (3)
- *There is a need to study the Swift transportation truck routes and use of this highway have not been studied since there are no laws to restrict truck traffic on this freeway. No enforcement nor acknowledgment in the study reviews the new camex traffic or other illegal truck traffic will now drive on this faster new highway. .* (1)
- *Population growth alone will estimate a severe worsening of health risks and cause air quality to be worse than EPA standards in 43 ave 51 ave zip 85045 85048 GRIC and laveen.* (4)
- *Address impacts to school kids whose play area and day cares will be less than ¼ of a mile from traffic* (5)
- *Did the study add in the new additional traffic due to the building of the premium outlet mall at 10 and 202. .* (6)
- *Blasting thru south mountain will cause religious and racial discrimination and civil rights violations in SMF DEIS Is it legal to destroy burial rights and petroglyphs and Indian artifacts in the line of demolition. DEIS should have to study all the true direct and indirect impacts to the highway after its built.AIRFA passed in 1978 is not being followed nor respected.* (7)
- *Truck traffic from Mexico and high sulfur diesel and benzene levels will be worse than study portrays. The DEIA clearly does not model the additional air pollution for this traffic,* (3)
- *There is no serious consideration in the DEIS of the 2005 monitoring of toxic chemicals (present air toxins) . This 2005 study conducted by EPA and ADEQ in joint effort with JATAP showed results reported in 2006 showed emission from traffic were already (in 2006) above the standard of 1 million chance of cancer in a lifetime of exposure in west an south phoenix and GRIC, This need new data for 2007 2008 2009 2010 2011 2012 2013 since air and traffic are now worse. To not have DEIS study this is unethical and flawed.* (8)
- *Jatap monitoring already found formaldehyde at 34 times the standards,*
- *Benzene at 8 times the standard, butadiene 1 and 3 7.5 times the standard, acetaldehyde at 3.4 times the standard, our residents are being exposed to these entire carcinogens not just one. DEIS must study the combined effects of these current carcinogenic mixed compounds on Health. And then study the new higher levels of all of the above thru 2013, Then model and project the added issue when compounds are mixed.*
- *Health risks of JATAP have been studied and need to be updated and cancer risks have been extensively published by the EPA and are well known carcinogens hurting health.*
- *DEIS does not mention hazmat transportation issues a risk of tanked from Mexico. Must redo the study for this* (9)
- *The designed sharp curve in the highway south of 85045 zip code should be reviewed for the addition risks It is fully known that the pitch slope and angles of this curve will contribute to a truck safety issue and will increase the risks of track accidents and hazardous material spills. This extra detail is all missing from DEIS.* (10)
- *Ozone, Sulfur and benzene test stations should be set up to get accurate 2013 air quality sample readings in Laveen GRIC, Ahwatukee and Chandler.* (11)

Thank you,

Frank J. Kobylecki

1	**Air Quality**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix. In May 2012, the Arizona Department of Environmental Quality submitted a revised Maricopa Association of Governments 2012 Five Percent Plan for particulate matter (PM_{10}) for the region. On July 20, 2012, the U.S. Environmental Protection Agency made an official finding that the 2012 Five Percent Plan was administratively complete. This decision ended the sanctions clocks associated with Arizona's decision to withdraw the Maricopa Association of Governments 2007 Five Percent Plan. On February 6, 2014, the U.S. Environmental Protection Agency published a notice in the *Federal Register* proposing to approve the Maricopa Association of Governments *2012 Five Percent Plan for Attainment of the PM-10 Standard* for the Maricopa County Nonattainment Area. In the same notice, the U.S. Environmental Protection Agency stated that it would concur with exceptional event (as a result of haboobs and dust storms) documentation prepared by the Arizona Department of Environmental Quality, which would give the region the 3 years of clean data needed for attainment of the particulate matter (PM_{10}) 24-hour standard. Finally on May 30, 2014, the U.S. Environmental Protection Agency approved the 2012 Five Percent Plan and found the area in attainment of the 24-hour particulate matter (PM_{10}) standard based on monitoring data for the years 2010 to 2012 (see page 4-72 of the Final Environmental Impact Statement for more information).
2	**Air Quality**	As noted on page 4-76 of the Final Environmental Impact Statement, since ozone is a regional pollutant, there is no requirement to analyze potential impacts and no possibility of localized violations of ozone to occur at the project level. The Maricopa Association of Governments is responsible for developing plans to reduce emissions of ozone precursors in the Maricopa area. The Preferred Alternative is included in the *Regional Transportation Plan* that has been determined by the U.S. Department of Transportation to conform to the State Implementation Plan on February 12, 2014.
3	**Trucks**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix.
4	**Health Effects**

5	**Traffic**	The Federal Highway Administration and the U.S. Environmental Protection Agency approved the air quality conformity determination that includes the Maricopa Association of Governments regional travel demand model that produced the traffic projections used in the traffic analysis for the project (see Draft Environmental Impact Statement page 3-27). Traffic projections are regularly updated by the Maricopa Association of Governments. The traffic projections in the Draft Environmental Impact Statement are from a model adopted in 2011. When the Maricopa Association of Governments adopts new socioeconomic projections and traffic projections, it will be reflected in the study documents. Key model inputs used to forecast travel demand included (see Table 3-7 on Draft Environmental Impact Statement page 3-27): · socioeconomic data based on the adopted general plans of Maricopa Association of Governments members, which includes projected growth in population, housing, and employment (including proposed commercial centers), along with economic forecasts and the existing and planned transportation infrastructure as identified by Maricopa Association of Governments members · the anticipated average number of vehicle trips within the region (including those to and from the region's households) on a daily basis (this number is tracked regularly by the Maricopa Association of Governments) · the distribution of transportation modes used by travelers in the Maricopa Association of Governments region (also tracked regularly by the Maricopa Association of Governments · the capacity of the transportation infrastructure to accommodate regional travel · the future transportation infrastructure established using *Regional Transportation Plan*-planned projects and improvements and from known arterial street network improvements assumed to be made by the County, Cities, and private developers The Maricopa Association of Governments approved new socioeconomic projections in June 2013. The new data are presented in the Final Environmental Impact Statement (see page 1-11). Although slower growth in total vehicle miles traveled was noted, the need for the freeway did not change. The revised traffic analysis validated that the proposed project is needed today.
6	**Cultural Resources**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix. As discussed on page 4-147 of the Draft Environmental Impact Statement, a programmatic agreement was developed for the project to establish a process for consultation, review, and compliance with federal and State preservation laws as the effects of the project on historic properties become known. The programmatic agreement states that any data recovery on federal lands necessitated by the project must be permitted under the Archaeological Resources Protection Act in accordance with the federal land-holding agency and that, in the event any data recovery for the project should take place on tribal lands, all applicable permits would be obtained. Because the project is proposed, a programmatic agreement is in place to address data recovery on federal and tribal lands, and no excavations have yet occurred. The proposed freeway is and will continue to be in compliance with the Archaeological Resources Protection Act.

Code	Issue	Response
8	**Air Quality**	Summary information about the findings of the Joint Air Toxics Assessment Project study is provided as background information in the Draft and Final Environmental Impact Statements, but the study itself is not relevant to the type of analysis done pursuant to the Federal Highway Administration's mobile source air toxics guidance, which is an emissions analysis. Monitored ambient concentrations of mobile source air toxics (the focus of the Joint Air Toxics Assessment Project) do not inform this type of analysis. While monitoring data can be useful for defining current conditions in the affected environment (to the extent that the monitoring data are current), they don't tell us anything about future conditions, or the impacts of the project itself, which is why an emissions analysis was performed. The mobile source air toxic analysis presented beginning on page 4-77 of the Final Environmental Impact Statement is an estimated inventory of mobile source air toxic emissions for the entire Study Area for 2025 and 2035. This approach was used because the inventory estimate accounts for changes in traffic and emissions on all roadways affected by a proposed project, and would, therefore, be a more reliable predictor of changes in exposure to mobile source air toxics. The Draft and Final Environmental Impact Statements present information and analysis about the proposed action and the enhanced conditions when compared against the No-Action Alternative and would not cause substantial adverse effects. The Federal Highway Administration and Arizona Department of Transportation Draft and Final Environmental Impact Statements account for the potential effects when considering both adverse and beneficial impacts. The Draft and Final Environmental Impact Statements provide in-depth discussion of potential air quality impacts of the proposed alternatives. As noted above, the carbon monoxide analysis presented on page 4-65 of the Draft Environmental Impact Statement and updated on page 4-75 of the Final Environmental Impact Statement represents projected carbon monoxide concentrations along the project corridor, including those proposed interchange locations along the South Mountain Freeway corridor. The Arizona Department of Transportation also conducted a quantitative particulate matter (PM_{10}) hot-spot analysis that is discussed on page 4-76 of the Final Environmental Impact Statement. Both of these analyses demonstrate that the health-based National Ambient Air Quality Standards for carbon monoxide and particulate matter (PM_{10}) would not be exceeded at worst-case locations along the project corridor. The emission modeling developed for the proposed action showed that for the mobile source air toxics study area, there would be little difference in total annual emissions of mobile source air toxics emissions between the Preferred and No-Action Alternatives (less than a 1 percent difference) in 2025 and 2035. With the Preferred Alternative in 2035, modeled mobile source air toxics emissions would decrease by 57 percent to more than 90 percent, depending on the pollutant, despite a 47 percent increase in vehicle miles traveled in the Study Area compared with 2012 conditions (see discussion beginning on page 4-77 of the Final Environmental Impact Statement). The carbon monoxide and particulate matter (PM_{10}) analyses demonstrated that the proposed freeway would not contribute to any new localized violations, increase the frequency or severity of any existing violation, or delay timely attainment of the National Ambient Air Quality Standards or any required interim emissions reductions or other milestones.

ADOT Loop 202 South Mountain Freeway Study
1655 W. Jackson Street
MD126F
Phoenix, AZ 85007

Dear ADOT ,

I am a member of PARC and feel many issues not addressed or omitted in the recent DEIS. I would like the following issues entered into the public comment section:

Issues in DEIS

1. *Ozone levels today are exceeding the standard parts per million set by EPA and the clean air act and not considered to get worse in this study. Postponing EPA enforcement standards must be reconsidered to do a true DEIS . Also explaining that dust storms cause all this is not accurate. Modeling of today's air levels needs to be updated and relooked at accurately.* (1)
2. *Study must calculate and consider increased truck traffic from Mexico where trucks do not meet the CARB diesel standards adopted by AZ. Ignoring and assuming they won't take this faster route is seriously flawed part of DEIS study* (2)
3. *Also the DEIS needs to study the commercial development planned on the highway route. As of 5/21 several plans and public information on development are public including local business owners intended use of land leases on GRIC and truck stops and truck depots already planned. Also swift transportation truck routes and use of this highway have not been studied since there are no laws to restrict truck traffic on this freeway. Must require that camex trucks use highway 8 bypasses only but no enforcement nor acknowledgment in the study reviews the new camex traffic or other illegal truck traffic will now drive on this faster new highway. .* (3) (2)
4. *Direct impact to autism cause by highways built close to kids. Recent evidence already exists in 2013/2012 should be added into the impact and not avoided. DEIS does not have accurate and up-to-date 2013 2012 asthma and autism impacts growing in metro Phoenix nor updates to impacts of highway 51 health issues we see from folks living 1 mile for freeways.*
5. *DEIS need to go back and review current health impacts of existing highways air quality an EPA air violations. Then DEIS needs to model the impact of the growth projections on worsening the air and health risks.* (4)
6. *Population growth alone will estimate a severe worsening of health risks and cause air quality to be worse than EPA standards in 43 ave 51 ave zip 85045 85048 GRIC and laveen. Major flaw in such a study since it does not estimate these issues accurately for 2014 -2016 growth in toxic air and worsen health counts and health symptoms that the doctors and hospitals see now up for 2008 20010 etc..*
7. *Must better study for impacts to current and future residents and school kids whose play area and day cares will be less than ¼ of a mile from traffic*
8. *Did the study add in the additional traffic due to the building of the premium outlet mall at highway 10 and 202. This substantial increase in polluting traffic needs to be in the study. Not avoided since they exit the highway.* (3)
9. *Blasting thru south mountain will cause religious and racial discrimination and civil rights violations in SMF DEIS Is it legal to destroy burial rights and petroglyphs and Indian artifacts in the line of demolition. If DEIS does not really go on Indian land and it does not protect their adjacent artifacts is it accurate and inclusive. DEIS should study all the true direct and indirect impacts to the highway after its built.AIRFA passed in 1978 is not being followed nor respected.* (5) (6)
10. *Truck traffic from Mexico and high sulfur diesel and benzene levels will be worse than study portrays. The DEIA clearly does not model the additional air pollution for this traffic,* (2)
11. *This highway will not improve the air quality for phoenix . DEIS does not model the future impact accurately. Our city will be in violation of Clean air Act. Also will worsen west and south phoenix air.* (7)
12. *There is no serious discussion or consideration in the DEIS of the 2005 monitoring of toxic chemicals (present* (8)

Code	Issue	Response
1	**Air Quality**	As noted on page 4-76 of the Final Environmental Impact Statement, since ozone is a regional pollutant, there is no requirement to analyze potential impacts and no possibility of localized violations of ozone to occur at the project level. The Maricopa Association of Governments is responsible for developing plans to reduce emissions of ozone precursors in the Maricopa area. The Preferred Alternative is included in the *Regional Transportation Plan* that has been determined by the U.S. Department of Transportation to conform to the State Implementation Plan on February 12, 2014.
2	**Trucks**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix.
3	**Traffic**	The Federal Highway Administration and the U.S. Environmental Protection Agency approved the air quality conformity determination that includes the Maricopa Association of Governments regional travel demand model that produced the traffic projections used in the traffic analysis for the project (see Draft Environmental Impact Statement page 3-27). Traffic projections are regularly updated by the Maricopa Association of Governments. The traffic projections in the Draft Environmental Impact Statement are from a model adopted in 2011. When the Maricopa Association of Governments adopts new socioeconomic projections and traffic projections, it will be reflected in the study documents. Key model inputs used to forecast travel demand included (see Table 3-7 on Draft Environmental Impact Statement page 3-27): · socioeconomic data based on the adopted general plans of Maricopa Association of Governments members, which includes projected growth in population, housing, and employment (including proposed commercial centers), along with economic forecasts and the existing and planned transportation infrastructure as identified by Maricopa Association of Governments members · the anticipated average number of vehicle trips within the region (including those to and from the region's households) on a daily basis (this number is tracked regularly by the Maricopa Association of Governments) · the distribution of transportation modes used by travelers in the Maricopa Association of Governments region (also tracked regularly by the Maricopa Association of Governments · the capacity of the transportation infrastructure to accommodate regional travel · the future transportation infrastructure established using *Regional Transportation Plan*-planned projects and improvements and from known arterial street network improvements assumed to be made by the County, Cities, and private developers The Maricopa Association of Governments approved new socioeconomic projections in June 2013. The new data are presented in the Final Environmental Impact Statement (see page 1-11). Although slower growth in total vehicle miles traveled was noted, the need for the freeway did not change. The revised traffic analysis validated that the proposed project is needed today.
4	**Health Effects**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix.

Code	Comment Document

air toxins) . This 2005 study conducted by EPA and ADEQ in joint effort with JATAP showed results reported in 2006 showed emission from traffic were already (in 2006) above the standard of 1 million chance of cancer in a life time of exposure in west an south phoenix and GRIC, This need new data for 2007 2008 2009 2010 2011 2012 2013 since air and traffic are now worse. To not have DEIS study this is unethical and flawed.

8 4

13. *Jatap monitoring already found formaldehyde at 34 times the standards,*
14. *Benzene at 8 times the standard, butadiene 1 and 3 7.5 times the standard, acetaldehyde at 3.4 times the standard, our residents are being exposed to these entire carcinogens not just one. DEIS must study the combined effects of these current carcinogenic mixed compounds on Health. And then study the new higher levels of all of the above thru 2013, Then model and project the added compound and impacts caused by the study which will make all the toxin levels higher*
15. *Health risks of JATAP have been studied and need to be updated and cancer risks have been extensively published by the EPA and are well known carcinogens hurting health. The DEIS states it's uncertain of the risk proving the DEIS study is a cover-up and inaccurate denial of the facts.*

9 2 10

16. *DEIS does not mention hazmat transportation issues a risk of tanked from Mexico. Must redo the study for this*
17. *The sharp curve designed in the highway south of 85045 zip code should be reviewed for the addition risk for truck and car crashed since it's a steep banked curve, It is fully known that the pitch slope and angles of this curve will contribute to a truck safety issue and will increase the risks of track accidents and hazardous material spills. This extra detail is all missing from DEIS which is designed to protect and inform the public about impacts. A study of why the flaws in the DEIS need to be independently looked at as well and the influence the trucking industry is having and adot on rushing to poor judgment in this study. Independent review must be done to answer why the above points we omitted or played down and Environmental impacts since prior and current facts differ from the DEIS.*

11 3

18. *Congestion and future traffic counts not molded correctly and congestion on west I 10 on ramps not designed correctly to handle traffic volumes. ADOTS past modeling results have been inaccurate and realistic . We need better and realistic quality data inputs into the study. 2012 and 2013 traffic pattern data not updated in the study. Must relook at peak traffic from April 2013 as look at current air quality EPA violations.*

12

19. *Sulfur and benzene test stations should be set up to get accurate 2013 air quality reading in laveen GRIC and Ahwatukee and Chandler who are directly going to be impacted by this as well.*

13

20. *If you do major cut thru and removal of 3 to 5 ridges of South Mountain I assume the wind tunnel and wind patterns will be dramatically different and in the future will cause the wind , dust and pollution flows to be different. May cause more sulfur diesel and benzene to flow into the air and be trapped in zip codes 85045 85048 and on GRIC. The study does not seriously look at this impact with quality findings. I also am not certain that the studied the air quality and violations of EPA standards 2013 and may have exceeded EPA. Detail the EPA sensor air violations thru May 2013 so we all publically know what levels and issues we have before the freeway.*

12

8 14

21. *Dust particulate impact should be study at today's levels the construction levels and post construction levels since the natural wind tunnel with be changed due to cut thru mountain ridges and opening up air toxin portal.. What levels above EPA standard were exceeded in 2013 at the 43 ave EPA test monitor site.*
22. *It has been very difficult to breathe the air in 2013 in awhatukee and south leaven due to increase pollution and benzene and certainly worse than 2012 levels and worse thaqn what was identified inthe DEIS.*

12

23. *Updated data and study still needed and more air sampling must be done and study to wind pattern changes due to cutting thru mountains*

Sincerely concerned,

YUWEI QI

2810 W. WINDSONG DR.
PHOENIX, AZ 85045

Code	Issue	Response
5	**Cultural Resources**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix. As discussed on page 4-147 of the Draft Environmental Impact Statement, a programmatic agreement was developed for the project to establish a process for consultation, review, and compliance with federal and State preservation laws as the effects of the project on historic properties become known. The programmatic agreement states that any data recovery on federal lands necessitated by the project must be permitted under the Archaeological Resources Protection Act in accordance with the federal land-holding agency and that, in the event any data recovery for the project should take place on tribal lands, all applicable permits would be obtained. Because the project is proposed, a programmatic agreement is in place to address data recovery on federal and tribal lands, and no excavations have yet occurred. The proposed freeway is and will continue to be in compliance with the Archaeological Resources Protection Act.
6	**Environmental Justice/Lifestyle**	The cultural and religious importance of the South Mountains is acknowledged in the Draft Environmental Impact Statement in several locations, notably page 5-26. The proposed project, would accommodate and preserve (to the fullest extent possible from the available alternatives) access to the South Mountains for religious practices. Section 106 of the National Historic Preservation Act requires a government-to-government relationship between the Federal Government and Indian tribes as described beginning on page 4-140 of the Final Environmental Impact Statement. Section 106 requires federal agencies take into account the effects of their undertakings on historic properties and requires consultation with tribal authorities. Consultation has occurred with Gila River Indian Community government officials, the Tribal Historic Preservation Officer, the Cultural Resource Management Program, other tribes, and the State Historic Preservation Office and has led to concurrence from the Gila River Indian Community Tribal Historic Preservation Office and the State Historic Preservation Office on National Register of Historic Places eligibility recommendations (including traditional cultural properties like the South Mountains), project effects, and proposed mitigation and measures to minimize harm. This consultation has been ongoing and will continue until any commitments in a record of decision are completed. The section entitled *Title VI and Environmental Justice*, beginning on page 4-29 in the Draft Environmental Impact Statement, presents acceptable methods, data, and assumptions to assess the potential for disproportionately high and adverse effects from the proposed action on environmental justice populations and disparate impacts to populations protected under Title VI. Based upon the content of the section, no such effects would result from the action alternatives. In light of comments received on the Draft Environmental Impact Statement, the above-referenced conclusions were confirmed in the preparation of the Final Environmental Impact Statement. To provide further clarity, the discussions of environmental justice and Title VI were separated and additional text explaining the relationship of environmental justice and Title VI to various environmental elements was added throughout Chapter 4, *Affected Environment, Environmental Consequences, and Mitigation*, as exemplified by the inserted text on page 4-29 of the Final Environmental Impact Statement.

7	**Air Quality**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix.
8	**Air Quality**	Summary information about the findings of the Joint Air Toxics Assessment Project study is provided as background information in the Draft and Final Environmental Impact Statements, but the study itself is not relevant to the type of analysis done pursuant to the Federal Highway Administration's mobile source air toxics guidance, which is an emissions analysis. Monitored ambient concentrations of mobile source air toxics (the focus of the Joint Air Toxics Assessment Project) do not inform this type of analysis. While monitoring data can be useful for defining current conditions in the affected environment (to the extent that the monitoring data are current), they don't tell us anything about future conditions, or the impacts of the project itself, which is why an emissions analysis was performed. The mobile source air toxic analysis presented beginning on page 4-77 of the Final Environmental Impact Statement is an estimated inventory of mobile source air toxic emissions for the entire Study Area for 2025 and 2035. This approach was used because the inventory estimate accounts for changes in traffic and emissions on all roadways affected by a proposed project, and would, therefore, be a more reliable predictor of changes in exposure to mobile source air toxics. The Draft and Final Environmental Impact Statements present information and analysis about the proposed action and the enhanced conditions when compared against the No-Action Alternative and would not cause substantial adverse effects. The Federal Highway Administration and Arizona Department of Transportation Draft and Final Environmental Impact Statements account for the potential effects when considering both adverse and beneficial impacts. The Draft and Final Environmental Impact Statements provide in-depth discussion of potential air quality impacts of the proposed alternatives. As noted above, the carbon monoxide analysis presented on page 4-65 of the Draft Environmental Impact Statement and updated on page 4-75 of the Final Environmental Impact Statement represents projected carbon monoxide concentrations along the project corridor, including those proposed interchange locations along the South Mountain Freeway corridor. The Arizona Department of Transportation also conducted a quantitative particulate matter (PM_{10}) hot-spot analysis that is discussed on page 4-76 of the Final Environmental Impact Statement. Both of these analyses demonstrate that the health-based National Ambient Air Quality Standards for carbon monoxide and particulate matter (PM_{10}) would not be exceeded at worst-case locations along the project corridor. The emission modeling developed for the proposed action showed that for the mobile source air toxics study area, there would be little difference in total annual emissions of mobile source air toxics emissions between the Preferred and No-Action Alternatives (less than a 1 percent difference) in 2025 and 2035. With the Preferred Alternative in 2035, modeled mobile source air toxics emissions would decrease by 57 percent to more than 90 percent, depending on the pollutant, despite a 47 percent increase in vehicle miles traveled in the Study Area compared with 2012 conditions (see discussion beginning on page 4-77 of the Final Environmental Impact Statement). The carbon monoxide and particulate matter (PM_{10}) analyses demonstrated that the proposed freeway would not contribute to any new localized violations, increase the frequency or severity of any existing violation, or delay timely attainment of the National Ambient Air Quality Standards or any required interim emissions reductions or other milestones.

9	**Hazardous Materials**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix.
10	**Design**	All elements of the proposed freeway design are in accordance with the Arizona Department of Transportation's *Roadway Design Guidelines* and the American Association of State Highway and Transportation Officials' *A Policy on Geometric Design of Highways and Streets*. Emergency responders would address the construction of the proposed freeway by amending the local emergency response plan to include the facility. This would include emergency response on the road and alternative routes for diversion of traffic in the event that an incident occurred along the road. Information related to transport of hazardous materials is presented on Final Environmental Impact Statement page 4-166.
11	**Alternatives, W59 Alternative Versus W101 Alternative**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix.
12	**Air Quality**	Data from various Maricopa County Air Quality Department monitoring sites were used in the air quality analyses. Siting, operation, and recording information from monitoring sites are the responsibility of the Maricopa County Air Quality Department. See <maricopa.gov/aq/>. The monitoring information used in the air quality analyses is discussed in greater detail in the air quality technical report prepared for the project, which is available on the project Web site at <azdot.gov/southmountainfreeway>. The results of the analyses are summarized in the Final Environmental Impact Statement. According to U.S. Environmental Protection Agency guidance, new monitors are not necessary to analyze air quality impacts.
13	**Air Quality**	Air quality depends on several factors such as the area itself (size and topography), the prevailing weather patterns (meteorology and climate) and the pollutants released into the air. Cuts through the South Mountains would be expected to produce microclimate differences similar to those produced by a series of buildings in a large city which produce localized wind tunnel effects. The mountain cuts, however, would not affect regional air quality.
14	**Air Quality**	Emissions from road dust and additional sources were considered in the quantitative project-level particulate matter (PM_{10}) hot-spot analysis prepared for the proposed project. The results of the analysis are summarized in the prologue to the Final Environmental Impact Statement (page xiii) and more fully described beginning on page 4-68 of the Final Environmental Impact Statement. The carbon monoxide and particulate matter (PM_{10}) analyses demonstrated that the proposed freeway would not contribute to any new localized violations, increase the frequency or severity of any existing violation, or delay timely attainment of the National Ambient Air Quality Standards or any required interim emissions reductions or other milestones.

ADOT Loop 202 South Mountain Freeway Study
1655 W. Jackson Street
MD126F
Phoenix, AZ 85007

Dear ADOT ,

I am a member of PARC and feel many issues not addressed or omitted in the recent DEIS. I would like the following issues entered into the public comment section:

Issues in DEIS

- *DEIS panel needs to go back and review total current health impacts of existing highways air quality an EPA air violations. Then DEIS needs to model the impact of the growth projections on worsening the air and health risks. Assumptions made in study are understating the impacts and are unrealistic.* (1)
- *This highway will not improve the air quality for phoenix . DEIS does not model the future impact accurately. Our city will be in violation of Clean air Act. Also will worsen west and south phoenix air.* (2)
- *Ozone levels today are exceeding the standard parts per million set by EPA and the clean air act and not considered to get worse in this study. Postponing EPA enforcement standards must be reconsidered to do a true DEIS . Also explaining that dust storms cause all this is not accurate. Modeling of today's air levels needs to be updated and relooked at accurately.* (3)
- *Study must calculate and consider increased truck traffic from Mexico where trucks do not meet the CARB diesel standards adopted by AZ. Ignoring and assuming they won't take this faster route is seriously flawed part of DEIS study* (4)
- *There is a need to study the commercial development planned on the highway route. As of 5/21 several plans and public information on development are public including local business owners intended use of land leases on GRIC and truck stops and truck depots already planned. Also swift transportation truck routes and use of this highway have not been studied since there are no laws to restrict truck traffic on this freeway. Must require that camex trucks use highway 8 bypasses only but no enforcement nor acknowledgment in the study reviews the new camex traffic or other illegal truck traffic will now drive on this faster new highway. .* (5)
- *Direct impact to autism cause by highways built close to kids. Recent evidence already exists in 2013/2012 should be added into the impact and not avoided. DEIS does not have accurate and up-to-date 2013 2012 asthma and autism impacts growing in metro Phoenix nor updates to impacts of highway 51 health issues we see from folks living 1 mile for freeways.* (1)
- *Population growth alone will estimate a severe worsening of health risks and cause air quality to be worse than EPA standards in 43 ave 51 ave zip 85045 85048 GRIC and laveen. Major flaw in such a study since it does not estimate these issues accurately for 2014 -2016 growth in toxic air and worsen health counts and health symptoms that the doctors and hospitals see now up for 2008 20010 etc..* (1)
- *Must better study for impacts to current and future residents and school kids whose play area and day cares will be less than ¼ of a mile from traffic* (1)
- *Did the study add in the new additional traffic due to the building of the premium outlet mall at highway 10 and 202. This substantial increase in polluting traffic needs to be in the study. Not avoided since they exit the highway.* (5)
- *Blasting thru south mountain will cause religious and racial discrimination and civil rights violations in SMF DEIS Is it legal to destroy burial rights and petroglyphs and Indian artifacts in the line of demolition. If DEIS does not really go on Indian land and it does not protect their adjacent artifacts is it accurate and inclusive. DEIS should study all the true direct and indirect impacts to the highway after its built.AIRFA passed in 1978 is not being followed nor respected.* (6) (7)
- *Truck traffic from Mexico and high sulfur diesel and benzene levels will be worse than study portrays. The DEIA clearly does not model the additional air pollution for this traffic,* (4)
- *There is no serious consideration in the DEIS of the 2005 monitoring of toxic chemicals (present air toxins) .* (8)

Code	Issue	Response
1	**Health Effects**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix.
2	**Air Quality**	
3	**Air Quality**	As noted on page 4-76 of the Final Environmental Impact Statement, since ozone is a regional pollutant, there is no requirement to analyze potential impacts and no possibility of localized violations of ozone to occur at the project level. The Maricopa Association of Governments is responsible for developing plans to reduce emissions of ozone precursors in the Maricopa area. The Preferred Alternative is included in the *Regional Transportation Plan* that has been determined by the U.S. Department of Transportation to conform to the State Implementation Plan on February 12, 2014.
4	**Trucks**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix.
5	**Traffic**	The Federal Highway Administration and the U.S. Environmental Protection Agency approved the air quality conformity determination that includes the Maricopa Association of Governments regional travel demand model that produced the traffic projections used in the traffic analysis for the projectewed by the U.S. Environmental Protection Agency for air quality conformity (see Draft Environmental Impact Statement page 3-27). Traffic projections are regularly updated by the Maricopa Association of Governments. The traffic projections in the Draft Environmental Impact Statement are from a model adopted in 2011. When the Maricopa Association of Governments adopts new socioeconomic projections and traffic projections, it will be reflected in the study documents. Key model inputs used to forecast travel demand included (see Table 3-7 on Draft Environmental Impact Statement page 3-27): · socioeconomic data based on the adopted general plans of Maricopa Association of Governments members, which includes projected growth in population, housing, and employment (including proposed commercial centers), along with economic forecasts and the existing and planned transportation infrastructure as identified by Maricopa Association of Governments members · the anticipated average number of vehicle trips within the region (including those to and from the region's households) on a daily basis (this number is tracked regularly by the Maricopa Association of Governments) · the distribution of transportation modes used by travelers in the Maricopa Association of Governments region (also tracked regularly by the Maricopa Association of Governments · the capacity of the transportation infrastructure to accommodate regional travel · the future transportation infrastructure established using *Regional Transportation Plan*-planned projects and improvements and from known arterial street network improvements assumed to be made by the County, Cities, and private developers The Maricopa Association of Governments approved new socioeconomic projections in June 2013. The new data are presented in the Final Environmental Impact Statement (see page 1-11). Although slower growth in total vehicle miles traveled was noted, the need for the freeway did not change. The revised traffic analysis validated that the proposed project is needed today.

8 1	*This 2005 study conducted by EPA and ADEQ in joint effort with JATAP showed results reported in 2006 showed emission from traffic were already (in 2006) above the standard of 1 million chance of cancer in a lifetime of exposure in west an south phoenix and GRIC, This need new data for 2007 2008 2009 2010 2011 2012 2013 since air and traffic are now worse. To not have DEIS study this is unethical and flawed.* • *Jatap monitoring already found formaldehyde at 34 times the standards,* • *Benzene at 8 times the standard, butadiene 1 and 3 7.5 times the standard, acetaldehyde at 3.4 times the standard, our residents are being exposed to these entire carcinogens not just one. DEIS must study the combined effects of these current carcinogenic mixed compounds on Health. And then study the new higher levels of all of the above thru 2013, Then model and project the added compound and impacts caused by the study which will make all the toxin levels higher* • *Health risks of JATAP have been studied and need to be updated and cancer risks have been extensively published by the EPA and are well known carcinogens hurting health. The DEIS states it's uncertain of the risk proving the DEIS study is a cover-up and inaccurate denial of the facts.*
9	• *DEIS does not mention hazmat transportation issues a risk of tanked from Mexico. Must redo the study for this*
10	• *The designed sharp curve in the highway south of 85045 zip code should be reviewed for the addition risk for truck and car crashed since it's a steep banked curve, It is fully known that the pitch slope and angles of this curve will contribute to a truck safety issue and will increase the risks of track accidents and hazardous material spills. This extra detail is all missing from DEIS which is designed to protect and inform the public about impacts. A study of why the flaws in the DEIS need to be independently looked at as well and the influence the trucking industry is having and adot on rushing to poor judgment in this study. Independent review must be done to answer why the above points we omitted or played down and Environmental impacts since prior and current facts differ from the DEIS.*
11 5	• *Future traffic counts not molded correctly and congestion on west I 10 on ramps not designed correctly to handle traffic volumes. ADOTS past modeling results have been inaccurate and realistic . We need better and realistic quality data inputs into the study. 2012 and 2013 traffic pattern data not updated in the study. Must relook at peak traffic from April 2013 as look at current air quality EPA violations.*
12	• *Sulfur and benzene test stations should be set up to get accurate 2013 air quality sample readings in Laveen GRIC, Ahwatukee and Chandler who are directly going to be impacted by this as well.*
	Thank you, ,

Code	Issue	Response
6	**Cultural Resources**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix. As discussed on page 4-147 of the Draft Environmental Impact Statement, a programmatic agreement was developed for the project to establish a process for consultation, review, and compliance with federal and State preservation laws as the effects of the project on historic properties become known. The programmatic agreement states that any data recovery on federal lands necessitated by the project must be permitted under the Archaeological Resources Protection Act in accordance with the federal land-holding agency and that, in the event any data recovery for the project should take place on tribal lands, all applicable permits would be obtained. Because the project is proposed, a programmatic agreement is in place to address data recovery on federal and tribal lands, and no excavations have yet occurred. The proposed freeway is and will continue to be in compliance with the Archaeological Resources Protection Act.
7	**Environmental Justice/Lifestyle**	The cultural and religious importance of the South Mountains is acknowledged in the Draft Environmental Impact Statement in several locations, notably page 5-26. The proposed project, would accommodate and preserve (to the fullest extent possible from the available alternatives) access to the South Mountains for religious practices. Section 106 of the National Historic Preservation Act requires a government-to-government relationship between the Federal Government and Indian tribes as described beginning on page 4-140 of the Final Environmental Impact Statement. Section 106 requires federal agencies take into account the effects of their undertakings on historic properties and requires consultation with tribal authorities. Consultation has occurred with Gila River Indian Community government officials, the Tribal Historic Preservation Officer, the Cultural Resource Management Program, other tribes, and the State Historic Preservation Office and has led to concurrence from the Gila River Indian Community Tribal Historic Preservation Office and the State Historic Preservation Office on National Register of Historic Places eligibility recommendations (including traditional cultural properties like the South Mountains), project effects, and proposed mitigation and measures to minimize harm. This consultation has been ongoing and will continue until any commitments in a record of decision are completed. The section entitled *Title VI and Environmental Justice*, beginning on page 4-29 in the Draft Environmental Impact Statement, presents acceptable methods, data, and assumptions to assess the potential for disproportionately high and adverse effects from the proposed action on environmental justice populations and disparate impacts to populations protected under Title VI. Based upon the content of the section, no such effects would result from the action alternatives. In light of comments received on the Draft Environmental Impact Statement, the above-referenced conclusions were confirmed in the preparation of the Final Environmental Impact Statement. To provide further clarity, the discussions of environmental justice and Title VI were separated and additional text explaining the relationship of environmental justice and Title VI to various environmental elements was added throughout Chapter 4, *Affected Environment, Environmental Consequences, and Mitigation*, as exemplified by the inserted text on page 4-29 of the Final Environmental Impact Statement.

8	**Air Quality**	Summary information about the findings of the Joint Air Toxics Assessment Project study is provided as background information in the Draft and Final Environmental Impact Statements, but the study itself is not relevant to the type of analysis done pursuant to the Federal Highway Administration's mobile source air toxics guidance, which is an emissions analysis. Monitored ambient concentrations of mobile source air toxics (the focus of the Joint Air Toxics Assessment Project) do not inform this type of analysis. While monitoring data can be useful for defining current conditions in the affected environment (to the extent that the monitoring data are current), they don't tell us anything about future conditions, or the impacts of the project itself, which is why an emissions analysis was performed. The mobile source air toxic analysis presented beginning on page 4-77 of the Final Environmental Impact Statement is an estimated inventory of mobile source air toxic emissions for the entire Study Area for 2025 and 2035. This approach was used because the inventory estimate accounts for changes in traffic and emissions on all roadways affected by a proposed project, and would, therefore, be a more reliable predictor of changes in exposure to mobile source air toxics. The Draft and Final Environmental Impact Statements present information and analysis about the proposed action and the enhanced conditions when compared against the No-Action Alternative and would not cause substantial adverse effects. The Federal Highway Administration and Arizona Department of Transportation Draft and Final Environmental Impact Statements account for the potential effects when considering both adverse and beneficial impacts. The Draft and Final Environmental Impact Statements provide in-depth discussion of potential air quality impacts of the proposed alternatives. As noted above, the carbon monoxide analysis presented on page 4-65 of the Draft Environmental Impact Statement and updated on page 4-75 of the Final Environmental Impact Statement represents projected carbon monoxide concentrations along the project corridor, including those proposed interchange locations along the South Mountain Freeway corridor. The Arizona Department of Transportation also conducted a quantitative particulate matter (PM_{10}) hot-spot analysis that is discussed on page 4-76 of the Final Environmental Impact Statement. Both of these analyses demonstrate that the health-based National Ambient Air Quality Standards for carbon monoxide and particulate matter (PM_{10}) would not be exceeded at worst-case locations along the project corridor. The emission modeling developed for the proposed action showed that for the mobile source air toxics study area, there would be little difference in total annual emissions of mobile source air toxics emissions between the Preferred and No-Action Alternatives (less than a 1 percent difference) in 2025 and 2035. With the Preferred Alternative in 2035, modeled mobile source air toxics emissions would decrease by 57 percent to more than 90 percent, depending on the pollutant, despite a 47 percent increase in vehicle miles traveled in the Study Area compared with 2012 conditions (see discussion beginning on page 4-77 of the Final Environmental Impact Statement). The carbon monoxide and particulate matter (PM_{10}) analyses demonstrated that the proposed freeway would not contribute to any new localized violations, increase the frequency or severity of any existing violation, or delay timely attainment of the National Ambient Air Quality Standards or any required interim emissions reductions or other milestones.

Code	Issue	Response
9	**Hazardous Materials**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix.
10	**Design**	All elements of the proposed freeway design are in accordance with the Arizona Department of Transportation's *Roadway Design Guidelines* and the American Association of State Highway and Transportation Officials' *A Policy on Geometric Design of Highways and Streets*. Emergency responders would address the construction of the proposed freeway by amending the local emergency response plan to include the facility. This would include emergency response on the road and alternative routes for diversion of traffic in the event that an incident occurred along the road. Information related to transport of hazardous materials is presented on Final Environmental Impact Statement page 4-166.
11	**Alternatives, W59 Alternative Versus W101 Alternative**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix.
12	**Air Quality**	Data from various Maricopa County Air Quality Department monitoring sites were used in the air quality analyses. Siting, operation, and recording information from monitoring sites are the responsibility of the Maricopa County Air Quality Department. See <maricopa.gov/aq/>. The monitoring information used in the air quality analyses is discussed in greater detail in the air quality technical report prepared for the project, which is available on the project Web site at <azdot.gov/southmountainfreeway>. The results of the analyses are summarized in the Final Environmental Impact Statement. According to U.S. Environmental Protection Agency guidance, new monitors are not necessary to analyze air quality impacts.

1	Dear Arizona Department of Transportation: I support building the South Mountain Freeway. The freeway expansion would help in reducing traffic congestion on our existing freeways and streets, plus create thousands of jobs and pump millions of dollars into our economy. Please build the South Mountain Freeway. Sincerely, THE KASLER FAMILY 4064 E CLUBVIEW DR GILBERT, AZ 85298 4802846424

05-13 V-1 Petition

LET'S BUILD THE 202
People for the South Mountain Freeway

Petition in Support of the South Mountain Freeway

We, the undersigned concerned citizens of the Phoenix metropolitan area, do hereby urge the Arizona Department of Transportation (ADOT) and the Federal Highway Administration (FHWA) to proceed with construction of the Loop 202 South Mountain Freeway as soon as possible within the next twelve months. The freeway corridor is of vital importance to the region because of its anticipated positive impact on reducing Valley traffic congestion and air pollution. The freeway project also will create 30,000 jobs and pump $2 billion into the local economy over the five to six years needed for construction. Voters have shown strong support for this project twice at the ballot box, first in 1985 and again in 2004. Recent public opinion polling shows two-thirds of Maricopa County voters remain in strong support of building the freeway now. Fifty-nine percent of Ahwatukee and Laveen voters also support the project. The following signatures are from those living and working in the region to be served by the planned Loop 202 alignment. We implore ADOT to begin construction on the Loop 202 as soon as possible.

LET'S BUILD THE 202
People for the South Mountain Freeway

Petition in Support of the South Mountain Freeway

We, the undersigned concerned citizens of the Phoenix metropolitan area, do hereby urge the Arizona Department of Transportation (ADOT) and the Federal Highway Administration (FHWA) to proceed with construction of the Loop 202 South Mountain Freeway as soon as possible within the next twelve months. The freeway corridor is of vital importance to the region because of its anticipated positive impact on reducing Valley traffic congestion and air pollution. The freeway project also will create 30,000 jobs and pump $2 billion into the local economy over the five to six years needed for construction. Voters have shown strong support for this project twice at the ballot box, first in 1985 and again in 2004. Recent public opinion polling shows two-thirds of Maricopa County voters remain in strong support of building the freeway now. Fifty-nine percent of Ahwatukee and Laveen voters also support the project. The following signatures are from those living and working in the region to be served by the planned Loop 202 alignment. We implore ADOT to begin construction on the Loop 202 as soon as possible.

LET'S BUILD THE 202
People for the South Mountain Freeway

Petition in Support of the South Mountain Freeway

We, the undersigned concerned citizens of the Phoenix metropolitan area, do hereby urge the Arizona Department of Transportation (ADOT) and the Federal Highway Administration (FHWA) to proceed with construction of the Loop 202 South Mountain Freeway as soon as possible within the next twelve months. The freeway corridor is of vital importance to the region because of its anticipated positive impact on reducing Valley traffic congestion and air pollution. The freeway project also will create 30,000 jobs and pump $2 billion into the local economy over the five to six years needed for construction. Voters have shown strong support for this project twice at the ballot box, first in 1985 and again in 2004. Recent public opinion polling shows two-thirds of Maricopa County voters remain in strong support of building the freeway now. Fifty-nine percent of Ahwatukee and Laveen voters also support the project. The following signatures are from those living and working in the region to be served by the planned Loop 202 alignment. We implore ADOT to begin construction on the Loop 202 as soon as possible.

Petition to Complete the Loop 202

The concerned citizens of Phoenix respectfully petition the Arizona Department of Transportation (ADOT) to expedite the completion of the Loop 202 South Mountain Freeway. The completion of the freeway is of unquestionable importance for mobility and economic opportunities. The South Mountain Freeway was included in the Regional Transportation Plan in 1985. Nearly 27 years later we are still awaiting construction of this facility. The following signatures are from those living and working in the area to be served by the planned Loop 202 alignment. We, the concerned citizens, implore ADOT to begin construction on the Loop 202 as soon as possible.

Petition to Complete the Loop 202

The concerned citizens of Phoenix respectfully petition the Arizona Department of Transportation (ADOT) to expedite the completion of the Loop 202 South Mountain Freeway. The completion of the freeway is of unquestionable importance for mobility and economic opportunities. The South Mountain Freeway was included in the Regional Transportation Plan in 1985. Nearly 27 years later we are still awaiting construction of this facility. The following signatures are from those living and working in the area to be served by the planned Loop 202 alignment. We, the concerned citizens, implore ADOT to begin construction on the Loop 202 as soon as possible.

We are not selling anything, but are conducting a survey on some important issues and would like to ask you a few questions. Your name was chosen at random by computer and your answers are completely confidential.

Q. In general, would you say that Maricopa County is heading in the right direction, or off on the wrong track? **[IF RIGHT/WRONG: Would that be definitely right/wrong or probably right/wrong?]**

11.8% Definitely right direction
41.3% Probably right direction
10.3% Probably wrong track
11.0% Definitely wrong track
25.8% Don't know, refused

Q. Which of the following do you consider the largest challenge facing the Maricopa County today? **[Rotate options]**

26.3% Illegal Immigration
23.0% Education funding
14.3% Political turmoil and infighting
11.0% Creating Jobs
7.0% Balancing the County Budget
5.8% Healthcare
3.3% Taxes
3.3% Traffic congestion
3.3% Don't Know, Refused
3.0% Other

Q. The proposed South Mountain freeway planned along Pecos road through part of South Mountain Park and north along 51st Avenue has been twice approved by the voters, once in 1985 and again in 2004. The funding for the freeway is available through the voter approved plan. Knowing just what you know today, do you support or oppose the construction of the South Mountain freeway? **[Strongly/somewhat]**

9.8% Strongly Oppose
9.8% Somewhat Oppose
11.8% Neutral
23.3% Somewhat Support
41.0% Strongly Support
4.5% No Opinion, Refused

Comment Document

Q. How long have you lived in the State of Arizona?

1.3% 5 years or less
11.3% 6 to 10 years
15.7% 11 to 15 years
13.7% 16 years to 20 years
57.3% Longer than 20 years
0.7% Refused

Q. In politics, do you consider yourself to be conservative, moderate, or liberal? [Wait for response. If conservative or liberal, ask:] Would that be very conservative/liberal or just somewhat conservative/liberal?

17.7% Very Conservative
17.7% Somewhat Conservative
32.3% Moderate
11.7% Somewhat Liberal
9.3% Very Liberal
11.3% Don't Know, Refused

Comment Document

Q. Next, I am going to read two statements. Please tell me which statement opinion is closer to your own opinion. **[Rotate 1 and 2]**

(1) Citizen Smith says in 1985 voters approved the South Mountain Freeway. In 2004, voters overwhelmingly affirmed that vote by approving the South Mountain once again. It doesn't make sense that a small number of people can block the will of the voters. We need to finish building the entire freeway system, which includes the South Mountain bypass.

(2) Citizen Jones says the South Mountain Freeway Project is opposed by the Gila River Indian Community and a broad coalition of neighbors and others who would be negatively impacted by the project. Placing the freeway down Pecos would destroy neighborhoods, threaten the South Mountain preserve, create smog, and hurt endangered wild life in the area. It is time to close the book on the South Mountain Freeway and find an alternate bypass route.

Which viewpoint comes closer to your own - that of Citizen Smith who supports the freeway OR that of Citizen Jones who opposes it?

65.3% Smith (supports)
22.8% Jones (opposes)
6.0% Neither
6.0% Other, Don't Know

Finally, just to help us tabulate our data:

Q. Did I reach you on a:

53.0% Home telephone
42.3% Cellular telephone
1.8% Office telephone
1.0% Other
2.0% Refused

Q. How long have you lived in the State of Arizona?

3.5% 5 years or less
11.8% 6 to 10 years
13.8% 11 to 15 years
10.8% 16 years to 20 years
58.3% Longer than 20 years
2.0% Refused

Q. In politics, do you consider yourself to be conservative, moderate, or liberal? [Wait for response. If conservative or liberal, ask:] Would that be very conservative/liberal or just somewhat conservative/liberal?

20.0% Very Conservative
18.8% Somewhat Conservative
33.0% Moderate
12.8% Somewhat Liberal
8.8% Very Liberal
6.8% Don't Know, Refused

affecting this proposed freeway.

Also, the second issue is that this is a unique freeway in that it connects the north part of I-10 to the south, which is a bypass or a wraparound that makes all interstate traffic and truckers going through the Ahwatukee area and having congestion at the end of the road, where there is already major congestion from the 202 freeway, and there's miles and miles of stop-and-go traffic on the way to Maricopa, on the way to Sun City, and to the casino at that location.

I have a much longer statement that I would like to put into the information that's being collected today. I greatly oppose this freeway.

THE FACILITATOR: Thank you, Ms. Sampson.

MS. SAMPSON: Thank you.

THE FACILITATOR: Linda Abegg. Good afternoon. Did I pronounce your name right?

MS. ABEGG: Yes, you did.

THE FACILITATOR: Ms. Abegg, you have three minutes, there's a timer right down here. Begin, please.

1 MS. ABEGG: I just wanted to say that I'm in support of building the 202 freeway. I live in Laveen, I have been there for about six or seven years, I think that this would benefit our community in bringing more of the amenities and things that our community is lacking

and help us to -- I feel like Laveen is somewhat at a crossroads and we can move forward to be a good community for our families. Or if it stays kind of stagnant where it is, that it's not going to be as good of a place for people with families trying to improve their community, so I support the freeway coming through. Thank you.

THE FACILITATOR: Thank you.

David Gould.

MR. GOULD: I hope this is not the walk of shame.

THE FACILITATOR: Not at all.

MR. GOULD: It's a lovely facility you have here. I'm from Maine and we don't have anything like this up there. Bear with me until I get my question.

THE FACILITATOR: Mr. Gould, before you begin, this is not a Q-and-A session, it's a --

MR. GOULD: I'm kind of hard of hearing, I apologize.

THE FACILITATOR: Yes. This is not a question-and-answer session, it's merely to gather your comments.

MR. GOULD: All right.

THE FACILITATOR: And you have three minutes and the timer is right there. Begin, please.

MR. GOULD: Okay. Well, there are a lot of

Subject: South Mountain Freeway

The whiners protesting the freeway have forgotten that the original purpose of the interstate was modeled on the German Autobahn, and while a convenience to motorists its primary use was for military mobility.

1 The people like, Greta Rogers, Jim Jochims, Steve Brittle, et.al; need to get a grip with reality. We need the extension to insure we have adequate means of egress in case of emergency evacuation and to mediate the problems with I-10, the Broadway Curve and to create a bypass for those not wanting to go 'downtown' but continue western routing.

This issue is not about personal desires but what is best for the metropolitan area and best for Phoenix.

I am writing to state my opposition for the proposed expansion of Loop 202/ South Mountain Freeway. I want to advocate " no built" as only the option that preserves the environment, health of Laveen & Ahwatukee resident & respects O'dham traditions.
Sencerely,
Rebecca Aguayo

Subject: Comment on Proposed Loop 202 (South Mountain Freeway)

1 South Mountain Park would be irreparably harmed by having a major freeway crossing (or even close to) its western boundary. NO BUILD is the best option for the proposed Loop 202 Freeway extension.

2 As a resident of Ahwatukee, I urge that this project not go forward. A massive freeway just south of Ahwatukee will have negative consequences for our community and for South Mountain Park.

3 Vehicle exhaust – including noxious diesel fumes – from a massive freeway would foul the air in our neighborhood and in the park. Any expectation that the project would reduce regional air pollution simply reflects spreading that pollution into Ahwatukee. We don't want it. This would reduce the attractiveness of Ahwatukee as a place to live. If Ahwatukee becomes as hazy as the rest of Phoenix, property values here will suffer.

4

5 Additional traffic on a major freeway to our south and west would inevitably increase traffic in our neighborhoods – quite simply, there would be more cars in the area if a freeway is wrapped around us. Traffic here is bad enough as it is. Cut-through drivers would be speeding down our streets (endangering

(Comment codes continue on next page)

Code	Issue	Response
1	**Section 4(f) and Section 6(f)**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix.
2	**Alternatives, No-Action (No-Build) Alternative**	
3	**Air Quality**	
4	**Property Values**	A review of the literature reveals few detailed and comprehensive analyses of the relationship between the transportation infrastructure and residential property values (Transportation Research Record: Journal of the Transportation Research Board, No. 2174, Transportation Research Board of the National Academies, Washington, D.C., 2010, pp. 138–47; "Impact of Highways on Property Values: Case Study of the Superstition Freeway Corridor"). A recent study by the California Department of Transportation concluded that freeway facilities did not substantially affect sales prices in residential areas adjacent to the facility. The study concluded that it is the visibility of the freeway that may influence selling price and not distance or noise. As a result, the researchers generally concluded that the more the visibility of a new freeway is reduced, the less it would determine the sales price of homes sold in the area.
5	**Traffic**	In 2006, the City of Phoenix conducted a traffic circulation study to evaluate the impacts of the proposed freeway on the local street system. The City study found no adverse effects on the local street system from the freeway (see Appendix 3-1 in the Final Environmental Impact Statement).
6	**Neighborhoods/ Communities**	Unplanned growth is often termed "urban sprawl." Generally, this term is used in the context of rapid and uncontrolled urban growth onto previously undeveloped land—usually on the outskirts of an existing urban area. Projects like the proposed freeway are often identified as contributors to urban sprawl. Freeway projects are often cited as making land at the urban fringe more accessible and, therefore, more attractive for development. However, examination of data comparing population and land use between 1975 and 2000 suggests major transportation projects like the proposed freeway do not induce growth in the region (see Final Environmental Impact Statement pages 4-170 through 4-174). The proposed freeway would be implemented in a historically quickly urbanizing area (most noticeably in the Western Section of the Study Area, although the nationwide recession which began in 2007 slowed growth). In the Eastern Section of the Study Area, the proposed freeway would abut public parkland, Native American land, and a near-fully developed area—therefore, any contribution to accelerated or induced growth would be constrained. The proposed freeway would be built in an area planned for urban growth as established in local jurisdictions' land use plans for at least the last 25 years.
7	**Purpose and Need, Lack of Support**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix.

Code	Comment Document

children, pedestrians and cyclists) when they realize that speed limits are not enforced in our residential neighborhoods.

The proposed project has many negatives for Ahwatukee and South Mountain, and precious few positives. The main positive results of this project would accrue to developers who would profit by increasing suburban sprawl, and to the firms that build the road. These profits would come at the expense of reduced quality of life in Ahwatukee.

6

Ahwatukee does not need or want increased air pollution and traffic. Yes, these will increase with time anyway, but they would increase to a greater degree (and sooner) with the 202 extension in our backyard.

7 3

South Mountain Park is a valuable asset to Phoenix and should not be degraded by placing a major freeway at its western boundary. NO BUILD is the only acceptable option for Ahwatukee and South Mountain Park.

This Project is the completion of a great plan put in motion over two decades ago. It is imperative that the last leg of the program be completed. Without this leg of the 202 completed the congestion and ultimately the loss of commerce for the Valley is garanteed. My only comment on the preferred alignment is that with the 59th alignment the all vehicles that are using I-10 to 202S leg to bypass the core of the valley will still have have to travel deep into the city to gain access. The 101 alignments seems to be a better chose and will also gain easier access to the 101 corridor.

1	Mary Aldham Document Created: 5/21/2013 8:39:04 PM by Web Comment Form Hi there. I am a resident of Laveen. My husband and I chose Laveen because it was a great community. Having lived here for a year, it is evident that a freeway is much needed. You have professionals that have moved to Laveen either for the highly ranked schools for their kids, or for that small town sense of community on the outskirts of a big city... whatever the reason, without the 202, we all feel a sense of disconnect. Disconnect from shops, specialty grocery stores, malls, but most importantly, life-saving establishments such as hospitals, clinics, etc. The 202 is gravely needed. The 202 will ensure that we will not have to drive 30 minutes to go to the hospital. We won't have to drive a wasted 45 minutes to get to Chandler or Awhatukee. Most importantly, we won't have to waste time driving in grid-locked surface streets, such as Baseline to get to work. Please build the 202!!

of three announcements. The last shuttle will be leaving at 7:30 for all routes, that's the orange, green, and blue routes or 1, 2, and 3. Again, the last shuttle will leave at 7:30. Thank you.

Mary Aldham.

MS. ALDHAM: Hi, I just want to tell you I live in Laveen; I am pro 202. We -- my husband and I moved to Laveen a year ago, and just because we love the community, we thought it was a great -- there was a great sense of community. We've been living there a year. The community is still very tight, but everybody in the community feels a sense of disconnect. They feel that -- I feel that we're disconnected from a lot of things, shops, restaurants, hospitals, like, and I go to work and, you know, I have to take surface roads. We have to take surface roads wherever we go, and it's grid-locked, stop, start, stop, start. Lots of traffic. And the lady that spoke just before me, she wanted you to consider the area that she lives in, the traffic. Well, we deal with the traffic every day. That's why we need the 202. We don't want to feel a sense of disconnect. I don't want to know that if I get sick or something like that, it's going to take 25 minutes to get to a hospital.

So I -- I'm here in support of the 202. Just one of your statistics, people are talking about sacred land and so forth and South Mountain preservation land, taking your statistics, it's only going take .2 percent, which is 31 acres of the 16,600 acres of South Mountain Park.

So that's completely minimal. And, anyway, thank you for my -- for considering. Thank you.

THE FACILITATOR: Thank you.

If anybody out there would like to speak, please go out front and register at the front desk and then come on back in.

Before we call the next person up, the last shuttle will be leaving for all destinations at 7:30, that's orange, green, and blue or 1, 2, and 3.

Claudia "Leeschen," Leischen.

MS. LEISCHEN: Leischen.

THE FACILITATOR: Leischen. Would you mind using this other microphone, please.

MS. LEISCHEN: I wrote my statement. I live in Central Phoenix, just near Baseline and Central. As you know, Baseline is the main corridor for people who live in Laveen and work or shop in the East Valley. I suspect that an interchange on the proposed freeway at Baseline will now funnel even

ADOT,

1

Please continue to push forward with getting this important piece of the Phoenix freeway system designed & built. It is crucial to open up our down town to only the necessary traffic & get give the rest of us an option from funneling thru the neck at the Broadway curve. It's a crazy waste of time & energy for all.

The 60 & the rest of 202 is so wonderful now let's get an answer for that part of town & those passing thru Phoenix an option.

Thank you.

Kathy Aleman
Gilbert, Arizona

1

My husband and I attended the public hearing on the EIS draft last Tuesday in support of the continuation of the 202 but had a couple of questions. The video and the displays were very informative and the representatives were very helpful in answering those questions. We left feeling more confident that this freeway will finally be completed.

When we purchased our house in Ahwatukee in 2000, we were informed of and promised that the Loop 202 would eventually be completed. That was a deciding factor in the location of the home we chose. Following, in our opinion, are areas where this continuation of the 202 would be an asset.

FOR THE VALLEY - It will reduce the traffic throughout the city on the I-10 by drivers heading to the southeast of the Valley or out of the Valley towards Tucson and vice versa. It will also be another option when there are freeway closures or accidents on the I-10... which are often.

FOR AHWATUKEE - It will relieve the traffic for residents that have to commute during rush hour into the City, because those residing in the Desert Foothills would probably choose to exit Ahwatukee on the west end. Today at rush hour we sit in a parking lot on the I-10 from Chandler Boulevard to the Broadway curve. Also, our businesses might see more activity since the West Valley would now have easier access to our area's services and restaurants. But probably the biggest asset would be that many residents of Ahwatukee would save around 15 minutes or more driving time to the West Valley. And with high gas prices, saving 15 minutes is huge.

Draft Environmental Impact Statement
COMMENT FORM

Thank you for participating in the South Mountain Freeway Draft Environmental Impact Statement public comment process.

ADOT encourages all interested parties to submit written comments on any aspect of the Draft EIS. ADOT will consider all comments in preparing the Final EIS, which will include responses to all comments, final conclusions on potential impacts, and ADOT's final recommendation.

When submitting comments, please be as specific as possible and substantiate your concerns and recommendations.

It is helpful to ADOT to receive comments on:

- A particular alternative, environmental impact assessment, and/or draft mitigation.
- Any information you feel is incomplete or incorrect.
- How the proposed action would affect you.

Comments must be received or postmarked by July 24, 2013. STOP negotiations with The GILA RIVER INDIAN TRIBE IF "NOT a YES" on the freeway BY NOW on their Land, Heres the answer; THEY DONT WANT IT. SO Dont WASTE Any more Time, And JUST FINALLY BUILD the freeway, or rather START BUILDING THE FREEWAY

Luther Allen.

MR. ALLEN: Hi, I'm Luther Allen. I'm a recent graduate at the University of Arizona, and I got my degree in urban development, which involves a lot of what you guys do. I've been following this project for years, and it is feasible that something like this gets built, because being that, you know, Phoenix has basically hardly any bypass routes and Interstate 10 is basically getting congested on -- it seems like on a monthly basis, and there needs to be a reliever, you know, some airspace, other routes for traffic to go. And this would be great.

Now, this ain't something that's cropped up overnight. I know the residents of Ahwatukee may say otherwise about this, but this has been for planned in years. As a matter of fact, I have a map here that shows that this project is -- well, this is 1986, this was called the Southwest Loop, and now it's called the South Mountain Freeway. This was planned for years, long before Ahwatukee became what it is today.

So, now, I think the developers, you know, it's unfortunate that they didn't give the residents of Ahwatukee proper notice, or whatever information that the proposed freeways was going to

Code	Issue	Response
1		Comment noted.

Code	Comment Document

be in the making, you know, a few miles to the south of where they live, but the fact of the matter is, you know, this highway project is needed.

Now, I understand that, you know, you guys are negotiating with the Indian tribe called the Gila River to the south, since then the Proposition 400 taxes passed, If they haven't said yes by now, you know -- I understand you guys have been back and forth in negotiations with them -- if they haven't said yes by now, you know, I think they don't want it. So it's time to, you know, quit wasting time, move on, build this thing, because the longer you wait to build it, the more construction costs are going to skyrocket, and that's what we don't need right now today. And, what, another form of tax revenue will need to be passed to allow for more funding, so I say, get busy, build this thing, because it's desperately needed.

Now, the Proposition 400, you know, included, you know, this freeway project was included in those plans. And this is what the voters wanted, so I think it's time to, you know, give them what they wanted, and just, you know, stop negotiating, and build this thing. And that's all I got. Thank you.

Code	Issue	Response

Code	Comment Document

This environmental impact draft study doesn't seem to think that it will worsen the air quality on the sensor that's on 43rd Avenue, which will be two to three miles away from this construction. So it really needs to be understood that it could -- could risk Arizona losing its federal funds. And then the City and our citizens will have to pay the bill. This could turn into one of the more expensive highways. And I think a separate study of that impact is very, very important before we go to the final phase of the environmental study.

So thank you very much for your time. I appreciate the opportunity to comment.

MR. SMITH: They've already spent a lot of money studying this thing, right? And they might as well finish the project or a lot of people's work has been wasted already.

And as far as alignments go, I think, even though the one that's more expensive, that would link up to the 101, is probably a better option in the long run, even though it looks like it might be more expensive now. I don't think I have anything else to say.

MR. STROOP: Well, I just wanted to say that I am a Laveen resident and that I am for the proposal to build the freeway in any of the capacities that I saw today. I don't really have a preference on an alternative, but I would prefer it to get built as soon as possible.

MR. ALLEN: I don't know what ADOT's plans for

the -- for the 101 -- or I mean the 202 merging into the I-10, as far as lane -- you know, lanes merging, you know, lanes from the 202 merging into the 10.

But what I think is that lanes from the 202 should stay -- you know, should stay as extra lanes. Instead of merging in, just stay as extra lanes on Interstate 10 until they get to the 101, which is, like, another four miles westward, because some of that traffic coming from northbound 202 is going to want to connect with 101 going south instead of going to an Arizona Cardinals game.

So they're not going to have -- They're probably not going to have -- They're not going to have a purpose to merge onto the Interstate 10 and then merge back onto the -- you know, merge back to the right to get onto the 101. So they should just keep those lanes off of 202 as additional lanes, all the way out to the 101, and then maybe points further west. And then, after the 101, then that's when they should merge into the -- into what's existing on the Interstate 10, you know.

Because, the way I understand it now, it's going to merge some point, you know, a couple miles after -- a mile or so after the 202/Interstate 10 junction. And that's just going to create a traffic nightmare like the Broadway Curve. So but, if they keep the lanes -- keep them as additional lanes, all the way out to the 101, then I think that would be -- that

1	**Design**	The construction of the proposed freeway would include widening along Interstate 10 to facilitate the entrance and exit of vehicles between the two freeways. Additional information related to the Interstate 10 modifications can be found in Figure 3-26 on page 3-49 and Figure 3-29 on page 3-53 of the Final Environmental Impact Statement. The design of the connection to Interstate 10 and the widening along Interstate 10 was developed in accordance with Federal Highway Administration's Interstate System Access Informational Guide and has received an initial determination of operational and engineering acceptability from Federal Highway Administration.

Code	Comment Document

would be feasible. And that's what I've got.
MR. HAMILTON: I just did a comment via the computer, but I thought of something else.
COURT REPORTER: Okay. What is it?
MR. HAMILTON: You mean, specifically, my comment?
COURT REPORTER: Yes.
MR. HAMILTON: I would like ADOT to keep the preferred route, the purple route, in the west end. That's the only -- That's the only thing I forgot to add to my original comment.
MR. BRENNAN: Okay. So I already spoke inside, regarding some of the impacts specifically with traffic.
Oh, you have to do every stutter and "Oh," don't you? I'm sorry.
Traffic, particularly with existing traffic conditions with the trucks, the warehousing and shipping business located to the north of Laveen, currently using 51st Avenue going south, as well as spilling over frequently onto our surface streets like Baseline Road, as well as whenever traffic incidents slow traffic on the I-10, which pushes traffic onto our surface streets, and I think that that creates a negative impact on both the Laveen community as well as the rest of the South Mountain/South Phoenix area, which is where I presently live, and have previously lived in Laveen and remain fairly active in that part of the South Phoenix

(Comments made by public members to the court reporter as follows:)

MR. HARTLEY: My name is Chad Hartley, Gilbert, Arizona. I travel the Santan on 202 daily towards 32nd Street and I-10.

I believe the Broadway Curve to be dangerous due to high congestion that it sees in the morning and the afternoon.

To alleviate that with the new 202 would be -- I support the construction to alleviate the congestion and the -- I believe it would help alleviate the -- I don't know how to say -- the dangerous Broadway Curve.

Thank you so much for your time.

1 LAWRENCE ALLEN: Lawrence Allen. Basically this South Mountain Freeway has been in place since early 1980s. You know, this map dates back to, what, 1986. So we might as well go back to 1980. So these are plans. So they had to, you know, think about this for a few years to actually put it on paper.

So this ain't something that cropped up yesterday, as the Ahwatukee residents are probably thinking. Now, it's unfortunate that the developers who built Ahwatukee where those residents live that

Driver and Nix Court Reporters - (602) 266-6525
www.drivernix.com

Code	Issue	Response
1		Comment noted.

Code	Comment Document

they weren't given the proper information from the developers, because I think the developers are more concerned about their pocketbook; or, you know, there may be rules where they had to disclose it. But I pretty much think the developers had a way of going around it without eking out the fine details.

So I think that, you know, the developers they didn't want to leak that information to the residents and say, "Oh, nothing is going to happen here, so let's just move right in." Lo and behold, you know, Phoenix grew to be the 5th largest city in the nation. You know, we were past Philadelphia a couple of years ago in terms of population alone.

So, yes, we need some bypass routes, because Interstate 10 is getting congested on a monthly basis. And there needs to be some more space on the freeway.

And if I am going from Southeast Valley to, let's say, going to Arizona Cardinals game, I don't want to drive through Central Phoenix if I don't have to. I don't want to drive through downtown if I don't have to. I want to bypass that route and avoid that whole area altogether, if I had to chose. But being Phoenix is so big as it is, we need that so desperate.

Now, the Indian tribe that ADOT has been negotiating with for, you know, what, five or six

Code	Issue	Response

Code	Comment Document

years, they have been back and forth: Well, maybe we should; maybe we shouldn't; maybe we will look at this. If they haven't said a definitely yes by now, they don't want it.

So ADOT needs to quit stalling with them and build this thing and stop wasting time. The longer they wait, the more construction is going to be. And then, what? We need another proposition sales tax to provide more funding?

So hopefully ADOT kind of comes to a conclusion that, you know, let's build this thing yesterday and, you know, get this thing built before, you know, something else comes through the cracks.

And that's pretty much all I've got.

Well, there's another concern that a few ridges of South Mountain Park will be taken out. Please. What portion of the park do 100 percent of the population visit? They visit the part that you come in, come in southbound on Central Avenue, on the other side of Ahwatukee. They don't go to that little itsy-bitsty, teeny-weeny little southwestern portion of the park. There's not even a road over there. They go to the other side.

So for them to say that cutting out a few small ridges of the park would be devastating, that's

Code	Issue	Response

Code	Comment Document

just completely bogus, because nobody visits that portion of the park anyway. It's very insignificant.

You know, if they want -- otherwise, how did Squaw Peak -- or actually Piestewa Freeway -- how did that get through. When you go through there, you see big ridges on either side of the freeway. So they -- you know, look, how about that? Either that, why don't we just take out that road and replace it to what it was before?

But to say a few ridges of the least-used portion of the park would be devastating, it just -- it's just, what do you say, really stupid, I would say.

And that's what I wanted to add; it's just insignificant.

MICHAEL MOSS: I live in the path of the freeway, in Laveen. And I have lived there most of my life. And the traffic over the last ten years has just doubled on the surface streets: on 16th, on Baseline Road, 51st Avenue, 67th Avenue, 91st Avenue.

So many people when the freeway I-10 plugs up, they go to the surface streets. And there's accidents and there's just major traffic. They go to the surface streets. They ditch off of I-10. If they're going to the east, they ditch off at 91st or 67th Avenue, which takes them to Baseline Road. And

We have to constantly keep our interstates and streets able to handle the influx of people and new communities. I just spent 4 months in Indianapolis and their traffic and roads were not well planned for and it was very frustrating to sit in traffic everyday because the city planners thought that a new football stadium and a new airport were more important. I love Arizona and would hate to see it look anything like Indianapolis. You have done a wonderful job with the interstate systems we have today but now is not the time to drop the ball. Build the 202!

1 At this point I am proud of the interstate system here in the Phoenix area but it will not stay that way if we don't keep up with the growth. I just spent 3 months in Indiana caring for my aging parents and I guarantee you that if you drive you do not want our city to become like Indianapolis. The gridlock there is horrible and it is a pain to even go grocery shopping. The state government in Indiana would rather spend their money on frivolous stadiums and airports that are not needed. The roads were not planned well there to start with and some are still the same as they were when I was a young man in the 50's and 60's. Let's keep the Phoenix area a place that we can all be proud of. Life is stressful enough without having to sit in traffic for 2 hours every day. Thank you for your time, Michael Allison

THE REPORTER: Please state your name.

MR. ALLISON: Matthew Allison.

I'm pretty much here today to put my comment to say no against the build 202. The reason I'm dressed as a zombie is that the air quality and the environmental state and just being our native culture of O'odham people, this will take a lot away from us as our people, as our mountain is sacred to our land. And I just would like to state that I would really strongly -- for the people to really look at the stand that we're trying to make. And we may be young and growing to come against this, but to me that's the start of us to grow as people and reclaim our land and reclaim our culture to rebuild it again, because it is -- it has been kind of lost, in a way, but we are trying to come and reclaim it back. And pretty much saying, it hasn't been lost.

That's all I want to say. Thank you.

THE REPORTER: Thank you.

Subject: South Mountain Freeway

Hi there,

1

We are absolutely in support of building the final phase of the Loop 202! As Laveen residents for just over a year now, we are excited to see how things are developing here. We fell in love with the "small-town" feel of the Laveen community, having participated in the annual parade, Laveen 5k, Laveen Turkey Trot and more this year, and we love getting to know people within our community. We dislike, however, the traffic heading down 51st Avenue, not to mention other major streets, on our daily commutes, and the congestion it causes around our neighborhood (at 51st Avenue and Dobbins Rd) day in and day out. Having freeway access will alleviate the traffic from the surface streets, and would actually help with pollution, getting some of the stagnant air moving. It would also provide an alternate route for semis, which really back up the surface streets in our community, as well as casino traffic, which typically uses 51st Avenue as a primary route. Basic business sense would also indicate improvement to our economy. With quick access to the area comes larger retail outfits, even opportunity for local businesses to grow and thrive, with the greater traffic flow, which, in turn, encourages residents to keep money local. I know, personally, we drive to Goodyear, Avondale, Tolleson, Ahwatukee, Tempe and Phoenix for our everyday shopping needs and HATE it! Even as just one family, this is a lot of money that could be spent within our community. If we had the opportunity to do so, at stores that would subsequently be built near the freeway, the Laveen economy would see immediate and exponential growth. We feel the Loop 202 South Mountain Freeway will be great for our community, and is necessary for its sustainability as a major Phoenix suburb.

Thank you for listening to the people of OUR community,
Richard and Jacqueline Alvarado

PROCEEDINGS

MR. ALVARADO: My name is Frank Alvarado. I just wondered if they were going to put in a light rail. It's been in the air or something. I think it could probably help with the recycling the rubber, the road as well.

Well, I need some kind of a -- help get started on the project, and there would be a lot of benefit in return. I guess I'm interested in probably rubber recycling for the freeway. And possibly putting the funds into a suspended light rail system.

Anything else? I don't know. That's where I'm at.

THE REPORTER: Okay. If you think of anything else, you're welcome to come back and speak with one of us again.

By putting this freeway this close to our community you will be ruining it! The village feel will be gone and along will come a ton of traffic and pollution! I am concerned the pollution from all the trucks will get "trapped" by South Mountain and we will be living in it. The impact on our community and health will be greatly impacted in a negative way on us. PLEASE MOVE THIS FREEWAY OUT AWAY FROM AHWATUKEE!!!! DON"T RUIN OUR COMMUNITY AND MY CHILDREN"S HEALTH!

Code	Issue	Response
1	**Air Quality**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix. Air quality depends on several factors such as the area itself (size and topography), the prevailing weather patterns (meteorology and climate) and the pollutants released into the air. Cuts through the South Mountains would be expected to produce microclimate differences similar to those produced by a series of buildings in a large city that produce localized wind tunnel effects. The mountain cuts, however, would not affect regional air quality.

Ryan Andersen Document Created: 6/22/2013 2:52:57 PM by Web Comment Form

I do NOT want this freeway built unless on Indian Land. I don't know why this freeway has to go on the Pecos Road plan when the Indians have plenty of unused land which would save homes, churches, pollution near schools, noise etc. I vote NO NO NO on this plan. The original plan is from 1985 at which time this plan sounded great, today not so much. Talk to the chief at the casino and get this moved and tell some politicians to do their jobs and help save peoples homes. This whole thing is just a pile of....

1	Timothy Anderson Document Created: 5/21/2013 2:31:42 PM by Web Comment Form I have lived in the Phoenix Metro area since 1982 and am a current Ahwatukee resident since 1998. I am a strong advocate for this freeway. I believe it should have been built years ago. We need to get more trucks off the freeways through town and also give our residents and visitors another option to get from the southern part of the valley to the west valley. I firmly believe that the construction of this freeway will improve my quality of life and the quality of life for the majority of the residents in the Phoenix area. This should also improve congestion which will ultimately reduce the air pollution from idling and slow moving commuters. Let's Build the 202!

I think that the W101 Alternative is the best option because:

1. It gathers the traffic from the north which wants to by-pass the city. This also will smoothly mesh traffic from the south on to both west bound I-10 or north loop 101.

2

2. The object is to relieve eastbound traffic on I-10. Why have more traffic build up all the way to 59th ave when much traffic could go south and by-pass the city with the W101 alternative

Comments about South Mountain Impact on Ahwatukee

1 1.Better use of the Pecos Rd 202 alignment would be light rail going in both east and west directions of South Mountain and along I-10 to Tucson. Help get rid of traffic and congestion! Especially since Ahwatukee pays high taxes and doesn't even get City bus service! Well, very very limited service!

2 2.Place the 202 extension from I-10 along Queen Creek Road going west toward the City of Maricopa and prepare for the growth of the south west valley. It could then go north along the Estrella Mountains to connect at I-10. This would keep the noise, pollution, hazardous cargo etc. etc. all away from more populated areas. Also, if the road went to Maricopa, it could also connect I-8 with I-10 at a more convenient point for those going to Phoenix, Yuma, or southern California instead of south toward Tucson. It would also take some traffic off I-10 to travel along I-8 instead.

3 3.Keep the land at Pecos Road alignment for future necessity, not for main highway. Putting the proposed freeway along Pecos Road is like putting a new freeway through the middle of Paradise Valley. It would never happen for it would ruin the area!!!

4 5 4.When we moved to the Foothills of Ahwatukee in 1991, the only thing you could hear at night were the coyotes! It was so refreshing then. No dark brown cloud hanging over the area. You could breathe! Now, pollution is seen coming around the mountain and the noise from the traffic on Pecos Road wakes you up at night. I don't even live that close to the road, but the noise comes right up the slope of the land, because of the mountain, right to all

6 of the homes in the area. I can't even phantom the amount of noise pollution that all of the extra traffic and trucks would cause. I sell real estate and I know how hard it is to sell homes that are near the I-10 corridor that is routed alongside Ahwatukee between Baseline and Pecos Roads. It is so noisy!

7 5.Have you ever studied the traffic that is now on Chandler Blvd between 24th Street and the Ray Chandler Loop? During certain hours of the day it is almost impossible to make a left-hand turn out of the neighborhoods located here (from either direction), let alone try to cross the road on foot. It is extremely dangerous! What will happen when all the extra traffic being routed from the 202 to Chandler Blvd. enters this area! Do you have to wait until people are killed! This is a neighborhood area with schools, parks, bike trails, walking trails etc. that is not made for major traffic!

8 6.What about all the homes, schools, churches etc. that will have to be torn down! And what about the people that bought homes in a beautiful neighborhood only to find out that they will have to look at a freeway. If this was your home, you wouldn't like it!

9 7.Why haven't the people of Ahwatukee been able to vote on wanting or not wanting a freeway in their backyard? I can say that I don't know one person that lives here in Ahwatukee that wants a freeway in their backyard to connect around the mountain!

10 8. When there are accidents on the proposed 202 (and we know there will be) where will all of the traffic be diverted to? Bingo, onto the few streets we have in the largest cul-de-sac!!!!! Let's make it more difficult to live here. Let's make more pollution! What about the safety here? How will the residents of Ahwatukee get out if a disaster happened and the roads

Code	Issue	Response
1	**Alternatives, Nonfreeway Alternatives**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix.
2	**Alternatives, Gila River Indian Community Alignment**	
3	**Alternatives**	The proposed freeway would address the purpose and need criteria, including relieving Interstate 10 congestion. The discussion of the responsiveness of the proposed freeway to the purpose and need criteria is presented beginning on page 3-27 of the Final Environmental Impact Statement. Alternatives farther south, such as the Interstate 8/State Route 85 Alternative were considered in this study (see page 3-9 for more information). The Paradise Parkway was included in the original "Prop 300" packages of road improvements (see Figure 1-2 on page 1-6). However, it was dropped from the plan and was not included in the projects proposed in Prop 400 (the Maricopa Association of Governments *Regional Transportation Plan*). The South Mountain Freeway was part of both Prop 300 and 400 proposals.
4	**Neighborhoods/ Communities**	While the E1 Alternative is adjacent to the largely residential areas of Ahwatukee Foothills Village (to the north), a freeway has been planned in this location for many years (see Final Environmental Impact Statement pages 4-17 and 4-21). Where existing residential uses are adjacent to the proposed freeway, noise mitigation would be implemented according to Arizona Department of Transportation policy (see Final Environmental Impact Statement beginning on page 4-91).
5	**Noise**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix.
6	**Air Quality**	
7	**Traffic**	In 2006, the City of Phoenix conducted a traffic circulation study to evaluate the impacts of the freeway on the local street system. The City study found no adverse effects on the local street system from the proposed freeway (see Appendix 3-1 in the Final Environmental Impact Statement).
8	**Neighborhoods/ Communities**	Prospective home buyers and members of the church built after the freeway was conceived, according to State law, should have been informed of the proposed facility. (Sellers are obligated by Arizona common law to disclose all known material facts about a property to the buyer.)

(Responses continue on next page)

Code	Comment Document
	already filled with trucks and auto congestion boxing us in on all 4 sides?
11	9.An extension of Pecos Road could be added later, but not as a main highway for trucks and hazardous materials etc. Only for local traffic.
12	10. Why take a beautiful area that people seek out to live in and destroy it while calling it progression for the future. Doesn't make any sense to me. I'm all for future plans that make sense, but not for stupidity! And this is stupidity!
13	11.It's always been said that if you follow the money you can figure out who benefits from things (ex: the alignment of the 202). One that I have noticed is the Casinos at either end of the proposed route. The Casino at the intersection of I-10 and proposed new freeway, and the other (the new Casino) at 51st Avenue right by where the proposed freeway would connect to I-10. Amazing no one has commented on this……get the tax payers to build a road to gambling meccas and we could care less about the impact on them!
	12.I haven't seen even one good reason to put the proposed 202 along Pecos Road yet. You show me the good in this! I'm very interested in finding out.

Code	Issue	Response
9	**Public Involvement**	No public vote was held as part of the Draft Environmental Impact Statement review process. Members of the public were encouraged to participate and submit their comments on the Draft Environmental Impact Statement during the 90-day comment period. The proposed Loop 202 South Mountain Freeway has been a critical part of the Maricopa Association of Governments' Regional Freeway and Highway System since it was first included in funding approved by Maricopa County voters in 1985. It was also part of the *Regional Transportation Plan* funding passed by Maricopa County voters in 2004 through Proposition 400.
10	**Traffic**	Hazardous materials commodity flow studies and other information are considered by emergency response planners (such as the Arizona State Emergency Response Commission statewide and the Maricopa County Local Emergency Planning Commission for Maricopa County) when developing emergency response plans. If the plan were amended, it would be made available to the Arizona Department of Transportation.
11	**Alternatives**	Extending Pecos Road through the South Mountains along the same alignment as the freeway would result in similar environmental impacts as the freeway. However, the arterial facility type would not meet the level of travel demand for this corridor (see page 3-19 of the Final Environmental Impact Statement).
12	**Purpose and Need, Lack of Support**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix.
13	**Alternatives**	The proposed freeway is part of a transportation system developed to improve mobility in the region by increasing capacity and providing alternatives to allow traffic to bypass already congested routes (see Final Environmental Impact Statement pages 1-21, 1-22, 3-1, and 3-3). Like other "loop" freeways in the Phoenix metropolitan area, the proposed South Mountain Freeway would be a commuter corridor, helping to move local traffic between the eastern and western portions of Maricopa County.

Subject: South Mountain Freeway

We oppose the freeway for so many reasons, not the least of which are:

1

1. You are exploiting Native Americans and infringing on their sacred land.

2

2. The plan includes extending Chandler Boulevard Westbound through beautiful hiking terrain on the SOuth Mountain Preserve, where new trails were JUST CREATED, and now you will destroy them and send a whole neighborhood of traffic through the pristine area to the neighborhood at the end of Pecos Rd. If this project goes through, you must create an exit for this neighborhood at the end of Pecos Road so that they do not go through the hiking area land.

3

4

3. You are being deceptive about the claim that pollution will be less with the new freeway. That is a farce for stupid people to believe who don't know any better. Adding highways has NEVER improved pollution.

5

4. Just the name tells you this project is not right - you are destroying a sacred mountain for the sake of development, when it is not absolutely necessary.

We urge you to reconsider!

Daniel and Jean Arlotti

1	**Cultural Resources**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix.
2	**Section 4(f) and Section 6(f)**	South Mountain's newest trails are the Bursera and Pyramid Trails (see Final Environmental Impact Statement page 5-8). The E1 Alternative is approximately 1 mile south of the Pyramid Trail and even farther from the Bursera Trail; thus, it would not affect either trail. The trails have walk-in access from Chandler Boulevard and 19th Avenue, with on-street parking. This walk-in access would be north of and adjacent to the planned extension of Chandler Boulevard and, thus, would not be directly affected. The walk-in access point and the part of the Pyramid Trial at the access point are located adjacent to a residential neighborhood and the City of Phoenix's planned Chandler Boulevard Extension. These trails are typically used for high-intensity recreational activities such as running, hiking, and biking, not noise- or viewshed-sensitive activities. All proposed action alternatives would span existing and proposed trails to avoid impacts. However, during construction (if an action alternative were selected), trails that would be spanned or would be near potential freeway construction would be closed for limited times for safety reasons. Closures would necessitate that trail users detour around construction sites to rejoin the trails farther along their length. According to Phoenix South Mountain Park/Preserve rangers, the Gila Trail—although well-defined—is not a designated trail within the park. That said, the Gila Trail would not be affected by the proposed freeway or by the Chandler Boulevard Extension. The Draft Environmental Impact Statement Appendix A394 contains information directly from the Phoenix General Plan and early coordination with the City of Phoenix Parks Department. The trails in the preserve are exceptions to this statement and were always meant as such. The trails within 1/4 mile of the proposed alternatives were treated separately, as in the case of the Maricopa County Regional Trails System. Should an alternative be selected, the Arizona Department of Transportation and Federal Highway Administration would work closely with the City of Phoenix during final design to ensure the connectivity of trails is maintained, whether they are eligible as Section 4(f) resources or not.
3	**Traffic**	Impacts associated with extension of Chandler Boulevard are included in the Final Environmental Impact Statement. The new road is not located within the Phoenix South Mountain Park/Preserve boundary. The road is planned in the City of Phoenix General Plan and would be constructed eventually with or without the proposed freeway. The extension of Chandler Boulevard west of 19th Avenue is included in this project because access must be maintained to the neighborhoods at the west end of Pecos Road. Early in the study process an interchange at approximately 27th Avenue was evaluated but ultimately eliminated because of increased residential displacements and cost.
4	**Air Quality**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix.
5	**Section 4(f) and Section 6(f)**

Draft Environmental Impact Statement
COMMENT FORM

Thank you for participating in the South Mountain Freeway Draft Environmental Impact Statement public comment process.

ADOT encourages all interested parties to submit written comments on any aspect of the Draft EIS. ADOT will consider all comments in preparing the Final EIS, which will include responses to all comments, final conclusions on potential impacts, and ADOT's final recommendation.

When submitting comments, please be as specific as possible and substantiate your concerns and recommendations.

It is helpful to ADOT to receive comments on:

- A particular alternative, environmental impact assessment, and/or draft mitigation.
- Any information you feel is incomplete or incorrect.
- How the proposed action would affect you.

Comments must be received or postmarked by July 24, 2013.

Subject: AZ Loop 202 South Mountain Freeway

To whom it may concern,

1

I am a resident of Ahwatukee and I am a staunch supporter of the 202 expansion. I purchased a home there a little over year ago where my beautiful fiancee lives and it is the home that I hope some day to start a family in. I want someday my family to live in the best metro area in the US and I struggle to understand how that can happen without the 202 expansion.

In today's age and with private-political-activitst groups with their own self-serving agendas, it is so easy to find things wrong with development and progress. I hope that our leaders at ADOT recognize that this issue has a silent majority and that a boisterous few do not represent the citizens of Maricopa County.

No plan is 100% perfect but that shouldn't be the reason why a much needed project is thrown in the garbage. The Hoover Dam had its naysayers. The Chesapeake Bay Bridge-Tunnel had its critics. People at first hated the Eiffel Tower. Even the light rail in Phoenix had opponents. But it was cooler heads that prevailed and people who understood that real progress has some risks made the right decision. I sincerely hope ADOT's leaders will reconize that too.

Good luck. I wish you well in making your decision and I sincerely hope this project comes a reality.

John

1	Laurel Arndt Document Created: 6/7/2013 12:26:08 PM by Web Comment Form I have reviewed the Noise section on the DEIS. This information is not presented in a manner in which residents can compare the existing condition with the future conditions. On page 4-83, Table 4-39 shows the ambient noise monitoring results at various locations along the Eastern Section. It is relatively easy to identify where each on of the sites was located, they area pretty specific, allowing a resident to look on a map and see where the reading may have been taken. On page 4-88, Table 4-40 shows the noise analysis results that were modeled base on the proposed project. This information is useless in evaluating the change in conditions; as not only are the locations different but they do not give enough information for a resident to identify where the modeling points are. The locations identified in able 4-40 are not identifiable to the average resident. Residents to not know where "parcels" are. Why were the points in Table 4-39 not carried over and identified in Table 4-40, so a reviewer could actually see the difference before and after the proposed freeway is constructed? Why was the information but in "parcels" (Receiver ID #11-26a), this seems to cloud the analysis. The amount of information and the manner in which it is reported in Table 4-40 obfuscates the ability to evaluate the increase in noise at a one location and understand the impacts. I suggest that this Table 4-40 be redone to reflect comparative information and not just information for information's sake. The subconsultant can do the modeling at the same points which are in Table 4-39, THIS is the information which should be in Table 4-40.

Code	Issue	Response
1	**Noise**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix. The locations used for measuring existing noise levels do not necessarily correspond to locations used for noise modeling for future conditions. Therefore, combining the two tables would not be practical. The neighborhood, or parcel, name was obtained from Maricopa County Assessor records and is the legal name for the residential development. This information is easily obtained on the Maricopa County Assessor's Web site. In addition to the name reference in the table, the monitor and receiver locations are shown on maps to assist the reviewer (see Figure s 4-29 to 4-32 in the Draft Environmental Impact Statement).

Code	Comment Document
1	Laurel Arndt Document Created: 6/7/2013 1:22:04 PM by Web Comment Form Presenting current and accurate information is part of the NEPA process. The DEIS does not reflect current conditions, and was not updated after it was first started in 2006, nor was it reviewed properly before being released. This is evident be many statement which do not reflect current conditions including the statement below in Chapter 5, page 5-25: "The cuts would be located in a remote portion of the SMPP, not near any trails and barely visible from any of the readily used trail." This is a erroneous analysis. This statement was true in 2006. The subconsultant and ADOT have not re-evaluated the study area since 2006. Conditions have changed, in 2011, the City of Phoenix added two new trails in the west end of SMPP. The trails start at the future 19th Ave Trailhead and go west and east along the Main Ridge South (and connecting to the National Trail). They are called the Bursera Trail and the Pyramid Trail. While the trails are physically more than a 1/4 mile away from the proposed project area, the project is clearly visible when you are on the Bursera Trail. These trails were not identified or evaluated for their 4(f) status, they are strictly for hiking and biking. Therefore the statement in the Appendix 5-1 pA586 is also false: "This statement in the General Plan indicates that pedestrian tails maintained by the City of Phoenix are used for transportation and thus not primarily recreational". This statement is a generalization which is incorrect. It is clear that these trails in the Preserve are not used for transportation and are strictly recreational. I request that these trails be inventoried, assessed and given a full Section 4(f) impacts analysis as to the visual and noise impacts of the proposed project on these resources.

Code	Issue	Response
1	**Section 4(f) and Section 6(f)**	South Mountain's newest trails are the Bursera and Pyramid Trails (see Final Environmental Impact Statement page 5-8). The E1 Alternative is approximately 1 mile south of the Pyramid Trail and even farther from the Bursera Trail; thus, it would not affect either trail. The trails have walk-in access from Chandler Boulevard and 19th Avenue, with on-street parking. This walk-in access would be north of and adjacent to the planned extension of Chandler Boulevard and, thus, would not be directly affected. The walk-in access point and the part of the Pyramid Trial at the access point are located adjacent to a residential neighborhood and the City of Phoenix's planned Chandler Boulevard Extension. These trails are typically used for high-intensity recreational activities such as running, hiking, and biking, not noise- or viewshed-sensitive activities. All proposed action alternatives would span existing and proposed trails to avoid impacts. However, during construction (if an action alternative were selected), trails that would be spanned or would be near potential freeway construction would be closed for limited times for safety reasons. Closures would necessitate that trail users detour around construction sites to rejoin the trails farther along their length. According to Phoenix South Mountain Park/Preserve rangers, the Gila Trail—although well-defined—is not a designated trail within the park. Document Created: 6/27/2013 10:51:16 AM by Web Comment Form

I am concerned that the DEIS does not address the secondary impacts of the freeway on local traffic in Ahwatukee.

1

The discussion on induced traffic in Chapter 4 p.4-168-169 is primarily a discussion on the traffic offsets (which the City of Mesa and Scottsdale experienced with the opening of the SR 101L and SR 202L) and the elimination of traffic congestion for the W59 Alternatives. This "analysis" only states how it relieved traffic on arterials in Mesa and Scottsdale. This is accurate for Laveen where the freeway is not replacing an arterial and will provide additional mobility.

This comparative is irrelevant for the E1 Alternative where the proposed SR202 is replacing a major arterial (Pecos Rd) and eliminating access to another collector (32nd St).

Pecos Road currently provides access for residents west of Desert Foothill Parkway and east of 40th Street to Desert Vista High School and Akimel Middle School. With the elimination of the 32nd Street access from Pecos Rd/SR 202, the traffic volumes will adversely impact Chandler Blvd and neighborhoods adjacent to the schools. The proposed SR202 will promote cut through traffic in the Lakewood community (directly east of the schools) and to the west via Liberty Lane (west of 24th Street) as residents try to access the schools on Liberty Lane without the use of 32nd Street via Pecos Road. Elimination of access south of these schools will lead to increased congestion on Chandler Blvd as students/resident reroute their travel to get to the schools.The increased use of the Pecos Rd/24th Street exit will also lead to increased congestion and cut through traffic as student are funneled to 24th Street exit to access Akimel Middle School and Desert Vista High School. Additionally, cut through traffic may chose to use Liberty west of 24th Street to get to the schools. This will contribute even further to local congestion and cut through traffic as there are already two primary schools operating on Liberty Lane (Keystone Montessori and Sierra Elementary). This will cause further traffic congestion because of the decreased speed limits and increased am traffic from working residents leaving the neighborhoods.

A traffic study should be conducted to evaluate the impacts on local traffic from the proposed South Mountain 202.

There are unintended consequences to eliminating Pecos Rd as a local arterial and eliminating access to 32nd Street from Pecos Road. These indirect impacts have been excluded from the DEIS and MUST be included in the secondary impacts analysis section of the DEIS. In order to properly assess the impacts a traffic analysis must be completed, analyzed and included in the DEIS in order to disclose the significant impacts to local traffic the proposed South Mountain 202 will have on Ahwatukee.

Code	Issue	Response
1	**Design**	The determination to not include an interchange at 32nd Street was made in coordination with the City of Phoenix (see Figure 3-8 on page 3-15 of the Draft Environmental Impact Statement). The interchange would have required the displacement of over 100 homes and would have been located near an existing high school. The City recommended that, based on these impacts, the interchange be removed from the study. In 2006, the City of Phoenix conducted a traffic circulation study to evaluate the impacts of the proposed freeway on the local street system, including the shift of access to Foothills Reserve and Calabrea from Pecos Road to Chandler Boulevard. The City study found no adverse effects on the local street system from the freeway (see Appendix 3-1 in the Final Environmental Impact Statement).

From: Sierra Club on behalf of Eric Arnould
To: Projects
Subject: Comments in opposition to South Mountain Freeway
Date: Monday, May 27, 2013 11:15:20 PM

May 28, 2013

Arizona Department of Transportation South Mountain Study Team
1655 W Jackson St, MD 126F
Phoenix, AZ 85007

Dear South Mountain Study Team,

1 I am writing to express my opposition to the proposed South Mountain Freeway and to urge ADOT to select the No-Build Alternative.

2 3 4 I can hardly believe that in an era of emerging alternatives to the automobile and when the effects of climate change provoked by air pollution are becoming increasingly obvious all around us that ADOT can think of no other solution for traffic congestion than more roads. The proposed freeway would cause more problems than it would solve. In addition, it would only provide short-term congestion relief. As is evident by our numerous clogged roads and freeways, many of which have recently been built or widened, building more roads is not the answer. ADOT needs to instead focus on planning for and investing in long-term transportation solutions, including mass transit. The only way to effectively reduce congestion and mobilize people is by reducing the number of vehicles utilizing our roads, not by encouraging more to use them.

5 6 South Mountain Freeway would have incredible negative impacts on our communities. Despite what the DEIS claims, air quality in the region would worsen over time, increasing public health risks. As more vehicles fill the "uncongested" areas this freeway would temporarily provide, more pollution will be spewed into the air, exacerbating asthma, cancer, and other diseases.

7 8 The freeway would also negatively effect our environment. South Mountain Park is the largest city park in our nation. It was set aside to protect resources and to benefit our communities. By blasting a freeway through a portion of this park, wildlife and habitat will be destroyed, movement corridors will be cut off, valuable public spaces will be lost, and more. This would set a terrible precedent by demolishing what should remain a protected area.

9 The freeway will also exacerbate urban sprawl and further burden Arizona's taxpayers. Its construction would continue ADOT's trend of forcing residents to remain vehicle-dependent while paying for infrastructure so that others can live farther and farther from a city center.

1 Please help protect our communities, our health, and our environment by selecting the No Action Alternative. Thank you.

Sincerely,

Mr. Eric Arnould

Code	Issue	Response
1	**Alternatives, No-Action (No-Build) Alternative**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix.
2	**Alternatives, Nonfreeway Alternatives**	
3	**Purpose and Need**	Although the region's freeways are now congested during the peak travel period, conditions in 2035 without the proposed freeway would be substantially worse with more congested areas and congested conditions for longer periods of time (see Final Environmental Impact Statement pages 1-21 and 1-22). Congestion relief resulting from the proposed freeway would provide localized reductions of delays on arterial streets and at interchanges. Reduced travel times would result in lower exposure to elevated concentrations of mobile source air toxics occurring in traffic. Other benefits of the proposed freeway in comparison to the No-Action Alternative are presented in Table 3-9 on page 3-38 of the Final Environmental Impact Statement.
4	**Alternatives**	Federal regulations stipulate that an environmental impact statement shall "rigorously explore and objectively evaluate all reasonable alternatives" (40 Code of Federal Regulations § 1502.14; see Final Environmental Impact Statement page 3-1). All alternatives were screened using a multidisciplinary set of criteria. Nonfreeway alternatives were considered (see Final Environmental Impact Statement pages 3-3 through 3-6). Among other things, the study took into account improving existing freeways, improving or expanding other travel modes, strategies to reduce travel demand, and various roadway configurations. This study examined not only the potential impacts from improvements, but also the consequences of building nothing, the No Action Alternative. As proposed by the Maricopa Association of Governments, the South Mountain Freeway would be part of the Regional Freeway and Highway System. Other transportation improvements such as mass transit and local roads are specified in the *Regional Transportation Plan* and were considered during the evaluation of this proposed new freeway. As noted in the Final Environmental Impact Statement (see page 3-60), the proposed freeway would provide opportunities to enhance operation of future mass transit improvements.
5	**Air Quality**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix.
6	**Health Effects**

9	**Neighborhoods/ Communities**	Unplanned growth is often termed “urban sprawl.” Generally, this term is used in the context of rapid and uncontrolled urban growth onto previously undeveloped land—usually on the outskirts of an existing urban area. Projects like the proposed freeway are often identified as contributors to urban sprawl. Freeway projects are often cited as making land at the urban fringe more accessible and, therefore, more attractive for development. However, examination of data comparing population and land use between 1975 and 2000 suggests major transportation projects like the proposed freeway do not induce growth in the region (see Final Environmental Impact Statement pages 4-170 through 4-174). The proposed freeway would be implemented in a historically quickly urbanizing area (most noticeably in the Western Section of the Study Area, although the nationwide recession which began in 2007 slowed growth). In the Eastern Section of the Study Area, the proposed freeway would abut public parkland, Native American land, and a near-fully developed area—therefore, any contribution to accelerated or induced growth would be constrained. The proposed freeway would be built in an area planned for urban growth as established in local jurisdictions’ land use plans for at least the last 25 years.

1

While I was employed as a Hydrologist with the Gila River Indian Community (GRIC),
major South Mountain drainage issues flared up.
The Ahwatukee southerly flows had been diverted
to a concentration point impacting the El Paso natural Gas pipelines within
the GRIC Farmlands. During this time (1993-1995),
ADOT was busy preparing the South Mountain freeway alignment.
It seemed to me that a useful plan creating benefits for the State and GRIC
was to route the purposed freeway along the Queen Creek Wash,
within the GRIC, and north of the Gila River. This would utilize unusable lands bordering the wash.
By aligning the wash and superimposing the freeway on top of the Wash, the route would be
beneficial to everyone.
This implies the Tribe was made aware of the benefits of using unusable land and deriving fees for
such use.
Several factors were obvious — ADOT staff could not bring about such a proposal
without internal approval. Secondly, no one within the tribe could submit such
an idea without the entire Council approving the idea.
Thus, both sides would need concurrent approval to engage in such a proposal.
That is not a simple matter and thus a valuable alternative was never submitted.
Years later (2000), I worked for ADOT as a Project Manager (Local Govt. Section)
and acquired a better understanding of how ADOT approaches these complex issues.

2

A proposal to depress the freeway (Republic July 6, 2013) within its current alignment would not be
necessary.

1	**Alternatives, Gila River Indian Community Alignment**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix.
2	**Drainage**	Pecos Road drainage is designed as a pass-through system. In other words water is allowed to drain along its natural existing pathway underneath the freeway and to Gila River Indian Community land. If an action alternative were to become the Selected Alternative, the E1 Alternative would be constructed aboveground and the existing culverts would extend to pass drainage under the freeway. Pecos Road currently has numerous existing culvert crossings. Doing so would ensure that there would be no adverse flooding impacts to adjacent properties. (See Draft Environmental Impact Statement pages 3-18, 4-98, and 4-107.)

I was a member of the Transportation Board between 1983 and 1989. The South Mountain Freeway alignment was placed on all public materials produced by the Department before and after the 1985 bond election and again before and after the bond renewal election twenty years later.

Ahwatukee-Foothills is a much different place now than it was in 1985. Then there was the Warner-Elliot Loop, jackrabbits and little more. Therefore, there is more pressure brought to bear when discussing the South Mountain Freeway now than there was initially. Initially, no churches or homes were in the way of construction. Now there are both. However, the need for the freeway now is as great or greater than planners would have anticipated in 1985. That is the reality that must lead to one conclusion: the freeway must move forward and must be built as originally planned.

Individuals will be displaced and hurt by a freeway build but overall the freeway will become a major benefit to the whole Valley. Anyone who travels I-10 will welcome the congestion relief from large trucks. Anyone who plans our freeway road repairs will appreciate the lessened pressure on maintenance from so many heavy 18 wheelers. The occasional rush hour closures and delays from not too infrequent accidents involving 18 wheelers will decline.

Granted, ideally a positive vote by the Tribe allowing the freeway to be built on its land (like the 101 through Scottsdale) would have been ideal, but it's their land and they have said "no." That's reality and the remaining option must proceed. Talking and arguing time has gone far beyond what is constructive.

By the way, I lived in Cochise County when I was on the Board in the 1980's. For the past 23 years I have lived in Ahwatukee-Foothills. Our community will be enhanced, not unduly harmed, by the construction. I support moving forward with the design and building of the South Mountain Freeway.

Subject: FW: Please build the south mountain bypass freeway
Date: Wednesday, May 22, 2013 2:52:31 PM

From: Timothy Ault [mailto:tim.ault@asu.edu]
Sent: Wednesday, May 22, 2013 2:31 PM
To: Projects
Subject: Please build the south mountain bypass freeway

Hello,

1

I'm here to voice my support (via email) for the construction of the SM I-10 bypass freeway because the benefits truly outweigh the costs, especially over the long haul:

By reduced congestion/traffic on the current I-10 corridor with the bypass in place, the realized benefits would be:

1. Less fuel consumption, including the interstate truckers, benefits both locals and out of towners with their discretionary income
2. Less accidents/bodily injury, especially since the big rigs would be concentrated on the bypass (when the big rigs have traffic accidents, the whole freeway shuts down, evident of some recent spills on the phoenix freeways)
3. Less need for freeway construction expansion of the current I-10 corridor through Phoenix, which would cause additional traffic delays, increase traffic congestion, accidents, etc
4. Usually there would be a negative economic $$ impact as traffic congestion increases (people don't want to deal with traffic delays)

This benefits positively affect the quality of life, consumer spending (going shopping instead of I'll stay home because I don't want to be stuck in traffic), reduced government spending on maintaining the freeways and dealing with the accidents, and less use of fuel while crawling in traffic. Hopefully the project will be approved and we will see the benefits once this segment is completed. Regards.

Timothy Ault

I am curious as to what consideration was given to including a multi-use bike/ped trail alignment within the freeway ROW. This would incorporate "multi-modal" aspect of ADOT's responsibilities into the project. Looking at the draft drawings, it would likely be very easy to incorporate a multi-use path on the south side of the freeway along the eastern alignment, connecting with the residential neighborhoods through standard street alignments. The western section would be more complex, but developing an onramp/offramp system along with but separated from the freeway on and off ramps and continuing the multi-use trail main line under those ramps to eliminate conflicts with vehicles would be the likely be the most economical way of doing that. This would provide a great benefit to the areas immediately adjacent to the freeway for recration and transportation, and connect the neighborhoods directly with the western edge of South Mountain Park. I know many people from Tempe and Mesa who would ride their bikes to South Mountain on Silent Sundays if it weren't so dangerous to ride on the local streets in the area; this would be a great opportunity to provide 365-day access to a safe, reliable transportation/recreation corridor for bicyclists and pedestrians, as well as access to the park that would reduce the need for regional automobile travel.

As or even more important than a multi-use path within the freeway alginment is the bike/ped access at the interchanges. What steps would be taken to create a SAFE and COMFORTABLE crossing of the freeway for persons walking or biking along the arterial streets, and how would that be an improvement over existing conditions at other freeway crossings? Thank you very much for taking the time to be sensitive to and aware of the multi-modal potential of this extremely large public works project.

Code	Issue	Response
1	**Design**	The study has considered concepts for parallel multiuse paths; however, the main line of the proposed freeway would not have a bicycle route as part of the design. The design of the traffic interchanges includes provisions for pedestrian and bicycle movement in accordance with current design guidelines and regulations. While not currently included, enhancements such as pedestrian bridges or multiuse paths may be added during the final design phase through coordination with the City of Phoenix (see page 3-60 of the Draft Environmental Impact Statement). The cost and maintenance of these enhancements would be the responsibility of the City of Phoenix.

Subject: Loop 202 Freeway Bike Lanes
Date: Thursday, June 20, 2013 8:57:07 PM

Dear Sir or Ma'am,

1 My name is Anthony Avery and I am a concerned citizen residing at 6262 East Brown Road Unit 49, Mesa, AZ 85205 who feel like the Loop 202 extension through South Mountain will be a hazard to our environment and our standard of living. It has been demonstrated time (link to academic study through summary portal) and time again that adding freeway lanes only exacerbates the prevalence of suburban sprawl and contributes to traffic congestion, rather than the stated goal of relieving said congestion.

2 That being said, there is one addition I did not see at the exhibition at the convention center that would make me shift my support from opposing the construction of the South Mountain Freeway to supporting it, and that is a parallel bike facility. Early in 2012 I had the following conversation with your Twitter agent:
Me: You know what would be a cool project/job creator? Grade-separated bike trails along freeway alignments! @ArizonaDOT tinyurl.com/7vyqflf ADOT: @TripleAvery We have them in a few locations - in fact, there is one under construction in North Phoenix along the CAP. Me: @ArizonaDOT awesome! I know some underpasses. Any plans to design them into freeways? Would love to take 202 dwntwn 2 work via bike 4 exampl Them: @TripleAvery Oftentimes, ped/bike crossings are funded by local cities so money is always an issue. Crossings are integrated where possible. Me: @ArizonaDOT oh definitely. Let me re-phrase: Does ADOT have any funds allocated to build bike lanes in FWY ROW? Or at all? Is it possible?...

3 No response. What I was trying to articulate, and apparently couldn't, was exactly what I had seen on I-70 from Grand Junction to Denver, Colorado. If this were to be implemented, and the South Mountain Freeway be researched and included as a true multi-modal corridor, I would be more willing to lend my support to the project. Thank you very much for your consideration on this much contested issue. Because I clearly was unable to articulate what I was referring to, what I had seen on my trip to Denver should articulate what my words could not: I-70 trial.

Thank you for taking the time to respond to this very important e-mail as the South Mountain Freeway decision is one of the most important decisions that will be made concerning the MSA transportation options in the foreseeable future.

Sincerely,

Anthony A. Avery

1	**Secondary and Cumulative**	Unplanned growth is often termed "urban sprawl." Generally, this term is used in the context of rapid and uncontrolled urban growth onto previously undeveloped land—usually on the outskirts of an existing urban area. Projects like the proposed freeway are often identified as contributors to urban sprawl. Freeway projects are often cited as making land at the urban fringe more accessible and, therefore, more attractive for development. However, examination of data comparing population and land use between 1975 and 2000 suggests major transportation projects like the proposed freeway do not induce growth in the region (see Final Environmental Impact Statement pages 4-170 through 4-174). The proposed freeway would be implemented in a historically quickly urbanizing area (most noticeably in the Western Section of the Study Area, although the nationwide recession which began in 2007 slowed growth). In the Eastern Section of the Study Area, the proposed freeway would abut public parkland, Native American land, and a near-fully developed area—therefore, any contribution to accelerated or induced growth would be constrained. The proposed freeway would be built in an area planned for urban growth as established in local jurisdictions' land use plans for at least the last 25 years.
2	**Purpose and Need**	Although the region's freeways are now congested during the peak travel period, conditions in 2035 without the proposed freeway would be substantially worse with more congested areas and congested conditions for longer periods of time (see Final Environmental Impact Statement pages 1-21 and 1-22). Congestion relief resulting from the proposed freeway would provide localized reductions of delays on arterial streets and at interchanges. Reduced travel times would result in lower exposure to elevated concentrations of mobile source air toxics occurring in traffic. Other benefits of the proposed freeway in comparison to the No-Action Alternative are presented in Table 3-9 on page 3-38 of the Final Environmental Impact Statement.
3	**Design**	The study has considered concepts for parallel multiuse paths; however, the main line of the proposed freeway would not have a bicycle route as part of the design. The design of the traffic interchanges includes provisions for pedestrian and bicycle movement in accordance with current design guidelines and regulations. While not currently included, enhancements such as pedestrian bridges or multiuse paths may be added during the final design phase through coordination with the City of Phoenix (see page 3-60 of the Final Environmental Impact Statement). The cost and maintenance of these enhancements would be the responsibility of the City of Phoenix.

Please build this freeway. The hazardous waste argument is fear mongering and the lost of bike trails is laughable. South Mountain Park, the largest in the country is just to the north, ride or run there.

Build it and save traffic issues on I-10 on both sides of the Valley.

Like it or not and not everybody will be happy with the result but the time for this project to proceed is now. A native Arizonan, I remember all the back lash when the very first freeway was built thru town. What would we do without them now? 2025 will be here before we know it and then where will we be? I vote build it on Pecos it the Gila Indians do not want it on their land.

Pls do not add my email to any lists.

1 2 3 4	Humberto Badillo Document Created: 5/21/2013 6:07:31 PM by Web Comment Form Thank you for giving us an chance to give our comments on the proposeed freeway, the visuals are very helpful. The part of the proposed freeway that really concern's me is the Pecos Rd section of the freeway, specifically the Dusty Lane section. That part of the proposed freeway will cut through one of the best places visually of South Mountain Park. In that part of South Mountain Park, the Gila River Indian Community, Phoenix, and the park all link up in that specific area. From there, one can look west for an uninterupted view of the magnificent Estrella Mountains. Furthermore, that area contains a jackpot of historical and prehistoric resources that make the Phoenix metro area unique to the rest of the nation. It's no suprise that the City Archaeologist has spent countless days out there recording archaeological sites. Although we always take pride in our Native American population here in Phoenix, it is quite obvious that there is a clear divide between the reservation and the metro area. We see this every time we commute on the 101, the Santan portion of the 202, and even on Hunt Hwy in Chandler. This attitude toward reservation land on our part must change in order to have a united Phoenix Metro, not just Indian land and non-Indian land. We must start with the way we just push a proposed freeway system with out having a clear understading of how people who dont have the means to come to these pulic commnents feel about an 8- lane freeway cutting through there yard. Most of these people dont even have acess to the internet. In short, there is not much I could say about the portion of the freeway that will run north and south because I'm not very familiar with the area. However, I have been to western portion South Mountain Park, particularly the section where the freeway is going to cut through it, and I'm telling you that the area has too much historical and pre-historic relevance, not to mention the visual beauty, for a freeway to be cutting through there. Also, the Pecos Rd section of the freeway will just be another clear division between Phoenix Metro and the reservation. Just go down there yourself, and take a look towards the Estrellas.

Code	Issue	Response
1	**Visual Resources**	The Final Environmental Impact Statement on pages 4-160 and 4-161 states that construction of the proposed road cuts at the western end of the South Mountains would cause "severe visual impacts" and that these cuts "would be visually inconsistent with the natural setting of the surrounding area." These impacts would, however, be in a remote, seldom-used area of the Phoenix South Mountain Park/Preserve and not near any major trails. General mitigation measures to minimize these visual impacts are described on page 4-161. These measures would include the incorporation of newly exposed rock faces characteristic of the adjacent natural rock features. Contractors would respond to the faces' scale, shape, slope, and fracturing to the extent that could be practicable and feasible as identified through geotechnical testing and constructibility reviews. The Arizona Department of Transportation would require the contractor to round and blend new slopes to mimic the existing contours to highlight natural formations. The Arizona Department of Transportation would evaluate having the contractor adjust and warp slopes at intersections of cuts and natural grades to flow into each other or transition with the natural ground surfaces without noticeable breaks. A local example of such treatment would be the cuts associated with Dreamy Draw on State Route 51 in northern Phoenix.
2	**Cultural Resources**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix.
3	**Environmental Justice/Lifestyle**	The Gila River Indian Community is a sovereign nation, and as such has the authority to regulate land uses and activities on its land (see Draft Environmental Impact Statement, page 2-1 sidebar, "*What is a sovereign nation?*"). Throughout the preparation of the Draft Environmental Impact Statement, consultation and coordination with the Gila River Indian Community has been occurring (see Draft Environmental Impact Statement, Chapter 2, *Gila River Indian Community Coordination*).

Code	Issue	Response
4	**Public Involvement**	This study, which began in July 2001, is expected to be completed in 2014. During the study process, community members have had and will continue to have various opportunities to ask questions, express opinions and provide comments about the proposed action (see Chapter 6, *Comments and Coordination*). To facilitate public input to the environmental impact statement process, a variety of communication tools were used at major project milestones, including: · During the EIS process, over 200 presentations were made to community groups, homeowners' associations, chambers of commerce, village planning committees, trade associations, and other interested parties. · Eleven formal public meetings were held. Fifteen days prior to each meeting, display advertising was placed in the *Arizona Republic*, the *Ahwatukee Foothills News*, the *Gila River Indian News*, the *East Valley Tribune*, *La Voz*, and the *West Valley View*. Total distribution was approximately 260,000 newspapers per formal meeting. · One meeting notice flier and four newsletters were distributed throughout the Study Area in the following quantities (per distribution per meeting): 28,500 door hangers, 5,000 inserts in the *Gila River Indian News*, and 28,000 inserts in the *Ahwatukee Foothills News*. In addition, newsletters and fliers were sent to over 4,500 individuals on the project mailing list. · The November 2008 project newsletter was mailed to 78,700 businesses and residences in the Study Area and to 3,300 individuals on the project mailing list. · The February 2010 project newsletter was mailed to 62,400 businesses and residences in the Study Area and to 3,600 individuals on the project mailing list. A project Web site was developed to provide the public with project information and obtain feedback. Approximately half of comments received were submitted electronically through the Web site's online survey or e-mail. Over 5,000 comments have been received by the project team. Since 2002, the Arizona Department of Transportation has worked with a South Mountain Citizens Advisory Team, representing various stakeholder groups in the South Mountain Freeway Study Area including Districts 4, 6, and 7 of the Gila River Indian Community and the Interstate 10/Pecos Road Landowners Association. The group met regularly to review environmental and technical data, discuss the interests and concerns of their respective organizations, and to help find a consensus solution for this proposed project. The general public was welcome to attend each one of these meetings. There also have been various community meetings through the course of this study. For a listing of the past South Mountain Citizens Advisory Team and community meetings, visit <azdot.gov/southmountainfreeway/meeting_notices.asp#communitypast>. Additionally, individual members of the community had an opportunity to review the Draft Environmental Impact Statement, attend the public hearing, attend the forum held at the Komatke Boys & Girls Club in District 6 of the Gila River Indian Community, and provide comments to be included in the Final Environmental Impact Statement.

Subject: Comments on the Loop 202 South Mountain Freeway
Date: Friday, May 31, 2013 9:20:43 PM

Hello

1 I would like to start by saying I am excited about an alternate route to the NE side of town. I currently work in Chandler and it takes me about 50 minutes to get to work each way. I think my first option would be the W101 Alternative because west side residents will not have to travel far to get to the interchange; specifically the central or west interchange. I think as we improve our freeways in AZ, businesses will be willing to expand to West valley.

Thanks

Carissa Bailey-Wade

Subject: ADOT Loop 202 South Mountain Freeway Study

1

How will ADOT ensure that residents that live around/near the Loop 202 South Mountain highway extension won't be infected by the sometimes deadly valley fever fungus? This disease is caused by the dispersal of fungal spores when the soil is disturbed. Highway construction is one of the means be which this dispersal can occur.

Recently a federal court ordered the removal of up to several thousand inmates out of two California state prisons...

http://www.latimes.com/news/local/political/la-me-pc-ff-court-orders-inmates-moved-out-of-valley-fever-prisons-20130624,0,2870415.story

The court judged that these individuals were at risk for getting severe infections or worse due to valley fever. Apparently, 36 people with this fever died over the past 6 years.

How many valley fever infections does ADOT judge to be an acceptable risk for building the Loop 202 South Mountain freeway? I wonder. Personally, I haven't heard or read how ADOT and the State of Arizona plans to address this issue.

Respectfully,

Richard Baker
3216 E. Ashurst Drive
Phoenix, AZ 85048

Code	Issue	Response
1	**Safety and Health**	Detecting the fungus responsible for valley fever in soils is not practical at this time. However, to reduce the amount of construction dust generated that could carry the fungus, particulate control measures related to construction activities would be followed. The following mitigation measures would be followed, when applicable, in accordance with the most recently accepted version of the Arizona Department of Transportation *Standard Specifications for Road and Bridge Construction* (2008). Prior to construction and in accordance with Maricopa County Rule 310, Fugitive Dust Ordinance, the contractor shall obtain an approved dust permit from the Maricopa County Air Quality Department for all phases of the proposed action. The permit describes measures to be taken to control and regulate air pollutant emissions during construction (see page 4-173 of the Final Environmental Impact Statement).

MR. BANYAI: James Banyai. My concern is the lack of alignment of the northern portion -- northbound portion, southbound portion with the 101. And I understand it's not even being talked about anymore. They say, oh, it's still on the table, but nobody's addressing it. That's a concern. I think that's going to be the biggest congestion in the whole mess. It's doubling the traffic flow through there and it's doubling the cost because you've got two T intersections and they're huge, both of them.

We're extending the 101 directly south and then bringing it over would make a lot more sense and it would be a loop. Right now it's not a loop. It's two Ts. That would be, I don't know, four miles or so of congestion. People trying to get to Los Angeles and back are going to be slowed down even more than they are today. People coming north have to swing east and then south, and that common area they're fighting the northbound or fighting the southbound traffic trying to get onto I-10. So to me it's a very poor choice as far as alignment. And I probably won't be around to see it. I'm 72 years old right now, but I think that's a major flaw in what I see today.

The other one would be -- I guess I don't

2	**Design**	The proposed connection to Interstate 10 (Papago Freeway) would include substantial improvements (widening) along Interstate 10 to allow traffic to and from the South Mountain Freeway to enter and exit the Interstate 10 main line smoothly (see page 3-48 of the Final Environmental Impact Statement).

Code	Comment Document

3

quite understand -- ignoring of working with the Indian community to put the -- at least half of the eastbound portion south of South Mountain on the other side of the power line easement. Just run the power down the center, half of it at least on Indian land.

And I think as far as the Indian community would be the least affected -- least impact on them. They'd lose some farmland, but it's a lot different than losing mountains, the corner of South Mountain, and the noise would be alleviated somewhat to South Mountain people.

But, you know, our wonderful planners have not established firm right-of-way plans early enough to make a difference, and that's why it's so expensive. I'm disappointed in the political aspects of that, I guess.

I think the 101 extension should have gone between the border of Tolleson and is it Avondale? And I realize it's been hard on those communities, but people built in the way of it thinking that for years, and it's kind of an impact that they devised themselves. And they could join with Laveen and join together and make common communities, not little provincial states. So that

adding trucks and a longer length of I-10 that will congest the traffic even more, so the faster you can get them off I-10, the better off we will all be.

Other than that, I hope that they build it quickly, you know, cause this would not take forever to build.

Okay. Thank you very much.

MR. HUSTON: I just want to say that I am in favor of the project and after I've reviewed all the boards and the entire process, it seems to make sense what they've narrowed it down to. I think, based on cost alone, it seems like 59th is the best alternative. If cost weren't a factor, I think some of the ones that go further to the west would also be nice to help tie into the west valley. It seems like a long time coming.

It seems like a great project. I think it would be good for, not only our freeway system, but putting people back to work. Overall I just think it would be a really good thing for the community.

That's it.

MR. BAREHAND: My name is Harlan Barehand. I'm from the Gila River Indian Community. I'd like to thank ADOT for finally listening to us and not putting it on the Reservation. I just got through seeing a video next door; it was beautiful. I think it works out fine.

1

Code	Issue	Response

2

It's not on the Reservation at all. It boundaries to it but that's about it.

The only comment that -- you know, since we didn't want it on the Reservation, it would be nice to have some egress onto the freeway on the Reservation areas especially between 40th Street and the curve all the way around to 51st Avenue. That's about it.

And also I hope that the tribe, the Gila River Indian Community, will take advantage of this opportunity. And since they don't want to have -- the whole reason that we didn't want to have the freeway on the Reservation is because we would have no control over it. We want control over things that happen on the Reservation from here on out.

It wouldn't have been -- it would have been fine if they would have put it on the Reservation, but we had no control over it. This way, if we put our own roads close to the freeway so we can get on the freeway easily from the Reservation side, that would be, I think, our next move for the Council to consider it. That's what we're going to submit to the Council meeting tomorrow morning.

I think this is great. I'm really happy with it. I'm happy that we don't have to vote on it a fifth time, vote on it on the Reservation for what would

Driver and Nix Court Reporters - (602) 266-6525
www.drivernix.com

Code	Issue	Response
2	**Alternatives**	Federal law prohibits the denial of access to any community. Thus, traffic interchanges would be located along the freeway where it borders the Gila River Indian Community (see Final Environmental Impact Statement page 3-51). Roadway connections on Gila River Indian Community land to the traffic interchanges would be the responsibility of the Gila River Indian Community, in coordination with appropriate jurisdictions.

Code	Comment Document

be their fifth time. Four times we said no and they still want to bring it up. I think it's just the landowners that want to -- that are standing to make a lot of money off the freeway. It's not but a handful of them. I'm one of the handful. I would make a lot of money off of it.

I also realize that the land is more important itself because I need to keep that within my family to hand down to my children and their children, et cetera, et cetera. If we do it this way, we would lose it forever. They'd never have it. And it just decreases our Reservation by a thousand acres. Originally our reservation went down to Van Buren Street. You can imagine all this land all the way across we lost all to the City of Phoenix.

What have we got for it?

Nothing.

It wouldn't have done us any good the way they had everything set up. They had nothing for us to really build any businesses next to the Reservation. They really didn't consider Indians. The cost of having exits put on was their argument, it would cost too much to have all the exits. But they were here to serve the traffic problem and that was it. I just remember the first meeting they had when they said that we have a

Code	Issue	Response

Code	Comment Document

traffic problem. ADOT said, "We have a traffic problem."
When it was my turn to speak, I said, "No you have a traffic problem. Gila River does not have one. We didn't have a transportation problem. We have no transportation problems."
But I just want to say, thank you very much for the Arizona voters for not putting it on the Reservation. I thank you very much for ADOT to finally come to the decision to put it on the boundaries to it. I think that works out well. And I've seen the video; it's beautiful; it's gorgeous. Laveen will benefit big time and so will the Ahwatukee community, too, I think.
As far as the Gila River is concerned, we have a long ways to go to develop our own. Until we have complete control, we have to work on our own Tribal Council and people that we elect in our districts. Since all this money thing waged with the casino and all, it has really changed quite a lot of attitudes for a lot of people. I think that when our people become more educated, we can start handling our own real estate, our own financial affairs, our own businesses and so forth, then we can step into those shoes. Then we can start dealing with it. We can have our own economy boost.
As it is, I'm pretty sure we're still probably at poverty level, a third-world country even

Code	Issue	Response

Code	Comment Document

though we're right next door until we and our kids and our people realize that we can make bigger strides if we apply ourselves and our children and not be afraid to stand in places where we need to stand up. That's about it.

Thank you very much.

MS. FORGY: My name is Janet Forgy. I have lived in Laveen area, the 67th Avenue and Baseline subdivision, Laveen Meadows, for about six years in November. And I can tell you we desperately need to have this 202. It's imperative. It's like we're out in the boondocks. Businesses are not developing. We have to go five miles to get to I-10, that's the shortest distance, five or 13 miles to get to an interstate.

I-10 is like a parking lot sometimes. There's no development of businesses. I mean, there's nothing. We need that desperately, and so I strongly encourage the 202 to be developed as soon as possible without any delays cause we definitely need it.

UNIDENTIFIED SPEAKER: One of the things I want to stress is that when I purchased my house in November of 2007 I saw the possibilities of development and I was assured that it was going to be developed. It subsequently has not. As a matter of fact I understand because of the economic situations, things had a way of

Code	Issue	Response

4366

tribes in Southern Arizona, being Tohono O'odham, Ak Chin, Salt River Indian Community, culturally it affects them and is disgusting to see how this is still being pushed forward.

THE FACILITATOR: Thank you.

If anybody else who has not registered would like to speak at the hearing, please make sure that you register at the registration desk and then come before us.

If you need additional time, please, if you would like to make additional comments, please give your comments to the court reporter. Thank you.

Harlan Barehand.

MR. BAREHAND: Good morning, sirs. Thank you for the opportunity to come and speak with you this morning. I am Harlan Barehand, I'm registered with the Gila River Indian Community. Thank you very much for not putting it on our reservation, we appreciate that very much. I hope that it will stay off our borders and into the Ahwatukee and the Laveen area. And I think that we can benefit financially through them, but our reservation as it is is very small and we cannot afford to lose any more land as it is. And history tells us that the original Gila River boundaries is Van Buren on this side, so you're asking for Gila River land, but that's history.

1

I came here primarily because I understood that the freeway was going to make a loop and enter our reservation at Pecos Road, and my niece just told me that I was mistaken, that it's not going to, that it is going to stay on Pecos Road, so my presentation is really ineffective and has no balance as to -- like I said, my whole thought is to not put anything on the reservation, because we cannot lose any more land, and I congratulate you on the wise decision not to put it on the Ahwatukee side, and I think that'll be best for everybody and speed up the process of the freeway and so forth. And I thank you very much, and that's all I have to say. Thank you.

THE FACILITATOR: Thank you.

Do we have another name up there? There it is.

Dave Von Tersch. Did I pronounce that right? Dave Von Tersch.

As a reminder, anyone in the auditorium, if you would like to speak just register at the front desk, your name will appear on the screen, and we will call you up.

Ken Lapierre.

Dave Von Tersch, is that you, sir?

MR. VON TERSCH: Hi, my name is Dave Von Tersch, I live in Ahwatukee. I'd like to suggest, as long as there's no ordinance against it or law against it, that the committee 202 project team might consider a

commute. Thank you.

THE FACILITATOR: Thank you.

The next speaker, could you use this microphone, please. Thank you, ma'am.

Raven Barehand.

As we're waiting for the next speaker, I'd like to remind you to refrain from clapping or making comments regarding any speaker's position on any of this out of respect for their position.

Ms. Barehand, you can use this microphone here. You have three minutes, the timer is here in front of you. You may begin.

1 MS. BAREHAND: Okay. Hi, my name is Raven Barehand, I live over there in Laveen and Komatke in the Hillcrest area. One thing I'd like to say is that that freeway would steal the blue from the Estrella Mountain range. It's a brilliant blue, it's a brilliant, cobalt blue or very bright blue. There's no other mountain around here that is that blue as that mountain, and on days when there is a lot of smog that comes in from Phoenix, that mountain turns gray. And so I know that it would cause more emphysema, a lot of people don't want it but the thing is it would cause a lot more sicknesses to come to that area.

I know that the people who were pushing to have

Code	Comment Document

their freeway built, they are thinking of economic development, but that's just people who are money -- they always want more money and some that is -- you can't buy that blue, you can't go back there and repaint it blue. So I just -- I'm against building of that.

I know we do need some kind of a roadway, because the existing 51 that turns into belt line is too small and we do need some kind of a widening through there to stop all this speeding and accidents; and when emergency vehicles need to get through, we do need more of a -- we do need a road or widening of that road, but for something like an eight-lane freeway, that's not really necessary. They can even do a smaller, two-lane or something that wouldn't cause so much traffic that would bombard, and it would -- there would be too much air pollution with an eight-lane freeway.

And so those are the points I wanted to make, and I know -- I am hoping that this doesn't go through, especially because we're trying to break a lot of rules to get it passed and hold back the studies and lying and moving information around; that just shows that they're shady, there's something wrong with that, there's something very wrong with what they're trying to do in passing that eight-lane freeway. So that's everything I have to say and I appreciate, you know, you having this

Code	Issue	Response
2	**Alternatives**	An alternative that included widening 51st Avenue and Beltline Road was considered as part of this study. It was called the Riggs Road Alternative (see Final Environmental Impact Statement page 3-9). The Riggs Road Alternative would be almost entirely on Gila River Indian Community, would not complete the loop system as part of State Route 202L, and would require substantial out of direction travel. Therefore the alternative would not meet the project's purpose and need criteria and was eliminated from further study. Similarly, the concept of building an arterial or a parkway was also considered. In the best-case scenario, a parkway would carry approximately 105,000 vehicles per day, well below the average daily traffic on the proposed freeway, which would range from 117,000 to 190,000 vehicles per day (see Final Environmental Impact Statements page 3-19). As a result, the Arizona Parkway would lack sufficient capacity to meet projected travel demand. The Arizona Parkway would not adequately address the projected transportation system capacity deficiency, would not remove a sufficient amount of traffic from arterial streets, and, therefore, would not meet the project's purpose and need. For these reasons, the Arizona Parkway was eliminated from further consideration.
3	**Air Quality**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix.
4	**Purpose and Need**	The Federal Highway Administration and the U.S. Environmental Protection Agency approved the air quality conformity determination that includes the Maricopa Association of Governments regional travel demand model that produced the traffic projections used in the traffic analysis for the project (see Draft Environmental Impact Statement page 3-27). The model projects demand for multiple modes of travel, including automobile, bus, and light rail. Key model inputs used to forecast travel demand in the Study Area included socioeconomic data (based on land use plans and population and economic forecasts), the anticipated average number of vehicle trips within the region on a daily basis, the distribution of transportation modes used by travelers in the region, the capacity of the transportation infrastructure to accommodate regional travel, and the future transportation infrastructure. The project team used the most recent and reliable data available. The Final Environmental Impact Statement (Chapter 1, *Purpose and Need*, and Chapter 3, *Alternatives*) provides more detail on the data inputs to the modeling effort and discussions of the assumptions used. The Maricopa Association of Governments approved new socioeconomic projections in June 2013. The new data are presented in the Final Environmental Impact Statement (see page 1-11). Although slower growth in total vehicle miles traveled was noted, the need for the freeway did not change. The revised traffic analysis validated that the proposed project is needed today.

forum open, so no build. Do not build Loop 202. Thank you.

THE FACILITATOR: Thank you.

If there's anyone in the auditorium that would like to speak, please make sure you're registered at the front desk. Your name will appear on the screen and we'll call you up in the order that you register.

Again, if there's anyone in the ballroom who would like to speak, please make sure you register at the front desk. Thank you.

Ruben Gallego.

MR. GALLEGO: Hello.

THE FACILITATOR: Mr. Gallego, you have three minutes, here's the timer. Please begin.

MR. GALLEGO: Thank you. My name is Ruben Gallego, I'm a resident of South Mountain, I live right next to the mountain, I'm also the state representative for the area that would be impacted by this freeway. I represent the Laveen area, South Mountain, Gila River Indian Community, as well as portions of the west side of Phoenix. I'm here in support of the 202 highway, not only as a resident, but also as a representative of the people in the district. For years I've been hearing about complaints in terms of traffic and traffic congestion. A lot of the jobs that are currently being

PROCEEDINGS

THE REPORTER: Please state your name.

MS. BAREHAND: Raven Barehand.

My first thought is, you know, instead of an eight-lane freeway, why not have a four-lane freeway in the style of the Maricopa Freeway? That's one thought. That way the people who are concerned about the animals that might lose access to that area, they can run across, you know, they'll chance it just like they do with the freeway now, but at least they get across to their different territories.

And the four-lane freeway wouldn't attract the constant, you know, there would be -- it wouldn't be such a draw of so much traffic, because you can see the Maricopa Freeway and even though there's a ton of traffic, they use that Maricopa Freeway, and it's -- it gives them space. It's not just congested all the time. And so that's my thought on that.

And the other thought is the money that they would save on building an eight-lane freeway with all that concrete laying and everything, they could just build a wall to shield the people in District 6 in that housing development and the hospital from the noise. They could plant a lot of

Driver and Nix Court Reporters - (602) 266-6525
www.drivernix.com

Code	Issue	Response
1	**Alternatives**	The concept of building a four-lane freeway would be similar to an alternative that was considered, the Arizona Parkway. In the best-case scenario, a parkway would carry approximately 105,000 vehicles per day, well below the average daily traffic on the proposed freeway, which would range from 117,000 to 190,000 vehicles per day (see Final Environmental Impact Statements page 3-19). As a result, the Arizona Parkway would lack sufficient capacity to meet projected travel demand. The Arizona Parkway would not adequately address the projected transportation system capacity deficiency, would not remove a sufficient amount of traffic from arterial streets, and, therefore, would not meet the project's purpose and need. For these reasons, the Arizona Parkway was eliminated from further consideration.

4

trees to kind of offset the carbon dioxide and, you know, have reminders about updating your vehicle along the sides. And the ecological conservation or, you know, when they design the freeway, little information about the animals that live in the area, you know, "Please respect us, we live here too," you know, just little cute things. I mean, that would be a good education for the people who come through, like visitors. They don't know the desert animals out here and their habitat and everything. So that would kind of educate on that.

And what else? There was something else. How -- I wanted to know how do we -- because we could put it on the reservation and it's less invasive and then the tribe people who want money for their land would get, you know, something, and it wouldn't tear up that mountain. And I was one of the people who said no freeway, no freeway, no freeway, but I changed my mind, because this two-lane freeway of 51st and Beltline, every time I hear those sirens and I know they can't get through, because that two-lane gets backed up and where there's 20 cars sometimes. And during the rush-hour traffic, you'll just see a straight stream of cars, and there's no way. And then you hear the sirens, and I'm thinking, God, how

5	**Alternatives, Gila River Indian Community Alignment**	

Code	Comment Document

did those ambulance and fire trucks get through?

And then I know throughout the years that two-lane freeway is too small anyway, it's like a two-lane freeway, but the oncoming traffic is versing each other. So we've had -- my ex-boyfriend was in a real deadly accident, and they were sober, and it was just the big 18-wheelers that go through and they go really fast. And here it would be like the people who didn't drive that much, and they get scared, people that are slow, and I've been doing it when I was younger and I was a daredevil, and I would get past there and almost get in accidents twice. And that's a dangerous two-lane highway.

I know we need another way through here, and I went to the end of the freeway where the freeway ends, and I said, we do -- they're going to build it no matter what, I hope they don't cut that mountain open. And I'm going to have to change my stance to, yeah, build it on the res, because before I was saying we don't owe them any more land, they keep taking little bits and pieces. Because in Ahwatukee, that was Gila River land in the '70s, and my uncle who kind of watches the council's decisions, he said, "When did we give that land away? For what?" And it was our land. The map showed it, and

5

Code	Issue	Response

Code	Comment Document

now it's not our land. And there's no documentation. And that was before they were really watching. That's before on the other side, or whatever.

That's just how I feel.

And it would benefit our businesses a little bit. I know they were already thinking of that. I was one who said no freeway, no freeway, no freeway. Now I'm saying a four-lane freeway, not an eight-lane freeway, and then something to block the noise, something to clean the air. Something to let the animals go through, they just chance it, and that's it. Those are my ideas.

THE REPORTER: Okay. Thank you very much.

MS. BAREHAND: I was wondering if I could make another statement.

THE REPORTER: Yes, of course.

MS. BAREHAND: Maybe a program could be started when -- what we notice on the reservation is that a lot of people who work in Phoenix will live in Tucson or in Maricopa, and you know, or Casa Grande, and they go back and forth. And so maybe people could get some kind of credit or a tax break for living in the town where they work. Because they're taking air out -- bad air out of the, you know, out of the atmosphere, or tax for fuel efficient

Code	Issue	Response

Code	Comment Document

vehicles, some kind of discount, like at the DMV, or something like that, to encourage more people getting the fuel-efficient cars. And so that -- so that will reduce the air pollution and then the travel. So that might benefit -- and then having -- encouraging, I don't know, but through the City of Phoenix, maybe encouraging more job advertisers who list the city they're in or the area they're in. That way people in that area will comply to that area, because they, a lot of times, they don't tell you, so that's just something to benefit the air.

And there was something else. I can't remember. I can't remember, but if I remember, I will come back and tell you again.

THE REPORTER: Okay. Thank you.

Code	Issue	Response

Code	Comment Document

***

MS. BAREHAND: Raven Barehand.

It is wrong that they don't have the study available at the Cesar Chavez Library because that is the closest library to the area that would be most impacted on the reservation, the District 6 area, or even the Ocotillo branch is close, that's in the southwest of Phoenix. But all these studies are being made available at three public libraries, and they are all far away.

And that shows that they are doing dirty work, kind of manipulating this whole situation. And it also shows down there on their EIS study they're blatantly lying. There's a part there that says it doesn't do cultural damage, and that is a lie. It shows that they weren't -- they didn't -- they don't have a connection with the people here, and they don't care about the people's culture here, because if they did, they would be talking to all these many voices who keep saying no 202. There's a -- that's our cultural -- that's what we're about, that's our man in the maize, that's Jesus Christ coming back to earth, that's who gave us this O'odham land. And it is a direct attack on our O'odham hemda. Our Pima way of life, our Pima and Tohono O'odham way of life.

We are here still as people with a language, and it's not going to go away.

And God will not let this happen. God is on our side. He doesn't like that his mountain is being destroyed. And these are lies and manipulations to give them right-of-way that they've already decided on, that they've already approved. And this is a mockery that we even have a say right here, but we do have a say. We know that they have all these deals in place. The asphalt workers are ready to go, ready to pour. They're already ordering the supplies. They already have this whole plan in place. This is all a farce. And you can tell that they had it all worked out, maybe years ago, because why would they not have the library access for us? In Casa Grande, that Gila River has a, you know, it's available in Sacaton. That's only Sacaton. But they did not put the libraries that are of easy access to the Pima. They make sure it's far away, in places where people who don't even care about this area can access this, but it's not even -- it's at the Burton C. Central Library, but that's only because it's the main library, even that is hard to get to from here.

But I just want to say that they left out our cultural information. There is nothing out here

Code	Issue	Response

5

about the Pima and Maricopa tribes. There is nothing about Gila River on this EIS study. There's nothing about the culture, the animals, nothing about it. It is all presented very one sidedly, and that's why this big, huge eight-lane freeway will not be built. We can let them put a two-lane level freeway, but this eight-lane freeway will not be built. I can speak right now. Yahweh will not let this freeway be built. That is not happening. It is not going to happen. No eight-lane freeway is going to be built.

That South Mountain is not going to be blasted, God's creation, his cultural marker for this tribe that goes from south of Flagstaff all the way down into Mexico is not going to be blown apart, and that is not the key to destroying my tribe, so that you can take my people's land in the year 3000, which is your plan, and I know. I already seen it in the paper. No.

1	**Alternatives**	Federal regulations stipulate that an environmental impact statement shall "rigorously explore and objectively evaluate all reasonable alternatives" (40 Code of Federal Regulations § 1502.14; see Final Environmental Impact Statement page 3-1). All alternatives were screened using a multidisciplinary set of criteria. Nonfreeway alternatives were considered (see Final Environmental Impact Statement pages 3-3 through 3-6). Among other things, the study took into account improving existing freeways, improving or expanding other travel modes, strategies to reduce travel demand, and various roadway configurations. This study examined not only the potential impacts from improvements, but also the consequences of building nothing, the No-Action Alternative). The proposed freeway is part of the multimodal *Regional Transportation Plan* (see Final Environmental Impact Statement page 1-5 for more information regarding the *Regional Transportation Plan*). The determination of purpose and need for the proposed project includes an assumption that substantial improvements would be made to the Interstate 10 corridor between State Route 51 and U.S. Route 60 (see Final Environmental Impact Statement page 1-13). The Maricopa Association of Governments, in coordination with the Arizona Department of Transportation recently completed the Southeast Corridor Major Investment Study (see <azmag.gov/Projects/>) and developed multimodal concepts for addressing transportation issues in the Interstate 10 corridor. Even with these planned improvements to Interstate 10, the proposed project remains a vital component of the Regional Freeway and Highway System.
2	**Acquisitions and Relocations**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix.
3	**Safety and Health**	To reduce the number of freeway accidents and the expenses associated with responding to them, particular attention was paid to safety factors in the design of the proposed freeway. The proposed South Mountain Freeway's eight-lane section is shown on Final Environmental Impact Statement page 3-58, with discussion and remarks that the freeway would be consistent with the design of other freeways in the region and thereby would improve driver expectancy and safety. The sidebar on Final Environmental Impact Statement page 3-59 discusses the safety features of auxiliary lanes (used at traffic interchanges) for facilitating acceleration and deceleration, thereby reducing potential conflicts with through-traffic and travelers merging onto or exiting from the proposed freeway.
4	**Alternatives**	Alternatives were screened for their (see Final Environmental Impact Statement page 3-3): · ability to satisfy purpose and need · ability to minimize impacts on the human and natural environments · ability to improve operational characteristics of the region's transportation system · degree of public and political acceptability · ability to be constructed within project budget

FORMULARIO DE COMENTARIOS

Gracias por participar en el proceso de recopilación de comentarios sobre el Reporte del Impacto Ambiental del proyecto de la autopista South Mountain.

ADOT alienta a todos los interesados, a presentar sus comentarios por escrito sobre cualquier aspecto del Reporte del Impacto Ambiental. ADOT considerará todos los comentarios en la preparación final de este reporte e incluirá las respuestas a todos los comentarios, conclusiones finales sobre impactos potenciales, y la recomendación final de ADOT.

Para ADOT es muy útil recibir comentarios sobre:

- Alguna alternativa en particular, cúal sería su impacto ambiental y las medidas propuestas para reducir dicho impacto.
- Cualquier información que usted sienta que está incompleta o incorrecta.
- Cómo le afectará a usted la acción propuesta.

Los comentarios deben ser recibidos o tener el sello postal con fecha límite del 24 de julio de 2013. 7 Angela

Thank You for the Opportunity to be Heard and Considered in my following statement ADOT:

5 Am favoring "no build" Scenario. 40 CFR1502.4 stipulates this EIS be "rigourous exploration" of alternatives. Any real transportation/ congestion/pollution problem with determines action upon needs herein, should be current "Multi-modal". EVEN MAG's RTP in last 15 years considers all modes NOT just "freeways" an Oxymoron due to expensive costs, $$$. South loop 202 and its W59/E1 parts

4352

We do have a light at 67th, which makes it a lot better for us. We didn't have the light for a long time. But they did put a light in, I guess, about a year or year and a half ago. Which I knew if they did that at the place where we exit from her home, it would make it a lot better too. They don't have a light there. They have one four blocks down the street. And we can sit there forever trying to get out of there.

And I guess that's about it for now. That's all I can think about right now.

Oh, except for the infrastructure. They did promise us we were going to have shopping centers and other things to make it convenient for us to live in that area. And they have never materialized.

My comments are certainly my own, and they may not be many of the other people's.

DIANNE BARKER: I am a resident, citizen resident here in Phoenix and have lived in the Valley for over 25 years.

I was raised in Ohio, The Buckeye State. And I do want to thank you for this opportunity to be heard and believe I will be considered by ADOT.

I am favoring no-build scenario. 40 CFR 1502.4 -- that's federal regulations -- stipulates that the Environmental Impact Statement, this EIS, be

Code	Comment Document

rigorous exploration of all alternatives.

Any real transportation, congestion, pollution problem which determined action upon the needs should be current with the idea of multimodal. It is a Maricopa, a MAG, regional plan trip term meaning many modes of transportation.

2

And MAG has been doing this in the last 15 years, considering all modes, just not the freeways and the traditional building of ADOT. By the way, freeway is an oxymoron due to the fact that somebody pays. They are very expansive too.

Now, South Loop 202 and its parts, W-59 and E-1, are simply old ADOT. It's rather unchanged since the ADOT state board approved it in the 1980s.

What is needed is a holistic review of all transportation of MAG with ADOT enjoining the I-10 EIS -- or MIS, as you may want to say -- around the Broadway Curve. That's the culprit here in the Valley. It's got the most pollution and congestion in Arizona, and it's right around six freeways of the Phoenix Sky Harbor, so you can understand that planes, trains, et cetera, commuter trains, freeways, and plumes, underground leakages; the whole ball of wax. That's where we should focus.

3

Now, neither should we lay more debt on our

Code	Issue	Response
2	**Purpose and Need**	The proposed freeway is part of the multimodal *Regional Transportation Plan* (see Draft Environmental Impact Statement page 1-5 for more information regarding the *Regional Transportation Plan*). The *Regional Transportation Plan* addresses freeways, streets, transit, airports, bicycle and pedestrian facilities, freight, demand management, system management, and safety. The proposed freeway is only one part of the overall multimodal transportation system planned to meet the travel demand needs of the Maricopa Association of Governments region. The Maricopa Association of Governments, as the region's metropolitan planning organization, has the responsibility to perform regional multimodal planning. The Arizona Department of Transportation is charged with implementation of the freeway program (of which the proposed freeway is a part) within the *Regional Transportation Plan*. Similarly, Valley Metro is charged with implementing the transit program within the *Regional Transportation Plan*.
3	**Purpose and Need**	While the Interstate 10 Corridor Improvement Study was canceled by the Arizona Department of Transportation, there remains funding in the *Regional Transportation Plan* for substantial improvements along the Interstate 10 corridor. The Maricopa Association of Governments and Arizona Department of Transportation are initiating a new study to identify short-range improvements and a long-range multimodal framework for the Interstate 10 corridor.

6

children with the status quo, using the exorbitant right-of-way freeway paid the landowners the highest buildout cost. The Arizona legislature has done that to us.

Nor should we ignore the many deaths, semi rollovers, and the expensive public responders to the many and frequent crash freeway accidents.

Now, what we need is safe, efficient, useful, sustainable, affordable, state-of-art regional connective transportation.

And even considering a fast train, high-speed elevated train, from Tucson to Phoenix around this Broadway Curve as a viable alternative.

MANUEL TOPETE: And I live in Laveen, 51st and Baseline. And I can't wait for this to happen. As simple as that.

My only regret is I won't live to see it. Just I wish it was already done. I think you should also hear this, aside from all this bad.

KARIN GRAY: I have been a resident of Ahwatukee for over ten years, moved here from Texas, and absolutely love South Mountain. One of the reasons I moved to that area was to have access to all 15 miles of the Nation Trail, from one end to the other on South Mountain, the biggest city park in the United States.

4	**Acquisitions and Relocations**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix.
5	**Safety and Health**	To reduce the number of freeway accidents and the expenses associated with responding to them, particular attention was paid to safety factors in the design of the proposed freeway. The proposed South Mountain Freeway's eight-lane section is shown on Final Environmental Impact Statement page 3-58, with discussion and remarks that the freeway would be consistent with the design of other freeways in the region and thereby would improve driver expectancy and safety. The sidebar on Final Environmental Impact Statement page 3-59 discusses the safety features of auxiliary lanes (used at traffic interchanges) for facilitating acceleration and deceleration, thereby reducing potential conflicts with through-traffic and travelers merging onto or exiting from the proposed freeway.
6	**Alternatives**	The Arizona Department of Transportation is currently undertaking a study related to passenger rail between Tucson and Phoenix (see <azdot.gov/planning/CurrentStudies/PassengerRail/overview>). Passenger rail between Tucson and Phoenix would not adequately address projected capacity and mobility needs of the Phoenix metropolitan area and, therefore, would not meet the purpose and need criteria.

Code	Comment Document

family's safety, if for nothing else, I say yes, let's do it. And the 59th Avenue Freeway is the one that I would be concerned about.

Thank you very much.

THE FACILITATOR: Thank you, Ms. Williams.

We welcome our next speaker, Diane Barker. Welcome, Ms. Barker, you have three minutes.

MS. BARKER: Oh, thank you. And I imagine you're the ADOT board; is that who I'm addressing? Can I get you to respond? Okay. Now that you notice, I came in with my suitcase. I am a person that believes in [unintelligible]. I have just seen your video, and I've read the bulk of your EIS. And I would like to apologize up front if what I have to say offends anybody, but I believe it's the truth, certainly mine.

I favor a no-build. 40 CFR 15024 stipulates that the Environmental Impact Statement conducted by ADOT and all will be a rigorous exploration of alternatives to a real problem, need an action herein, of any possible growth in population with socioeconomic viability, as we are one of the USA's largest and fastest-growing counties, Maricopa.

Therefore, completion of the South 202 Loop

is a regurgitative ADOT state board 1980s idea, out of date of current modes, multi-modalism, certainly defined by MAG's members, department and public deserving safe, efficient, convenient, affordable, state of art, usable, sustainable transportation. Resolution of any real or perceived problem of the region's priority and its plan should be holistic and inclusive of present and future largest pollution and congestion areas in MAG -- in the MAG region, the Broadway curve.

ADOT wrongly eliminated I-10 CIS, favoring building Loop 202 south. Why? Is it because the state legislative body still allows the building of public dollars going to right-of-way purchases? For example, landowners have to pay the highest in build-out compensation -- they would receive the highest in build-out compensation for their property when ADOT builds it.

These horrible and expensive life-taking accidents that are currently around our I-10 because of our current modes, the rollovers of trucks and so -- and a lot of vehicles, this extends from I-10 to Broadway curve down to Tucson, clutters our freeways, stops progress. I won't accept this. I won't ignore better multi-modal solutions, even high

Code	Issue	Response
1	**Purpose and Need**	The proposed freeway is part of the multimodal *Regional Transportation Plan* (see Draft Environmental Impact Statement page 1-5 for more information regarding the *Regional Transportation Plan*). The *Regional Transportation Plan* addresses freeways, streets, transit, airports, bicycle and pedestrian facilities, freight, demand management, system management, and safety. The proposed freeway is only one part of the overall multimodal transportation system planned to meet the travel demand needs of the Maricopa Association of Governments region. The Maricopa Association of Governments, as the region's metropolitan planning organization, has the responsibility to perform regional multimodal planning. The Arizona Department of Transportation is charged with implementation of the freeway program (of which the proposed freeway is a part) within the *Regional Transportation Plan*. Similarly, Valley Metro is charged with implementing the transit program within the *Regional Transportation Plan*.
2	**Alternatives**	While the Interstate 10 Corridor Improvement Study was canceled by the Arizona Department of Transportation, there remains funding in the *Regional Transportation Plan* for substantial improvements along the Interstate 10 corridor. The Maricopa Association of Governments and Arizona Department of Transportation are initiating a new study to identify short-range improvements and a long-range multimodal framework for the Interstate 10 corridor.
3	**Acquisitions and Relocations**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix.
4	**Safety and Health**	To reduce the number of freeway accidents and the expenses associated with responding to them, particular attention was paid to safety factors in the design of the proposed freeway. speed rail to --

THE FACILITATOR: Thank you, Ms. Barker, I'm sorry, your three minutes have run.

MS. BARKER: -- killing the citizens, just to satisfy old ADOT.

THE FACILITATOR: I'd like to welcome our next speaker, Travis Hardin.

Welcome, Mr. Hardin, you have three minutes.

MR. HARDIN: Thank you. To the committee that sits here today, I'm definitely in favor of this Loop 202 transition. I believe this is going to do two major things: One thing that's focused on is the congestion coming from the Southwest Valley, as well as the West Valley. I think you free up a lot of travel time, travel space for those community members that are in the Laveen area, Tolleson, Avondale. I think you're going to clear up with this project, with the proposed being a yes, I think you're going to clear up more room for retail. I think this brings a lot of retail opportunity for the Southwest Valley, and then you also -- you open up areas for the East Valley to meet with the West Valley. I'm not a native of Arizona, but you often hear about people in the West Valley saying they don't know much

Subject: Pecos Rd Freeway
Date: Monday, May 27, 2013 12:51:04 PM

1 2 3 4 5 6 7

I currently reside at the end of Pecos Road in a Woodside housing development. My family moved here to be farther away from the hustle and bustle and to take advantage of Pecos Rd as a route to exercise and stay healthy. We bike ride as do hundreds of people who also enjoy running, rollerblading, and hiking.

I am extremely opposed to building a freeway on the Pecos alignment. This will not only change our ability to have a quiet out of the way place to live, but will ruin our environment, air quality, view and noise level. This would have an impact on our way of life in Ahwatukee.

Please consider other alternatives as hundreds of people will be impacted in a negative way including my family who has lived here for 10 years and plan to stay through retirement.

Sent from my iPad

Code	Issue	Response
1	**Traffic**	The study has considered concepts for parallel multiuse paths, however the main line of the proposed freeway would not have a bicycle route as part of the design. The design of the traffic interchanges includes provisions for pedestrian and bicycle movement in accordance with current design guidelines and regulations. While not currently included, enhancements such as pedestrian bridges or multiuse paths may be added during the final design phase through coordination with the City of Phoenix (see page 3-60 of the Final Environmental Impact Statement). The cost and maintenance of these enhancements would be the responsibility of the City of Phoenix.
2	**Alternatives, Nonfreeway Alternatives**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix.
3	**Neighborhood**	While the E1 Alternative is adjacent to the largely residential areas of Ahwatukee Foothills Village (to the north), a freeway has been planned in this location for many years (see Final Environmental Impact Statement pages 4-17 and 4-21).
4	**Biology, Plants, and Wildlife**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix.
5	**Air Quality**	
6	**Visual Resources**	Because Pecos Road is already a four-lane arterial street and is in approximately the same location as the proposed E1 Alternative, viewers would not be seeing any phenomena they do not already see (see Final Environmental Impact Statement page 4-169). The proposed freeway would have eight lanes of traffic and carry more vehicles, but what park users and residents would see would not be substantively different from what they already see along Pecos Road. Page 4-170 in the Final Environmental Impact Statement lists measures that should help to avoid, reduce, or mitigate aesthetic impacts. Larger saguaro cacti, mature trees, and large shrubs that would likely survive the transplanting and sitting-in period would help in visually sensitive or critical roadway areas.
7	**Noise**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix.

1 2 3 Please do not continue the efforts to extend the Loop 202 around South Mountain from Chandler to Laveen, AZ. Based on the materials provided, I do not agree that the extension would alleviate traffic or provide a vital traffic route around the city. I do believe that the extension would contribute to the degradation of the Valley's air quality, cost the taxpayers too much money and force the relocation of too many businesses and homes. No on 202 extension!

Code	Issue	Response
1	**Purpose and Need**	The proposed freeway is needed to serve projected growth in population and accompanying transportation demand and to correct existing and projected transportation system deficiencies. See Chapter 1, *Purpose and Need*, in the Final Environmental Impact Statement. Although the region's freeways are now congested during the peak travel period, conditions in 2035 without the proposed freeway would be substantially worse with more congested areas and congested conditions for longer periods of time (see Final Environmental Impact Statement pages 1-21 and 1-22). Congestion relief resulting from the proposed freeway would provide localized reductions of delays on arterial streets and at interchanges. Reduced travel times would result in lower exposure to elevated concentrations of mobile source air toxics occurring in traffic. Other benefits of the proposed freeway in comparison to the No-Action Alternative are presented in Table 3-9 on page 3-38 of the Final Environmental Impact Statement.
2	**Air Quality**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix.

I want to express my absolute support to get this freeway built. We in Laveen are in need of infrastructure and transportation options... the whole west valley would benefit from greater infrastructure and transportation options that would alleviate congestion and provide better access to the I-10. It is a wonderful opportunity to connect people and places, creating a greater more beautiful community. Please also consider when building this freeway that families and communities would greatly appreciate bike paths, bridges and sound walls that would add functional beauty to all the communities! Please build for our future!!! Thank you.

1	**Design**	The Arizona Department of Transportation Roadside Development Section is responsible for assigning a wide range of standard treatment applications and wall materials, including color, to noise barriers and other structures. Typically the community where the wall will be constructed would work closely with its City Architect or planning department to decide on a theme for the wall. Usually, this can be accomplished by using the Arizona Department of Transportation's standard applications.
2	**Design**	The study has considered concepts for parallel multiuse paths; however, the main line of the proposed freeway would not have a bicycle route as part of the design. The design of the traffic interchanges includes provisions for pedestrian and bicycle movement in accordance with current design guidelines and regulations. Respected Sir/Madam
Extention of freeways is part of modern life and construction of South mountain free way will have positive impact on community especially laveen residents. Construction of South Mountain freeway is not only required but its also right of residents to reach hospitals, emergency cares, schools, colleges, work on time. It will definately help save lifes. Please go for it, this project should not be stopped for any reason.

Thanking you

May 28, 2013

Arizona Department of Transportation South Mountain Study Team
1655 W Jackson St, MD 126F
Phoenix, AZ 85007

Dear South Mountain Study Team,

(1) I am writing to express my opposition to the proposed South Mountain Freeway and to urge ADOT to select the No-Build Alternative.

(2) The proposed freeway would cause more problems than it would solve. In addition, it would only provide short-term congestion relief. As is evident by our numerous clogged roads and freeways, many of which have recently been built or widened, building more roads is not the answer.
(3) ADOT needs to instead focus on planning for and investing in long-term transportation solutions, including mass transit. The only way to effectively reduce congestion and mobilize people is by reducing the number of vehicles utilizing our roads, not by encouraging more to use them.

(4) (5) South Mountain Freeway would have incredible negative impacts on our communities. Despite what the DEIS claims, air quality in the region would worsen over time, increasing public health risks. As more vehicles fill the "uncongested" areas this freeway would temporarily provide, more pollution will be spewed into the air, exacerbating asthma, cancer, and other diseases.

(6) (7) The freeway would also negatively effect our environment. South Mountain Park is the largest city park in our nation. It was set aside to protect resources and to benefit our communities. By blasting a freeway through a portion of this park, wildlife and habitat will be destroyed, movement corridors will be cut off, valuable public spaces will be lost, and more. This would set a terrible precedent by demolishing what should remain a protected area.

(8) The freeway will also exacerbate urban sprawl and further burden Arizona's taxpayers. Its construction would continue ADOT's trend of forcing residents to remain vehicle-dependent while paying for infrastructure so that others can live farther and farther from a city center.

(1) Please help protect our communities, our health, and our environment by selecting the No Action Alternative. Thank you.

The basis for building new roads is WILDLY UNREALISTIC PROJECTIONS OF UNSUSTAINABLE POPULATION GROWTH. Please do not destroy Arizona beauty for an almost extinct dependancy on personal automobiles & gasoline.
Thank you
Councilperson Anne Bassett

Sincerely,

Code	Issue	Response
1	**Alternatives, No-Action (No-Build) Alternative**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix.
2	**Purpose and Need**	Although the region's freeways are now congested during the peak travel period, conditions in 2035 without the proposed freeway would be substantially worse with more congested areas and congested conditions for longer periods of time (see Final Environmental Impact Statement pages 1-21 and 1-22). Congestion relief resulting from the proposed freeway would provide localized reductions of delays on arterial streets and at interchanges. Reduced travel times would result in lower exposure to elevated concentrations of mobile source air toxics occurring in traffic. Other benefits of the proposed freeway in comparison to the No-Action Alternative are presented in Table 3-9 on page 3-38 of the Final Environmental Impact Statement.
3	**Alternatives**	Federal regulations stipulate that an environmental impact statement shall "rigorously explore and objectively evaluate all reasonable alternatives" (40 Code of Federal Regulations § 1502.14; see Final Environmental Impact Statement page 3-1). All alternatives were screened using a multidisciplinary set of criteria. Nonfreeway alternatives were considered (see Final Environmental Impact Statement pages 3-3 through 3-6). Among other things, the study took into account improving existing freeways, improving or expanding other travel modes, strategies to reduce travel demand, and various roadway configurations. This study examined not only the potential impacts from improvements, but also the consequences of building nothing, the No Action Alternative. As proposed by the Maricopa Association of Governments, the South Mountain Freeway would be part of the Regional Freeway and Highway System. Other transportation improvements such as mass transit and local roads are specified in the *Regional Transportation Plan* and were considered during the evaluation of this proposed new freeway. As noted in the Final Environmental Impact Statement (see page 3-60), the proposed freeway would provide opportunities to enhance operation of future mass transit improvements.
4	**Air Quality**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix.

Code	Issue	Response
8	**Neighborhoods/ Communities**	Unplanned growth is often termed "urban sprawl." Generally, this term is used in the context of rapid and uncontrolled urban growth onto previously undeveloped land—usually on the outskirts of an existing urban area. Projects like the proposed freeway are often identified as contributors to urban sprawl. Freeway projects are often cited as making land at the urban fringe more accessible and, therefore, more attractive for development. However, examination of data comparing population and land use between 1975 and 2000 suggests major transportation projects like the proposed freeway do not induce growth in the region (see Final Environmental Impact Statement pages 4-170 through 4-174). The proposed freeway would be implemented in a historically quickly urbanizing area (most noticeably in the Western Section of the Study Area, although the nationwide recession which began in 2007 slowed growth). In the Eastern Section of the Study Area, the proposed freeway would abut public parkland, Native American land, and a near-fully developed area—therefore, any contribution to accelerated or induced growth would be constrained. The proposed freeway would be built in an area planned for urban growth as established in local jurisdictions' land use plans for at least the last 25 years.

Jun 4, 2013

Arizona Department of Transportation South Mountain Study Team
1655 W Jackson St, MD 126F
Phoenix, AZ 85007

Dear South Mountain Study Team,

(1) I am writing to express my opposition to the proposed South Mountain Freeway and to urge ADOT to select the No-Build Alternative.

(2) (3) The proposed freeway would cause more problems than it would solve. In addition, it would only provide short-term congestion relief. As is evident by our numerous clogged roads and freeways, many of which have recently been built or widened, building more roads is not the answer. ADOT needs to instead focus on planning for and investing in long-term transportation solutions, including mass transit. The only way to effectively reduce congestion and mobilize people is by reducing the number of vehicles utilizing our roads, not by encouraging more to use them.

(4) (5) (6) (7) South Mountain Freeway would have incredible negative impacts on our communities. Despite what the DEIS claims, air quality in the region would worsen over time, increasing public health risks. As more vehicles fill the "uncongested" areas this freeway would temporarily provide, more pollution will be spewed into the air, exacerbating asthma, cancer, and other diseases.

The freeway would also negatively effect our environment. South Mountain Park is the largest city park in our nation. It was set aside to protect resources and to benefit our communities. By blasting a freeway through a portion of this park, wildlife and habitat will be destroyed, movement corridors will be cut off, valuable public spaces will be lost, and more. This would set a terrible precedent by demolishing what should remain a protected area.

(8) The freeway will also exacerbate urban sprawl and further burden Arizona's taxpayers. Its construction would continue ADOT's trend of forcing residents to remain vehicle-dependent while paying for infrastructure so that others can live farther and farther from a city center.

When relatives and friends from out of state visit, they all comment on what a great park we have in the South Mountain Park and it is often what they remember most.

(1) Please help protect our communities, our health, and our environment by selecting the No Action Alternative. Thank you.

Sincerely,

Mrs. Joan Batchelor

Subject: Proposed Loop 202

Dear Sir, Ma'am,

1 I am writing in support of the proposed Loop 202 extension. This extension will provide a long-needed relief for surface streets in South Phoenix and Laveen, Arizona where I live. This will increase the level of overall safety on our streets and reduce the amount of wear-and-tear on the surface roadways, and reduce air and noise pollution where I live.

This extension is long overdue and needs to be fully funded and completed as soon as possible.

Sincerely,

Andrew Bateman

> I am writing in support of the proposed Loop 202 extension. This extension will provide a long-needed relief for surface streets in South Phoenix and Laveen, Arizona where I live. This will increase the level of overall safety on our streets and reduce the amount of wear-and-tear on the surface roadways, and reduce air and noise pollution where I live.
>
> This extension is long overdue and needs to be fully funded and completed as soon as possible.
>
> Sincerely,
>
> Lindsay Bateman

with the intention that the freeway had been approved. So we really struggle with being able to get to the places that we need to get to, particularly having a, you know, young son. We don't have the resources that we need. So we just really want to stay in Laveen. We want Phoenix and the Laveen area to stay liveable, but without the freeway, we're stuck in traffic. We can't get the hospital, the resources and things that we need without it.

So we just encourage moving forward with the plan for the freeway. Thank you.

THE FACILITATOR: Thank you.

Lindsay Bateman.

An announcement, please. The last bus will be running in about five minutes, at 7:30, for all destinations, orange, green, and blue, routes 1, 2, and 3.

MS. BATEMAN: Just talk? All right.

THE FACILITATOR: Are you Lindsay?

MS. BATEMAN: I'm Lindsay Bateman. I'm just here to support the South Mountain Freeway. I'm a resident of Laveen. And I'm just looking forward the economic development open to our area, and really relieve the congestion on the surface streets. And

help the commute to work. I know a lot of times the freeway, I-10 gets closed and then the surface streets are just blocked all the time and I just really hope that we can get there. We moved to Laveen counting on that freeway coming in, knowing that it was approved, so I just really hope that you guys take that into consideration and support the freeway.

That's all I have to say. Thanks.

THE FACILITATOR: Thank you.

For those of you who may not have heard, the last bus is leaving in about three minutes for all destinations out there.

Jennifer Rouse, take your time.

MS. ROUSE: Hi, thank you. I wanted to speak on the record in favor of the 202. I live in Laveen, and have lived there for seven years. When we first moved there I lived close to 35th and [unintelligble] Road, where traffic jams pretty much with the big trucks going down the road, and things have changed, and having moved closer to 51st Avenue and Baseline, we see the semis that come through that earlier we heard people talk about how this is going to bring all of these semis coming through the neighborhood. It's already there. It's already

1

We Moved to Laveen almost 10 years ago. Part of the reason we moved to this part of the valley was because we were told that the South Mountain Freeway would be built through Laveen. This area grew astronomically the first year we lived here. The traffic in our area has become so bad that getting on to Baseline road and 51st ave. can take you 7-10 minutes or longer during the morning and evening commuter traffic. Please honor the voters that passed the bills to build our freeway. We have taken our time to vote so don't show us that our votes don't count or that we should have voted differently for the people making the decisions.
Thank you for listening

As a daily commuter on I-10 I feel it is important that we have additional routes between the East and West valleys. The highways are congested now and with future growth the existing highways will not be able to handle the traffic. The existing roads are becoming unsafe with the amount of traffic that is expected to use them. Additional routes are needed to make the roads safe for our families to travel.

Subject: Southmountain Freeway Extension

1

It is time for ADOT to correctly interpret the needs of the South Mountain Freeway Extension as it relates to the needs of the US Interstate 10 that now provides the only access into and around Phoenix for residents and commercial entities in Ahwatukee and points south. ADOT has a duty to resolve the problems on the federally funded Interstate 10 that worsen on a daily basis. Interstate 10 is the primary southern conduit linking east to west, and it's capability to meet this need is already being compromised. The South Mountain Freeway Extension is a vital solution to ease the Interstate 10 problems, no matter what path it may take. As a member of the silent majority who regularly use Interstate 10 and wanting this project to go forward as planned, I urge ADOT to not be swayed by the relatively few who oppose the extension for selfish reasons, such as buying and owning homes that were clearly presented many years ago as being in the path of a future freeway.

1	**Purpose and Need**	The proposed project is part of the *Regional Transportation Plan* for the Maricopa County region. In 2004, the voters of Maricopa County approved the *Regional Transportation Plan* and the extension of a half-cent sales tax to fund the projects. The funding for the right-of-way acquisition and construction of the proposed project would come from a combination of Federal (National Highway Performance Program) and County (half-cent sales tax, also known as Regional Area Road Funds) sources. Use of these funds for construction of the proposed freeway would not affect available funds for statewide projects nor would not constructing this facility make additional funds available for other statewide projects.

1 I am writing in opposition to this freeway taking portions of the South Mountain Preserve. Aside from the damage to the ecosystem, this project damages the heart of what makes living in PHoenix so wonderful.

For many years my out of town visitors remark at how much foresight and wisdom was done in preserving the mountain areas. My father stated: What a wonderful effort.

2 The mountain preserves are the only thing that makes living in Phoenix bearable. Hopefully, you can find a better alternate route.

Thank you,

Marsha Bennett

Draft Environmental Impact Statement
COMMENT FORM

Thank you for participating in the South Mountain Freeway Draft Environmental Impact Statement public comment process.

ADOT encourages all interested parties to submit written comments on any aspect of the Draft EIS. ADOT will consider all comments in preparing the Final EIS, which will include responses to all comments, final conclusions on potential impacts, and ADOT's final recommendation.

When submitting comments, please be as specific as possible and substantiate your concerns and recommendations.

It is helpful to ADOT to receive comments on:

- A particular alternative, environmental impact assessment, and/or draft mitigation.
- Any information you feel is incomplete or incorrect.
- How the proposed action would affect you.

Comments must be received or postmarked by July 24, 2013.

I SUPPORT THE NO ACTION (AKA NO BUILD) ALTERNATIVE FOR THE FOLLOWING REASONS:

1 ① AS A TRIATHLETE, I USE SOUTH MOUNTAIN PARK ON A REGULAR BASIS FOR BICYCLE TRAINING. THE PARK IS VERY POPULAR FOR CYCLISTS, RUNNERS AND HIKERS. THE PROPOSED FREEWAY WOULD CAUSE INCREASED AIR POLLUTION WHICH

2 WOULD NEGATIVELY IMPACT OUR HEALTH. IT IS NOT FAIR TO ASSUME THAT COMPARABLE AIR POLLUTION WOULD RESULT FROM THE NO ACTION ALTERNATIVE.

3 ② THE PROPOSED FREEWAY (ALL ACTION ALTERNATIVES) WOULD LARGELY BLOCK AN IMPORTANT WILDLIFE CORRIDOR CONNECTING SOUTH MOUNTAIN PARK TO THE ESTRELLA MOUNTAINS. (OVER)

4	**Section 4(f) and Section 6(f)**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix.
5	**Visual Resources**	Because Pecos Road is already a four-lane arterial street and is in approximately the same location as the proposed E1 Alternative, viewers would not be seeing any phenomena they do not already see (see Final Environmental Impact Statement page 4-169). The proposed freeway would have eight lanes of traffic and carry more vehicles, but what park users and residents would see would not be substantively different from what they already see along Pecos Road. Page 4-170 in the Final Environmental Impact Statement lists measures that should help to avoid, reduce, or mitigate aesthetic impacts. Larger saguaro cacti, mature trees, and large shrubs that would likely survive the transplanting and sitting-in period would help in visually sensitive or critical roadway areas.
6	**Noise**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix.

To: Projects
Subject: Comments in opposition to South Mountain Freeway
Date: Monday, May 27, 2013 11:14:51 PM

May 28, 2013

Arizona Department of Transportation South Mountain Study Team
1655 W Jackson St, MD 126F
Phoenix, AZ 85007

Dear South Mountain Study Team,

(1) I am writing to express my opposition to the proposed South Mountain Freeway and to urge ADOT to select the No-Build Alternative.

(2) (3) The proposed freeway would cause more problems than it would solve. In addition, it would only provide short-term congestion relief. As is evident by our numerous clogged roads and freeways, many of which have recently been built or widened, building more roads is not the answer. ADOT needs to instead focus on planning for and investing in long-term transportation solutions, including mass transit. The only way to effectively reduce congestion and mobilize people is by reducing the number of vehicles utilizing our roads, not by encouraging more to use them.

(4) (5) South Mountain Freeway would have incredible negative impacts on our communities. Despite what the DEIS claims, air quality in the region would worsen over time, increasing public health risks. As more vehicles fill the "uncongested" areas this freeway would temporarily provide, more pollution will be spewed into the air, exacerbating asthma, cancer, and other diseases.

(6) (7) The freeway would also negatively effect our environment. South Mountain Park is the largest city park in our nation. It was set aside to protect resources and to benefit our communities. By blasting a freeway through a portion of this park, wildlife and habitat will be destroyed, movement corridors will be cut off, valuable public spaces will be lost, and more. This would set a terrible precedent by demolishing what should remain a protected area.

(8) The freeway will also exacerbate urban sprawl and further burden Arizona's taxpayers. Its construction would continue ADOT's trend of forcing residents to remain vehicle-dependent while paying for infrastructure so that others can live farther and farther from a city center.

Only the "Anti-Christ" would approve of such a thing. Is that ADOT???

(1) Please help protect our communities, our health, and our environment by selecting the No Action Alternative. Thank you.

Sincerely,

Mr. Dahniayl Benyahmeen
PO Box 209

Code	Issue	Response
1	**Alternatives, No-Action (No-Build) Alternative**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix.
2	**Purpose and Need**	Although the region's freeways are now congested during the peak travel period, conditions in 2035 without the proposed freeway would be substantially worse with more congested areas and congested conditions for longer periods of time (see Final Environmental Impact Statement pages 1-21 and 1-22). Congestion relief resulting from the proposed freeway would provide localized reductions of delays on arterial streets and at interchanges. Reduced travel times would result in lower exposure to elevated concentrations of mobile source air toxics occurring in traffic. Other benefits of the proposed freeway in comparison to the No-Action Alternative are presented in Table 3-9 on page 3-38 of the Final Environmental Impact Statement.
3	**Alternatives**	Federal regulations stipulate that an environmental impact statement shall "rigorously explore and objectively evaluate all reasonable alternatives" (40 Code of Federal Regulations § 1502.14; see Final Environmental Impact Statement page 3-1). All alternatives were screened using a multidisciplinary set of criteria. Nonfreeway alternatives were considered (see Final Environmental Impact Statement pages 3-3 through 3-6). Among other things, the study took into account improving existing freeways, improving or expanding other travel modes, strategies to reduce travel demand, and various roadway configurations. This study examined not only the potential impacts from improvements, but also the consequences of building nothing, the No Action Alternative. As proposed by the Maricopa Association of Governments, the South Mountain Freeway would be part of the Regional Freeway and Highway System. Other transportation improvements such as mass transit and local roads are specified in the *Regional Transportation Plan* and were considered during the evaluation of this proposed new freeway. As noted in the Final Environmental Impact Statement (see page 3-60), the proposed freeway would provide opportunities to enhance operation of future mass transit improvements.
4	**Air Quality**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix.

Code	Issue	Response
8	**Neighborhoods/ Communities**	Unplanned growth is often termed "urban sprawl." Generally, this term is used in the context of rapid and uncontrolled urban growth onto previously undeveloped land—usually on the outskirts of an existing urban area. Projects like the proposed freeway are often identified as contributors to urban sprawl. Freeway projects are often cited as making land at the urban fringe more accessible and, therefore, more attractive for development. However, examination of data comparing population and land use between 1975 and 2000 suggests major transportation projects like the proposed freeway do not induce growth in the region (see Final Environmental Impact Statement pages 4-170 through 4-174). The proposed freeway would be implemented in a historically quickly urbanizing area (most noticeably in the Western Section of the Study Area, although the nationwide recession which began in 2007 slowed growth). In the Eastern Section of the Study Area, the proposed freeway would abut public parkland, Native American land, and a near-fully developed area—therefore, any contribution to accelerated or induced growth would be constrained. The proposed freeway would be built in an area planned for urban growth as established in local jurisdictions' land use plans for at least the last 25 years.

educated myself.

It's time to build the South Mountain Freeway. Valley commuters have waited in traffic jams long enough. The freeway will cut traffic congestion across the metro area, reduce air pollution and save drivers time and money. 64.3 percent of likely voters in Maricopa County support construction of the freeway, according to the results of a new poll commissioned by the We Build Arizona. 19.6 percent said they were either opposed or likely to oppose a project. In a separate survey also commissioned by We Build Arizona, 59 percent of likely voters living in Ahwatukee and Laveen support the freeway as well. If we don't build the South Mountain Freeway, traffic in the region will get much worse over the next two decades. According to ADOT's own study, traffic on I-10 between Ahwatukee and Goodyear will grow 28 percent. Another 103,000 cars will use the Broadway curve each day. Another 38,000 cars will jam the tunnel every day. Morning and evening commute times will increase 39 percent to 82 percent, traffic congestion on city streets will increase 46 percent. The same report indicates the project also will reduce air pollution by reducing the time vehicles spend stuck in traffic. The

project will create 38,000 jobs during the five- to six-year construction period that will result in a $2 billion investment in the Phoenix area economy.

The money to build the freeway is in the budget, and again, this has been approved by voters twice, first in 1985 and again in 2004. I approve the 202, and I would like to see it built. Thank you for your time.

THE FACILITATOR: Thank you, sir. Garell Jordan. Did I get that name proper?

MS. JORDAN: Garell.

THE FACILITATOR: Ma'am, you have three minutes. Here's the timer; please begin.

MS. JORDAN: My name is Garell Jordan; I am a proud resident of Laveen for the last two years. We moved to Laveen, I live at 64th Avenue and Southern, so very close to the 59th Avenue alignment. We knew when we moved there that there was a freeway planned. And we moved there because we wanted more acreage; we wanted land for our animals; we have six dogs, three horses, and a bunch of chickens. But we also knew that we wanted to live in close proximity to downtown Phoenix, where I work, two blocks from here. And we knew that we wanted some of the amenities of living in the city that, you know,

Subject: south mt freeway

1 Please--I have lived in Ahwahtukee and Tempe for over 25 years, always waiting for this freeway to be built.
NOW please build it before I get to old to ever use it.

David C. Berliner

LOOP 202
South Mountain
Freeway Study

Draft Environmental Impact Statement
COMMENT FORM

Thank you for participating in the South Mountain Freeway Draft Environmental Impact Statement public comment process.

ADOT encourages all interested parties to submit written comments on any aspect of the Draft EIS. ADOT will consider all comments in preparing the Final EIS, which will include responses to all comments, final conclusions on potential impacts, and ADOT's final recommendation.

When submitting comments, please be as specific as possible and substantiate your concerns and recommendations.

It is helpful to ADOT to receive comments on:

- A particular alternative, environmental impact assessment, and/or draft mitigation.
- Any information you feel is incomplete or incorrect.
- How the proposed action would affect you.

Comments must be received or postmarked by July 24, 2013.

1 JUST IN CONSIDERATION OF THE COST, I DO NOT UNDERSTAND HOW THIS PROJECT CAN BE CARRIED OUT. IF THE LAND HAD BEEN PURCHASED & SET ASIDE BACK WHEN THE PROJECT WAS RECORDED, IT MAY HAVE BEEN FEISBLE. TODAY, HOUSES & COMMUNITIES

2 HAVE BEEN ESTABLISHED. THE CITY & STATE ~~DOES~~ DO NOT HAVE THE FUNDS TO PURCHASE & DESTROY WHAT HAS BEEN BUILT. THESE FUNDS CANNOT BE RECOVERED.

3 ON A PERSONAL SIDE, I DO NOT WANT THE ADDITIONAL TRAFFIC THAT WOULD BE ROUTED THROUGH OUR COMMUNITY.

Optional

Name LYNN BIAGIOTTI Email

Address 15820 S 25TH WAY

City PHOENIX State AZ Zip 85048

Code	Issue	Response
1	**Neighborhoods/ Communities**	While the City has some ability to control development through its zoning ordinances, the City does not have the authority to stop private land from being developed. The Arizona Department of Transportation was able to acquire large tracts of land along the Pecos Road alignment in the 1980s, but funding shortfalls kept the Arizona Department of Transportation from acquiring all of the needed land. Developers were aware of the potential freeway and made the decision to develop the land despite the risk that the freeway would eventually be built. Citizens were also aware of the potential and chose to buy homes near the freeway despite the same risk. Information related to freeway awareness and the responsibilities of the City of Phoenix, developers, and the Arizona Department of Transportation related to disclosure of the planning for the freeway is presented on page 4-13 of the Final Environmental Impact Statement.
2	**Purpose and Need**	The cost estimate for the proposed freeway includes the cost to acquire, relocate residents, and clear the necessary properties for the freeway as well as to build and design the project (see page 3-59 of the Final Environmental Impact Statement). The funding for the project is programmed in the Maricopa Association of Governments *Regional Transportation Plan*, adopted by the Maricopa Association of Governments Regional Council, and the Arizona Department of Transportation 5-year Transportation Facilities Construction Program, approved by the State Transportation Board. Both actions indicate this project is the highest priority for each agency. The funding for right-of-way acquisition and construction of the proposed project would come from a combination of federal (National Highway Performance Program) and County (half-cent sales tax, also known as Regional Area Road Funds) sources.
3	**Traffic**	In 2006, the City of Phoenix conducted a traffic circulation study to evaluate the impacts of the freeway on the local street system. The City study found no adverse effects on the local street system from the proposed freeway (see Appendix 3-1 in the Final Environmental Impact Statement).

Subject: Comments in opposition to South Mountain Freeway
Date: Thursday, May 30, 2013 6:38:53 PM

May 30, 2013

Arizona Department of Transportation South Mountain Study Team
1655 W Jackson St, MD 126F
Phoenix, AZ 85007

Dear South Mountain Study Team,

(1) I am writing to express my opposition to the proposed South Mountain Freeway and to urge ADOT to select the No-Build Alternative.

(2) The proposed freeway would cause more problems than it would solve. In addition, it would only provide short-term congestion relief. As is evident by our numerous clogged roads and freeways, many of which have recently been built or widened, building more roads is not the answer.

(3) ADOT needs to instead focus on planning for and investing in long-term transportation solutions, including mass transit. The only way to effectively reduce congestion and mobilize people is by reducing the number of vehicles utilizing our roads, not by encouraging more to use them.

(4) South Mountain Freeway would have incredible negative impacts on our communities. Despite what the DEIS claims, air quality in the region would worsen over time, increasing public health risks. As more

(5) vehicles fill the "uncongested" areas this freeway would temporarily provide, more pollution will be spewed into the air, exacerbating asthma, cancer, and other diseases.

(6) The freeway would also negatively effect our environment. South Mountain Park is the largest city park in our nation. What a shame that we would even consider destroying part of it with a freeway. The park was set aside to protect resources and to benefit our communities; it is a point of pride in our community that we should be protecting. By blasting a freeway through a portion of this park, wildlife and habitat

(7) will be destroyed, movement corridors will be cut off, valuable public spaces will be lost, and more. This would set a terrible precedent by demolishing what should remain a protected area.

(8) The freeway will also exacerbate urban sprawl and further burden Arizona's taxpayers. Its construction would continue ADOT's trend of forcing residents to remain vehicle-dependent while paying for infrastructure so that others can live farther and farther from a city center. Phoenix is one of the ten most dangerous cities for pedestrians and bicyclists, and we should spend money on making safe bikeways and greenbelts that will improve our health, reduce gasoline consumption, and improve air quality.

(1) Please help protect our communities, our health, and our environment by selecting the No Action Alternative. Thank you.

Sincerely,

Code	Issue	Response
1	**Alternatives, No-Action (No-Build) Alternative**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix.
2	**Purpose and Need**	Although the region's freeways are now congested during the peak travel period, conditions in 2035 without the proposed freeway would be substantially worse with more congested areas and congested conditions for longer periods of time (see Final Environmental Impact Statement pages 1-21 and 1-22). Congestion relief resulting from the proposed freeway would provide localized reductions of delays on arterial streets and at interchanges. Reduced travel times would result in lower exposure to elevated concentrations of mobile source air toxics occurring in traffic. Other benefits of the proposed freeway in comparison to the No-Action Alternative are presented in Table 3-9 on page 3-38 of the Final Environmental Impact Statement.
3	**Alternatives**	Federal regulations stipulate that an environmental impact statement shall "rigorously explore and objectively evaluate all reasonable alternatives" (40 Code of Federal Regulations § 1502.14; see Final Environmental Impact Statement page 3-1). All alternatives were screened using a multidisciplinary set of criteria. Nonfreeway alternatives were considered (see Final Environmental Impact Statement pages 3-3 through 3-6). Among other things, the study took into account improving existing freeways, improving or expanding other travel modes, strategies to reduce travel demand, and various roadway configurations. This study examined not only the potential impacts from improvements, but also the consequences of building nothing, the No Action Alternative. As proposed by the Maricopa Association of Governments, the South Mountain Freeway would be part of the Regional Freeway and Highway System. Other transportation improvements such as mass transit and local roads are specified in the *Regional Transportation Plan* and were considered during the evaluation of this proposed new freeway. As noted in the Final Environmental Impact Statement (see page 3-60), the proposed freeway would provide opportunities to enhance operation of future mass transit improvements.
4	**Air Quality**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix.

Code	Issue	Response
8	**Neighborhoods/ Communities**	Unplanned growth is often termed “urban sprawl.” Generally, this term is used in the context of rapid and uncontrolled urban growth onto previously undeveloped land—usually on the outskirts of an existing urban area. Projects like the proposed freeway are often identified as contributors to urban sprawl. Freeway projects are often cited as making land at the urban fringe more accessible and, therefore, more attractive for development. However, examination of data comparing population and land use between 1975 and 2000 suggests major transportation projects like the proposed freeway do not induce growth in the region (see Final Environmental Impact Statement pages 4-170 through 4-174). The proposed action would be implemented in a historically quickly urbanizing area (most noticeably in the Western Section of the Study Area, although the nationwide recession which began in 2007 slowed growth). In the Eastern Section of the Study Area, the proposed freeway would abut public parkland, Native American land, and a near-fully developed area—therefore, any contribution to accelerated or induced growth would be constrained. The proposed freeway would be built in an area planned for urban growth as established in local jurisdictions’ land use plans for at least the last 25 years.

South Mountain Study Team
Arizona Department of Transportation
1655 West Jackson Street, MD 126F
Phoenix, Arizona 85007

Dear Study Team,

(1) I strongly oppose the proposed South Mountain freeway. The proposed freeway would cause more problems than it would solve. In addition, it would only provide short-term congestion relief. As is evident by our numerous clogged roads and freeways, many of which have recently been built or widened, building more roads is not the answer. ADOT needs to instead focus on planning for and investing in long-term transportation solutions, including mass transit. The only way to effectively reduce congestion and mobilize people is by reducing the number of vehicles utilizing our roads, not by encouraging more to use them.

(2) (3) South Mountain Freeway would have incredible negative impacts on our communities. Despite what the DEIS claims, air quality in the region would worsen over time, increasing public health risks. As more vehicles fill the "uncongested" areas this freeway would temporarily provide, more pollution will be spewed into the air, exacerbating asthma, cancer, and other diseases.

(4) (5) The freeway would also negatively effect our environment. South Mountain Park is the largest city park in our nation. What a shame that we would even consider destroying part of it with a freeway. The park was set aside to protect resources and to benefit our communities; it is a point of pride in our community that we should be protecting. By blasting a freeway through a portion of this park, wildlife and habitat will be destroyed, movement corridors will be cut off, valuable public spaces will be lost, and more. This would set a terrible precedent by demolishing what should remain a protected area.

(6) (7) The freeway will also exacerbate urban sprawl and further burden Arizona's taxpayers. Its construction would continue ADOT's trend of forcing residents to remain vehicle-dependent while paying for infrastructure so that others can live farther and farther from a city center. Phoenix is one of the ten most dangerous cities for pedestrians and bicyclists, and we should spend money on making safe bikeways and greenbelts that will improve our health, reduce gasoline consumption, and improve air quality.

(8) Please help protect our communities, our health, and our environment by selecting the No Action Alternative. Thank you.

doing a great job and we appreciate that. Thank you.

At this point, David Bickford. Mr. Bickford.

MR. BICKFORD: Good morning, thank you for the opportunity. In discussing the proposed freeway's impact on South Mountain, ADOT spokesperson Tim Tate has said the following: "You can't build a freeway without some sort of consequence."

That's true, but what the statement omits is the distinction between acceptable consequences and unacceptable ones. If we allow the world's largest municipal park to be violated by a freeway, Phoenix may become the world's largest municipal laughingstock; that is clearly an unacceptable consequence. If we absolutely must have this freeway, then another route must be found. Nevertheless, it's unclear if this freeway is needed at all.

After reading the entire report, I believe it is based on out-of-date assumptions and faulty reasoning. On the issue of induced demand, I quote from the draft: "The purpose of the proposed action is not to promote economic development, but to respond to a growing need for additional transportation capacity as a result of regional growth occurring now and is projected. Therefore, the action alternatives are not expected to contribute to induced growth in the region."

That's like going to the doctor, telling him or her that you eat nothing but bacon, but you don't expect any negative impact on your health because you aren't eating bacon with the intent of hurting your health. If only we can simply wish away the unintended consequences of our actions. The more likely outcome is that this freeway will provide short-term relief but that induce more traffic. Contrary to the claims made in the report, induced demand happens routinely as a result of road building, even when transportation demand exceeds supply.

4

Of course, there are different ways to meet transportation demand, and a far better scenario is not a freeway connecting two suburban neighbors but instead, enriching those areas with the best possible rail and bus links to existing employment centers. Unfortunately, the draft report dismisses these options with insufficient consideration.

Chapter three notes that "No planned rail lines will serve the territory connected by the proposed freeway," but doesn't even contemplate that additional rail lines beyond those currently planned could be added. A strategy that does not rely exclusively on automotive travel would be aligned with shifting demographic realities, ones that were ignored in the draft EIS. Since 2005 there has been substantial downturn in driving

6

and car ownership by young adults. Why, then, assume that patterns that held prior to 2005 will inevitably be repeated over the next few decades? Why not reinforce this positive trend toward diminished driving by enhancing transit, rather than building a freeway that may counteract the positive trend with an inducement to drive more?

Please don't destroy part of South Mountain on the basis of insufficient justification. I urge you to rethink this report and the freeway it recommends.

THE FACILITATOR: Thank you, Mr. Bickford.

Shana Velasquez.

MS. VELASQUEZ: Hi, thank you. I may not be as eloquent of a speaker as my speakers before me, but I'm here today as a mother that lives in Laveen. And we moved there originally four years ago because we were told there's going to be a lot more things that were going to be built, and so far that has not happened because we do not have the access to the 202. We can't have a hospital, we don't have a rec center, I have to drive my children 30 minutes just to, you know, take them to dance classes.

I personally work in Tempe, I used to work in North Scottsdale when I originally moved to Laveen and that takes me the same amount of time to get to Tempe as

Code	Issue	Response
6	**Traffic**	The historical growth in the Maricopa County region is discussed in the Draft Environmental Impact Statement beginning on page 1-5. The critical factors such as available land, mild climate, affordable cost of living, and employment opportunities that led to the historical growth rates in the region remain unchanged. The comment relies heavily on national trends for travel; however the local conditions and setting of the Phoenix metropolitan area are not consistent with areas of high-density cities in other parts of the country. In Maricopa County, daily vehicle miles traveled levels increased by almost 2 percent between 2011 and 2012 and the 2012 daily vehicle miles traveled is approaching the prerecession peak in 2007. (*Source:* Arizona Department of Transportation Multimodal Planning Division Highway Performance Monitoring System Data for the Calendar Year 2012 and 2011). Even if the trend of vehicle miles traveled "per capita" decreasing continues, the total vehicle miles traveled in the region would still increase along with increases in total population. A critical factor not acknowledged in the comment is that the proposed project is needed today. Details of this need are presented in the Draft Environmental Impact Statement beginning on page 1-13. While new projections based on the 2010 Census and emerging national trends may show a lower anticipated population and vehicle miles traveled in 2035 than the previous projections, the need for the freeway has not changed. The Maricopa Association of Governments approved new socioeconomic projections in June 2013. The new data are presented in the Final Environmental Impact Statement beginning on page 1-11.

Subject: Comments on the South Mountain Freeway Draft EIS

I am commenting as a concerned citizen and not as a representative of any organization. In discussing the proposed freeway's impact on South Mountain, ADOT Spokesperson Tim Tait has said the following: "You can't build a freeway without some sort of consequence …." That's true, but the statement fails to distinguish between acceptable consequences and unacceptable ones. If we allow the world's largest municipal park to be violated by a freeway, Phoenix may become the world's largest municipal laughing stock. If we absolutely must have this freeway, then another route must be found. Nevertheless, it's unclear if this freeway is needed at all. After reading the entire report, I believe it is based on out-of-date assumptions and faulty reasoning. (1)

Starting with the issue of induced demand, I quote from the draft: "The purpose of the proposed action is not to promote economic development but to respond to a growing need for additional transportation capacity as a result of regional growth occurring now and as projected. Therefore, the action alternatives are not expected to contribute to induced growth in the region."

That wording is astonishing. The claim being made in the passage above can be compared to going to the doctor, telling him or her that you eat nothing but bacon, but that you don't expect any negative impact on your health because you aren't eating bacon with the intent of hurting your health. If only we could simply wish away the unintended consequences of our actions. The more likely outcome is that this freeway will provide short term relief but then induce more traffic.

Contrary to the claims made in the report, induced demand happens routinely as a result of road building, even when transportation demand exceeds supply. The induced traffic may not come primarily from the Laveen and Ahwatukee neighborhoods linked by the proposed freeway, but instead from more far-flung suburban regions that become more appealing when a commute that had been previously unthinkable suddenly becomes "not so bad." Is it really in the best interests of the metropolitan area to enable daily drives between Buckeye and Queen Creek, for example? (2)

Supporters of the South Mountain Freeway claim that construction of this road will bring economic development to Laveen. While a freeway is likely to bring construction projects and real estate investment to the area, the most likely result will be inefficient, unsustainable job sprawl instead of a strong local economy. The idea of decentralized employment has been pursued for years, most notably in Phoenix's urban village concept, and its failure is evident in the long suburb-to-suburb commutes that have resulted.

Because contemporary labor markets are so specialized, few job seekers find work in their particular professional niches close to home. Instead, the jobs in one suburb are often filled not by nearby

1	**Section 4(f) and Section 6(f)**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix.
2	**Neighborhoods/ Communities**	Unplanned growth is often termed "urban sprawl." Generally, this term is used in the context of rapid and uncontrolled urban growth onto previously undeveloped land—usually on the outskirts of an existing urban area. Projects like the proposed freeway are often identified as contributors to urban sprawl. Freeway projects are often cited as making land at the urban fringe more accessible and, therefore, more attractive for development. However, examination of data comparing population and land use between 1975 and 2000 suggests major transportation projects like the proposed freeway do not induce growth in the region (see Final Environmental Impact Statement pages 4-170 through 4-174). The proposed freeway would be implemented in a historically quickly urbanizing area (most noticeably in the Western Section of the Study Area, although the nationwide recession which began in 2007 slowed growth). In the Eastern Section of the Study Area, the proposed freeway would abut public parkland, Native American land, and a near-fully developed area—therefore, any contribution to accelerated or induced growth would be constrained. The proposed freeway would be built in an area planned for urban growth as established in local jurisdictions' land use plans for at least the last 25 years.

Code	Comment Document

residents, but instead by people commuting long distances in single-occupant motor vehicles from another suburb miles away. Even if one is lucky enough to find work close to home, job transfers and office relocations are such a frequent occurrence that the congruence of residence and workplace can disappear with little notice. Likewise, even someone employed close to home may find his or her spouse, domestic companion, or adult child traveling a long distance to find employment in his or her area of specialized area of expertise.

For all those reasons, a far better scenario is not a freeway connecting two suburban neighborhoods and encouraging unproductive land use, but instead enriching those areas with the best possible rail and bus links to existing employment centers. Unfortunately, the draft report dismisses these options with insufficient consideration. Chapter 3 notes that no planned rail lines will serve the territory connected by the proposed freeway, but doesn't even contemplate that additional rail lines beyond those currently planned could be added.

3

That's quite an omission considering how many times the map of planned light rail extensions has been revised since the passage of Proposition 400 in 2004. The original map did not envision light rail in South Phoenix, but a line to that part of town is now being studied. A second phase extending that line to Laveen might be feasible. While the study acknowledges that other modes of transport could be added in the future, relegating non-automotive modes to a wish list is not responsible planning. The time to look at those alternatives in depth is now, before any park land is sacrificed for a freeway.

Similarly, the report considers each mode of transport in isolation without appropriate attention to the possibilities that an appropriate mixture of modes might present. Could the proposed freeway be built as a parkway with a smaller footprint? The study claims that would not fulfill transportation needs by itself, but doesn't address the possibility of a parkway combined with investments in public transit as a more balanced approach to regional transportation needs.

4

A strategy that does not rely exclusively on automotive travel would be in line with shifting demographic realities, ones that were ignored if the draft EIS. Since 2005, the date from which most projections in the report are extrapolated, there has been a substantial downturn in driving and car ownership, particularly by young adults. Quoting from the U.S. Public Interest Research Group's May 2013 report, "The Millennial generation is leading the change in transportation trends. 16 to 34-year-olds drove a whopping 23 percent fewer miles on average in 2009 than in 2001— the greatest decline in driving of any age group." Why then assume that patterns that held prior to 2005 will inevitably be repeated over the next few decades?

5

Of course, one might argue that a reduction in driving could offset the induced traffic mentioned earlier in these comments. That optimal balance between opposing forces would come about only with extraordinarily good fortune. Instead of relying on luck, why not reinforce the positive trend toward diminished driving instead of building roads that might have a contrary effect of inducing traffic? In addition, why spend substantial amounts of money on a freeway that may not be needed when it is clear that increasing numbers of Americans want to see more investment in public transit, along with bicycling and pedestrian infrastructure.

In light of all these considerations, the only logical conclusion is that the draft report relies on outmoded data and assumptions to forecast growth in vehicle miles traveled, and it casually dismisses non-automotive modes of travel that might meet transportation demand, either by themselves or in conjunction with a smaller road project. Even if ADOT's VMT projections are accurate, it likely the freeway will only worsen the problem due to induced demand. Don't destroy part of South Mountain on the basis of such insufficient justification. Please rethink this report and the freeway it advocates.

3	**Purpose and Need**	The proposed freeway is part of the *Regional Transportation Plan* for the Maricopa Association of Governments region. The *Regional Transportation Plan*, as described on pages 1-5 and 1-10 of the Draft Environmental Impact Statement, addresses freeways, streets, transit, airports, bicycle and pedestrian facilities, freight, demand management, system management, and safety. The proposed freeway is only one part of the overall multimodal transportation system planned to meet the travel demand needs of the Maricopa Association of Governments region.
4	**Alternatives, Nonfreeway Alternatives**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix.
5	**Traffic**	The historical growth in the Maricopa County region is discussed in the Draft Environmental Impact Statement beginning on page 1-5. The critical factors such as available land, mild climate, affordable cost of living, and employment opportunities that led to the historical growth rates in the region remain unchanged. The comment is based on national trends for travel; however, the local conditions and setting of the Phoenix metropolitan area are not consistent with areas of high-density cities in other parts of the country. In Maricopa County, daily vehicle miles traveled levels increased by almost 2 percent between 2011 and 2012 and the 2012 daily vehicle miles traveled is approaching the prerecession peak in 2007. (*Source:* Arizona Department of Transportation Multimodal Planning Division Highway Performance Monitoring Program Data for the Calendar Year 2012 and 2011). Even if the trend of vehicle miles traveled "per capita" decreasing continues, the total vehicle miles traveled in the region would still increase along with increases in total population. A critical factor not acknowledged in the comment is that the proposed project is needed today. Details of this need are presented in the Draft Environmental Impact Statement beginning on page 1-13. While new projections based on the 2010 Census and emerging national trends may show a lower anticipated population and vehicle miles traveled in 2035 than the previous projections, the need for the freeway has not changed. The Maricopa Association of Governments approved new socioeconomic projections in June 2013. The new data are presented in the Final Environmental Impact Statement beginning on page 1-11.

Subject: South Mountain Freeway

Hello,
I am a resident of Laveen and would like to thank the ADOT project team for completing the Draft EIS.

By looking a the details of the Draft EIS, it absolutely makes sense that the E1 and the W59 are the Recommended Alternatives.

1

I am looking forward eagerly for this freeway to be built quickly as we have a huge commute problem in Laveen area. The Baseline road is heavily clogged during rus hours and also when it is free cars go at a very high speed through Baseline road due to unavailability of any nearby freeway for people travelling from Laveen to South East valley. Taking the I-10 E from Laveen for travelling to Chandler is not really an option.

Also I think this proposed South Mountain freeway would free-up the downtown congestion with I-10 and improve the overall air quality of central Phoenix area.

All the best to the ADOT project team!!

Regards,
Tamal Biswas

LOOP 202
South Mountain
Freeway Study

2013

Draft Environmental Impact Statement
COMMENT FORM

Thank you for participating in the South Mountain Freeway Draft Environmental Impact Statement public comment process.

ADOT encourages all interested parties to submit written comments on any aspect of the Draft EIS. ADOT will consider all comments in preparing the Final EIS, which will include responses to all comments, final conclusions on potential impacts, and ADOT's final recommendation.

When submitting comments, please be as specific as possible and substantiate your concerns and recommendations.

It is helpful to ADOT to receive comments on:

- A particular alternative, environmental impact assessment, and/or draft mitigation.
- Any information you feel is incomplete or incorrect.
- How the proposed action would affect you.

Comments must be received or postmarked by July 24, 2013.

I used to live in Laveen and work in Chandler. The commute traffic through Baseline was getting so worse that I had to move to Chandler. I still have my house in Laveen and I think the economic growth of the Laveen area will grow significantly when this freeway is built.

PLEASE BUILD South Mountain Freeway ASAP !!

Thank you.

Temal Biswas. Could I ask you to use this microphone, please.

MR. BISWAS: Hello. My name is Temal Biswas, so I am currently a resident of Chandler. I used to live in Laveen from 2007 to 2012 and I work at Intel Corporation and my main commute goes to the Baseline Road and it was getting worse day by day. I pretty much had to skip morning meetings because I just couldn't travel through there, so I had to go off hours, late hours in the evening so that I am not caught in the Baseline traffic. And I know many of my colleagues start to move out of the area because not having a proper alternate to travel to the Southeast Valley where a lot of employees are.

So I think this freeway is badly needed for the reasons, and I still have my home there, but I see my home value regularly falls because there is no growth happening and I think having a freeway would help the area. And I think the primary consideration of any government body should be the overall, long-term economic growth of an area, and I strongly believe by looking at the EIS statement that building a freeway would accommodate different regions of the Valley and economy is deemed to be one of the main things that drives economy growth, so I absolutely would support the plan,

the proposed alternative to build the freeway. Thank you.

THE FACILITATOR: Thank you.

Phillip Morales.

Use this microphone, please.

MR. MORALES: Good evening. Thank you for letting me speak. I'm kind of emotional right now, but I'm a veteran, I'm a Gila River Community member, I speak my language, I'm very related to my culture.

South Mountain is the most sacred mountain we have for the Akimel and O'odham people. And I know that's -- I'm from District 6 and I know that that freeway's going to go through our cultural sites. Elaborate petroglyphs that our great-, great-, great-, great-grandfathers kids' hands put their hands on there. You know, I could put my hand on there, I know I'm touching their hands from hundreds of years ago.

Suhu, man of the maize, you all know was -- this was the son of God, like Jesus Christ, it was son of our mountain tribes, we are all related to one God. He came down from heaven, we call him elder brother Suhu, he came and lived in South Mountain and he showed us how to live our life, the four stages of life: How to respect, how to learn your language, your first love, when you have a family do it right, then your third sage is to become

timer. Please begin.

MR. BIVVINS: Okay. Pretty much the same thing, I travel on this piece of freeway every day between the 99th and 59th Avenue, and it's the biggest bottleneck in town. We watch the news every morning and that piece of freeway is always backed up and a mess every day, every morning and every afternoon.

So the thought to me is to bring the 101 down and feed to the freeway and bring the 202 up and feed into that freeway. Everyone going north who wants to go north will get on that piece of I-10, Everyone going south would go on that piece of I-10. If you lined them up, that piece of freeway will not end up being jammed up with all this traffic, it will end up being funneled on that five-mile stretch of road.

I'm all for the 202, I just think it could be moved further west where Tolleson is at and go through that same piece of freeway, that same interchange and make it one big -- hopefully like the other things are in town. That's all I have. Thank you.

1

THE FACILITATOR: Thank you.

Another reminder for those of you who are in the ballroom, if you're planning on speaking please make sure you register at the registration desk, your name will appear on the screen, and we'll call you in the order

Ladies & Gentlemen,

1 I vote in favor of this long over due project. I recently moved to Laveen, AZ (originally from San Antonio, TX) in March 2013 and agree that this highway would bring a positive economic impact to Laveen, AZ and help drivers like myself commute better in the metro Phoenix area. Please do not delay this project anymore. I can hardly wait to see the construction team to build...wish it were tomorrow!

Thank you for reading.

Sincerely,
Maria D. Blessing

1	**Alternatives**	Federal regulations stipulate that an environmental impact statement shall "rigorously explore and objectively evaluate all reasonable alternatives" (40 Code of Federal Regulations § 1502.14; see Final Environmental Impact Statement page 3-1). All alternatives were screened using a multidisciplinary set of criteria. Nonfreeway alternatives were considered (see Final Environmental Impact Statement pages 3-3 through 3-6). Among other things, the study took into account improving existing freeways, improving or expanding other travel modes, strategies to reduce travel demand, and various roadway configurations. This study examined not only the potential impacts from improvements, but also the consequences of building nothing, the No Action Alternative. As proposed by the Maricopa Association of Governments, the South Mountain Freeway would be part of the Regional Freeway and Highway System. Other transportation improvements such as mass transit and local roads are specified in the *Regional Transportation Plan* and were considered during the evaluation of this proposed new freeway. As noted in the Final Environmental Impact Statement (see page 3-60), the proposed freeway would provide opportunities to enhance operation of future mass transit improvements.

Subject: public hearing phase of the Draft Environmental Impact Study/South Mountain Freeway

Dear ADOT,

As a longtime resident of Ahwatukee, I am deeply opposed to the freeway being built through the Ahwatukee Foothills.

I lived and raised my son in the Ahwatukee Foothills for many years. After 4 years in Seattle I have once again chosen Ahwatukee as my home for my my family. Ahwatukee is a unique part of Phoenix that enjoys access to one of the most beautiful parts of the city, the foothills and South Mountain Park. We live here because of the quality of life. It is quiet, has relatively low crime and traffic and has more of a "neighborhood" feel than most parts of the city. In addition, and probably most importantly, we are surrounded with the beautiful Sonoran Desert and it's wildlife. We enjoy seeing javelina, coyotes, owls, eagles etc. on a regular basis that reside in South Mountain Park and the surrounding desert. (1)

We currently reside just a couple of miles north of Pecos road at the base of South Mountain and would love to continue to make our home here. We chose the area specifically because of it's separation from the rest of the city, it's desert (not city) feel, it's distant proximity to a freeway and general quality of life.

Building the freeway would route the freeway by-pass directly through the Ahwatukee foothills. First of all, the noise pollution alone would ruin the serenity we currently enjoy as part of our quality of life. Secondly, the long-term impact of the pollution of hundreds of thousands of cars and trucks through this pristine desert environment is almost unimaginable. Not only to the desert animals we share our home with but to all of the residents of the Ahwatukee foothills. Thirdly, the quality of life that the residents chose the foothills for would all but disappear. Property values will plummet, crime will rise, and our "neighborhood feel" will be a thing of the past. Furthermore, there is always the potential of hazardous waste accidents on the freeway and an unimaginable impact from that alone. And lastly, the construction of the freeway itself would immediately and intensely disrupt the lives of all foothills and Gila River residents in a dramatically negative manner. (2) (3) (4) (5) (6) (7)

I simply cannot imagine climbing telegraph pass trail as I often do and instead of the serene beautiful view of the desert as far as the eye can see south, there is a roaring freeway and a resulting low hanging dark cloud of pollution. (8) (3)

The Ahwatukee foothills are one of the last remaining truly lovely and suburban desert areas of Phoenix with one of the highest qualities of life in the city in my opinion. This proposed freeway would forever ruin the area and I would imagine prompt many, many residents (including myself) that chose the area because of it's beauty and remoteness to leave.

Code	Issue	Response
1	**Biology, Plants, and Wildlife**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix.
2	**Noise**	
3	**Air Quality**	
4	**Neighborhoods/ Communities**	While the E1 Alternative is adjacent to the largely residential areas of Ahwatukee Foothills Village (to the north), a freeway has been planned in this location for many years (see Final Environmental Impact Statement pages 4-17 and 4-21). Where existing residential uses are adjacent to the proposed freeway, noise mitigation would be implemented according to Arizona Department of Transportation policy (see Final Environmental Impact Statement beginning on page 4-91).
5	**Economics, Socioeconomics**	A review of the literature reveals few detailed and comprehensive analyses of the relationship between the transportation infrastructure and residential property values (Transportation Research Record: Journal of the Transportation Research Board, No. 2174, Transportation Research Board of the National Academies, Washington, D.C., 2010, pp. 138-47; "Impact of Highways on Property Values: Case Study of the Superstition Freeway Corridor"). A recent study by the California Department of Transportation concluded that freeway facilities did not substantially affect sales prices in residential areas adjacent to the facility. The study concluded that it is the visibility of the freeway that may influence selling price and not distance or noise. As a result, the researchers generally concluded that the more the visibility of a new freeway is reduced, the less it would determine the sales price of homes sold in the area.
6	**Neighborhoods/ Communities**	While the City of Phoenix Police Department reported in 2005 that it did not have any statistics specific to crime adjacent to freeways, the Police Department did note that, based on its experience, there does not appear to be a correlation between crime rates and freeways. See Draft Environmental Impact Statement sidebar on page 4-21.
7	**Hazardous Materials**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix.
8	**Visual Resources**	Because Pecos Road is already a four-lane arterial street and is in approximately the same location as the proposed E1 Alternative, viewers would not be seeing any phenomena they do not already see (see Final Environmental Impact Statement page 4-169). The proposed freeway would have eight lanes of traffic and carry more vehicles, but what park users and residents would see would not be substantively different from what they already see along Pecos Road. Page 4-170 in the Final Environmental Impact Statement lists measures that should help to avoid, reduce, or mitigate aesthetic impacts. Larger saguaro cacti, mature trees, and large shrubs that would likely survive the transplanting and sitting-in period would help in visually sensitive or critical roadway areas.

Code	Comment Document
9	I urge you to find another solution to this proposed freeway to preserve the residents quality of life, the beautiful foothills and the desert surrounding it. Once the freeway is built this area will forever change for the negative and the desert foothills will never be the same. This brings tears to my eyes. Please find another solution with far less impact to this environment and neighborhood. Sincerely, Brynda L. Blowers 730 E. MS. BLOWERS: I am deeply passionate about this neighborhood. My son grew up here, and we loved it so much. We moved to Seattle, and when we came back to Phoenix, we chose Ahwatukee again, to live here. So we love the neighborhood. We live up against South Mountain.

So I have several things I'm deeply opposed to about this.

Number one, the construction alone: the impact on the neighborhood traffic, the noise, the dust. I can't even imagine the problems we would have with that.

Number two, there is animals all over this place. It's separated from the city. You know, we hear the coyotes at night. We have eagles. We have owls. The environment alone, the exhaust from the freeway. The impact on the land and the animals would just change so much. South Mountain Park is something that we use a lot.

Number three, the proximity to the schools. My son attended Keystone Montessori. It's right next to where the freeway will be built. It's an amazing school. I can't even imagine how different it would be, being right next to a freeway, because, you know, it's just so -- It's so much desert. It's just desert out there. You can see the stars at night. You know, it's quiet. I would really be concerned about -- I just wouldn't want my son to attend a school next to a freeway.

Code	Issue	Response
1	**Construction**	The freeway construction staging plan for the area along Pecos Road would allow for keeping east-west travel open during construction. One side of the freeway would be constructed while traffic remained on Pecos Road. When complete, traffic would be shifted from Pecos Road to the new freeway. At that time, the other side of the freeway would be built. Therefore, traffic would be able to continue to operate as it currently does during construction. However, temporary detours may be needed during construction. (See Final Environmental Impact Statement page 3-27.) Where feasible, noise barriers would be constructed as early as possible in the construction phasing to shield adjacent properties from construction-related noise impacts
2	**Safety and Health**	To reduce the amount of construction dust generated, particulate control measures related to construction activities must be followed. The following mitigation measures would be followed, when applicable, in accordance with the most recently accepted version of the Arizona Department of Transportation *Standard Specifications for Road and Bridge Construction* (2008). Prior to construction and in accordance with Maricopa County Rule 310, Fugitive Dust Ordinance, the contractor shall obtain an approved dust permit from Maricopa County Air Quality Department for all phases of the proposed action. The permit describes measures to be taken to control and regulate air pollutant emissions during construction (see page 4-173 of the Final Environmental Impact Statement).
3	**Biology, Plants, and Wildlife**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix.

Number four, the housing impact. I think property values would drop considerably because the desirability of the neighborhood would greatly go down. I personally would -- probably would leave the neighborhood. So it just wouldn't be the same. And I think that would really impact the housing market.

Number five, it would route all the trucks with hazardous waste through the Ahwatukee Foothills. And all those trucks that are bypassing Phoenix: Right through.

Again, the school, the proximity to the schools; there is always a possibility of an accident. The -- I just -- I can't -- I would never move here if that were, you know, an issue.

Number six, the noise alone. I know there would be sound walls built. But we live up against South Mountain. I think that would create kind of a -- just a noise tunnel between the freeway and South Mountain. I think it would -- It's really quiet at night here. It's nice. It's serene. It's the reason we moved here. The freeway would change all of that, noise-wise, noise pollution.

And the most important point of all is that Ahwatukee is very unique in the Phoenix area. You know, there is places in other cities that -- Cave Creek has the term of the mountains of the desert. Parts of Scottsdale, Carefree, you know, they have that, what people move there for. And

Code	Issue	Response
6	**Economics, Socioeconomics**	A review of the literature reveals few detailed and comprehensive analyses of the relationship between the transportation infrastructure and residential property values (Transportation Research Record: Journal of the Transportation Research Board, No. 2174, Transportation Research Board of the National Academies, Washington, D.C., 2010, pp. 138–47; "Impact of Highways on Property Values: Case Study of the Superstition Freeway Corridor"). A recent study by the California Department of Transportation concluded that freeway facilities did not substantially affect sales prices in residential areas adjacent to the facility. The study concluded that it is the visibility of the freeway that may influence selling price and not distance or noise. As a result, the researchers generally concluded that the more the visibility of a new freeway is reduced, the less it would determine the sales price of homes sold in the area.
7	**Hazardous Materials**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix.
8	**Noise**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix. As discussed in the Noise Analysis Technical Report prepared for the Final Environmental Impact Statement, the proposed South Mountain Freeway was modeled in the latest version of the Traffic Noise Model (version 2.5). This is a three-dimensional model that factors in elements of the proposed freeway using x, y, and z coordinates. The model did account for the elevations of the freeway, nearby homes, which may be elevated above the roadway, and any recommended barriers between the homes and freeway. This is the same procedure and same model used for other freeway projects in the Valley and across the country.

9

people -- This is, I think, the last part of Phoenix that I know of that has that kind of charm and quietness, and you live in the city but you're not in the city.

The reason -- People don't move to Ahwatukee because it's convenient. They call it the world's largest cul-de-sac. I personally moved here because it's not convenient. Both times I moved here, we chose to be as far from the freeway as possible because we knew that's less pollution, less noise, less crime.

You build a freeway right through the Ahwatukee Foothills: The charm, I mean, you know, the noise. You would have exits. There would be, you know, who knows? Truck stops, gas stations would be built. Everything that comes with a freeway.

10

Immediately, crime is completely going to change. The crime is relatively not -- It's not bad out here. I mean, it is here, but we don't really worry about it much because, you know, it's too inconvenient. Things don't happen out here. You know, crooks don't want to come out and rob you and then drive 10 miles back to the freeway. It's just too -- You know, it does happen, but I think crime would go up exponentially.

The entire -- Again, the inconvenience of Ahwatukee. We're sandwiched back here in the corner, behind the mountain. We have the reservation on the other side. So it's this little micro-environment of: You know, we are part

9	**Neighborhoods/ Communities**	While the E1 Alternative is adjacent to the largely residential areas of Ahwatukee Foothills Village (to the north), a freeway has been planned in this location for many years (see Final Environmental Impact Statement pages 4-17 and 4-21). Where existing residential uses are adjacent to the proposed freeway, noise mitigation would be implemented according to Arizona Department of Transportation policy (see Final Environmental Impact Statement beginning on page 4-91).
10	**Neighborhoods/ Communities**	While the City of Phoenix Police Department reported in 2005 that it did not have any statistics specific to crime adjacent to freeways, the Police Department did note that, based on its experience, there does not appear to be a correlation between crime rates and freeways. See Final Environmental Impact Statement sidebar on page 4-21.

Code	Comment Document

of Phoenix, but we're completely separate. And we live here because we love that. We love that.

I don't mind driving, you know, 20 minutes into the city. I just don't mind it. For me, the tradeoff is worth it.

I think the entire charm, the neighborhood feel of Ahwatukee which it really has right now, would completely change. I think the impact on what Ahwatukee is, a neighborhood, a quiet neighborhood, a safe neighborhood, a place to raise children, a beautiful neighborhood -- Granted, you know, a lot of that, some of it won't change.

But the long-term impacts on the environment, on South Mountain. You know, I can't imagine climbing that, like we do all the time in the winter, and looking out and it's, you know, seeing a haze and seeing the freeway instead of just beautiful desert. I mean, it just will change everything.

11

And I -- It would make me so sad to -- I would want to leave. You know, I don't want to be that close to a big freeway. I don't want to be that close to -- to the noise. I don't want to be that close to -- Well, the reason we moved out here is because we're -- we're separate. We're far. We like it that way.

And I -- I think, generally, most people would agree with me. It makes -- It's a very, very unique neighborhood to Phoenix because of the way it -- because it's the world's largest cul-de-sac. It is -- It has charm. It has

Code	Issue	Response
11	**Visual Resources**	Because Pecos Road is already a four-lane arterial street and is in approximately the same location as the proposed E1 Alternative, viewers would not be seeing any phenomena they do not already see (see Final Environmental Impact Statement page 4-169). The proposed freeway would have eight lanes of traffic and carry more vehicles, but what park users and residents would see would not be substantively different from what they already see along Pecos Road. Page 4-170 in the Final Environmental Impact Statement lists measures that should help to avoid, reduce, or mitigate aesthetic impacts. Larger saguaro cacti, mature trees, and large shrubs that would likely survive the transplanting and sitting-in period would help in visually sensitive or critical roadway areas.

Code	Comment Document

quiet. It has the environment. It has -- We're separated a little bit from the smog because of that. And that's very important to me.

I think a freeway down Pecos Road, where -- where they plan on, is just going to change everything. It's going to change everything. I just can't even imagine it. And it just brings me to tears to think about it. And I hope -- I hope the people, you know, are paying attention and they can find another alternative for this.

Or perhaps don't even build it. You know, ultimately, just leave it the way it is. Phoenix is big enough. You know, things -- Certain things are inconvenient. But, you know, find another solution because I think I speak for a lot of people. We don't want it. And I think it will just ruin what is the last of Phoenix's very unique neighborhoods.

You know, I would personally want to move to something like Cave Creek, if this happens, because of that.

So I just urge them to consider an alternative, something without the incredible, incredible environmental and neighborhood impact. There is only something like 77,000 residents here. The impact, you know, in the Foothills, to those people, would be enormous comparatively and to each individual family that lives there and the children.

And -- And I think, honestly think -- I can't

I am a resident of Laveen and I am completely against the new freeway idea as it will destroy the quality of life in this community. We don't want this to become another central Phoenix or Tempe. Life here is peaceful and it needs to stay this way. Please respect the lives of the people of our community and do not build this freeway through the South Mountain area.
Freeways divide communities, destroy nature and bring urban blight. You need to find another place for a bypass. We don't want it here.

Theodore G. Bodjanac
Laveen, AZ

Code	Issue	Response
1	**Neighborhoods/ Communities**	The Laveen Village area is anticipated to have a built-out population of over 105,000 (see Final Environmental Impact Statement page 4-14). This proposed level of development places increasing demand on the road network. The City of Phoenix's General Plan for Laveen Village has designated areas along the proposed freeway for commercial development that cannot support the projected densities without implementation of the proposed freeway. Without the proposed freeway, the conversion of land from undeveloped and agricultural uses to residential, commercial, and industrial land uses would likely continue, placing a greater demand on surface streets (see Final Environmental Impact Statement page 4-14).
2	**Section 4(f) and Section 6(f)**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix.
3	**Purpose and Need, Truck Bypass**	
4	**Neighborhoods/ Communities**	Unplanned growth is often termed "urban sprawl." Generally, this term is used in the context of rapid and uncontrolled urban growth onto previously undeveloped land—usually on the outskirts of an existing urban area. Projects like the proposed freeway are often identified as contributors to urban sprawl. Freeway projects are often cited as making land at the urban fringe more accessible and, therefore, more attractive for development. However, examination of data comparing population and land use between 1975 and 2000 suggests major transportation projects like the proposed freeway do not induce growth in the region (see Final Environmental Impact Statement pages 4-170 through 4-174). The proposed freeway would be implemented in a historically quickly urbanizing area (most noticeably in the Western Section of the Study Area, although the nationwide recession which began in 2007 slowed growth). In the Eastern Section of the Study Area, the proposed freeway would abut public parkland, Native American land, and a near-fully developed area—therefore, any contribution to accelerated or induced growth would be constrained. The proposed freeway would be built in an area planned for urban growth as established in local jurisdictions' land use plans for at least the last 25 years.

From: Sierra Club on behalf of Murray Bolesta
To: Projects
Subject: Comments in opposition to South Mountain Freeway
Date: Wednesday, July 24, 2013 12:05:31 PM

Jul 24, 2013

Arizona Department of Transportation South Mountain Study Team
1655 W Jackson St, MD 126F
Phoenix, AZ 85007

Dear South Mountain Study Team,

(1) I am writing to express my opposition to the proposed South Mountain Freeway and to urge ADOT to select the No-Build Alternative.

America's past was defined by rapacious exploitation. Her future will be defined by balanced conservation.

(2) The proposed freeway would cause more problems than it would solve. In addition, it would only provide short-term congestion relief. As is evident by our numerous clogged roads and freeways, many of which have recently been built or widened, building more roads is not the answer. (3) ADOT needs to instead focus on planning for and investing in long-term transportation solutions, including mass transit. The only way to effectively reduce congestion and mobilize people is by reducing the number of vehicles utilizing our roads, not by encouraging more to use them.

(4) South Mountain Freeway would have incredible negative impacts on our communities. Despite what the DEIS claims, air quality in the region would worsen over time, increasing public health risks. As more vehicles fill the "uncongested" areas this freeway would temporarily provide, (5) more pollution will be spewed into the air, exacerbating asthma, cancer, and other diseases.

(6) The freeway would also negatively effect our environment. South Mountain Park is the largest city park in our nation. It was set aside to protect resources and to benefit our communities. By blasting a freeway through a portion of this park, (7) wildlife and habitat will be destroyed, movement corridors will be cut off, valuable public spaces will be lost, and more. This would set a terrible precedent by demolishing what should remain a protected area.

(8) The freeway will also exacerbate urban sprawl and further burden Arizona's taxpayers. Its construction would continue ADOT's trend of forcing residents to remain vehicle-dependent while paying for infrastructure so that others can live farther and farther from a city center.

(1) Please help protect our communities, our health, and our environment by selecting the No Action Alternative. Thank you.

Sincerely,

Mr. Murray Bolesta
291 W Calle Lecho
Green Valley, AZ 85622-1603

1	**Alternatives, No-Action (No-Build) Alternative**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix.
2	**Purpose and Need**	Although the region's freeways are now congested during the peak travel period, conditions in 2035 without the proposed freeway would be substantially worse with more congested areas and congested conditions for longer periods of time (see Final Environmental Impact Statement pages 1-21 and 1-22). Congestion relief resulting from the proposed freeway would provide localized reductions of delays on arterial streets and at interchanges. Reduced travel times would result in lower exposure to elevated concentrations of mobile source air toxics occurring in traffic. Other benefits of the proposed freeway in comparison to the No-Action Alternative are presented in Table 3-9 on page 3-38 of the Final Environmental Impact Statement.
3	**Alternatives**	Federal regulations stipulate that an environmental impact statement shall "rigorously explore and objectively evaluate all reasonable alternatives" (40 Code of Federal Regulations § 1502.14; see Final Environmental Impact Statement page 3-1). All alternatives were screened using a multidisciplinary set of criteria. Nonfreeway alternatives were considered (see Final Environmental Impact Statement pages 3-3 through 3-6). Among other things, the study took into account improving existing freeways, improving or expanding other travel modes, strategies to reduce travel demand, and various roadway configurations. This study examined not only the potential impacts from improvements, but also the consequences of building nothing, the No Action Alternative. As proposed by the Maricopa Association of Governments, the South Mountain Freeway would be part of the Regional Freeway and Highway System. Other transportation improvements such as mass transit and local roads are specified in the *Regional Transportation Plan* and were considered during the evaluation of this proposed new freeway. As noted in the Final Environmental Impact Statement (see page 3-60), the proposed freeway would provide opportunities to enhance operation of future mass transit improvements.
4	**Air Quality**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix.

Subject: Freeway comment

To whom it may concern:

1 We would urge ADOT to make the connection with I-10 west (59th Ave) starting at Riggs Road and cutting west. This location has very few nearby homes or communities, that would suffer from the huge amount of air and noise pollution generated by a new Freeway.

2 3 4 The proposed route along Pecos road, in contrast, is very close to thousands of homes, along with churches and schools - with many people who would suffer daily from the intense pollution.

5 We also urge ADOT to avoid cutting into South Mountain Park. The Phoenix area had plenty of roads, highways, and sprawled developments, but the park is a irreplaceable jewel of peace, quiete, and desert habitat within this huge metropolitan areas. To have a freeway so close to the park (actually within part of the park) would be a tragedy for all of our valley residents and tourist visitors.

6 Lastly, Pecos road has become a Mecca for bicyclists, runners, roller bladers and others, with its wide shoulders and desert views. Putting a freeway there instead would of course destroy the value and current use of this important road.

Thank you for reviewing our comments,
Paul and Pamela Bosch

Code	Issue	Response
1	**Alternatives**	A Riggs Road Alternative was considered. It would replace 51st Avenue south of its connection to Interstate 10 (Papago Freeway) for approximately 21 miles. It would then replace approximately 4 miles of Beltline Road in an easterly direction. At the Riggs Road/State Route 347 intersection, the alternative would replace approximately 3 miles of Riggs Road before connecting to Interstate 10 (Maricopa Freeway) (see Final Environmental Impact Statement page 3-9). While the Riggs Road Alternative would serve regional mobility needs, particularly of those living in the Maricopa area, meeting this travel demand would not address specific planning goals for an integrated regional transportation network. The *Regional Transportation Plan* identifies the proposed South Mountain Freeway as a critical link in the Regional Freeway and Highway System. The Riggs Road Alternative would not complete the Phoenix metropolitan area's loop system as part of State Route 202L, thereby causing substantial out-of-direction travel for motorists. Therefore, the Riggs Road Alternative would not meet the project's purpose and need criteria and was eliminated from further study. In addition, nearly two-thirds of any alternative using Riggs Road would be on Gila River Indian Community land. Tribal sovereignty is based in the inherent authority of Native American tribes to govern themselves. While this notion of sovereignty is manifested in many areas, generally Native American land is held in trust by the United States. Native American communities have the authority to regulate land uses and activities on their lands. States have very limited authority over activities within tribal land (see page 2-1 of the Final Environmental Impact Statement). From a practical standpoint, this means that the Arizona Department of Transportation and Federal Highway Administration do not have the authority to survey tribal land, make land use (including transportation) determinations directly affecting tribal land, or condemn tribal land for public benefit through an eminent domain process.
2	**Neighborhoods/ Communities**	While the E1 Alternative is adjacent to the largely residential areas of Ahwatukee Foothills Village (to the north), a freeway has been planned in this location for many years (see Final Environmental Impact Statement pages 4-17 and 4-21). Where existing residential uses are adjacent to the proposed freeway, noise mitigation would be implemented according to Arizona Department of Transportation policy (see Final Environmental Impact Statement beginning on page 4-91).
3	**Air Quality**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix.
4	**Noise**	
5	**Section 4(f) and Section 6(f)**	
6	**Neighborhoods/ Communities**	The study has considered concepts for parallel multiuse paths, however the main line of the proposed freeway would not have a bicycle route as part of the design. The design of the traffic interchanges includes provisions for pedestrian and bicycle movement in accordance with current design guidelines and regulations. While not currently included, enhancements such as pedestrian bridges or multiuse paths may be added during the final design phase through coordination with the City of Phoenix (see page 3-60 of the Final Environmental Impact Statement). The cost and maintenance of these enhancements would be the responsibility of the City of Phoenix.

1	Jeff Bowman Document Created: 5/21/2013 8:34:00 PM by Web Comment Form This section of the freeway is overdue to be built. It is unfortunate that the State did not lock up this land earlier and avoid the extra costs that will be incurred to build it today. I would prefer to see it built on the reservation and let Pecos remain as a street. It could be useful as a relief if there was ever an accident on the new freeway.

Matthew Boyd Document Created: 7/12/2013 1:26:27 PM by Web Comment Form

1 Soon I will be leaving Arizona and the Ahwatukee Foothills area that I have called home for the past 31 years. ADOT do your best to destroy this wonderful community and I will remember it fondly as it used to be and should remain. What person has this project continuing seems to want to remain hidden but there is no doubt there is a person who is 2 driving this insistently forward. Aside from a few developers and greedy land owners, who couldn't care less about our community, no one wants to see the truck traffic this road will 3 bring. Anyone who has seen the roads and the traffic, as I have for many years traveling for work, knows the attraction of this by-pass will be irresistible for the big rigs. The prevailing winds will blow it all right into the Foothills and into Ahwatukee. Who is it that is so angry with 4 Ahwatukee Foothills?

Code	Issue	Response
1	**Purpose and Need**	The proposed Loop 202 South Mountain Freeway has been a critical part of the Maricopa Association of Governments' Regional Freeway and Highway System since it was first included in funding approved by Maricopa County voters in 1985. It was also part of the *Regional Transportation Plan* funding passed by Maricopa County voters in 2004 through Proposition 400.
2	**Purpose and Need, Lack of Support**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix.
3	**Air Quality**	
4	**Neighborhoods/ Communities**	While the E1 Alternative is adjacent to the largely residential areas of Ahwatukee Foothills Village (to the north), a freeway has been planned in this location for many years (see Final Environmental Impact Statement pages 4-17 and 4-21). Where existing residential uses are adjacent to the proposed freeway, noise mitigation would be implemented according to Arizona Department of Transportation policy (see Final Environmental Impact Statement beginning on page 4-91).

LOOP 202
South Mountain
Freeway Study

2013

Draft Environmental Impact Statement
COMMENT FORM

Thank you for participating in the South Mountain Freeway Draft Environmental Impact Statement public comment process.

ADOT encourages all interested parties to submit written comments on any aspect of the Draft EIS. ADOT will consider all comments in preparing the Final EIS, which will include responses to all comments, final conclusions on potential impacts, and ADOT's final recommendation.

When submitting comments, please be as specific as possible and substantiate your concerns and recommendations.

It is helpful to ADOT to receive comments on:

- A particular alternative, environmental impact assessment, and/or draft mitigation.
- Any information you feel is incomplete or incorrect.
- How the proposed action would affect you.

Comments must be received or postmarked by July 24, 2013.

I oppose the South Mt. Freeway for several reasons:

1 • Impact on air quality, e.g. children + schools near the Freeway. It's been determined that asthma + Autism are linked to auto + diesel exhaust fumes.

2 • No one has convinced me that this road is needed.

3 • No one has convinced me that it will not become a TRUCK route for CAN-MEX TRUCKS

As an Ahwatukee senior resident, and supporter of PARC, I appose the freeway for the following reasons:

1 Dated projections were used to justify the project. No justification to build it now. Plus growth conditions can change due to water shortages, etc. which could diminish the need of such an expensive and divisive project.

2 No emergency plan is part of "draft" to evacuate residents in the event of a chemical spill.

3 4 Mexican truck traffic would generate high sulphur diesel exhaust fumes, exasperating existing and causing new serious breathing problems.

5 It is an environmental travesty to ruin South Mountain Park by routing the unnecessary freeway through it. This would never be acceptable in environmental friendly states like Oregon, Washington, or California.

1 I am in favor of the new Freeway. I support either the W59 alternative or the W101 Central alternative with a preference of the W101. I beleive that the study participants have put forth a good faith effort to determine all the possible impacts that this new freeway will have and have done a good job of mitigating those impacts with the alternatives proposed. Phoenix is going to continue to grow whether this freeway is built or not, the only way to keep Phoenix a great place to live is to provide the people with adequate infrastructure.

I'm writing in support of the building of the South Mountain Loop 202 Extension. This route is long overdue and will have a long term positive impact in our valley. I'm an Awhatukee/Foothills resident of 20 years and I urge you to move forward to build this freeway.

I would like to express my desire for a no build option on the proposed loop 202 South Mountain Freeway. I use Pecos Road for biking and find the unobstructed view of the mountains important to my community.

I do not want Ahwatukee to become a major thoroughfare for cross-country traffic. I believe this proposed freeway is a waste of taxpayer money.

5

Thank you for your time and consideration.

Code	Issue	Response
1	**Alternatives, No-Action (No-Build) Alternative**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix.
2	**Design**	The study has considered concepts for parallel multiuse paths; however, the main line of the proposed freeway would not have a bicycle route as part of the design. The design of the traffic interchanges includes provisions for pedestrian and bicycle movement in accordance with current design guidelines and regulations. While not currently included, enhancements such as pedestrian bridges or multiuse paths may be added during the final design phase through coordination with the City of Phoenix (see page 3-60 of the Final Environmental Impact Statement). The cost and maintenance of these enhancements would be the responsibility of the City of Phoenix.
3	**Neighborhoods/ Communities**	While the E1 Alternative is adjacent to the largely residential areas of Ahwatukee Foothills Village (to the north), a freeway has been planned in this location for many years (see Final Environmental Impact Statement pages 4-17 and 4-21). Where existing residential uses are adjacent to the proposed freeway, noise mitigation would be implemented according to Arizona Department of Transportation policy (see Final Environmental Impact Statement beginning on page 4-91).
4	**Visual Resources**	Because Pecos Road is already a four-lane arterial street and is in approximately the same location as the proposed E1 Alternative, viewers would not be seeing any phenomena they do not already see (see Final Environmental Impact Statement page 4-169). The proposed freeway would have eight lanes of traffic and carry more vehicles, but what park users and residents would see would not be substantively different from what they already see along Pecos Road. Page 4-170 in the Final Environmental Impact Statement lists measures that should help to avoid, reduce, or mitigate aesthetic impacts. Larger saguaro cacti, mature trees, and large shrubs that would likely survive the transplanting and sitting-in period would help in visually sensitive or critical roadway areas.
5	**Purpose and Need, Truck Bypass**	The Arizona Department of Transportation and Federal Highway Administration identified several issues and concerns that were frequently noted by commenters. Responses to these issues can be found in the *Responses to Frequently Submitted Public Comments* beginning on page B733 of this appendix.

AZDOT,

1 I support the 202 Red Mountain Freeway build. Traffic is constantly getting worse and will never get better. I understand that this is an expensive project, however, it will never be cheaper to build that right now and the need will only increase!

If more tax is needed for this project I for one will pay more taxes as this is a vital project and if Arizona is to continue to grow and attract more people and more business we must build it and as soon as possible. Thank you for listening to my thoughts!

Best Regards,

Robert H. Brady

KYLA BRAKER: I believe that there should be actually an exit also off of 32nd Street. That's all.

* * * *

Code	Issue	Response
1	**Traffic**	The determination to not include an interchange at 32nd Street was made in coordination with the City of Phoenix (see Figure 3-8 on page 3-15 of the Draft Environmental Impact Statement). The interchange would have displaced more than 100 homes and would have been located near an existing high school. The City recommended that, based on these impacts, the interchange be removed from the study. In 2006, the City of Phoenix conducted a traffic circulation study to evaluate the impacts of the proposed freeway on the local street system, including the shift of access to Foothills Reserve and Calabrea from Pecos Road to Chandler Boulevard. The City study found no adverse effects on the local street system from the freeway (see Appendix 3-1 in the Final Environmental Impact Statement).

Code	Comment Document
1	Dave Brandau Document Created: 7/23/2013 9:54:50 PM by Web Comment Form Build it! When looking at what has been done for the freeway transportation system in the phoenix metro area, it is more than obvious that the Loop 202 (South Mountain Freeway) is the primary component that is missing. When we see 2nd tier freeways being built prior to this (e.g. 303) and see what local government officials have been able do to influence extensions from other freeways (e.g. State Route 802), it only becomes a question of who else needs to be brought into the process of assuring that the 202 South Mountain is built. It is necessary for reasons articulated much better and in much more detail in the EIS than I can provide in these comments.

1		Comment noted.

Code	Comment Document

at the registration desk, with the exception of some of the pre-registered folks. And we will wait until they arrive or until the next person has registered.

Patrick Brennan. Patrick Brennan.

Are you Patrick Brennan?

MR. BRENNAN: Yes. Sorry it took a minute to get in here. I haven't been watching, so I'm not sure of the appropriate format to address you guys, but --

THE FACILITATOR: You just have three minutes to provide your comments. If you exceed the three minutes, you're welcome to provide your information to our court reporters.

MR. BRENNAN: My name is Patrick Brennan; I live in South Phoenix, in the 85042 zip code, which is the eastern portion of South Phoenix. Although I do own a home in Laveen, which is currently rented, is where we used to live. And so I like to think that I have both the economic interest on the Laveen side of this issue, as well as some interest in how this freeway stands to impact the overall South Phoenix area, which is inclusive of the Laveen, South Mountain, and Ahwatukee Villages.

On one hand, from the Laveen side, I've been pretty actively involved in advocating for the

(Comment codes begin on later page)

Code	Issue	Response

(Response codes begin on later page)

Code	Comment Document

202 for a number of years, part of that is because of my background as a brand development specialist in hospitality, which allowed me to work with a whole lot of folks in the commercial real estate industry, and particularly on the development side, and one of the absolute truths that we can see about new development areas like this that have grown as much as they have in recent years in population, is that we are looking for commercial amenities, we're looking for healthcare, and we're looking for other basic things that that population needs, and we can't get that until we have some way to decrease drive times to about 10 minutes, 5 minutes, 10 minutes, 15 minutes, tend to be kind of the general rules of thumb, depending on what we're talking about.

And so in Laveen we have just over 40,000 households. In Ahwatukee, we have plenty more, I'm not sure of the precise number, what I do know is that the entire western portion of Ahwatukee is fairly isolated from the amenities that are accessible to the eastern portion of Ahwatukee. So what we'd like to see is bringing those areas together, the Ahwatukee and Laveen communities, simply so that we can get through some of those thresholds of population count. Bring in the

(Comment codes begin on next page)

Code	Issue	Response

(Response codes begin on next page)

Code	Comment Document

hospital, bring in some retail and everything else.

Now, one of the other issues, I know you're hearing from plenty of people who live particularly in some of the older, more established areas of Laveen close to 51st Avenue who've seen traffic just increase dramatically on 51st Avenue, and it's become really hazardous to the community in the surrounding area. We're seeing the same thing on Baseline, Baseline Road. Now living further east, I never thought that I would be as impacted by this, but we are; we see surface traffic from trucks that are being diverted off the freeway for various reasons. Some of them just use the area as a short-cut. We're also seeing the -- all the other overflow traffic every time there's an accident or something else.

1

We know that we have air pollution problems in South Phoenix that desperately need to be addressed, but I think it's time we bring those cars off the street and help them get through as fast as possible. And I'm over time. Thank you.

THE FACILITATOR: Okay. Thanks. Ed Mears.

MR. MEARS: Thank you very much for inviting us. Can you guys hear me just fine?

4301

would be feasible. And that's what I've got.

MR. HAMILTON: I just did a comment via the computer, but I thought of something else.

COURT REPORTER: Okay. What is it?

MR. HAMILTON: You mean, specifically, my comment?

COURT REPORTER: Yes.

MR. HAMILTON: I would like ADOT to keep the preferred route, the purple route, in the west end. That's the only -- That's the only thing I forgot to add to my original comment.

MR. BRENNAN: Okay. So I already spoke inside, regarding some of the impacts specifically with traffic.

Oh, you have to do every stutter and "Oh," don't you? I'm sorry.

Traffic, particularly with existing traffic conditions with the trucks, the warehousing and shipping business located to the north of Laveen, currently using 51st Avenue going south, as well as spilling over frequently onto our surface streets like Baseline Road, as well as whenever traffic incidents slow traffic on the I-10, which pushes traffic onto our surface streets, and I think that that creates a negative impact on both the Laveen community as well as the rest of the South Mountain/South Phoenix area, which is where I presently live, and have previously lived in Laveen and remain fairly active in that part of the South Phoenix

Code	Comment Document

community, as well.

Some of the other things that I think are important to look at are the economic impacts. We've talked quite a bit about the population thresholds that we need to reach, for the sake of a hospital and for regional retail and other commercial amenities, additional employment for the area, for instance.

And I think, in addition to that, one of the other things to look at is housing. And we currently have a shortage of housing available for sale in the Phoenix market, which is why we see the construction and general construction-related services industries now lobbying in favor of the Loop 202. What I think is an important nuance to that part of the discussion is that we're not looking at overall increasing housing for the Phoenix area and looking at increasing growth for the Phoenix area.

What we are looking at, however, is increasing the incentives for growth in an area that's closer to our current population centers, that geographically would be in the central Phoenix area, close to downtown Phoenix, stretching across to Tempe. So, if we actually want to dissuade people from moving to the outskirts, like Queen Creek on the southeast side or to the extreme northwest side of town, and continue putting pressure on the northwest-to-southeast growth of population, then we absolutely need the infrastructure in this area, which creates that development opportunity in a more in-fill type

1

location and also at the same time enhances the amenities within the City of Phoenix, keeps tax dollars here, keeps people able to stay within the lesser range for seeking out employment or shopping.

And I think that's about all that I can muster at this point, so I will probably be back if that's okay.

MS. DAD: I'm in favor of the acquisition for the freeway. I think it will be a benefit for the west side of the -- of the -- of the area, for people to be able to travel from the west side to the east side, avoiding the midtown congestion. I think they have studied every stick and stone and that they can now move forward and pick the 59 route. I think that is the best one for the freeway. That's it. I'm in favor of it.

MR. CARRILLO: I've been a resident of South Phoenix, in Laveen, all my life, which is 38 years old. I mean, I'm 38 years old now. And, absolutely, there's no question, the freeway being built would be the absolute best for that community in Laveen. And I did hold back in putting in my opinion, to study more concerning the South Mountain, the Gila River. A lot of them are my friends, and I understand their -- their dissatisfaction with everything.

But I do understand that they also had a problem with the casino first coming in there, a lot of these friends of mine. And, now that the casino has become something

lineup -- 59th connection would be an economic engine. And so it's designed that way. The setbacks are already set up that way. And it would be a -- It would just be a win/win for everybody at the end of the day.
