PUBLIC COMMENTS ON THE SOUTH MOUNTAIN FREEWAY DRAFT ENVIRONMENTAL IMPACT STATEMENT AND SECTION 4(F) EVALUATION

The 90-day comment period on the Draft Environmental Impact Statement (DEIS) for the South Mountain Freeway began on April 26, 2013, and closed on July 24, 2013. During that period, 8,221 comments were submitted to the Arizona Department of Transportation (ADOT) and Federal Highway Administration through various media, including the ADOT project Web site, e-mails, telephone hotline, letters, and oral and written testimony.

The comment documents and responses are presented side-by-side in this appendix. Comments are organized alphabetically by the affiliation of the commenter (see Table of Contents). Anonymous comments are located at the end of the *Citizen Comments and Responses* section. Comments received after the July 24, 2013, deadline are at the end of the entire document.

The responses are structured to be comprehensive and address the content of the comments. The reader may be referred to other similar responses and/or the text in the DEIS or Final Environmental Impact Statement (FEIS); this is done to create a more concise response section and to help guide the reader to the sections of the DEIS and FEIS where the information about the content of the comment is contained.

Subject: Draft Environmental Impact Statement and Section 4(f) Evaluation for the Proposed South Mountain Freeway (Loop 202), Interstate 10 (Papago Freeway) to Interstate 10 Maricopa Freeway), Maricopa County, AZ

Dear Mr. Hansen:

Thank you for the opportunity to review the Draft Environmental Impact Statement and Draft Section 4(f) Evaluation for South Mountain Freeway (Loop 202) Phoenix, Arizona. The Department of the Interior has reviewed the document, and offers these comments for your consideration and use.

SECTION 4(f) COMMENTS

We acknowledge that this project will constitute direct use of public parklands and will also have adverse effects to historic properties. We further understand that you are preparing a Programmatic Agreement (PA) in consultation with the Arizona State Historic Preservation Office and other consulting parties to minimize adverse effects to historic properties.

Following our review of the Section 4(f) Evaluation, we concur that there is no feasible or prudent alternative to the Preferred Alternative selected in the document, and that all measures have been taken to minimize harm to these resources. Please note however, that this concurrence is contingent upon successful completion of the PA among the consulting parties.

SECTION 6(f) COMMENTS

We have reviewed the subject Draft Environmental Impact Statement for any possible relationship to or conflict with the Land and Water Conservation Fund (LWCF) and the Urban Park and Recreation Recovery grant programs within the State of Arizona and have the following comment:

Code	Issue	Response

Code	Comment Document
1	There are Land and Water Conservation Fund (LWCF) projects within or near the study area that could be affected by this project. These include the following LWCF Grants: 04-00013, South Mountain Park 04-00552, Development of Vista Park and Acquisition South Mountain Parcel 04-00548, Acquisition - Parcel 49 Phoenix Mountain Preserve We recommend consultation directly with the official who administers the LWCF program in Arizona to determine any potential conflicts with Section 6(f)(3) of the LWCF Act (Public Law 88-578, as amended.) This section states: "No property acquired or developed with assistance under this section shall without the approval of the Secretary (of the Interior), be converted to other than public outdoor recreation uses. The Secretary shall approve such conversion only if he finds it to be in accord with the then existing comprehensive statewide outdoor recreation plan and only upon such conditions as he deems necessary to assure the substitution of other recreation properties of at least equal fair market value and of reasonably equivalent usefulness and location." The Administrator for the LWCF program in the state of Arizona is Ms. Doris Pulsifer, Chief, Resources and Public Programs, Arizona State Parks, 1300 West Washington Street, Phoenix, Arizona 85007. Ms. Pulsifer's phone number is 602-542-7172 and her email is dpulsifer@azstateparks.gov. We appreciate the opportunity to review this document. Should you have questions about the Section 4(f) comments, please contact Cheryl Eckhardt at 303.969.2851 and for Section 6(f) comments, please contact Kelly Pearce at 402.661.1552 Sincerely, Patricia Sanderson Port Regional Environmental Officer cc: Director, OEPC OEPC Staff Contact: Dave Sire David Hurd, NPS Roxanne Runkel, NPS Cheryl Eckhardt, NPS Kelly Pearce, NPS

Code	Issue	Response
1	**Section 4(f) and Section 6(f)**	The referenced Land and Water Conservation Fund projects are associated with the Phoenix South Mountain Park/Preserve. No property acquired or developed with assistance under Section 6(f) would be used for the proposed project. The proposed South Mountain Freeway would pass through the park's southwestern edge. The portion of the park that would be used for the proposed freeway would be 31.3 acres of the park's 16,600 acres (0.2 percent). During the design phase, the Arizona Department of Transportation would consult directly with the City of Phoenix to identify and purchase replacement land. Replacement land would not exceed a 1:1 ratio unless the Arizona Department of Transportation and City of Phoenix determine jointly that exceeding the 1:1 ratio would be in the best interests of both parties (see page 5-23 of the Final Environmental Impact Statement).

Subject: South Mountain Freeway Project, Maricopa County, Arizona [CEQ#20130104]

Dear Ms. Petty,

The U.S. Environmental Protection Agency has reviewed the Draft Environmental Impact Statement (DEIS) for the South Mountain Freeway Project. Our review and comments are provided pursuant to the National Environmental Policy Act, the Council on Environmental Quality Regulations (40 CFR Parts 1500-1508), and our NEPA review authority under Section 309 of the Clean Air Act.

As stated in the DEIS, the South Mountain Freeway Project is a proposal to build a new 8-lane freeway extending approximately 22 to 24 miles from the Interstate 10 and Santan Freeway interchange westward through the community of Ahwatukee, paralleling the Gila River Indian Community (GRIC) border. The DEIS has identified a preferred alternative which is estimated to displace 845 housing units, including 680 multifamily units and 165 single family residences.

The project represents a new highway alignment in a heavily urbanized area currently designated as nonattainment for particulate matter less than 10 microns in diameter (PM10). It is therefore critically important that potential impacts to air quality be accurately analyzed, disclosed, and reduced as much as possible. The DEIS does not provide the information needed to assess the potential significance of the air quality impacts of the proposed action. In view of the area's current designation as nonattainment for PM10, it is essential to accurately assess and disclose potential PM10 hotspot impacts, as well as determine whether the project meets the transportation conformity requirements of the Clean Air Act. The Act and its implementing regulations provide that a project may not cause or contribute to any new localized violation of a national ambient air quality standard (NAAQS), increase the frequency or severity of any existing violations, or delay timely attainment of the NAAQS (CAA section 176(c)(1)(B) and 40 CFR 93.116(a)). The analysis found in the DEIS does not provide the information necessary to make an accurate determination of PM10-related impacts. It also does not sufficiently address other potential air quality issues of concern. The EPA is available to work with FHWA and other agencies to complete needed analyses as this effort moves forward.

The DEIS presents no stand-alone emissions analyses of the portion of the project that introduces new general purpose lanes, despite indications from the carbon monoxide (CO) hotspot analysis that

Printed on Recycled Paper

Code	Issue	Response
1		The information in the cover letter and introduction is noted. Responses to specific comments are provided on the following pages.

Code	Comment Document

concentrations of criteria pollutants will increase relative to current levels, along with increased emissions of mobile source air toxics (MSATs). The potential increase indicated by the analysis would occur despite the fact that per-vehicle emissions are declining substantially over time. Instead, the DEIS presents an estimated value of emissions that combines the impact of the new freeway alignment with emissions from the adjacent, and existing, I-10 freeway. This methodology does not provide the information needed to disclose, analyze and potentially mitigate the actual emissions anticipated from a new highway segment. Additionally, we believe the analysis of congestion and emissions impacts from the No Action alternative includes estimates of congestion and vehicle miles traveled (VMT) that are higher than appropriate considering relevant facts and analysis. As a result, the relative benefits of all Action alternatives when compared to a future No Action alternative are likely to be overstated.

We also note that no air toxics risk assessment has been provided, even though there is a documented history of local public concern and requests to ADOT and FHWA for analysis of the potential health effects from the proposed new freeway. We do not believe the reasoning provided in the DEIS for not providing such an assessment is compelling, especially in light of the history of requests for such analysis. Risk assessments for air toxics from vehicle traffic have been included in many published studies as well as in EISs for other projects. EPA has emission and air quality models that can be used to predict concentrations of air toxics at receptors near the project, and we would be happy to assist ADOT and FHWA in using the models, which are available on EPA's web site.

Based upon this lack of information important to analyzing the project's potentially significant impacts on air quality, EPA has rated the South Mountain Freeway DEIS as "3 – Inadequate Information" (see Enclosure 1: "Summary of Rating Definitions and Follow-Up Action"). EPA believes the following information would serve as the basis for a robust and meaningful air quality analysis: 1) Assessment and disclosure of potential PM10 hotspot impacts and confirmation of whether the project meets the Clean Air Act's transportation conformity requirements; 2) Emissions analyses that present the emissions of the South Mountain Freeway corridor separate from those of I-10, along with updated traffic forecasting for the No Action alternative; and 3) A robust air toxics risk assessment that addresses potential health effects from the proposed new freeway.

We recommend this information be circulated in a Supplemental DEIS for public comment, in accordance with NEPA and CEQ's NEPA Implementation Regulations. EPA respectfully requests the opportunity to review this information and provide ADOT and FHWA our feedback before a Supplemental DEIS is published. In the attached detailed comments, we also provide recommendations regarding the assessment of impacts to children's health, environmental justice, aquatic resources and other issues we recommend be addressed in the NEPA document.

We appreciate the opportunity to review this DEIS and look forward to working with ADOT and FHWA to address the issues outlined in this letter. If you have any questions, please refer staff to Clifton Meek at (415) 972-3370 or to Angeles Herrera, Associate Director in our Communities and Ecosystems Division, at 415-972-3144. Please send a copy of the Supplemental DEIS to this office (mail code CED-2) when it is electronically filed with our Washington, D.C. office.

SUMMARY OF EPA RATING DEFINITIONS

This rating system was developed as a means to summarize EPA's level of concern with a proposed action. The ratings are a combination of alphabetical categories for evaluation of the environmental impacts of the proposal and numerical categories for evaluation of the adequacy of the EIS.

ENVIRONMENTAL IMPACT OF THE ACTION

"LO" (Lack of Objections)

The EPA review has not identified any potential environmental impacts requiring substantive changes to the proposal. The review may have disclosed opportunities for application of mitigation measures that could be accomplished with no more than minor changes to the proposal.

"EC" (Environmental Concerns)

The EPA review has identified environmental impacts that should be avoided in order to fully protect the environment. Corrective measures may require changes to the preferred alternative or application of mitigation measures that can reduce the environmental impact. EPA would like to work with the lead agency to reduce these impacts.

"EO" (Environmental Objections)

The EPA review has identified significant environmental impacts that must be avoided in order to provide adequate protection for the environment. Corrective measures may require substantial changes to the preferred alternative or consideration of some other project alternative (including the no action alternative or a new alternative). EPA intends to work with the lead agency to reduce these impacts.

"EU" (Environmentally Unsatisfactory)

The EPA review has identified adverse environmental impacts that are of sufficient magnitude that they are unsatisfactory from the standpoint of public health or welfare or environmental quality. EPA intends to work with the lead agency to reduce these impacts. If the potentially unsatisfactory impacts are not corrected at the final EIS stage, this proposal will be recommended for referral to the CEQ.

ADEQUACY OF THE IMPACT STATEMENT

Category 1" (Adequate)

EPA believes the draft EIS adequately sets forth the environmental impact(s) of the preferred alternative and those of the alternatives reasonably available to the project or action. No further analysis or data collection is necessary, but the reviewer may suggest the addition of clarifying language or information.

"Category 2" (Insufficient Information)

The draft EIS does not contain sufficient information for EPA to fully assess environmental impacts that should be avoided in order to fully protect the environment, or the EPA reviewer has identified new reasonably available alternatives that are within the spectrum of alternatives analysed in the draft EIS, which could reduce the environmental impacts of the action. The identified additional information, data, analyses, or discussion should be included in the final EIS.

"Category 3" (Inadequate)

EPA does not believe that the draft EIS adequately assesses potentially significant environmental impacts of the action, or the EPA reviewer has identified new, reasonably available alternatives that are outside of the spectrum of alternatives analysed in the draft EIS, which should be analysed in order to reduce the potentially significant environmental impacts. EPA believes that the identified additional information, data, analyses, or discussions are of such a magnitude that they should have full public review at a draft stage. EPA does not believe that the draft EIS is adequate for the purposes of the NEPA and/or Section 309 review, and thus should be formally revised and made available for public comment in a supplemental or revised draft EIS. On the basis of the potential significant impacts involved, this proposal could be a candidate for referral to the CEQ.

U.S. EPA DETAILED COMMENTS ON THE DRAFT ENVIRONMENTAL IMPACT STATEMENT FOR THE SOUTH MOUNTAIN FREEWAY PROJECT, MARICOPA COUNTY, ARIZONA, JULY 23, 2013

Air Quality

2 A new 22- to 24- mile 8-lane freeway in the greater Phoenix area has the potential to negatively affect regional air quality, which is particularly important in light of the existing air quality challenges facing Phoenix and recent efforts to address PM10 undertaken by the Maricopa Association of Governments, Maricopa County Air Quality Department, and Arizona Department of Environmental Quality. Portions of Maricopa County (Phoenix PM10 nonattainment area) are federally designated as serious nonattainment for the 1987 PM10 NAAQS. Currently, the area is violating the 24 -hour PM10 NAAQS of 150 µg/m3. Further, while Maricopa County is currently designated attainment/unclassifiable for the 2006 24-hour and 1997 annual PM2.5 NAAQS of 35 µg/m3 and 15 µg/m3, respectively, monitors in the Phoenix area measure concentrations that approach the new 2012 annual PM2.5 NAAQS of 12 µg/m3. Moreover, the Phoenix area is federally designated as "marginal" nonattainment area for the 2008 Ozone NAAQS and continues to violate the 8-hour Ozone NAAQS of 0.075 ppm. Portions of Maricopa County are also maintenance for the CO NAAQS. Therefore, it is critical that the project's assessment of potential air quality impacts be accurate and thorough. As described below, EPA provides comments and recommendations concerning our finding that the DEIS did not adequately assess and identify potential air quality impacts from the new proposed freeway.

Transportation Conformity

As the project is both 1) located in a PM10 nonattainment area that continues to experience exceedances of the PM10 NAAQS, and 2) needs a PM10 hot-spot analysis according to the transportation conformity regulation at 40 CFR 93.123, it is critical to accurately assess and identify potential PM10 hotspot impacts, as well as determine whether or not the project meets transportation conformity requirements found in the Clean Air Act. However, the DEIS does not do so adequately, and EPA has identified substantial deficiencies in the current draft analysis that preclude the ability to determine whether the project complies with transportation conformity requirements.

First, since the analysis presented is a qualitative one, rather than a quantitative one, the DEIS should clarify when the analysis started and whether the analysis was begun during the grace period for quantitative analyses.[1] Furthermore, the DEIS seems to indicate that the years 2020 and 2035 are being examined but does not clearly explain why these years are chosen for analysis. Section 93.116(a) of the transportation conformity rule requires that PM hot-spot analyses consider the full time frame of an area's transportation plan. To meet this requirement and the general requirements in Section 93.123(c)(1), hot-spot analyses should include the year(s) within the transportation plan during which peak emissions from the project are expected and any new NAAQS violation or worsening of an existing violation would most likely occur due to the impacts of the project and background concentrations in the project area.

While the DEIS provides some information about increases in vehicles, information about total numbers of vehicles and the numbers of diesel trucks on the proposed highway is not easily found in the narrative. Complete traffic data for the proposed project should be included in a PM hot-spot analysis, regardless of whether the analysis is qualitative or quantitative. This section of the DEIS does

1 The grace period for using MOVES for quantitative PM hot-spot analyses has ended (i.e., any new analyses begun after December 20, 2012, must be quantitative and rely on MOVES) (December 20, 2010, 75 FR 79370)

Code	Issue	Response
2	Air Quality	The first sentence of the detailed comments states, "A new 22- to 24-mile 8-lane freeway in the greater Phoenix area has the potential to negatively affect regional air quality." The Clean Air Act requires that transportation plans, programs, and projects that are developed, funded, or approved by departments of transportation and metropolitan planning organizations will not cause new or worsen existing violations of certain transportation-related National Ambient Air Quality Standards and will not delay timely attainment of any National Ambient Air Quality Standards or any required interim emissions reductions or milestones. The U.S. Environmental Protection Agency issued the transportation conformity regulations (40 Code of Federal Regulations § 93) to implement the Clean Air Act requirements. The conformity regulations require that the metropolitan planning organization's transportation plan and Transportation Improvement Program must include the specific federal projects in the regional emissions analysis that must not exceed a certain emissions level for the area. As noted in the Final Environmental Impact Statement on page 4-76, the Preferred Alternative is included in the Maricopa Association of Governments' conforming plan and program. The Preferred Alternative has complied with all requirements related to regional emissions required by the Clean Air Act and 40 Code of Federal Regulations § 93 and has demonstrated that it would not "negatively affect regional air quality."

Code	Comment Document

not include the average daily traffic (ADT) of the new highway, or the number of trucks within overall traffic volumes. Without this information clearly presented, it is difficult to assess whether the air quality monitor chosen as the comparison for the draft qualitative PM hot-spot analysis represents the expected traffic from the project.

The DEIS should state which method from the 2006 EPA-FHWA PM qualitative guidance was used, (i.e., "Comparison to another location with similar characteristics," from Section 4.1 A of the 2006 guidance). [2] Page 4-68 of the DEIS states that the monitoring locations used for the PM10 qualitative analysis were the Central Phoenix and the Greenwood monitoring sites because they "most closely resemble the characteristics of the Buckeye Road and Baseline Road Interchanges in 2035." This choice of monitoring sites requires further explanation. When comparing the project location to other monitoring locations in the area, the Buckeye monitor may better represent project characteristics such as nearby traffic activity and surrounding land use. Given the contribution of fugitive dust sources to the concentrations of PM10, the monitors referenced in the analysis may underestimate fugitive dust present at the source as they appear to represent central Phoenix, with little proximity to the arid land surfaces near the proposed project.

In addition, the draft qualitative PM10 hot-spot analysis does not address whether transportation-related construction emissions should be considered in the analysis. Section 93.123(c)(5) of the conformity rule states that construction-related PM emissions due to a particular project are not required to be included in a hot-spot analysis if such emissions are considered temporary (i.e., emissions which occur only during the construction phase and last five years or less at any individual site). It is unclear whether the current draft analysis has met this requirement or whether the period of construction and the emissions that would be generated were considered in the selection of analysis years for this project.

Similar issues regarding the MOVES grace period and the analysis years apply for the CO analysis included in the DEIS. It is unclear from the DEIS when the project-level CO analysis started in relation to the grace period for the latest version of the MOVES model (MOVES2010). The DEIS states that the CO analysis was performed for the existing condition (2010) and for the action and No-Action alternatives in the design year (2035). However, the year of peak emissions must be examined in a hot-spot analysis, which is not necessarily the design year.

Given the magnitude of the proposed project and its potential to negatively affect regional and local air quality, we provide the following recommendations:

Recommendations:

3

- Address the deficiencies in the current qualitative PM10 hot-spot analysis, and demonstrate how a revised qualitative analysis complies with CAA conformity requirements for the PM10 NAAQS. Clearly explain and document how the qualitative analysis complies with applicable requirements of the CAA and transportation conformity regulations for conducting a hot-spot analysis. Completing a quantitative PM hot-spot analysis that meets applicable requirements and is fully documented is an option that continues to be available as well. EPA guidance for a quantitative PM analysis is available and can be used. [3] EPA is available to coordinate with

2 "Transportation Conformity Guidance for Qualitative Hot-spot Analyses in PM2.5 and PM10 Nonattainment and Maintenance Areas," EPA420-B-06-902, March 2006.
[3] See http://www.epa.gov/otaq/stateresources/transconf/policy/420b10040.pdf for details on completing such analyses.

Code	Issue	Response
3	**Air Quality**	The U.S. Environmental Protection Agency's detailed comments summarize the requirements for project-level conformity and imply that they should have been addressed in the Draft Environmental Impact Statement. Section 93.104(d) of the conformity regulations states that a project-level conformity determination is required before a project is adopted, accepted, approved, or funded. To clarify this point, the Federal Highway Administration in May 2003 issued guidance on *Clarification of Transportation Conformity Requirements for FHWA/FTA Projects Requiring Environmental Impact Statements*, stating that projects that are evaluated through an environmental impact statement process are encouraged to include a project-level conformity determination in the Final Environmental Impact Statement, but a final conformity determination is required before the record of decision is signed. (This guidance is posted on the U.S. Environmental Protection Agency's Web site at <epa.gov/otaq/stateresources/transconf/policy/dot052003.pdf>.) The U.S. Environmental Protection Agency's comments provide detailed information on the required content for the project-level conformity determination; these comments do not reflect a shortcoming with respect to the Draft Environmental Impact Statement since no project-level conformity documentation is required to be included in the Draft Environmental Impact Statement. 40 Code of Federal Regulations § 93.111(c) was followed to conduct a qualitative analysis for particulate matter (PM_{10}) for the Preferred Alternative. This analysis complied with National Environmental Policy Act requirements for the development of the Draft Environmental Impact Statement. In December 2010, the U.S. Environmental Protection Agency established transportation conformity guidance for performing quantitative particulate matter ($PM_{2.5}$ and PM_{10}) hot-spot analyses for transportation projects and established a 2-year grace period. U.S. Environmental Protection Agency conformity guidance continues to allow qualitative particulate matter (PM_{10}) hot-spot conformity analyses for analyses that were started before or during the grace period and if the final environmental document for the project is issued no more than 3 years after issuance of the draft environmental document. A particulate matter (PM_{10}) qualitative analysis was performed for this project because the initial air quality technical analysis report for the proposed action was produced in October 2005. The Final Environmental Impact Statement has been updated with a quantitative analysis for particulate matter (PM_{10}) to ensure that a state-of-the-art analysis is completed for the Preferred Alternative. The results of the analysis are summarized in the prologue to the Final Environmental Impact Statement (page xiii) and are more fully described beginning on page 4-68 of the Final Environmental Impact Statement and in Section 3 of the air quality technical report (see sidebar on page 4-2 of the Final Environmental Impact Statement for information on how to review the report). Thus, the particulate matter (PM_{10}) analysis demonstrated that the proposed freeway would not contribute to any new localized violations, increase the frequency or severity of any existing violation, or delay timely attainment of the National Ambient Air Quality Standards or any required interim emissions reductions or other milestones.

Code	Comment Document
	ADOT and FHWA through interagency consultation to confirm use of accurate modeling methodology, assumptions, and data for the analysis.
4	• Clearly indicate what the year(s) of peak emissions is expected to be, including supporting information for why that year(s) will result in peak emissions. Include a table with 2020 total ADT, 2020 diesel truck numbers, 2035 ADT, and 2035 diesel truck numbers, or other year(s) where peak emissions are expected. Provide complete traffic information for the new project and provide the source of this data, or provide a page number if this data is found elsewhere in the DEIS.
5	• Clarify, including a specific date, when the project-level CO and PM10 hot-spot analyses began.
6	• EPA believes this is a project of local air quality concern that needs a PM10 hot-spot analysis, but we recommend additional documentation in the conformity section. Discuss why, for PM10, this is a "project of air quality concern" under 40 CFR 93.123(b)(1), including a reference to the number of diesel vehicles expected on the freeway in the analysis year (s) of peak emissions.
	• Clarify which method from the 2006 EPA-DOT PM qualitative guidance was used, i.e., "Comparison to another location with similar characteristics," from Section 4.1 A of the 2006 guidance. If this method was relied on, provide additional discussion of how the location selected for comparison represents the proposed project.
	• As stated in the Air Quality Technical Report provided to our agency on June 15, 2013, ADOT and FHWA will be completing a "final transportation conformity determination" prior to releasing the Final EIS. EPA recommends initiating interagency consultation with our agency prior to the development of the draft transportation conformity analysis, as we believe consultation with EPA prior to the draft analysis will allow for important feedback regarding analysis and methodology.
	• In addition, due to the extended construction phase of the project, additional explanation and documentation is needed that 40 CFR 93.123(c)(5) is met.
	Emissions Analyses and Traffic Forecasting
	The air quality impacts presented in the DEIS for the entire alignment of the South Mountain Freeway corridor are not adequately assessed. The analysis incorporated existing I-10 emissions with emissions anticipated from the project into a "sub-area" which does not permit a clear understanding of emissions from the new freeway alignment, separate from the current setting. For example, the emission trends presented in Chapter 4 convey the conclusion that the preferred alternative reduces emissions throughout the study area. However, the DEIS presents no emissions analyses of the South Mountain Freeway corridor itself, despite indications from the CO hotspot analyses (tables 4-31 and 4-32) that concentrations of criteria pollutants along the Pecos Road corridor will increase above current levels (in spite of falling CO emission factors over time), and indications that MSAT emissions will be higher in the future. Since the South Mountain Freeway corridor is the area to be most heavily affected, not presenting the emissions along the corridor prevents the public and decisionmakers from gaining a clear understanding of the extent of impacts from the different Alternatives and the potential basis for reducing impacts.
	Recommendations:
	• Emissions analyses should be revised with the South Mountain Freeway corridor modeled independently of I-10 and other roads.
	3

Code	Issue	Response
4	**Air Quality**	As noted on page 4-76 of the Final Environmental Impact Statement, the year of highest particulate matter (PM_{10}) emissions is expected to be the year of highest vehicle miles traveled, 2035. According to the Maricopa Association of Governments *2012 Five Percent Plan for Attainment of the PM-10 Standard* for the Maricopa County Nonattainment Area, the largest single source category is paved road dust, including track-out, at 20 percent. By contrast, on-road mobile vehicle exhaust, tire wear, and brake wear contribute 6 percent. The relative contribution of these emissions is expected to represent about the same contribution in the future; therefore, the highest projected vehicle miles traveled occur in the design year, 2035. The analysis year(s) was determined through the process established by the Arizona Department of Transportation interagency consultation procedures [40 Code of Federal Regulations § 93.105(c)(1)(i)]. The selection of 2035 as the peak year of emissions is appropriate. Vehicle miles traveled for 2025 and 2035 may be found in Table 4-36 on page 4-81 of the Final Environmental Impact Statement. The traffic information used in the modeling was obtained from the Maricopa Association of Governments travel demand model.
5	**Air Quality**	The air quality analysis for the project, including the particulate matter (PM_{10}) hot-spot analysis, began in the summer of 2005. The initial air quality technical report, which included discussions of both particulate matter (PM_{10}) and carbon monoxide, was completed in October 2005 (see sidebar on page 4-2 of the Final Environmental Impact Statement for information on how to review the report).
6	**Air Quality**	The transportation conformity rule [40 Code of Federal Regulations § 93.123(b)(1)(i)] defines projects of local air quality concern as new highway projects that have a significant number of diesel vehicles and expanded highway projects that have a significant increase in the number of diesel vehicles. According to the Draft Environmental Impact Statement page 3-19, annual average daily traffic on the Preferred Alternative would range from 120,000 to 175,000 vehicles per day. Revised forecasts provided by the Maricopa Association of Governments and presented in the Final Environmental Impact Statement page 3-19 confirm that annual average daily traffic in some areas would range from approximately 117,000 to 190,000 vehicles per day and projected heavy diesel trucks would range from approximately 3,800 to 17,000 per day. Because this would be a new facility with approximately 3,800 to 17,000 diesel trucks per day, it was determined that this is a project of local air quality concern and a quantitative particulate matter (PM_{10}) hot-spot analysis was conducted for the Final Environmental Impact Statement.

Code	Comment Document
	ADOT and FHWA through interagency consultation to confirm use of accurate modeling methodology, assumptions, and data for the analysis. • Clearly indicate what the year(s) of peak emissions is expected to be, including supporting information for why that year(s) will result in peak emissions. Include a table with 2020 total ADT, 2020 diesel truck numbers, 2035 ADT, and 2035 diesel truck numbers, or other year(s) where peak emissions are expected. Provide complete traffic information for the new project and provide the source of this data, or provide a page number if this data is found elsewhere in the DEIS. • Clarify, including a specific date, when the project-level CO and PM10 hot-spot analyses began. • EPA believes this is a project of local air quality concern that needs a PM10 hot-spot analysis, but we recommend additional documentation in the conformity section. Discuss why, for PM10, this is a "project of air quality concern" under 40 CFR 93.123(b)(1), including a reference to the number of diesel vehicles expected on the freeway in the analysis year (s) of peak emissions.
7	• Clarify which method from the 2006 EPA-DOT PM qualitative guidance was used, i.e., "Comparison to another location with similar characteristics," from Section 4.1 A of the 2006 guidance. If this method was relied on, provide additional discussion of how the location selected for comparison represents the proposed project.
8	• As stated in the Air Quality Technical Report provided to our agency on June 15, 2013, ADOT and FHWA will be completing a "final transportation conformity determination" prior to releasing the Final EIS. EPA recommends initiating interagency consultation with our agency prior to the development of the draft transportation conformity analysis, as we believe consultation with EPA prior to the draft analysis will allow for important feedback regarding analysis and methodology.
9	• In addition, due to the extended construction phase of the project, additional explanation and documentation is needed that 40 CFR 93.123(c)(5) is met.
	Emissions Analyses and Traffic Forecasting The air quality impacts presented in the DEIS for the entire alignment of the South Mountain Freeway corridor are not adequately assessed. The analysis incorporated existing I-10 emissions with emissions anticipated from the project into a "sub-area" which does not permit a clear understanding of emissions from the new freeway alignment, separate from the current setting. For example, the emission trends presented in Chapter 4 convey the conclusion that the preferred alternative reduces emissions throughout the study area. However, the DEIS presents no emissions analyses of the South Mountain Freeway corridor itself, despite indications from the CO hotspot analyses (tables 4-31 and 4-32) that concentrations of criteria pollutants along the Pecos Road corridor will increase above current levels (in spite of falling CO emission factors over time), and indications that MSAT emissions will be higher in the future. Since the South Mountain Freeway corridor is the area to be most heavily affected, not presenting the emissions along the corridor prevents the public and decisionmakers from gaining a clear understanding of the extent of impacts from the different Alternatives and the potential basis for reducing impacts. ***Recommendations:*** • Emissions analyses should be revised with the South Mountain Freeway corridor modeled independently of I-10 and other roads.

Code	Issue	Response
7	**Air Quality**	This comment is applicable only to qualitative particulate matter (PM_{10}) hot-spot analyses. Although a particulate matter (PM_{10}) qualitative analysis was included in the Draft Environmental Impact Statement, a quantitative particulate matter (PM_{10}) hot-spot analysis was completed for the Final Environmental Impact Statement in accordance with the U.S. Environmental Protection Agency's 2013 *Transportation Conformity Guidance for Quantitative Hot-Spot Analyses in $PM_{2.5}$ and PM_{10} Nonattainment and Maintenance Areas*. See page 4-76 of the Final Environmental Impact Statement and Section 3 of the air quality technical report for more information (see sidebar on page 4-2 of the Final Environmental Impact Statement for information on how to review the report).
8	**Air Quality**	The transportation conformity determination reflected on page 4-76 of the Final Environmental Impact Statement is consistent with the *Maricopa Association of Governments Conformity Analysis for the FY 2014-2018 Transportation Improvement Program and the 2035 Regional Transportation Plan*, January 2014 (see Final Environmental Impact Statement Appendix 4-3) and the project-level particulate matter (PM_{10}) hot-spot analysis. The U.S. Environmental Protection Agency was a consulting party in the development of the transportation conformity processes; the U.S. Environmental Protection Agency had the opportunity to comment on the carbon monoxide and particulate matter (PM_{10}) analyses as part of its comments on the Draft Environmental Impact Statement. Subsequent to issuance of the Draft Environmental Impact Statement, the U.S. Environmental Protection Agency was provided an opportunity to review the particulate matter (PM_{10}) analysis protocol for the Final Environmental Impact Statement, was consulted on background concentrations for the particulate matter (PM_{10}) analysis, and was provided an opportunity to review and comment on the air quality technical report and the modeling files and assumptions used in the Final Environmental Impact Statement carbon monoxide and particulate matter (PM_{10}) analyses.
9	**Air Quality**	The transportation conformity rule in 40 Code of Federal Regulations § 93.123(c)(5) states that hot-spot analyses are not required to consider construction-related activities that cause temporary increases in emissions. Temporary increases are defined as those that occur only during the construction phase and last 5 years or less at any individual site. The project is identified in the Fiscal Year 2014–2018 Transportation Improvement Program and the 2035 *Regional Transportation Plan* using several different project identification numbers by construction segment (47518, 43086, 43087, 11305, 15671, 19029, 17193, 6458, 1790, 6919, and 47857). The Arizona Department of Transportation is evaluating construction delivery methods for the proposed freeway. One concept is to deliver it as a single design-build project. This method would expedite the construction duration for the entire project to around 3 to 3.5 years. Another concept would be to deliver the project in a more traditional method, breaking the 22-mile corridor into nine segments (each 1 to 3 miles long) and constructing them in phases. Each segment would be under construction for 1 to 3 years and the total construction duration for the entire corridor would be 5 to 6 years. A discussion of construction implementation is provided beginning on page 3-59 of the Final Environmental Impact Statement. Any particular area of the Preferred Alternative would not be expected to see construction activities beyond an approximate 2-year period; therefore, the construction effects described above would be temporary and would not require additional analysis.

Code	Comment Document

ADOT and FHWA through interagency consultation to confirm use of accurate modeling methodology, assumptions, and data for the analysis.

- Clearly indicate what the year(s) of peak emissions is expected to be, including supporting information for why that year(s) will result in peak emissions. Include a table with 2020 total ADT, 2020 diesel truck numbers, 2035 ADT, and 2035 diesel truck numbers, or other year(s) where peak emissions are expected. Provide complete traffic information for the new project and provide the source of this data, or provide a page number if this data is found elsewhere in the DEIS.
- Clarify, including a specific date, when the project-level CO and PM10 hot-spot analyses began.
- EPA believes this is a project of local air quality concern that needs a PM10 hot-spot analysis, but we recommend additional documentation in the conformity section. Discuss why, for PM10, this is a "project of air quality concern" under 40 CFR 93.123(b)(1), including a reference to the number of diesel vehicles expected on the freeway in the analysis year (s) of peak emissions.
- Clarify which method from the 2006 EPA-DOT PM qualitative guidance was used, i.e., "Comparison to another location with similar characteristics," from Section 4.1 A of the 2006 guidance. If this method was relied on, provide additional discussion of how the location selected for comparison represents the proposed project.
- As stated in the Air Quality Technical Report provided to our agency on June 15, 2013, ADOT and FHWA will be completing a "final transportation conformity determination" prior to releasing the Final EIS. EPA recommends initiating interagency consultation with our agency prior to the development of the draft transportation conformity analysis, as we believe consultation with EPA prior to the draft analysis will allow for important feedback regarding analysis and methodology.
- In addition, due to the extended construction phase of the project, additional explanation and documentation is needed that 40 CFR 93.123(c)(5) is met.

Emissions Analyses and Traffic Forecasting

10 The air quality impacts presented in the DEIS for the entire alignment of the South Mountain Freeway corridor are not adequately assessed. The analysis incorporated existing I-10 emissions with emissions anticipated from the project into a "sub-area" which does not permit a clear understanding of emissions from the new freeway alignment, separate from the current setting. For example, the emission trends presented in Chapter 4 convey the conclusion that the preferred alternative reduces emissions throughout the study area. However, the DEIS presents no emissions analyses of the South Mountain Freeway corridor itself, despite indications from the CO hotspot analyses (tables 4-31 and 4-32) that concentrations of criteria pollutants along the Pecos Road corridor will increase above current levels (in spite of falling CO emission factors over time), and indications that MSAT emissions will be higher in the future. Since the South Mountain Freeway corridor is the area to be most heavily affected, not presenting the emissions along the corridor prevents the public and decisionmakers from gaining a clear understanding of the extent of impacts from the different Alternatives and the potential basis for reducing impacts.

Recommendations:

11
- Emissions analyses should be revised with the South Mountain Freeway corridor modeled independently of I-10 and other roads.

3

Code	Issue	Response
10	**Air Quality**	Under the Federal Highway Administration's December 2012 *Interim Mobile Source Air Toxics (MSAT) Guidance*, mobile source air toxics emissions assessments in the agency's National Environmental Policy Act documents are designed to evaluate emissions changes attributable to the project in question plus other roadways affected by the project (e.g., where traffic volumes would change if the project were built). The reason for this approach is to capture changes in emissions attributable to the project within the Study Area, which is a more reliable indicator of potential changes in health risk than estimating changes in emissions on just the Preferred Alternative alone. The Draft Environmental Impact Statement included an overall project study area, along with two "subareas" reflecting the eastern and western ends of the project corridor, in an attempt to address public concerns about potential emissions changes. The U.S. Environmental Protection Agency states that "not presenting the emissions along the corridor prevents the public and decision makers from gaining a clear understanding of the extent of impacts from the different Alternatives and the potential basis for reducing impacts." In addition to the information above, reporting emissions for the corridor alone would not provide an understanding of impacts because there is no "emissions budget" for the corridor that defines an acceptable level of emissions and no other guideline to help the Federal Highway Administration, U.S. Environmental Protection Agency, or the public to determine whether a given amount of emissions represents a potential health risk. Likewise, an emissions estimate for the corridor itself does not help decision makers determine whether mitigation resources should be directed toward reducing corridor emissions or be applied to some more pressing environmental impact. Increases in traffic volumes attributable to a project do not necessarily result in an increase in emissions over time because the U.S. Environmental Protection Agency's emissions control regulations and fleet turnover play an important role. In the U.S. Environmental Protection Agency's MOVES model, emissions rates for mobile source air toxics drop by 80 to 90 percent between 2012 and 2025, and MOBILE6.2 estimated a similar reduction. The effects of this are apparent from the mobile source air toxic analysis conducted for the Final Environmental Impact Statement; in the mobile source air toxics study area, total mobile source air toxics emissions are estimated to decline by more than 80 percent even though traffic is expected to increase by 47 percent (Final Environmental Impact Statement Table 4-36 on page 4-81).
11	**Air Quality**	While the Final Environmental Impact Statement does not produce emissions estimates for the Preferred Alternative itself, the carbon monoxide analysis presented on page 4-65 of the Draft Environmental Impact Statement and updated on page 4-75 of the Final Environmental Impact Statement represents projected carbon monoxide concentrations along the project corridor, including those proposed interchange locations along the Preferred Alternative. This also applies to the particulate matter (PM_{10}) hot-spot analysis discussed on page 4-76 of the Final Environmental Impact Statement. Both of these analyses demonstrate that the National Ambient Air Quality Standards would not be exceeded at worst-case locations along the project corridor. The mobile source air toxic analysis presented beginning on page 4-70 of the Draft Environmental Impact Statement and updated beginning on page 4-77 of the Final Environmental Impact Statement is an estimated inventory of mobile source air toxic emissions for the entire Study

(Response 11 continues on next page)

Code	Comment Document
11	• Emissions trends from the South Mountain Freeway corridor should be presented, by themselves, in addition to emissions along other road links (e.g., I-10). Chapters 1 and 4 of the DEIS appear to overstate traffic problems and emissions resulting from the No Action alternative and the benefits of the Action alternatives. The population projections employed in the DEIS are based on pre-recession projections, and now exceed the current highest population projections for Maricopa County by Arizona's Office of Employment and Population Statistics. As a result, the forecasted traffic problems and emissions associated with all alternatives in the DEIS are likely higher than what is reasonably expected to occur based on more current data. Additionally, the congestion issues and emissions that the DEIS describes as a result of the No Action alternative include more trips and more congestion than are reasonable to expect. As a result, the relative benefits of Action alternatives are also likely to be overstated. This overestimate occurs because the travel model forecasts for the Action and No Action alternatives employ the same socioeconomic projections from the Maricopa Association of Governments, which are based on municipal master plans. The underlying master plans assume that the South Mountain Freeway is completed, and do not have land use plans that represent the No Action alternative. ***Recommendations:*** • Present congestion impacts and emissions for the No Action alternative using updated socioeconomic projections that do not assume completion of the South Mountain Freeway (with appropriate caveats about uncertainty).
12	
13	• Present the comparison of impacts from the Action and No Action alternatives to reflect the likely differences in land use (e.g., residential and commercial development) between the Action and No Action alternatives. **Health Effects** The proposed South Mountain Freeway will place a high-volume roadway adjacent to hundreds of residences and several schools. Although the DEIS did not analyze the number of residences remaining within a designated "buffer of impact" (i.e. within 500 feet of the centerline or edge of the new highway alignment), the document does state that the preferred alternative will displace 845 units, including 680 multifamily residences and 165 single family residences. This is an indication of the urbanized footprint of the proposed project and raises a question regarding the number of remaining residences within close distance of the new highway. It also raises the importance of fully assessing, disclosing, and identifying mitigation measures to address the potential health-related impacts to the remaining adjacent residences. Further, as proposed, the new highway alignment will place 8 lanes of high-volume freeway traffic adjacent to Gila River Indian Community (GRIC) land, where little development, residences, or sensitive receptors currently exist. The disclosure of the potential health impacts of the highway within the EIS process could assist the future of GRIC land-use planning and zoning decisions regarding the types of land uses that will be appropriate directly adjacent to the new freeway. In addition to the requirement of NEPA to evaluate and disclose such impacts, FHWA has received numerous public comments expressing concern about the potential health impacts in their communities related to air pollution emitted by construction and operation of the proposed South Mountain Freeway (see Chapter 6 appendices). EPA also received request letters asking us to require ADOT and FHWA to assess health impacts of the proposed freeway. We discussed these requests during an interagency call with ADOT and FHWA on February 23, 2010. The DEIS currently does not address these

Code	Issue	Response
11 (cont.)		Area. Such an inventory would be incomplete without the inclusion of emissions from Interstate 10 because Interstate 10 is within the Study Area, and because, as noted above, emissions changes in the Study Area, accounting for changes in traffic and emissions on all roadways affected by a proposed project, are a more reliable indicator of changes in health risk.
12	**Land Use**	Section 93.110 of the U.S. Environmental Protection Agency transportation conformity rule requires that the population and employment projections used in a conformity analysis be the most recent estimates that have been officially approved by the metropolitan planning organization. The Maricopa Association of Governments is the metropolitan planning organization for the Maricopa County nonattainment and maintenance areas. In accordance with the Arizona Governor's Executive Order 2011-04, county-level population projections used for all State agency planning purposes were updated by the Arizona Department of Administration in December 2012, based on the 2010 U.S. Census. The Arizona Department of Administration projections for Maricopa County were distributed to smaller geographic areas by the Maricopa Association of Governments using the latest available data, including general plans for local jurisdictions, and a state-of- the-art land use model system called AZ-SMART. The nationally-recognized UrbanSim microsimulation model was integrated into AZ SMART and used to allocate county projections of population and employment to regional market areas based upon the pre-existing location of these activities, land consumption, and transportation system accessibility. The allocation from market areas to land use parcels was accomplished with UrbanSim, which simulates real-estate development based on measures such as accessibility to employment, adjacent land uses, highway access, and proximity to other development. Population, households and employment (socioeconomic) projections at the land use parcel level in the Maricopa Association of Governments planning area were aggregated to Traffic Analysis Zones using AZ-SMART. The subcounty socioeconomic projections developed with the AZSMART model were approved by the Maricopa Association of Governments Regional Council in June 2013. The traffic analysis zones socioeconomic projections take into account the transportation improvements contained in the conforming Maricopa Association of Governments Transportation Improvement Program and *Regional Transportation Plan* in effect at the time the projections were approved. As required by the U.S. Environmental Protection Agency, the Maricopa Association of Governments-approved population and employment projections were used to estimate auto and transit trips, vehicle miles of travel, and congestion for each analysis year in the 2014 Maricopa Association of Governments Conformity Analysis and the Final Environmental Impact Statement for the South Mountain Freeway. The methodology used to prepare the socioeconomic projections is described in the *Maricopa Association of Governments Conformity Analysis for the FY 2014-2018 Transportation Improvement Program and the 2035 Regional Transportation Plan*, January 2014 (see Appendix 4-3), which was approved by the U.S. Department of Transportation on February 12, 2014.
13	**Land Use**	Section 93.110 of the U.S. Environmental Protection Agency transportation conformity rule requires that the population and employment projections used in a conformity analysis be the most recent estimates that have been officially approved by the metropolitan planning organization. The Maricopa Association of Governments is the metropolitan planning organization for the Maricopa County

- Emissions trends from the South Mountain Freeway corridor should be presented, by themselves, in addition to emissions along other road links (e.g., I-10).

Chapters 1 and 4 of the DEIS appear to overstate traffic problems and emissions resulting from the No Action alternative and the benefits of the Action alternatives. The population projections employed in the DEIS are based on pre-recession projections, and now exceed the current highest population projections for Maricopa County by Arizona's Office of Employment and Population Statistics. As a result, the forecasted traffic problems and emissions associated with all alternatives in the DEIS are likely higher than what is reasonably expected to occur based on more current data. Additionally, the congestion issues and emissions that the DEIS describes as a result of the No Action alternative include more trips and more congestion than are reasonable to expect. As a result, the relative benefits of Action alternatives are also likely to be overstated. This overestimate occurs because the travel model forecasts for the Action and No Action alternatives employ the same socioeconomic projections from the Maricopa Association of Governments, which are based on municipal master plans. The underlying master plans assume that the South Mountain Freeway is completed, and do not have land use plans that represent the No Action alternative.

Recommendations:

- Present congestion impacts and emissions for the No Action alternative using updated socioeconomic projections that do not assume completion of the South Mountain Freeway (with appropriate caveats about uncertainty).
- Present the comparison of impacts from the Action and No Action alternatives to reflect the likely differences in land use (e.g., residential and commercial development) between the Action and No Action alternatives.

Health Effects

14 The proposed South Mountain Freeway will place a high-volume roadway adjacent to hundreds of residences and several schools. Although the DEIS did not analyze the number of residences remaining within a designated "buffer of impact" (i.e. within 500 feet of the centerline or edge of the new highway alignment), the document does state that the preferred alternative will displace 845 units, including 680 multifamily residences and 165 single family residences. This is an indication of the urbanized footprint of the proposed project and raises a question regarding the number of remaining residences within close distance of the new highway. It also raises the importance of fully assessing, disclosing, and identifying mitigation measures to address the potential health-related impacts to the remaining adjacent residences. Further, as proposed, the new highway alignment will place 8 lanes of high-volume freeway traffic adjacent to Gila River Indian Community (GRIC) land, where little development, residences, or sensitive receptors currently exist. The disclosure of the potential health impacts of the highway within the EIS process could assist the future of GRIC land-use planning and zoning decisions regarding the types of land uses that will be appropriate directly adjacent to the new freeway.

In addition to the requirement of NEPA to evaluate and disclose such impacts, FHWA has received numerous public comments expressing concern about the potential health impacts in their communities related to air pollution emitted by construction and operation of the proposed South Mountain Freeway (see Chapter 6 appendices). EPA also received request letters asking us to require ADOT and FHWA to assess health impacts of the proposed freeway. We discussed these requests during an interagency call with ADOT and FHWA on February 23, 2010. The DEIS currently does not address these

Code	Issue	Response
13 (cont.)		nonattainment and maintenance areas. In accordance with the Arizona Governor's Executive Order 2011-04, county-level population projections used for all State agency planning purposes were updated by the Arizona Department of Administration in December 2012, based on the 2010 U.S. Census. The Arizona Department of Administration projections for Maricopa County were distributed to smaller geographic areas by the Maricopa Association of Governments using the latest available data, including general plans for local jurisdictions, and a state-of- the-art land use model system called AZ-SMART. The nationally-recognized UrbanSim microsimulation model was integrated into AZ-SMART and used to allocate county projections of population and employment to regional market areas based upon the pre-existing location of these activities, land consumption, and transportation system accessibility. The allocation from market areas to land use parcels was accomplished with UrbanSim, which simulates real-estate development based on measures such as accessibility to employment, adjacent land uses, highway access, and proximity to other development. Population, households and employment (socioeconomic) projections at the land use parcel level in the Maricopa Association of Governments planning area were aggregated to Traffic Analysis Zones using AZ-SMART. The subcounty socioeconomic projections developed with the AZSMART model were approved by the Maricopa Association of Governments Regional Council in June 2013. The traffic analysis zones socioeconomic projections take into account the transportation improvements contained in the conforming Maricopa Association of Governments Transportation Improvement Program and *Regional Transportation Plan* in effect at the time the projections were approved. As required by the U.S. Environmental Protection Agency, the Maricopa Association of Governments-approved population and employment projections were used to estimate auto and transit trips, vehicle miles of travel, and congestion for each analysis year in the 2014 Maricopa Association of Governments Conformity Analysis and the Final Environmental Impact Statement for the South Mountain Freeway. The methodology used to prepare the socioeconomic projections is described in the *Maricopa Association of Governments Conformity Analysis for the FY 2014-2018 Transportation Improvement Program and the 2035 Regional Transportation Plan*, January 2014 (see Appendix 4-3), which was approved by the U.S. Department of Transportation on February 12, 2014.
14	**Health Risk Assessment**	The U.S. Environmental Protection Agency comments request "an air toxics risk assessment that assesses potential health impacts of the project and characterizes exposures to and risks from the pollutants of concern." The U.S. Environmental Protection Agency previously recommended an air toxics risk assessment in an e-mail dated March 12, 2010, and provided two examples from projects in California. The Federal Highway Administration reviewed these materials and provided an extensive response on May 6, 2010. In its response, the Federal Highway Administration provided information on concerns with risk assessment as it relates to highway projects; identified limitations with the two example California studies, including use of a cancer risk factor for diesel particulate matter that has not been adopted or approved by the U.S. Environmental Protection Agency in the Integrated Risk Information System; and pointed out that both of the California examples identified very low risk if diesel particulate matter is excluded. The U.S. Environmental Protection Agency's comments on the Draft Environmental Impact Statement were silent with regard to the Federal Highway Administration's conclusions in its May 6, 2010, review of these studies.

(Response 14 continues on next page)

Code	Comment Document

community concerns. A new freeway would significantly increase the exposure of the surrounding community to mobile source air pollution, including diesel emissions. As many studies suggest this increased exposure is problematic to health, the DEIS should include an air toxics risk assessment that assesses potential health impacts of the project and characterizes exposures to and risks from the pollutants of concern. This analysis could be useful for decision makers by indicating areas where future risk would be elevated, and further mitigation could be considered.

EPA does not agree with the characterization in the DEIS of available modeling tools for conducting emissions and dispersion modeling and risk assessment. The uncertainties in modeling discussed between pages 4-68 and 4-76 have been well-known factors in risk assessment since at least 1983 (http://www.epa.gov/risk_assessment/history.htm), and EPA's risk assessment guidance includes much discussion of such uncertainties, including low-dose extrapolation, and how modeling results may be characterized and assessed in view of these uncertainties. EPA's guidelines on risk assessment have been the subject of numerous reviews by EPA's Scientific Advisory Board and the National Research Council.

Recommendations:

- Analyze and discuss the potential health impacts from the construction and operation at full build out of the new proposed 8-lane freeway to possible receptors along the new corridor.
- The supplemental EIS should describe all sensitive receptors that may be impacted, along with possible mitigation measures to reduce impacts.
- Coordinate with GRIC to disclose potential health impacts from the new freeway corridor so that information will be available to GRIC to assist with land-use and zoning decisions along GRIC lands that are adjacent to the new corridor.
- Available data and methodology for assessing health impacts are provided below.

All of the existing tools and guidance needed to perform a risk characterization for air toxics are available for free on EPA's web site:

- Emissions of air toxics from individual road links may be modeled with MOVES (http://www.epa.gov/otaq/models/moves/index.htm).
- AERMOD may be used to model ambient concentrations of toxics at locations in the project area, given emissions from MOVES. For guidance on how to conduct such analyses, consult the document, "Transportation Conformity Guidance for Quantitative Hot-spot Analyses in PM2.5 and PM10 Nonattainment and Maintenance Areas." (http://www.epa.gov/otaq/stateresources/transconf/projectlevel-hotspot.htm#pm-hotspot)
- Given ambient concentrations of air toxics, risk characterization can be done using EPA guidance and data:
    - EPA's Air Toxics Risk Assessment Reference Library (http://www.epa.gov/ttn/fera/risk_atra_main.html) describes how to conduct risk assessment "at the facility and community scale." Volume 1 of the library describes the process and basic technical tools for these analyses, and Volume 2 describes detailed procedures for source-specific or facility-specific risk assessment.
    - EPA's IRIS web site (http://www.epa.gov/IRIS/), referenced on page 4-69, includes the "individual unit risk estimates", also known as "potencies" or "slope factors," which may be employed in the process of cancer risk assessment, and reference concentrations for noncancer risk assessment.

Code	Issue	Response
14 (cont.)		**The Role of Health Risk Assessment in a National Environmental Policy Act Context** The Federal Highway Administration's National Environmental Policy Act documents are developed under two guiding regulations: the Council on Environmental Quality's National Environmental Policy Act regulations applicable to all federal agencies (40 Code of Federal Regulations Parts 1500–1508) and the Federal Highway Administration's implementing regulations governing Federal Highway Administration National Environmental Policy Act documents (23 Code of Federal Regulations Part 771). In its mobile source air toxics guidance, the Federal Highway Administration discusses 40 Code of Federal Regulations Part 1502.22 and acknowledges that while much work has been done to assess the overall health risk of mobile source air toxics, analytical tools and techniques for assessing project-specific health outcomes as a result of lifetime exposures to mobile source air toxics remain limited. These limitations impede the ability to evaluate the potential health risks attributable to exposure to mobile source air toxics as part of the decision-making process in the National Environmental Policy Act context. However, as with any analysis that the Federal Highway Administration conducts for National Environmental Policy Act purposes, the Federal Highway Administration's approach for mobile source air toxic analysis in National Environmental Policy Act documents is informed not just by 40 Code of Federal Regulations Part 1502.22, but by all applicable Council on Environmental Quality requirements. The appropriateness of air toxics health risk assessment as an analysis method for National Environmental Policy Act documents is discussed below, in the context of Council on Environmental Quality requirements for these documents. In addition to the 40 Code of Federal Regulations Part 1502.22 provisions regarding uncertainty and limitations discussed in the Federal Highway Administration's MSAT Interim Guidance Appendix C, three other provisions of the Council on Environmental Quality regulations are particularly relevant to the topic of health risk assessment: *40 Code of Federal Regulations § 1500.1(b): NEPA procedures must insure that environmental information is available to public officials and citizens before decisions are made and before actions are taken. The information must be of high quality. Accurate scientific analysis, expert agency comments, and public scrutiny are essential to implementing NEPA. Most important, NEPA documents must concentrate on the issues that are truly significant to the action in question, rather than amassing needless detail.* *40 Code of Federal Regulations § 1502.1: An environmental impact statement is more than a disclosure document. It shall be used by Federal officials in conjunction with other relevant material to plan actions and make decisions.* *40 Code of Federal Regulations § 1502.2: (a) Environmental impact statements shall be analytic rather than encyclopedic. (b) Impacts shall be discussed in proportion to their significance.(c) Environmental impact statements shall be kept concise and shall be no longer than absolutely necessary to comply with NEPA and with these regulations.* Section 1500.1(b) states that information for decision making must be of high quality and based on accurate scientific analysis. Air toxics health risk assessments can involve large uncertainties. The mobile source air toxic health risk assessment uncertainty builds on itself—each step of the analysis involves uncertainties, including modeling traffic and then modeling emissions, and using this estimated output to model dispersion/concentrations, which provide information for

(Response 14 continues on next page)

- EPA's Health Effects Notebook for Hazardous Air Pollutants also includes information on some of the MSATs, including benzene, 1,3-butadiene, formaldehyde, acetaldehyde, acrolein, and POMs (http://www.epa.gov/ttn/atw/hlthef/hapindex.html).
- Detailed cancer risk assessment guidance is available in the following EPA documents:
  - "Guidelines for Carcinogen Risk Assessment" (2005) (http://epa.gov/cancerguidelines/)
  - "Supplemental Guidance for Assessing Susceptibility from Early-Life Exposure to Carcinogens" (http://epa.gov/cancerguidelines/sup-guidance-early-life-exp-carcinogens.htm)

- If necessary, exposure modeling can be performed using models available from EPA's web site:
  - The Air Pollutants Exposure Model (http://www.epa.gov/ttn/fera/human_apex.html)
  - The Hazardous Air Pollutant Exposure Model (http://www.epa.gov/ttn/fera/human_hapem.html)
  - Another document that can address exposure modeling is EPA's Exposure Factors Handbook (http://cfpub.epa.gov/ncea/risk/recordisplay.cfm?deid=236252).

Children's Environmental Health and Safety

Executive Order 13045 on Children's Health and Safety directs each Federal agency, to the extent permitted by law, to make it a high priority to identify and assess environmental health and safety risks that may disproportionately affect children, and to ensure that its policies, programs, activities, and standards address these risks. Analysis and disclosure of these potential effects under NEPA is necessary because some physiological and behavioral traits of children render them more susceptible and vulnerable than adults to environmental health and safety risks. Although the DEIS identifies communities and public schools located near the proposed project area, the DEIS does not clearly describe the potential direct, indirect, and cumulative impacts of the project on children's health.

Recommendations:

- Evaluate the potential direct, indirect, and cumulative health impacts of the construction and operation of the various project alternatives on children's health. Obtain and discuss relevant health data (e.g., asthma data) for children living near the proposed project area, if available. The analysis should consider the following:
  - Potential respiratory impacts, including asthma, from air pollutant emissions and generation of fugitive dust;
  - Potential noise impacts to health and learning, especially in areas where the project is located near homes, schools, childcare centers and parks; and
  - Potential impacts from the use of chemicals, such as dust suppressants, and hazardous materials to children living near the proposed project areas.
- The population of children living within the affected communities and potential impacts to children's health should be added to the discussion on pages 4-29 through 4-38.
- Additional sensitive receptors, including private schools, charter schools, preschools, and childcare centers, should be added to Figure 5-6, and a discussion of the potential project impacts, including air quality and noise, to these sensitive receptors should be included.
- Further evaluate the proposed project alternatives in order to compare potential impacts to children's health. Clearly identify the project alternatives that have the least impact to children, as well as those alternatives that have the least impact on areas already significantly impacted by existing air pollution, high disease rates, and indicators of social vulnerability.

6

Code	Issue	Response
14 (cont.)		estimating or assuming exposures to those concentrations, and finally predicting health outcomes. Major uncertainties are associated with traffic and emissions projections over a 70-year period, and dispersion models are typically held to a "factor of 2" performance standard. Health impacts of mobile source air toxics in the U.S. Environmental Protection Agency Integrated Risk Information System are based on a 70-year lifetime exposure, which introduces significant uncertainty (e.g., on average, people in the United States change residence approximately once every 8 years and change jobs once every 3). Finally, as noted above, the U.S. Environmental Protection Agency's Integrated Risk Information System provides toxicity (risk) values for various pollutants and routes of exposure; in a health risk assessment, the Federal Highway Administration would compare calculated concentrations of mobile source air toxic pollutants to the Integrated Risk Information System values to estimate health risk. In the Integrated Risk Information System, the U.S. Environmental Protection Agency states the toxicity values are believed to be accurate to within an order of magnitude (a factor of 10). The total cumulative uncertainty involved in highway project health risk assessment is much larger than the change in emissions attributable to projects (typically a few percentage points). In this context, the information would not necessarily have a strong nexus to the requirements for high-quality information and accurate scientific analysis. Section 1500.1(b) also directs agencies to focus their National Environmental Policy Act analysis and documentation on issues that are truly significant to the action in question. In the context of mobile source air toxics, the Federal Highway Administration must consider whether changes in mobile source air toxic emissions attributable to a project have the potential for significant health risk. Using cancer risk as an example, the U.S. Environmental Protection Agency estimates that the overall risk of cancer in the United States is approximately 330,000 in a million, and that air toxics (from all sources) are responsible for a risk of approximately 50 in a million. In its most recent mobile source air toxics rule-making, the U.S. Environmental Protection Agency estimated mobile source air toxic cancer risk, after implementation of emissions controls, at approximately 5 in a million (or 0.0015 percent of overall cancer risk from any cause). For the Preferred Alternative, the mobile source air toxic emissions analysis for the Study Area found little difference in total annual emissions of mobile source air toxic emissions between the Preferred and No-Action Alternatives (less than a 1 percent difference) in 2025 and 2035. With the Preferred Alternative in 2035, modeled mobile source air toxic emissions would decrease by more than 80 percent, depending on the pollutant, despite a 47 percent increase in vehicle miles traveled in the Study Area compared with 2012 conditions (see the discussion beginning on page 4-77 of the Final Environmental Impact Statement). In summary, available information from the U.S. Environmental Protection Agency indicates that mobile source air toxics are a small component of overall cancer risk, and the analysis for the Final Environmental Impact Statement indicates both that the Preferred Alternative would result in a small change in the emissions contributing to this risk and that emissions will decline by a large amount regardless of alternative.

Code	Issue	Response
14 (cont.)		As discussed above and in Appendix C of the Federal Highway Administration's mobile source air toxic guidance, results from the health risk assessment would be influenced more by the uncertainty introduced into the process through assumptions and speculations rather than by genuine insight into the actual health impacts directly attributable to mobile source air toxic exposure associated with a project. Therefore, outcomes of such a health risk assessment do not provide useful information for decision makers, as required by Section 1502.1. The Federal Highway Administration emissions analysis meets the requirement to produce information that is useful for both disclosure and decision making because it allows the public and decision makers to see which alternative has less mobile source air toxic emissions, with much less uncertainty than a health risk assessment. Given the uncertainty of a mobile source air toxic health risk assessment, the Federal Highway Administration instead addresses the potential impacts of mobile source air toxics through an emissions assessment in its National Environmental Policy Act documents. For smaller projects with a lower likelihood of a meaningful impact, this discussion is qualitative. For larger projects, emissions analysis is conducted. The Federal Highway Administration approach is consistent with the Council on Environmental Quality's direction in Section 1502.2(b) to discuss impacts in proportion to their significance. The results of an emissions analysis can be summarized concisely in a National Environmental Policy Act document and provide useful information for decision makers (e.g., an alternative that has lower emissions is likely to be "better" from a mobile source air toxics health risk standpoint than one that has higher emissions). While the U.S. Environmental Protection Agency and the Federal Highway Administration both agree on the usefulness of addressing mobile source air toxics in National Environmental Policy Act documents for highway projects, the agencies disagree about the value of health risk assessment as a method for doing so. This issue has arisen in National Environmental Policy Act consultation for many highway projects around the country and is not unique to the proposed project. In its comment letter, the U.S. Environmental Protection Agency is treating the lack of an mobile source air toxic health risk assessment as a *technical deficiency*, stating that the National Environmental Policy Act document cannot provide a "robust and meaningful air quality analysis" without one. For the reasons described above, a mobile source air toxics health risk assessment is not a "robust and meaningful" method for assessing individual highway projects. As outlined in the Federal Highway Administration's guidance and elsewhere in this response to comments, health risk assessment for mobile source air toxics is not necessary in meeting applicable Council on Environmental Quality regulatory requirements for National Environmental Policy Act documents, nor would the results from the health risk assessment provide additional information over a mobile source air toxic emission assessment for decision makers. Another consideration with respect to health impacts is that the Preferred Alternative would also reduce in-vehicle mobile source air toxics exposure as opposed to the No-Action Alternative. The U.S. Environmental Protection Agency has found that in-vehicle benzene concentrations were between 2.5 and 40 times higher than nearby ambient concentrations, based on a review of studies discussed in the Regulatory Impact Analysis for the U.S. Environmental Protection Agency's 2007 mobile source air toxics rule-making (Final Regulatory Impact Analysis, Environmental Protection Agency 420-R-07-002, 3-17 [February 2007]). Construction of the Preferred Alternative would result in a reduction in benzene exposure to drivers and passengers for two reasons: decreased travel times

- EPA's Health Effects Notebook for Hazardous Air Pollutants also includes information on some of the MSATs, including benzene, 1,3-butadiene, formaldehyde, acetaldehyde, acrolein, and POMs (http://www.epa.gov/ttn/atw/hlthef/hapindex.html).
- Detailed cancer risk assessment guidance is available in the following EPA documents:
  - "Guidelines for Carcinogen Risk Assessment" (2005) (http://epa.gov/cancerguidelines/)
  - "Supplemental Guidance for Assessing Susceptibility from Early-Life Exposure to Carcinogens" (http://epa.gov/cancerguidelines/sup-guidance-early-life-exp-carcinogens.htm)

- If necessary, exposure modeling can be performed using models available from EPA's web site:
  - The Air Pollutants Exposure Model (http://www.epa.gov/ttn/fera/human_apex.html)
  - The Hazardous Air Pollutant Exposure Model (http://www.epa.gov/ttn/fera/human_hapem.html)
  - Another document that can address exposure modeling is EPA's Exposure Factors Handbook (http://cfpub.epa.gov/ncea/risk/recordisplay.cfm?deid=236252).

Children's Environmental Health and Safety

Executive Order 13045 on Children's Health and Safety directs each Federal agency, to the extent permitted by law, to make it a high priority to identify and assess environmental health and safety risks that may disproportionately affect children, and to ensure that its policies, programs, activities, and standards address these risks. Analysis and disclosure of these potential effects under NEPA is necessary because some physiological and behavioral traits of children render them more susceptible and vulnerable than adults to environmental health and safety risks. Although the DEIS identifies communities and public schools located near the proposed project area, the DEIS does not clearly describe the potential direct, indirect, and cumulative impacts of the project on children's health.

Recommendations:

15

- Evaluate the potential direct, indirect, and cumulative health impacts of the construction and operation of the various project alternatives on children's health. Obtain and discuss relevant health data (e.g., asthma data) for children living near the proposed project area, if available. The analysis should consider the following:
  - Potential respiratory impacts, including asthma, from air pollutant emissions and generation of fugitive dust;
  - Potential noise impacts to health and learning, especially in areas where the project is located near homes, schools, childcare centers and parks; and
  - Potential impacts from the use of chemicals, such as dust suppressants, and hazardous materials to children living near the proposed project areas.
- The population of children living within the affected communities and potential impacts to children's health should be added to the discussion on pages 4-29 through 4-38.
- Additional sensitive receptors, including private schools, charter schools, preschools, and childcare centers, should be added to Figure 5-6, and a discussion of the potential project impacts, including air quality and noise, to these sensitive receptors should be included.
- Further evaluate the proposed project alternatives in order to compare potential impacts to children's health. Clearly identify the project alternatives that have the least impact to children, as well as those alternatives that have the least impact on areas already significantly impacted by existing air pollution, high disease rates, and indicators of social vulnerability.

Code	Issue	Response
14 (cont.)		(motorists would spend less time in traffic to reach their destinations) and lower emissions rates (attributable to speed improvements). Reducing on-road exposure would provide a health benefit for motorists using the roadway network. The Federal Highway Administration determined that a supplemental environmental impact statement is not required at this time because there were no changes to the proposed action that will result in significant environmental impacts not evaluated in the Draft Environmental Impact Statement nor is there new information relevant to environmental concerns and bearings on the proposed action or its impacts that will result in significant environmental impacts not evaluated in the Draft Environmental Impact Statement.
15	**Children's Health**	Executive Order 13045 provides, in part, that federal agencies make it a high priority to identify and assess environmental health risks and safety risks that may disproportionately affect children and to ensure that their policies, programs, activities, and standards address disproportionate risks to children that result from environmental health risks or safety risks. It further directs federal agencies to protect children from environmental health and safety risks in carrying out their missions. For each "covered regulatory action" (e.g., any substantive action in rule making that is likely to result in a rule that is economically significant [Executive Order 12866] or rule making an agency has reason to believe may disproportionately affect children) submitted to the Office of Management and Budget Office of Information and Regulatory Affairs pursuant to Executive Order 12866, federal agencies should include an evaluation of the effects of the planned regulation on children and why it is preferable. The Federal Highway Administration and the Arizona Department of Transportation do not believe the proposed alternatives would disproportionately affect children, nor are the proposed alternatives described in the Draft Environmental Impact Statement regulatory in nature. Throughout the Draft Environmental Impact Statement, potential impacts on and subsequent mitigation for human health are disclosed and identified, as inherent in the environmental impact statement process. The Draft Environmental Impact Statement incorporates an assessment of the potential impacts of the proposed project on all populations, including children. The Draft Environmental Impact Statement addressed potential impacts of the project on children in the Chapter 4 environmental consequences analysis. In that chapter, the Draft Environmental Impact Statement notes that, based on U.S. Census results, the percentage of female heads of households with children in the Study Area was 59 percent higher than that of the county (see page 4-30 of the Draft Environmental Impact Statement). Additionally, local school districts and other organizations were contacted to determine the effects a major transportation project would have (noting that most low-income children arrived at school by bus) (see page 4-31 of the Draft Environmental Impact Statement). The Draft Environmental Impact Statement also included a review of the U.S. Environmental Protection Agency's Toxicity and Exposure Assessments for Children's Health, which indicated that indoor air concentrations of benzene are usually higher than outdoor levels and that indoor air in smokers' homes is a significant contributor to children's exposures and mentioned children when identifying the effects of acute exposure to naphthalene (see pages 4-63 and 4-64 of the Draft Environmental Impact Statement). The Draft Environmental Impact Statement acknowledged and fully disclosed public scoping comments that raised

(Response 15 continues on next page)

Code	Comment Document

Code	Issue	Response
15 (cont.)		the topic of health effects on neighborhoods and adjacent schools (see page 6-12 of the Draft Environmental Impact Statement). The Draft Environmental Impact Statement evaluated Clean Air Act criteria air pollutant concentrations in Maricopa County and the Phoenix area (see pages 4-58 to 4-62 of the Draft Environmental Impact Statement). With regard to air quality impacts, the Draft Environmental Impact Statement addressed children's health impacts within the broader discussion regarding health impacts under the National Ambient Air Quality Standards. Clean Air Act § 109(b)(1) requires the U.S. Environmental Protection Agency to promulgate primary National Ambient Air Quality Standards at levels that allow an adequate margin of safety and are requisite to protect the public health. As noted by the U.S. Environmental Protection Agency in its 2013 rulemaking for particulate matter, Clean Air Act § 109's legislative history demonstrates that the primary standards are "to be set at the maximum permissible ambient air level ... which will protect the health of any [sensitive] group of the population" (78 *Federal Register* 3086 and 3090) (quoting S. Rep. No. 91-1196, 91st Cong., 2 Sess. 10 [1970]) (alterations in original). Accordingly, the Draft Environmental Impact Statement National Ambient Air Quality Standards-based evaluation of criteria air pollutants included a health-based review of sensitive populations, including children, given the National Ambient Air Quality Standards' inherent consideration of those factors. Furthermore, the National Ambient Air Quality Standards-based assessment ensures adequate consideration of health-based issues as "[t]he requirement that primary standards provide an adequate margin of safety was intended to address uncertainties associated with inconclusive scientific and technical information ... and to protect against hazards that research has not yet identified" (78 *Federal Register* 3090). Sensitive receivers for noise and air are already included in the air quality and noise analyses in accordance with State and federal guidance. Both sections, *Air Quality* and *Noise*, beginning on Final Environmental Impact Statement pages 4-68 and 4-88, respectively, have addressed requirements under the National Environmental Policy Act. As stated on page 4-89 of the Final Environmental Impact Statement, over 220 sensitive receivers were evaluated at exterior locations from a traffic noise perspective. All of the receivers represent noise-sensitive land uses in proximity to the proposed project, including homes, schools, and parks, and these receivers would have higher noise levels than similar facilities more distant from the proposed action. In response to comments by the U.S. Environmental Protection Agency, each modeled school was reexamined to determine whether noise impacts would result from the proposed freeway and whether appropriate mitigation of these impacts was provided. Of the nine schools modeled in the analysis for the Draft and Final Environmental Impact Statements, all were predicted to exceed the Arizona Department of Transportation Noise Abatement Criteria (see Table 4-40, beginning on page 4-93). Mitigation, in the form of noise walls, was proposed for all schools. After applying this mitigation, all schools except one were mitigated according to the Arizona Department of Transportation noise policy. According to Arizona Department of Transportation policy, noise mitigation should achieve a reduction of 5 to 7 A-weighted decibels and result in a noise level of less than 64 A-weighted decibels for residential and similar areas. These criteria were not reached for one school (receiver 67, Santa Maria Elementary School) because the policy limits wall heights to 20 feet. A wall taller than 20 feet would be required to bring levels at this receiver down to 64 A-weighted decibels. However, a 5-decibel reduction would be

(Response 15 continues on next page)

Code	Comment Document

- EPA's Health Effects Notebook for Hazardous Air Pollutants also includes information on some of the MSATs, including benzene, 1,3-butadiene, formaldehyde, acetaldehyde, acrolein, and POMs (http://www.epa.gov/ttn/atw/hlthef/hapindex.html).
- Detailed cancer risk assessment guidance is available in the following EPA documents:
  - "Guidelines for Carcinogen Risk Assessment" (2005) (http://epa.gov/cancerguidelines/)
  - "Supplemental Guidance for Assessing Susceptibility from Early-Life Exposure to Carcinogens" (http://epa.gov/cancerguidelines/sup-guidance-early-life-exp-carcinogens.htm)

- If necessary, exposure modeling can be performed using models available from EPA's web site:
  - The Air Pollutants Exposure Model (http://www.epa.gov/ttn/fera/human_apex.html)
  - The Hazardous Air Pollutant Exposure Model (http://www.epa.gov/ttn/fera/human_hapem.html)
  - Another document that can address exposure modeling is EPA's Exposure Factors Handbook (http://cfpub.epa.gov/ncea/risk/recordisplay.cfm?deid=236252).

Children's Environmental Health and Safety

Executive Order 13045 on Children's Health and Safety directs each Federal agency, to the extent permitted by law, to make it a high priority to identify and assess environmental health and safety risks that may disproportionately affect children, and to ensure that its policies, programs, activities, and standards address these risks. Analysis and disclosure of these potential effects under NEPA is necessary because some physiological and behavioral traits of children render them more susceptible and vulnerable than adults to environmental health and safety risks. Although the DEIS identifies communities and public schools located near the proposed project area, the DEIS does not clearly describe the potential direct, indirect, and cumulative impacts of the project on children's health.

Recommendations:

- Evaluate the potential direct, indirect, and cumulative health impacts of the construction and operation of the various project alternatives on children's health. Obtain and discuss relevant health data (e.g., asthma data) for children living near the proposed project area, if available. The analysis should consider the following:
  - Potential respiratory impacts, including asthma, from air pollutant emissions and generation of fugitive dust;
  - Potential noise impacts to health and learning, especially in areas where the project is located near homes, schools, childcare centers and parks; and
  - Potential impacts from the use of chemicals, such as dust suppressants, and hazardous materials to children living near the proposed project areas.

16 • The population of children living within the affected communities and potential impacts to children's health should be added to the discussion on pages 4-29 through 4-38.

15 • Additional sensitive receptors, including private schools, charter schools, preschools, and childcare centers, should be added to Figure 5-6, and a discussion of the potential project impacts, including air quality and noise, to these sensitive receptors should be included.

15 • Further evaluate the proposed project alternatives in order to compare potential impacts to children's health. Clearly identify the project alternatives that have the least impact to children, as well as those alternatives that have the least impact on areas already significantly impacted by existing air pollution, high disease rates, and indicators of social vulnerability.

Code	Issue	Response
15 (cont.)		provided by the 20-foot wall proposed in this area. It is important to note that this receiver would be affected only by the W71 Alternative, which is not the Preferred Alternative. The Arizona Department of Transportation noise policy also states that noise abatement shall be considered if "substantial increases" (defined as a 15 A-weighted decibel or greater increase) are predicted. Of the nine schools modeled, substantial increases were predicted at six schools. As discussed above, however, noise walls would reduce noise levels at all schools according to the Arizona Department of Transportation noise policy, with the exception of Santa Maria Elementary School, which would be affected only by the W71 Alternative, which is not the Preferred Alternative. According to the Federal Highway Administration's 1995 Highway Traffic Noise Analysis and Abatement Policy and Guidance, in most cases, if the exterior area can be protected, the interior will also be protected. Likewise, as noted on page 4-65 of the Draft Environmental Impact Statement, over 700 receptors were modeled for carbon monoxide concentrations. Receptor placement met the criteria for selecting modeling locations as specified in 40 Code of Federal Regulations § 93.123(a). The carbon monoxide analysis was updated in the Final Environmental Impact Statement. Although a qualitative analysis of particulate matter (PM_{10}) was presented in the Draft Environmental Impact Statement, a quantitative project-level particulate matter (PM_{10}) hot-spot analysis is included in the Final Environmental Impact Statement. The results of the air quality updates are summarized in the prologue to the Final Environmental Impact Statement (page xiii) and are more fully described beginning on page 4-68 of the Final Environmental Impact Statement. Thus, the particulate matter (PM_{10}) analysis demonstrated that the proposed freeway would not contribute to any new localized violations, increase the frequency or severity of any existing violation, or delay timely attainment of the National Ambient Air Quality Standards or any required interim emissions reductions or other milestones. Through analysis, the Federal Highway Administration has determined that the proposed project would not produce disproportionate impacts to children.
16	**Children's Health**	Executive Order 12898 and Title VI of the Civil Rights Act of 1964 are discussed on pages 4-29 through 4-38 of the Draft Environmental Impact Statement. In the federal definitions characterizing these populations, "children" is not an included population. Therefore, it would be inaccurate to include a discussion on children.

Code	Comment Document
15	• Identify mitigation measures to reduce impacts from the proposed project's construction and operation to schools and child care centers near the proposed project area, including measures identified in the voluntary EPA School Siting Guidelines (http://www.epa.gov/schools/siting/download.html), and voluntary EPA Guidelines for States: Development and Implementation of a School Environmental Health Program (http://www.epa.gov/schools/ehguidelines/index.html). Engage local school districts, child care providers, and others to discuss mitigation measures. **Construction Emissions** Page 4-161 discusses mitigation measures to be implemented to reduce emissions from construction. In addition to the identified measures, EPA recommends that FHWA consider implementing the mitigation measures listed below. ***Recommendations:***
17	• Implement a strong anti-idling policy at all construction sites, and limit idling of heavy equipment and trucks to less than five minutes.
18	• Larger Tier 4 construction equipment will be more widely available in 2015.[4] To the extent practicable, starting in 2015, limit construction equipment to EPA's Tier 4 emission standards.
19	• Commit to the use of construction equipment powered by alternative fuels (i.e., biodiesel, compressed natural gas, and electricity) where feasible.
20	• Train construction contractors and their employees on air quality impacts from construction activities and potential health risks to nearby receptors, and ways to reduce emissions (no idling, using PM filters, using alternative fuels, etc.). **Displacement** Page 4-39 states that the preferred alternative will displace 165 single family residences and 680 multifamily residences, for a total of 845 displaced units. While this represents the fewest single family homes affected (other alternatives range in impacts from between 710 to 969 when adding the Eastern and Western alignments), the preferred alignment is the only alignment that will affect multifamily residences (other alternatives will affect no multifamily residences). The DEIS discussion of displacements focuses mainly on single residences being affected and lacks important detail regarding multifamily residential impacts. Page 4-40 states a rental vacancy rate of 9% for the displaced multifamily residences, based on 2009 data. It is unclear what opportunities exist currently for the potentially displaced 680 multifamily residences. The Environmental Justice Analysis on page 4-38 states that the "availability of replacement housing" for Section 8 vouchers is not easily quantified. It is therefore not clear to what extent low-income and/or minority populations will be affected by the project. Additional mitigation and/or community outreach, and assistance may be necessary to offset relocation impacts.

4 More information is available at http://www.dieselnet.com/standards/us/nonroad.php.

Code	Issue	Response
17	**Temporary Construction Impacts**	Environmental analyses conducted for and documented in the Draft Environmental Impact Statement comply with the Federal Highway Administration's regulations for implementing the National Environmental Policy Act at 23 Code of Federal Regulations § 771. Limiting trucks and equipment to 5 minutes of idling would be unsafe and inefficient. In the Phoenix area, equipment operators depend on air conditioning. Shutting down equipment would place equipment operators in danger of hyperthermia. In addition, shutting down equipment requires a cooling down period to allow hydraulic fluid to cool and a corresponding period to allow the fluid to warm to operating temperatures after a restart. As a result, shutting down and restarting equipment could actually result in more idling, not less.
18	**Temporary Construction Impacts**	Environmental analyses conducted for and documented in the Draft Environmental Impact Statement comply with the Federal Highway Administration's regulations for implementing the National Environmental Policy Act at 23 Code of Federal Regulations § 771; however, to address the comment from the U.S. Environmental Protection Agency, the following contractor mitigation measure has been added to the Final Environmental Impact Statement on page 4-173: "To the extent practicable, construction equipment that meets the U.S. Environmental Protection Agency's Tier 4 emission standards shall be used."
19	**Temporary Construction Impacts**	Environmental analyses conducted for and documented in the Draft Environmental Impact Statement comply with the Federal Highway Administration's regulations for implementing the National Environmental Policy Act at 23 Code of Federal Regulations § 771; however, to address the comment from the U.S. Environmental Protection Agency, the following contractor mitigation measure has been added to the Final Environmental Impact Statement on page 4-173: "Where feasible, construction equipment powered by alternative fuels (e.g., biodiesel, compressed natural gas, electricity) shall be used."
20	**Temporary Construction Impacts**	Environmental analyses conducted for and documented in the Draft Environmental Impact Statement comply with the Federal Highway Administration's regulations for implementing the National Environmental Policy Act at 23 Code of Federal Regulations § 771; however, to address the comment from the U.S. Environmental Protection Agency, the following Phoenix Construction District mitigation measure has been added to the Final Environmental Impact Statement on page 4-173: "ADOT will provide training to contractor's personnel regarding air quality impacts from construction activities, potential health risks to nearby residents, and methods to reduce emissions."

Code	Comment Document
21	***Recommendations:*** • Commit to specific mitigation measures to minimize the impacts of displacement and relocation on low-income and minority populations, with particular attention to the needs of those living in below-market rental housing. Identify each measure along with a description of the responsible party, timing for implementation, and length of time anticipated for complete implementation.
21	• Include commitments to specific funding options or other policy measures that would ensure the relocation of all displaced residents to decent, safe, and sanitary replacement housing that is within the residents' financial means.
21	• Discuss specifics of how and where potential relocation could occur, including reference to actual locations where housing can either be built or currently exists. Include a clear timeline, with responsible parties identified, to indicate the schedule for proposed relocations compared with the schedule for the proposed construction of the project.
21	• Include a more comprehensive vision of the future proposed relocation plan for affected residents as a result of this and other transportation projects in the area. ADOT and FHWA should provide additional information on assumptions, estimates, and projections for where displaced residences will ultimately live based on current (rather than 2009) estimates.
21	• Conduct interviews with all potential displaced residents to determine relocation needs. Confirm that those who have special needs will be accommodated with a plan for assistance as needed. Based on the results from the interviews, consider additional measures to minimize the impacts of relocation, such as providing translations services, transportation to visit potential replacement housing, and/or additional relocation specialists to work with these communities.
21	• To mitigate community character and cohesion impacts to low-income and minority communities, conduct public workshops and work directly with affected populations to identify effective and creative ways to minimize or mitigate these impacts.
	Noise Impacts The DEIS compares estimated noise levels to FHWA Noise Abatement Criteria. It is unclear whether potential project impacts to interior noise levels were estimated.
22	***Recommendations:*** • Clarify whether mitigated interior noise levels were estimated for homes, schools, childcare centers, and other sensitive receptors. If not, assess the potential interior noise levels that may be experienced at these locations. Discuss the potential noise impacts on health and learning, especially at homes, schools, and childcare centers.
22	• Page 4-90 of the DEIS identifies noise walls or earth berms as noise mitigation measures. As several homes and learning environments are located near the proposed project alignments and may be affected by both the construction and operation of the proposed project, EPA recommends that FHWA consider other noise mitigation measures, such as retrofitting homes, classrooms, and childcare centers with acoustic insulation.
	Tolling EPA is aware that several toll feasibility studies are underway in the Phoenix metropolitan area for roadways that are near or adjacent to the proposed project corridor, including I-10, I-17, and the proposed North-South Corridor. Tolling on these roadways has the potential to significantly affect traffic on the future South Mountain Freeway by reducing traffic on tolled facilities and shifting traffic

8

Code	Issue	Response
21	**Displacements and Relocations**	Based on the comment received, the Arizona Department of Transportation Right-of-Way Group in conjunction with the Federal Highway Administration Right-of-way Officer developed mitigation that explains in detail the actions that would be taken to implement the Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970, as amended (Uniform Act) (see page 4-46 of the Final Environmental Impact Statement). The mitigation would ensure that the Arizona Department of Transportation provides uniform, fair, and equitable treatment of people whose property is affected or who are displaced as a result of the project, including minority and low-income populations. Advisory assistance services and compensation practices are described in detail in the Arizona Department of Transportation's *Right-of-way Procedures Manual*, located at <azdot.gov/business/RightofWay_Properties/booklets-and-manuals>. For further discussion, see page 4-51 of the Final Environmental Impact Statement and Appendix 4-1. For questions on specific properties, contact the Arizona Department of Transportation Right-of-Way Group at (602) 712-7316.
22	**Noise**	The noise analyses conducted for and documented in the Final Environmental Impact Statement complies with the Federal Highway Administration's regulations for conducting noise analysis in 23 Code of Federal Regulations § 772. The Federal Aid Highway Act of 1970 required the Federal Highway Administration to develop highway traffic noise standards for use in the planning and design of new highway projects. These standards were promulgated by the Federal Highway Administration on February 8, 1973, and are currently contained in 23 Code of Federal Regulations Part 772. According to 23 Code of Federal Regulations § Part 772.11(c)(2)(iv), an indoor analysis shall be done only after exhausting all outdoor analysis options; therefore, interior noise levels were not specifically assessed in the Draft Environmental Impact Statement or the Final Environmental Impact Statement. Sensitive receivers for noise were included in the noise analysis in accordance with State and federal guidance. The section, *Noise*, beginning on Final Environmental Impact Statement page 4-88 has addressed requirements under the National Environmental Policy Act. As stated on page 4-89 of the Final Environmental Impact Statement, over 220 sensitive receivers were evaluated at exterior locations from a traffic noise perspective. All of the receivers represent noise-sensitive land uses in proximity to the proposed project, including homes, schools, and parks, and these receivers would have higher noise levels than similar facilities more distant from the proposed action. In response to comments by the U.S. Environmental Protection Agency, each modeled school was reexamined to determine whether noise impacts would result from the proposed freeway and whether appropriate mitigation of these impacts was provided. Of the nine schools modeled in the analysis for the Draft and Final Environmental Impact Statements, all were predicted to exceed the Arizona Department of Transportation Noise Abatement Criteria (see Table 4-40, beginning on page 4-93). Mitigation, in the form of noise walls, was proposed for all schools. After applying this mitigation, all schools except one were mitigated according to the Arizona Department of Transportation noise policy. According to Arizona Department of Transportation policy, noise mitigation should achieve a reduction of 5 to 7 A-weighted decibels and result in a noise level of less than 64 A-weighted decibels for residential and similar areas. These criteria were not reached for one school (receiver 67, Santa Maria Elementary School) because the policy limits wall heights to 20 feet. A wall taller than 20 feet would be required to bring levels at this receiver down to 64 A-weighted decibels. However, a 5-decibel reduction would be provided by the 20-foot wall proposed in this area. It is important to note that this receiver would be affected only by the W71 Alternative, which is not the Preferred Alternative.

Code	Comment Document

to non-tolled roads. This has potential implications for analyses of air quality, noise, and environmental justice, as well as additional potential indirect and cumulative impacts. It is unclear whether any toll feasibility study was conducted for the proposed South Mountain Freeway, and there is no discussion in the DEIS of the current toll feasibility studies on adjacent roadways.

Recommendations:

23
24

- Disclose results of any toll feasibility study conducted for the proposed project. If no toll feasibility study was conducted, provide a discussion as to why.
- Provide details of current toll feasibility studies being conducted on nearby roadways. Include a discussion of how future tolling on these roadways could affect traffic and associated impacts on the South Mountain Freeway.

Coordination with Gila River Indian Community and Impacts to Sacred Sites

The DEIS describes extensive coordination with the Gila River Indian Community (GRIC) and a history of considering a possible freeway alignment on GRIC lands. We understand that there is still interest within the GRIC community for analyzing a possible freeway alignment on GRIC lands that would avoid the impacts to sacred sites that will result from the current preferred alignment. While we understand that there may never be one alignment route fully supported by the entire tribal community and government, we encourage ADOT and FHWA to continue to work closely with GRIC to reduce impacts to sacred sites and traditional cultural properties to the greatest extent possible.

Further, there are many resources regarding the potential health impacts of locating sensitive receptors adjacent to freeways as well as the benefits of smart growth and location efficient housing. ADOT and FHWA should disclose these potential near-roadway health impacts and ensure GRIC has access to the most current information available regarding optimizing land use decisions and safeguarding health in the face of a potential new freeway directly adjacent to GRIC land.

Recommendations:

- Continue to work closely with GRIC to reduce the proposed project impacts to sacred sites and traditional cultural properties.
- Evaluate all mitigation measures suggested by GRIC to determine their effectiveness and feasibility. Identify where implementation of GRIC mitigation measures has been rejected and provide a discussion of the reasons for rejection.
- Provide all resources available to GRIC regarding near-roadway health impacts and land-use planning and zoning recommendations for lands adjacent to a new highway.
- Should additional alignment alternatives on GRIC land become feasible as a result of tribal approval, these alternatives should be studied in detail and all impacts disclosed in the supplemental DEIS.

Environmental Justice

Executive Order 12898, Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations, directs each Federal agency to make achieving environmental justice part of its mission by identifying and addressing, as appropriate, disproportionately high and adverse human health or environmental effects of its programs, policies, and activities on minority populations

Code	Issue	Response
22 (cont.)		The Arizona Department of Transportation noise policy also states that noise abatement shall be considered if "substantial increases" (defined as a 15 A-weighted decibel or greater increase) are predicted. Of the nine schools modeled, substantial increases were predicted at six schools. As discussed previously, however, noise walls would reduce noise levels at all schools according to Arizona Department of Transportation noise policy, with the exception of Santa Maria Elementary School, which would be affected only by the W71 Alternative, which is not the Preferred Alternative. According to the Federal Highway Administration's 1995 Highway Traffic Noise Analysis and Abatement Policy and Guidance, in most cases, if the exterior area can be protected, the interior will also be protected. The noise analysis has been updated for the Final Environmental Impact Statement using the most recent Arizona Department of Transportation and Federal Highway Administration policy and traffic projections provided by the Maricopa Association of Governments in November 2013. This updated analysis begins on page 4-88 of the Final Environmental Impact Statement, but no substantial differences between the analysis presented in the Draft Environmental Impact Statement and the Final Environmental Impact Statement resulted. Therefore, no substantial differences in mitigation between the Draft Environmental Impact Statement and Final Environmental Impact Statement were recommended and no mitigation methods other than noise walls were necessary. It is also important to note that the Arizona Department of Transportation noise analysis process is not complete. As design advances, should an action alternative be selected, additional modeling would occur to further refine the mitigation used for the project (see Figure 4-30 on page 4-100 of the Final Environmental Impact Statement).
23	**Tolling**	According to 40 Code of Federal Regulations § 1502.9(a), the agency shall make every effort to disclose and discuss at appropriate points in the draft statement all major points of view on the environmental impacts of the alternatives including the proposed action. Tolling in relation to the project is disclosed in both Chapters 1 and 3 of the Draft and Final Environmental Impact Statements. In 1996, a consortium of private companies proposed to build a South Mountain Freeway as a toll road. The consortium later withdrew its proposal, saying the project was not financially feasible. The proposal is documented in the *Alignment Recommendation, South Mountain Corridor Loop 202*, as noted on page 1-8 of the Draft Environmental Impact Statement. Tolling has not been considered for the current study. The project would be completely funded through federal sources and a local ½-cent sales tax, as programmed in the Arizona Department of Transportation 5-year Transportation Facilities Construction Program and the Maricopa Association of Governments *Regional Transportation Plan*; therefore, tolling is not required to fund the proposed action.
24	**Tolling**	According to 46 *Federal Register* 18026 (March 23, 1981), the environmental impact statement must discuss reasonably foreseeable actions. These are actions that are likely to occur or are probable, rather than those that are merely possible. The Maricopa Association of Governments has completed recent studies of the feasibility of implementing congestion pricing, also known as managed lanes or high-occupancy toll lanes, on the region's freeways (see *2035 Regional Transportation Plan*, Maricopa Association of Governments, January 2014). While these types of tolling are being considered in the Phoenix metropolitan area, there is no history of performance in the region by which to assess the effects on the proposed freeway.

Code	Comment Document

to non-tolled roads. This has potential implications for analyses of air quality, noise, and environmental justice, as well as additional potential indirect and cumulative impacts. It is unclear whether any toll feasibility study was conducted for the proposed South Mountain Freeway, and there is no discussion in the DEIS of the current toll feasibility studies on adjacent roadways.

Recommendations:

- Disclose results of any toll feasibility study conducted for the proposed project. If no toll feasibility study was conducted, provide a discussion as to why.
- Provide details of current toll feasibility studies being conducted on nearby roadways. Include a discussion of how future tolling on these roadways could affect traffic and associated impacts on the South Mountain Freeway.

Coordination with Gila River Indian Community and Impacts to Sacred Sites

The DEIS describes extensive coordination with the Gila River Indian Community (GRIC) and a history of considering a possible freeway alignment on GRIC lands. We understand that there is still interest within the GRIC community for analyzing a possible freeway alignment on GRIC lands that would avoid the impacts to sacred sites that will result from the current preferred alignment. While we understand that there may never be one alignment route fully supported by the entire tribal community and government, we encourage ADOT and FHWA to continue to work closely with GRIC to reduce impacts to sacred sites and traditional cultural properties to the greatest extent possible.

Further, there are many resources regarding the potential health impacts of locating sensitive receptors adjacent to freeways as well as the benefits of smart growth and location efficient housing. ADOT and FHWA should disclose these potential near-roadway health impacts and ensure GRIC has access to the most current information available regarding optimizing land use decisions and safeguarding health in the face of a potential new freeway directly adjacent to GRIC land.

Recommendations:

25 26

- Continue to work closely with GRIC to reduce the proposed project impacts to sacred sites and traditional cultural properties.
- Evaluate all mitigation measures suggested by GRIC to determine their effectiveness and feasibility. Identify where implementation of GRIC mitigation measures has been rejected and provide a discussion of the reasons for rejection.
- Provide all resources available to GRIC regarding near-roadway health impacts and land-use planning and zoning recommendations for lands adjacent to a new highway.
- Should additional alignment alternatives on GRIC land become feasible as a result of tribal approval, these alternatives should be studied in detail and all impacts disclosed in the supplemental DEIS.

Environmental Justice

Executive Order 12898, Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations, directs each Federal agency to make achieving environmental justice part of its mission by identifying and addressing, as appropriate, disproportionately high and adverse human health or environmental effects of its programs, policies, and activities on minority populations

Code	Issue	Response
25	**Cultural Resources**	Section 106 of the National Historic Preservation Act requires a government-to-government relationship between the Federal Government and Indian tribes as described beginning on page 4-140 of the Final Environmental Impact Statement. Section 106 requires federal agencies take into account the effects of their undertakings on historic properties and requires consultation with tribal authorities. Consultation has occurred with Gila River Indian Community government officials, the Tribal Historic Preservation Officer, the Cultural Resource Management Program, other tribes, and the State Historic Preservation Office and has led to concurrence from the Gila River Indian Community Tribal Historic Preservation Office and the State Historic Preservation Office on National Register of Historic Places eligibility recommendations (including traditional cultural properties such as the South Mountains), project effects, and proposed mitigation and measures to minimize harm. This consultation has been ongoing and will continue until any commitments in a record of decision are completed.
26	**Cultural Resources**	Section 106 of the National Historic Preservation Act requires a government-to-government relationship between the Federal Government and Indian tribes as described beginning on page 4-140 of the Final Environmental Impact Statement. Section 106 requires federal agencies take into account the effects of their undertakings on historic properties and requires consultation with tribal authorities. Consultation has occurred with Gila River Indian Community government officials, the Tribal Historic Preservation Officer, the Cultural Resource Management Program, other tribes, and the State Historic Preservation Office and has led to concurrence from the Gila River Indian Community Tribal Historic Preservation Office and the State Historic Preservation Office on National Register of Historic Places eligibility recommendations (including traditional cultural properties such as the South Mountains), project effects, and proposed mitigation and measures to minimize harm. This consultation has been ongoing and will continue until any commitments in a record of decision are completed. Since the beginning of the environmental impact statement process, the Federal Highway Administration and Arizona Department of Transportation have been carrying out cultural resource studies and engaging in an ongoing, open dialogue with the Gila River Indian Community Tribal Historic Preservation Office regarding the identification and evaluation of places of religious and cultural importance to the Gila River Indian Community that may be adversely affected by the proposed freeway. Such places are referred to as traditional cultural properties. As a result of these discussions and of studies conducted by the Gila River Indian Community's Cultural Resource Management Program, the Gila River Indian Community has identified traditional cultural properties that are eligible for listing in the National Register of Historic Places and that could be affected by construction of the proposed South Mountain Freeway. In certain cases, listing these properties on the National Register of Historic Places may offer them protection under Section 4(f) of the Department of Transportation Act. The traditional cultural properties identified are culturally important to other Native American tribes as well. For more discussion of traditional cultural properties, see the section, *Cultural Resources*, beginning on page 4-140 of the Final Environmental Impact Statement and pages 5-26 through 5-28. The physical impact on land designated as part of the South Mountains has been minimized through design and much has already been done to replace or otherwise mitigate that effect. Access to the mountain would be maintained and multiple other mitigation measures would be implemented due in part to suggestions made by the Gila River Indian Community itself. The proposed mitigation for the South Mountains Traditional Cultural Property is discussed in the Final Environmental Impact

(Response 26 continues on next page)

to non-tolled roads. This has potential implications for analyses of air quality, noise, and environmental justice, as well as additional potential indirect and cumulative impacts. It is unclear whether any toll feasibility study was conducted for the proposed South Mountain Freeway, and there is no discussion in the DEIS of the current toll feasibility studies on adjacent roadways.

Recommendations:

- Disclose results of any toll feasibility study conducted for the proposed project. If no toll feasibility study was conducted, provide a discussion as to why.
- Provide details of current toll feasibility studies being conducted on nearby roadways. Include a discussion of how future tolling on these roadways could affect traffic and associated impacts on the South Mountain Freeway.

Coordination with Gila River Indian Community and Impacts to Sacred Sites

The DEIS describes extensive coordination with the Gila River Indian Community (GRIC) and a history of considering a possible freeway alignment on GRIC lands. We understand that there is still interest within the GRIC community for analyzing a possible freeway alignment on GRIC lands that would avoid the impacts to sacred sites that will result from the current preferred alignment. While we understand that there may never be one alignment route fully supported by the entire tribal community and government, we encourage ADOT and FHWA to continue to work closely with GRIC to reduce impacts to sacred sites and traditional cultural properties to the greatest extent possible.

Further, there are many resources regarding the potential health impacts of locating sensitive receptors adjacent to freeways as well as the benefits of smart growth and location efficient housing. ADOT and FHWA should disclose these potential near-roadway health impacts and ensure GRIC has access to the most current information available regarding optimizing land use decisions and safeguarding health in the face of a potential new freeway directly adjacent to GRIC land.

Recommendations:

- Continue to work closely with GRIC to reduce the proposed project impacts to sacred sites and traditional cultural properties.
- Evaluate all mitigation measures suggested by GRIC to determine their effectiveness and feasibility. Identify where implementation of GRIC mitigation measures has been rejected and provide a discussion of the reasons for rejection.
- Provide all resources available to GRIC regarding near-roadway health impacts and land-use planning and zoning recommendations for lands adjacent to a new highway. (27)
- Should additional alignment alternatives on GRIC land become feasible as a result of tribal approval, these alternatives should be studied in detail and all impacts disclosed in the supplemental DEIS.

Environmental Justice

Executive Order 12898, Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations, directs each Federal agency to make achieving environmental justice part of its mission by identifying and addressing, as appropriate, disproportionately high and adverse human health or environmental effects of its programs, policies, and activities on minority populations

Code	Issue	Response
26 (cont.)		Statement beginning on page 4-143, and measures to minimize harm to the South Mountains Traditional Cultural Property are discussed on page 5-27 of the Final Environmental Impact Statement. No mitigation was "rejected" as part of the environmental impact statement process. Certain community factions and members of the Gila River Indian Community have supported the selection of the No-Action Alternative; however, to be clear, such a recommendation is not a form of mitigation. This is comprehensively discussed in the section, *Cultural Resources*, beginning on page 4-128, and in Chapter 5, *Section 4(f) Evaluation*, beginning on page 5-1 of the Draft Environmental Impact Statement. The Gila River Indian Community submitted comments on the Draft Environmental Impact Statement in a letter dated July 3, 2013. This letter and the responses to the Gila River Indian Community comments may be found beginning on page B38 of Appendix 7, Volume III, to the Final Environmental Impact Statement.
27	**Land Use**	"Near-roadway health impacts" is a broad topic that encompasses air quality and other environmental and social effects, including noise. For air quality, the Draft and Final Environmental Impact Statements present information about the Preferred Alternative compared with the No-Action Alternative that is applicable to both tribal and non-tribal lands. The carbon monoxide analysis presented on page 4-65 of the Draft Environmental Impact Statement and updated on page 4-75 of the Final Environmental Impact Statement represents projected carbon monoxide concentrations along the project corridor, including those proposed interchange locations along the South Mountain Freeway corridor. The Final Environmental Impact Statement also includes a quantitative particulate matter (PM_{10}) hot-spot analysis that is discussed on page 4-76. The carbon monoxide and particulate matter (PM_{10}) analyses demonstrated that the proposed freeway would not contribute to any new localized violations, increase the frequency or severity of any existing violation, or delay timely attainment of the National Ambient Air Quality Standards or any required interim emissions reductions or other milestones. The emission modeling developed for the proposed action estimated that for the mobile source air toxics study area, there would be little difference in total annual emissions of mobile source air toxics emissions between the Preferred and No-Action Alternatives (less than a 1 percent difference) in 2025 and 2035. Regardless of alternative, modeled mobile source air toxics emissions would decrease by more than 80 percent relative to 2012 levels, despite a 47 percent increase in vehicle miles traveled in the Study Area compared with 2012 conditions (see discussion beginning on page 4-77 of the Final Environmental Impact Statement). The Federal Highway Administration does not have land use planning or zoning authority. Its Office of Planning does publish some resources related to smart growth, health in transportation planning, and other related topics; see <fhwa.dot.gov/planning/>. The Gila River Indian Community can also benefit from the experience of many local governments in the Phoenix area that have already made land use and zoning decisions for vacant land adjacent to both new and existing roadway facilities.

Code	Comment Document

to non-tolled roads. This has potential implications for analyses of air quality, noise, and environmental justice, as well as additional potential indirect and cumulative impacts. It is unclear whether any toll feasibility study was conducted for the proposed South Mountain Freeway, and there is no discussion in the DEIS of the current toll feasibility studies on adjacent roadways.

Recommendations:

- Disclose results of any toll feasibility study conducted for the proposed project. If no toll feasibility study was conducted, provide a discussion as to why.
- Provide details of current toll feasibility studies being conducted on nearby roadways. Include a discussion of how future tolling on these roadways could affect traffic and associated impacts on the South Mountain Freeway.

Coordination with Gila River Indian Community and Impacts to Sacred Sites

The DEIS describes extensive coordination with the Gila River Indian Community (GRIC) and a history of considering a possible freeway alignment on GRIC lands. We understand that there is still interest within the GRIC community for analyzing a possible freeway alignment on GRIC lands that would avoid the impacts to sacred sites that will result from the current preferred alignment. While we understand that there may never be one alignment route fully supported by the entire tribal community and government, we encourage ADOT and FHWA to continue to work closely with GRIC to reduce impacts to sacred sites and traditional cultural properties to the greatest extent possible.

Further, there are many resources regarding the potential health impacts of locating sensitive receptors adjacent to freeways as well as the benefits of smart growth and location efficient housing. ADOT and FHWA should disclose these potential near-roadway health impacts and ensure GRIC has access to the most current information available regarding optimizing land use decisions and safeguarding health in the face of a potential new freeway directly adjacent to GRIC land.

Recommendations:

- Continue to work closely with GRIC to reduce the proposed project impacts to sacred sites and traditional cultural properties.
- Evaluate all mitigation measures suggested by GRIC to determine their effectiveness and feasibility. Identify where implementation of GRIC mitigation measures has been rejected and provide a discussion of the reasons for rejection.
- Provide all resources available to GRIC regarding near-roadway health impacts and land-use planning and zoning recommendations for lands adjacent to a new highway.
- Should additional alignment alternatives on GRIC land become feasible as a result of tribal approval, these alternatives should be studied in detail and all impacts disclosed in the supplemental DEIS.

28

Environmental Justice

Executive Order 12898, Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations, directs each Federal agency to make achieving environmental justice part of its mission by identifying and addressing, as appropriate, disproportionately high and adverse human health or environmental effects of its programs, policies, and activities on minority populations

Code	Issue	Response
28	**Alternatives**	In accordance with 40 Code of Federal Regulations § 1502.14, the Arizona Department of Transportation and Federal Highway Administration explored and evaluated all reasonable alternatives. Page 2-10 of the Draft Environmental Impact Statement discusses the path forward should alternatives on Gila River Indian Community land become available for study. Any alternative on Gila River Indian Community land must consider tribal sovereignty. Tribal sovereignty is based in the inherent authority of Native American tribes to govern themselves. While this notion of sovereignty is manifested in many areas, generally Native American land is held in trust by the United States. Native American communities have the authority to regulate land uses and activities on their lands. States have very limited authority over activities within tribal land (see page 2-1 of the Final Environmental Impact Statement). From a practical standpoint, this means that the Arizona Department of Transportation and Federal Highway Administration do not have the authority to survey tribal land, make land use (including transportation) determinations directly affecting tribal land, or condemn tribal land for public benefit through an eminent domain process.

Code	Comment Document

and low-income populations.[5] There is a growing body of evidence that low-income and minority communities are more vulnerable to pollution impacts than other communities, including deficits of both a physical and social nature that make the effects of environmental pollution more burdensome.[6] Environmental justice concerns may arise from the potential human health, ecological, social, cultural, and economic impacts associated with a proposed project. According to the DEIS (page 4-167), the communities within the study area have a much higher minority composition (68%) compared to Maricopa County (41%). The DEIS states that all action alternatives would have direct but not disproportionate impacts on populations with environmental justice characteristics (see page 4-175), but this appears to be a premature and unsupported conclusion. The current analysis does not consider the full suite of potential impacts from the proposed project and how these impacts may disproportionately affect minority, low-income, and indigenous populations. The environmental justice analysis in the DEIS focuses mainly on relocations and displacements. The environmental justice analysis should reference air quality, noise, and other potential project impacts to communities living near the proposed alignments.

Recommendations:

29

- Identify and document all environmental and human health impacts that may have a disproportionately high impact on minority populations, low-income populations, and/or indigenous populations. The environmental justice analysis should evaluate the direct, indirect, and cumulative impacts of each project alternative to these populations, and identify whether there may be disproportionately high and adverse human health or environmental effects. The analysis should incorporate relevant demographic, socioeconomic, environmental and health data, if available, to fully understand potential project impacts.
- Evaluate the localized impacts from the construction and operation of each project alternative and how these impacts affect minority, low-income, and indigenous communities located near proposed project alignments. Communities that are closer to the proposed project alignments are at a higher risk of near-roadway exposure. Near-roadway exposure to air pollution is linked to a variety of adverse health outcomes including asthma and adverse birth and childhood outcomes.[7]
- Identify appropriate mitigation measures to reduce or eliminate any adverse impacts to minority, low-income and indigenous populations throughout the project's construction and operation. Clearly identify project alternatives with the least impact to these populations.
- Mitigation measures should be developed through open, collaborative processes that include the public and affected communities. Identifying mitigation measures responsive to community concerns and supported by affected communities could further protect these communities from any disproportionate and adverse impacts.

Code	Issue	Response
29	**Environmental Justice**	Executive Order 12898 on environmental justice requires that environmental justice principles be considered in federal programs, policies, and activities. In preparing the Draft Environmental Impact Statement, a careful and comprehensive review was undertaken to evaluate whether the project would have disproportionately high and adverse effects on minority populations, low-income populations, and/or indigenous populations. According to Federal Highway Administration Order 6640.23A, a disproportionately high and adverse effect on a minority or low-income population means the adverse effect is predominantly borne by such population or is appreciably more severe or greater in magnitude on the minority or low-income population than the adverse effect suffered by the non-minority or non-low-income population. In undertaking this evaluation as to whether the project would result in disproportionately high and adverse impacts on minority, low-income, and/or indigenous populations, in accordance with Federal Highway Administration Order 6640.23A, the beneficial and adverse effects of the project on the overall population, and on minority, low-income, and indigenous populations in particular, were reviewed in the sections of the Draft Environmental Impact Statement pertaining to *Land Use, Social Conditions, Displacements and Relocations, Economic Impacts, Air Quality, Noise, Cultural Resources, Visual Resources, Prime and Unique Farmlands,* and *Temporary Construction Impacts*. Consistent with the National Environmental Policy Act, mitigation was proposed to address potential adverse impacts of the project for the overall population in the Study Area, including minority populations, low-income populations, and/or indigenous populations. It was determined that there would be no disproportionately high and adverse effects on minority populations, low-income populations, and/or indigenous populations. The section, *Title VI and Environmental Justice*, beginning on page 4-29 in the Draft Environmental Impact Statement, presents acceptable methods, data, and assumptions to assess the potential for disproportionate adverse effects from the proposed action on certain populations including minority and low-income populations. In light of the comments received, the environmental justice and Title VI analyses in the Draft Environmental Impact Statement were reviewed, and the Final Environmental Impact Statement has been revised to discuss environmental justice and Title VI separately and to clarify how the conclusions in the *Environmental Justice and Title VI* section were reached (see pages 4-41 and 4-45 of the Final Environmental Impact Statement). The Final Environmental Impact Statement also clarifies potential impacts on minority, low-income, and/or indigenous populations in sections other than the *Environmental Justice and Title VI* section. For example, in the *Noise* section, the number of receivers affected that are located in census blocks or census block groups with environmental justice populations are identified (see text beginning on page 4-89 of the Final Environmental Impact Statement). With this clarification, conclusions on the subject in the Draft Environmental Impact Statement were validated in so far as there would be no disproportionately high and adverse impacts on minority, low-income, and/or indigenous environmental justice populations or disparate impacts to minority groups protected by Title VI. Potential impacts from each alternative are discussed in the Final Environmental Impact Statement. To the extent this comment suggests that a health risk assessment is required, the Arizona Department of Transportation and Federal Highway Administration respectfully disagree, as explained in response code #14.

(Response 29 continues on next page)

Code	Comment Document

and low-income populations.[5] There is a growing body of evidence that low-income and minority communities are more vulnerable to pollution impacts than other communities, including deficits of both a physical and social nature that make the effects of environmental pollution more burdensome.[6] Environmental justice concerns may arise from the potential human health, ecological, social, cultural, and economic impacts associated with a proposed project. According to the DEIS (page 4-167), the communities within the study area have a much higher minority composition (68%) compared to Maricopa County (41%). The DEIS states that all action alternatives would have direct but not disproportionate impacts on populations with environmental justice characteristics (see page 4-175), but this appears to be a premature and unsupported conclusion. The current analysis does not consider the full suite of potential impacts from the proposed project and how these impacts may disproportionately affect minority, low-income, and indigenous populations. The environmental justice analysis in the DEIS focuses mainly on relocations and displacements. The environmental justice analysis should reference air quality, noise, and other potential project impacts to communities living near the proposed alignments.

Recommendations:

- Identify and document all environmental and human health impacts that may have a disproportionately high impact on minority populations, low-income populations, and/or indigenous populations. The environmental justice analysis should evaluate the direct, indirect, and cumulative impacts of each project alternative to these populations, and identify whether there may be disproportionately high and adverse human health or environmental effects. The analysis should incorporate relevant demographic, socioeconomic, environmental and health data, if available, to fully understand potential project impacts.

30

- Evaluate the localized impacts from the construction and operation of each project alternative and how these impacts affect minority, low-income, and indigenous communities located near proposed project alignments. Communities that are closer to the proposed project alignments are at a higher risk of near-roadway exposure. Near-roadway exposure to air pollution is linked to a variety of adverse health outcomes including asthma and adverse birth and childhood outcomes.[7]
- Identify appropriate mitigation measures to reduce or eliminate any adverse impacts to minority, low-income and indigenous populations throughout the project's construction and operation. Clearly identify project alternatives with the least impact to these populations.
- Mitigation measures should be developed through open, collaborative processes that include the public and affected communities. Identifying mitigation measures responsive to community concerns and supported by affected communities could further protect these communities from any disproportionate and adverse impacts.

Code	Issue	Response
29 (cont.)		The comment makes reference to indigenous populations. As shown in Table 4-10, "*Environmental Justice Population Percentages, Affected Study Area Jurisdictions*," on page 4-30 of the Final Environmental Impact Statement, indigenous populations are accounted for in the impact analyses. Further, Chapter 2, *Gila River Indian Community Coordination*, discloses the comprehensive nature of coordination efforts with the Gila River Indian Community. Important to note is the history of impact study on Gila River Indian Community land. For much of the study, the Gila River Indian Community did not permit any form of impact analyses of resources on its land as is its right as a sovereign nation (see page 2-1 of the Draft Environmental Impact Statement), and it did not wish to have any information about the Gila River Indian Community disclosed in the Draft Environmental Impact Statement. In 2007, right-of-entry was granted but expired 1 year later. In 2010, the permit was reissued to study an alignment on Gila River Indian Community land (which is discussed at length in Chapter 3, *Alternatives*) but was later withdrawn once consideration by the Gila River Indian Community for a Gila River Indian Community-located alignment was withdrawn. Despite the Gila River Indian Community's directive to neither study nor report on Gila River Indian Community resources and assets, the potential for such impacts is highly unlikely. Populations would not be directly affected by the proposed action. As detailed in the *Cultural Resources* section starting on page 4-128 of the Draft Environmental Impact Statement, the proposed action may pose indirect impacts such as altered access to places of tradition. The Draft Environmental Impact Statement, however, includes a detailed review of alternatives considered to avoid impacts to cultural resources, including the South Mountains. See the Chapter 5 section, *Avoidance Alternatives for Public Parkland Resources of the South Mountains Afforded Protection under Section 4(f)*, beginning on page 5-16 of the Draft Environmental Impact Statement; Chapter 2, *Gila River Indian Community Coordination*; and Chapter 3, *Alternatives*. Additionally, mitigation developed in consultation with the Gila River Indian Community and other tribes has been committed to ensure that access to places of tradition would be preserved (see page 5-27 in the Draft Environmental Impact Statement). Further, in addition to access to the overall public hearing outreach efforts, Gila River Indian Community members also had specific access to Gila River Indian Community-specific outreach, which are detailed on page 6-24 of the Final Environmental Impact Statement.
30	**Environmental Justice**	Executive Order 12898 and Title VI of the Civil Rights Act of 1964 are discussed on pages 4-29 through 4-38 of the Draft Environmental Impact Statement and pages 4-29 through 4-45 of the Final Environmental Impact Statement. Please see the response to the above comment. The impacts from the construction and operation of the action alternatives were subjected to analyses with respect to both the overall population and minority, low-income, and indigenous communities located near proposed project alignments. In light of the comments received, the environmental justice and Title VI analyses in the Draft Environmental Impact Statement were reviewed, and the Final Environmental Impact Statement has been revised to discuss environmental justice and Title VI separately and to clarify how the conclusions in the *Environmental Justice and Title VI* section were reached. Regarding the statement concerning the impacts associated with construction and implementation of each action alternative, potential impacts on all population segments located near the proposed freeway are described in the Draft and Final Environmental Impact Statements. For example, the air quality assessment for the

(Response 30 continues on next page)

Code	Comment Document

and low-income populations.[5] There is a growing body of evidence that low-income and minority communities are more vulnerable to pollution impacts than other communities, including deficits of both a physical and social nature that make the effects of environmental pollution more burdensome.[6] Environmental justice concerns may arise from the potential human health, ecological, social, cultural, and economic impacts associated with a proposed project. According to the DEIS (page 4-167), the communities within the study area have a much higher minority composition (68%) compared to Maricopa County (41%). The DEIS states that all action alternatives would have direct but not disproportionate impacts on populations with environmental justice characteristics (see page 4-175), but this appears to be a premature and unsupported conclusion. The current analysis does not consider the full suite of potential impacts from the proposed project and how these impacts may disproportionately affect minority, low-income, and indigenous populations. The environmental justice analysis in the DEIS focuses mainly on relocations and displacements. The environmental justice analysis should reference air quality, noise, and other potential project impacts to communities living near the proposed alignments.

Recommendations:

- Identify and document all environmental and human health impacts that may have a disproportionately high impact on minority populations, low-income populations, and/or indigenous populations. The environmental justice analysis should evaluate the direct, indirect, and cumulative impacts of each project alternative to these populations, and identify whether there may be disproportionately high and adverse human health or environmental effects. The analysis should incorporate relevant demographic, socioeconomic, environmental and health data, if available, to fully understand potential project impacts.
- Evaluate the localized impacts from the construction and operation of each project alternative and how these impacts affect minority, low-income, and indigenous communities located near proposed project alignments. Communities that are closer to the proposed project alignments are at a higher risk of near-roadway exposure. Near-roadway exposure to air pollution is linked to a variety of adverse health outcomes including asthma and adverse birth and childhood outcomes.[7]

31 - Identify appropriate mitigation measures to reduce or eliminate any adverse impacts to minority, low-income and indigenous populations throughout the project's construction and operation. Clearly identify project alternatives with the least impact to these populations.

31 - Mitigation measures should be developed through open, collaborative processes that include the public and affected communities. Identifying mitigation measures responsive to community concerns and supported by affected communities could further protect these communities from any disproportionate and adverse impacts.

Code	Issue	Response
30 (cont.)		proposed freeway analyzed impacts from carbon monoxide and particulate matter (PM_{10}) and followed U.S. Environmental Protection Agency guidelines. No violations of either the carbon monoxide or particulate matter (PM_{10}) standards were identified, even at worst-case locations along the project corridor. Thus, the carbon monoxide and particulate matter (PM_{10}) analyses demonstrated that the proposed freeway would not contribute to any new localized violations, increase the frequency or severity of any existing violation, or delay timely attainment of the National Ambient Air Quality Standards or any required interim emissions reductions or other milestones. For mobile source air toxics, the analysis showed that for the Study Area, constructing the freeway would have a marginal effect on annual emissions in 2025 and 2035 (less than a 1 percent difference in total annual emissions between the Preferred Alternative and No-Action Alternative). Regardless of alternative, modeled mobile source air toxics emissions would decrease by more than 80 percent relative to 2012 levels, despite a 47 percent increase in vehicle miles traveled in the Study Area compared with 2012 conditions (see discussion beginning on page 4-77 of the Final Environmental Impact Statement). The air quality analyses were updated for the Final Environmental Impact Statement, including a quantitative particulate matter (PM_{10}) analysis, and are more fully described beginning on page 4-68 of the Final Environmental Impact Statement. Congestion relief resulting from the proposed freeway would provide localized air quality emissions reductions on area freeways and arterial streets and at interchanges, benefiting users of area highways and those living near congested roads. To the extent this comment suggests that a health risk assessment is required, the Arizona Department of Transportation and Federal Highway Administration respectfully disagree, as explained in response code #14.
31	**Environmental Justice**	Executive Order 12898 and Title VI of the Civil Rights Act of 1964 are discussed on pages 4-29 through 4-38 of the Draft Environmental Impact Statement and pages 4-29 through 4-45 of the Final Environmental Impact Statement. As detailed in the Draft Environmental Impact Statement, there would be no distinct disproportionately high and adverse impacts on minority populations, low-income populations, and/or indigenous environmental justice populations or disparate impacts to minority groups protected by Title VI, so additional mitigation, beyond the mitigation measures proposed in the Draft and Final Environmental Impact Statements, is not required. See *Environmental Justice and Title VI*, beginning on page 4-29 of the Draft and Final Environmental Impact Statements. The beneficial and adverse effects of the project on the overall population, and on minority, low-income, and indigenous environmental justice populations or disparate impacts to minority groups protected by Title VI, were reviewed for in the sections of the Draft Environmental Impact Statement pertaining to *Land Use, Social Conditions, Displacements and Relocations, Economic Impacts, Air Quality, Noise, Cultural Resources, Visual Resources, Prime and Unique Farmlands,* and *Temporary Construction Impacts*. The impacts of the various alternatives on the overall population as well as minority, low-income, and indigenous environmental justice populations or disparate impacts to minority groups protected by Title VI were also addressed. The conclusions were summarized in the section *Environmental Justice and Title VI*, beginning on page 4-29 of the Final Environmental Impact Statement. In light of the comments received, the environmental justice and Title VI analyses in the Draft Environmental Impact Statement were reviewed, and the Final Environmental Impact Statement has been revised to discuss environmental justice and Title VI separately and to clarify how the conclusions in the *Environmental Justice and Title VI* section were reached.

Code	Comment Document

Impacts to Aquatic Resources

All of the Western Section alternatives involve placing a roadway bridge over the Salt River and the construction of piers in the channel, with stated impacts varying from 17 to 26 acres depending on which alternative is chosen. The Salt River channel functions as a surface water conveyance system and provides attenuation of flood flows, as well as sediment and nutrient retention from discharge flows, thus serving a valuable water quality function. The Eastern Section alternative involves potential filling of 51 ephemeral washes that originate in the Phoenix South Mountain Park and drain to the south or west, with a potential hydrological connection to the Gila River. Ephemeral washes perform a diversity of hydrologic and biogeochemical functions that directly affect the integrity and functional condition of higher-order waters downstream. Washes provide hydrologic connectivity within the watershed, facilitating the movement of water, sediment, nutrients, wildlife, and plant propagules throughout the watershed. Washes are responsible for a large portion of basin ground-water recharge in arid and semi-arid regions through channel infiltration and transmission losses. These ephemeral systems contribute to the biogeochemical functions of waters within their watershed by storing, cycling, transforming, and transporting elements and compounds. Ephemeral washes also provide habitat for breeding, shelter, foraging and movement of wildlife.[8]

The DEIS does not provide sufficient information to determine accurate impacts to aquatic resources. Acreage of waters impacted appears to be estimated and not accurately delineated. While the DEIS states that all waters were determined to be jurisdictional in 2003, a current jurisdictional determination by the U.S. Army Corps of Engineers (Corps) has not been made. Furthermore, the DEIS does not provide an estimate of the indirect effects to waters that may result from the proposed project. The project proposes to alter the natural surface hydrology though the construction of detention basins and diversions around the freeway to convey and store stormwater originating upgradient of the freeway as well as from the freeway itself. The elimination of minor washes on the northern side of the freeway will likely result in additional lost acreage of waters to the south. Other potential indirect effects include: 1) changes to hydrology; 2) changes to sediment transport; 3) decreases in water quality/quantity from the impairment of floodplain and ecosystem services including water filtration, groundwater recharge, and flood attenuation; 4) disruption of hydrological and ecological connectivity; 5) loss of wildlife and plant habitat due to the consolidation and elimination of washes; and 5) decreases in biodiversity and ecosystem stability.

Clean Water Act Compliance

The basic premise of the Clean Water Act Section 404 permitting program is that no discharge of dredged or fill material into waters of the United States shall be permitted if (1) a practicable alternative exists that is less damaging to the aquatic environment, or (2) the discharge would cause the nation's waters to be significantly degraded (40 CFR 230). When applying for a Section 404 permit, the applicant must demonstrate that the proposed action is the least environmentally damaging practicable alternative (LEDPA), while also not causing or contributing to significant degradation of the aquatic ecosystem.

Code	Issue	Response
31 (cont.)		In response to the comment regarding the identification of action alternatives with the least impact on populations, the impacts of each alternative on all population segments are described in the Draft and Final Environmental Impact Statements. Identifying the alternative with the least impact on populations is not required. With regard to the portion of the comment related to community involvement and collaboration in the identification of mitigation measures, the public outreach for the proposed action has been extensive. Through these efforts, as disclosed in the Draft and Final Environmental Impact Statements, the public played an important role in affecting design and location of the action alternatives as well as in establishing mitigation. Additionally, consultation has occurred with Gila River Indian Community government officials, the Tribal Historic Preservation Officer, the Cultural Resource Management Program, other tribes, and the State Historic Preservation Office and has led to concurrence from the Gila River Indian Community Tribal Historic Preservation Office and the State Historic Preservation Office on National Register of Historic Places eligibility recommendations (including traditional cultural properties such as the South Mountains), project effects, and proposed mitigation and measures to minimize harm. This consultation has been ongoing and will continue until any commitments in a record of decision are completed, if an action alternative is the Selected Alternative. The section, *Public Involvement Actions*, beginning on page 6-6 of the Draft Environmental Impact Statement, notes over 200 public presentations, 12 public meetings at-large, numerous newsletters, project Web site access, hotlines, and 800 news articles. The outreach established comprehensive access to the environmental impact statement process for the public at-large including all segments of the population. As detailed throughout Chapter 6, *Comments and Coordination*, all comments were carefully considered as part of the environmental impact statement process. The public engagement, disclosure, and process transparency has been and will continue to be exceptional for the proposed action. The Draft Environmental Impact Statement further points out the nature of public engagement that would occur after completion of the National Environmental Policy Act process in future project development phases. To clarify the efforts to allow environmental justice and Title VI populations access to the Environmental Impact Statement process, these efforts are specifically discussed on pages 4-38 and 4-44 of the Final Environmental Impact Statement, respectively.

Code	Comment Document

As described in the DEIS, the preferred alternative, W59, impacts 26 acres of the Salt River Channel, as compared with 19 acres and 17 acres for the other two alternatives. The DEIS states that the W59 alternative will ultimately have minimal impacts to waters since it involves placing only bridge piers in the river channel. However, the DEIS does not evaluate the specific impacts under each alternative or demonstrate how the preferred alternative, despite having a greater acreage of impacts, is the LEDPA. Additionally, the current alternative analysis does not address the impacts to the functional values of waters that would be impacted under each alternative, and does not include an analysis of design crossings (e.g., bridges and culverts) to address avoidance and minimization of impacts.

Recommendations:

32
- Include the findings of a Corps of Engineers' verified jurisdictional delineation for the proposed project.

33
- Include an alternatives analysis which demonstrates that the preferred alternative is the least environmentally damaging practicable alternative, including an analysis of indirect impacts to waters.
- Include a functional assessment of impacted waters for each alternative, discuss how those functions will be impacted, and explore mitigation measures to maintain functions.
- Provide hydrological modeling to demonstrate that downstream flows will not be disrupted due to proposed changes to any natural washes, or the excavation of large amounts of sediment.
- Provide a comprehensive discussion of mitigation measures, including:
  - A description of how impacts will be avoided or minimized.
  - Consideration of a commitment to maintain natural washes, in their present location and natural form and including adequate natural buffers, to the maximum extent practicable.
  - An analysis of avoidance and minimization options for each alternative, such as the use of bridges and soft bottom culverts.
  - A mitigation plan to compensate for any unavoidable impacts to waters of the United States.

Wildlife Habitat and Connectivity

The DEIS recognizes that there is growing support for maintaining habitat connectivity as it pertains to wildlife movement, and notes that significant work has already been completed in Arizona to identify essential landscape linkages for wildlife. The DEIS identifies the Salt River, as well as the area between South Mountain and the Sierra Estrella Mountains, as potentially important linkage areas for wildlife movement in the project area. The DEIS further acknowledges that the proposed freeway would cross the Salt River in an area proposed for future habitat restoration. This restoration project, known as the Rio Salado Oeste project, is a major river restoration project that would result in a continuous riparian corridor, connecting riparian and wetland habitats downstream with similar areas upstream. Currently, riparian areas in this stretch of the river are limited, and include the adjacent Pee Posh wetlands bald eagle breeding area, as well as several gravel pit ponds. The DEIS does not clearly demonstrate how the project alternatives could adversely affect these wildlife corridors and proposed restoration activities, or how impacts to these features will be addressed. Further, the DEIS provides little discussion of the many opportunities for the project to enhance habitat connectivity in the project area through the use of wildlife overcrossings, exclusionary fencing, and other design commitments that have been successful in facilitating the safe movement of wildlife across other Arizona roadway projects. This is particularly important in light of the projects proposal to cut through multiple

Code	Issue	Response
32	**Waters of the United States**	As required under 33 Code of Federal Regulations § 323.3, and as documented on page 4-108 of the Draft Environmental Impact Statement, a commitment was made between publication of the Draft Environmental Impact Statement and Final Environmental Impact Statement to revisit the field delineation of waters of the United States. The results of this effort are discussed in the prologue to the Final Environmental Impact Statement (page xiv) and are more fully described on page 4-116 of the Final Environmental Impact Statement. A field delineation of jurisdictional waters for the Preferred Alternative (E1 and W59) was conducted in the summer of 2013 to identify jurisdictional waters and to define the jurisdictional limits for the Clean Water Act Section 404 permitting. A preliminary jurisdictional determination was submitted to the U.S. Army Corps of Engineers in January 2014 in accordance with U.S. Army Corps of Engineers and Arizona Department of Transportation guidelines. The U.S. Army Corps of Engineers approved the jurisdictional determination in March 2014. The U.S. Army Corps of Engineers has been engaged in the environmental impact statement process for the proposed action since its inception (early comments as part of the scoping process, as an example, are cited on page 6-3 of the Draft Environmental Impact Statement). As a cooperating agency, the U.S. Army Corps of Engineers has had regular representation at project meetings, has reviewed early versions of the purpose and need and alternatives chapters, and has collaborated closely with the project team in assessing pertinent impacts. This is discussed on page 3-27 of the Draft Environmental Impact Statement, under the section, *Compliance with Section 404(b)(1) Guidelines*, as well as in the agency's lack of substantive comments on the Administrative Draft Environmental Impact Statement. In short, the U.S. Army Corps of Engineers has been an active participant in and supportive of the environmental impact statement process undertaken.
33	**Waters of the United States**	According to Clean Water Act Section 404(b)(1), the U.S. Army Corps of Engineers is required to select the least environmentally damaging practicable alternative after considering cost, existing technologies, and logistics in light of the overall project purpose, in cases where an individual permit is required. As noted on page 4-110 of the Draft Environmental Impact Statement, the U.S. Army Corps of Engineers has been involved in the alternatives analysis for the proposed action, as required by Section 404(b)(1). Based on the results of the field delineation of waters of the United States conducted during the summer of 2013 and subsequent consultation with the U.S. Army Corps of Engineers, disturbances to individual jurisdictional waters were confirmed to require an individual permit for the proposed action (see page 4-118 of the Final Environmental Impact Statement). However, only washes within the E1 Alternative would require an individual permit. All disturbances to jurisdictional waters caused by construction of the Western Section action alternatives would be within the limits for Nationwide Permit Number 14, Linear Transportation Projects. Furthermore, the Draft Environmental Impact Statement concluded that, although the area of impact for the Preferred Alternative in the Western Section is higher than the other action alternatives when comparing the acreage of the bridge design needed to cross the water, the actual physical impact on jurisdictional waters in the region would be negligible because the only permanent disturbances would be from bridge pier placement. This is because the smaller pier placements would occupy far less area than the acreage numbers based on the area of the bridge design needed to cross the waterways that were the source of comparison between right-of-way footprints among action alternatives in the Draft Environmental Impact Statement. As noted on page 4-117 of the Final

(Response 33 continues on next page)

As described in the DEIS, the preferred alternative, W59, impacts 26 acres of the Salt River Channel, as compared with 19 acres and 17 acres for the other two alternatives. The DEIS states that the W59 alternative will ultimately have minimal impacts to waters since it involves placing only bridge piers in the river channel. However, the DEIS does not evaluate the specific impacts under each alternative or demonstrate how the preferred alternative, despite having a greater acreage of impacts, is the LEDPA. Additionally, the current alternative analysis does not address the impacts to the functional values of waters that would be impacted under each alternative, and does not include an analysis of design crossings (e.g., bridges and culverts) to address avoidance and minimization of impacts.

Recommendations:

- Include the findings of a Corps of Engineers' verified jurisdictional delineation for the proposed project.
- Include an alternatives analysis which demonstrates that the preferred alternative is the least environmentally damaging practicable alternative, including an analysis of indirect impacts to waters.
- Include a functional assessment of impacted waters for each alternative, discuss how those functions will be impacted, and explore mitigation measures to maintain functions. (34)
- Provide hydrological modeling to demonstrate that downstream flows will not be disrupted due to proposed changes to any natural washes, or the excavation of large amounts of sediment. (35)
- Provide a comprehensive discussion of mitigation measures, including: (36)
    - A description of how impacts will be avoided or minimized.
    - Consideration of a commitment to maintain natural washes, in their present location and natural form and including adequate natural buffers, to the maximum extent practicable.
    - An analysis of avoidance and minimization options for each alternative, such as the use of bridges and soft bottom culverts.
    - A mitigation plan to compensate for any unavoidable impacts to waters of the United States.

Wildlife Habitat and Connectivity

The DEIS recognizes that there is growing support for maintaining habitat connectivity as it pertains to wildlife movement, and notes that significant work has already been completed in Arizona to identify essential landscape linkages for wildlife. The DEIS identifies the Salt River, as well as the area between South Mountain and the Sierra Estrella Mountains, as potentially important linkage areas for wildlife movement in the project area. The DEIS further acknowledges that the proposed freeway would cross the Salt River in an area proposed for future habitat restoration. This restoration project, known as the Rio Salado Oeste project, is a major river restoration project that would result in a continuous riparian corridor, connecting riparian and wetland habitats downstream with similar areas upstream. Currently, riparian areas in this stretch of the river are limited, and include the adjacent Pee Posh wetlands bald eagle breeding area, as well as several gravel pit ponds. The DEIS does not clearly demonstrate how the project alternatives could adversely affect these wildlife corridors and proposed restoration activities, or how impacts to these features will be addressed. Further, the DEIS provides little discussion of the many opportunities for the project to enhance habitat connectivity in the project area through the use of wildlife overcrossings, exclusionary fencing, and other design commitments that have been successful in facilitating the safe movement of wildlife across other Arizona roadway projects. This is particularly important in light of the projects proposal to cut through multiple

Code	Issue	Response
33 (cont.)	**Waters of the United States**	Environmental Impact Statement, the W59 Alternative would disturb less than 0.5 acre when considering only the bridge piers (as was done in the jurisdictional delineations approved by the U.S. Army Corps of Engineers). The lack of prudent and feasible alternatives to the E1 Alternative means that avoidance of waters of the United States would not be practicable; therefore, in consultation with the U.S. Army Corps of Engineers during project design, minimization of impacts would be achieved and unavoidable impacts would be mitigated to the extent reasonable and practicable. These steps are outlined beginning on page 4-118 of the Final Environmental Impact Statement and the U.S. Army Corps of Engineers has concurred with this approach.
34	**Waters of the United States**	According to 33 Code of Federal Regulations § 323.3, a permit is required for discharges of dredged or fill material into waters of the United States. As noted on page 4-110 of the Draft Environmental Impact Statement, as design proceeds, the Arizona Department of Transportation would prepare and submit an application to the U.S. Army Corps of Engineers for a permit under Section 404 of the Clean Water Act. As noted in the previous response, the lack of prudent and feasible alternatives to the E1 Alternative means that avoidance of waters of the United States would not be practicable; therefore, in consultation with the U.S. Army Corps of Engineers during project design, minimization of impacts would be achieved and unavoidable impacts would be mitigated to the extent reasonable and practicable. These steps are outlined beginning on page 4-118 of the Final Environmental Impact Statement and the U.S. Army Corps of Engineers has concurred with this approach.
35	**Hydrology**	Consistent with the Arizona Department of Transportation's 2012 *Roadway Design Guidelines*, preliminary hydrologic analysis has been performed. The project would pose no differences in treatment of hydrologic conditions than would other Phoenix metropolitan area projects. Experts in the field have adequately assessed the issue, which is neither an issue to be deemed a substantial adverse effect or a differentiator in the performance of alternatives. As noted on page 4-107 of the Draft Environmental Impact Statement, if an action alternative were to become the Selected Alternative, it would need comprehensive hydrologic, hydraulic, sediment transport, and erosion-related assessments regarding potential 100-year flood effects associated with ephemeral washes. Results would provide information necessary to make a determination regarding what mitigation measures would need to be implemented. Measures may include physical structures associated with the freeway such as culverts. These measures would be determined during the design phase.
36	**Waters of the United States**	According to Clean Water Act Section 404(b)(1), the U.S. Army Corps of Engineers is required to select the least environmentally damaging practicable alternative after considering cost, existing technologies, and logistics in light of the overall project purpose, in cases where an individual permit is required. As noted on page 4-118 of the Final Environmental Impact Statement, as design proceeds, the Arizona Department of Transportation would prepare and submit an application to the U.S. Army Corps of Engineers for a permit under Section 404 of the Clean Water Act and the U.S. Army Corps of Engineers has concurred with this approach. In consultation with the U.S. Army Corps of Engineers during project design, minimization of impacts would be achieved and unavoidable impacts would be mitigated to the extent reasonable and practicable. The general and special conditions of the Section 404 Individual Permit would minimize impacts on waters of the United States to the extent practicable. Detailed mitigation measures, including those noted in the comment, are described beginning on page 4-118 of the Final Environmental Impact Statement.

Code	Comment Document
	ridgelines of South Mountain in an area known to be the last remaining connection for wildlife to move between South Mountain and the Sierra Estrella Mountains. ***Recommendations:*** 37 • Provide additional qualitative information on any unavoidable impacts to wildlife movement corridors and proposed restoration activities in the Salt River. 38 • Document coordination with Fish and Wildlife Service and Arizona Department of Game and Fish regarding appropriate avoidance, wildlife crossings, and mitigation measures to address these impacts. 39 • Include specific design commitments that: 1) remove wildlife movement barriers; 2) enhance use of identified wildlife corridors; and 3) provide crossings with suitable habitat and topography to accommodate multiple species. • Describe specific project elements that would be constructed to enable wildlife connectivity, including types of features and approximate locations. • Commit to replacing any riparian and wetland habitat anticipated to be lost as a result of this project prior to project construction in order to avoid impacting occupancy and productivity of the adjacent Pee Posh bald eagle breeding area. • Provide further details regarding how stormwater runoff from the proposed freeway could be used in irrigating future restoration projects.

Code	Issue	Response
37	**Biological Resources/Waters of the United States**	Riparian and wetland habitat would be replaced in compliance with the Section 404 Clean Water Act nationwide permit received for the proposed action in the Salt River, as required by 33 Code of Federal Regulations § 323.3. This information is noted on page 4-118 of the Final Environmental Impact Statement. As noted on page 4-15 of the Draft Environmental Impact Statement, the City of Phoenix is aware of, has planned for, and has incorporated the proposed South Mountain Freeway in the City of Phoenix *General Plan* and in conceptual plans for the Rio Salado Oeste project (see Project Features Map in Appendix 4-8 of the Final Environmental Impact Statement). As noted on page 4-15 of the Draft Environmental Impact Statement and as agreed upon by the Bureau of Land Management, U.S. Army Corps of Engineers, and City of Phoenix, the project team would continue to consult with those entities to coordinate design efforts to minimize impacts on the proposed uses of the Rio Salado Oeste project (see Appendix 4-8 of the Final Environmental Impact Statement).
38	**Scoping**	Early and open scoping pursuant to 40 Code of Federal Regulations § 1501.7 is documented throughout the Draft and Final Environmental Impact Statements. Coordination efforts with the U.S. Fish and Wildlife Service and Arizona Game and Fish Department are documented throughout the *Biological Resources* section of the Final Environmental Impact Statement. Connectivity is planned to allow wildlife movement beneath the freeway. This is described in the text box, "*Habitat Connectivity and the Proposed Action*", on page 4-137 and in the section, *Habitat Connectivity*, on page 4-137 of the Final Environmental Impact Statement. Crossing structures are planned along major movement corridors (see Figure 4-38, on page 4-126, and the discussion on page 4-137 of the Final Environmental Impact Statement) and would provide connectivity between the South Mountains and the Sierra Estrella. Wildlife-friendly culvert design information would be considered during the design of the drainage and crossing structures for the freeway (see *Mitigation*, beginning on page 4-138 of the Final Environmental Impact Statement). The Federal Highway Administration and Arizona Department of Transportation have submitted the Biological Evaluation to the U.S. Fish and Wildlife Service, Arizona Game and Fish Department, and Gila River Indian Community's Department of Environmental Quality to continue coordination regarding wildlife concerns as a result of the freeway's potential implementation.
39	**Biological Resources**	The National Environmental Policy Act does not require the proposed action to improve the baseline condition. In correspondence, the Arizona Game and Fish Department (see page A139 in Appendix 1-1 of the Final Environmental Impact Statement) stated that the movement corridor between the South Mountains and the Sierra Estrella is degraded by the 51st Avenue travel corridor and that future planned development in the areas affected (supported by data presented in the sidebar, "*Existing versus planned land use*", on page 4-3 of the Final Environmental Impact Statement, showing the projected conversion of land in the Study Area to nonagricultural uses) will continue to inhibit movement between the South Mountains and the Sierra Estrella. Further, the comment requests enhancement of movement corridors, which indicates the historic habitat has already been adversely affected. Therefore, the current state of habitat limits is the baseline condition under consideration. It is not the obligation of the proposed action to mitigate impacts caused by other unrelated actions. Text beginning on page 4-138 of the Final Environmental Impact Statement discusses mitigation commitments for the proposed action, including continued coordination with the U.S. Fish and Wildlife Service and Arizona Game and Fish Department on wildlife crossing design.

Code	Comment Document
	ridgelines of South Mountain in an area known to be the last remaining connection for wildlife to move between South Mountain and the Sierra Estrella Mountains. *Recommendations:* • Provide additional qualitative information on any unavoidable impacts to wildlife movement corridors and proposed restoration activities in the Salt River. • Document coordination with Fish and Wildlife Service and Arizona Department of Game and Fish regarding appropriate avoidance, wildlife crossings, and mitigation measures to address these impacts. • Include specific design commitments that: 1) remove wildlife movement barriers; 2) enhance use of identified wildlife corridors; and 3) provide crossings with suitable habitat and topography to accommodate multiple species.
40	• Describe specific project elements that would be constructed to enable wildlife connectivity, including types of features and approximate locations.
41	• Commit to replacing any riparian and wetland habitat anticipated to be lost as a result of this project prior to project construction in order to avoid impacting occupancy and productivity of the adjacent Pee Posh bald eagle breeding area.
42	• Provide further details regarding how stormwater runoff from the proposed freeway could be used in irrigating future restoration projects.

Code	Issue	Response
40	**Biological Resources**	These elements are discussed on pages 4-137 and 5-27 of the Final Environmental Impact Statement. Potential locations of multiuse crossings are presented in Figure 4-38 on page 4-126 of the Final Environmental Impact Statement.
41	**Biological Resources**	The general and special conditions of the Section 404 Individual Permit obtained pursuant to 33 Code of Federal Regulations § 323.3 would minimize impacts on waters of the United States to the extent practicable. The Bald and Golden Eagle Protection Act protects bald eagles in the Study Area. Riparian and wetland habitat would be replaced in compliance with any Clean Water Act permit conditions as noted beginning on page 4-118 of the Final Environmental Impact Statement. This compliance is sufficient for the purposes of the environmental impact statement process. The Pee Posh bald eagle breeding area is discussed in the Draft Environmental Impact Statement on page 4-124, but not by name. The eagle information has been updated based on comments received on the Draft Environmental Impact Statement and may be found on page 4-136 of the Final Environmental Impact Statement; however, the discussion of impacts resulting from the action alternatives is largely unchanged from page 4-124 of the Draft Environmental Impact Statement. Namely, although the action alternatives are not expected to affect the nesting activities of these eagles because of the project's distance from the nest, the project may affect their foraging behavior along the Salt River when foraging opportunities exist near action alternatives.
42	**Biological Resources**	As discussed on page 4-125 of the Draft Environmental Impact Statement, the City of Phoenix and U.S. Army Corps of Engineers have anticipated a South Mountain Freeway crossing of the Rio Salado Oeste restoration project and view stormwater runoff from the proposed freeway as an opportunity to "irrigate" the river habitat. Also as discussed on page 4-125 of the Draft Environmental Impact Statement, as planning would progress, the City of Phoenix and U.S. Army Corps of Engineers have agreed to coordinate with the Arizona Department of Transportation on enhancement opportunities for the proposed action (see Appendix 4-8 in the Final Environmental Impact Statement).

Phoenix, Arizona 85007

Dear South Mountain Study Team:

The Gila River Indian Community (Community) hereby submits its comments on the Draft Environmental Impact Statement (DEIS) for the proposed South Mountain 202 Freeway Project (Project).

1 It is the firm position of the Community that the Arizona Department of Transportation (ADOT) should select the No-Action Alternative to avoid irreversible impacts to cultural resources and Traditional Cultural Properties and to protect the health, safety, welfare, and environment of the Community and its members. In addition, the DEIS fails to adequately analyze an alternative that avoids impacts to South Mountain. Finally, while the Community has objected to a Project alignment on its Reservation lands, ADOT and the Federal Highway Administration maintain their obligations to study the Project's impacts on Community lands. The DEIS fails, however, in many environmental resource areas, to adequately analyze the impacts of the Project on the Community's Reservation and its members.

Thank you for your consideration of the Community's comments.

Sincerely,

Gregory Mendoza, Governor
Gila River Indian Community

525 West Gu u Ki • Post Office Box 97 • Sacaton, Arizona 85147 • Telephone: (520) 562-9841 • Fax Line: (520) 562-9849

COMMENTS OF THE GILA RIVER INDIAN COMMUNITY ON THE SOUTH MOUNTAIN 202 FREEWAY DRAFT ENVIRONMENTAL IMPACT STATEMENT

July 03, 2013

The Gila River Indian Community (Community or GRIC) submits its comments on the Draft Environmental Impact Statement (DEIS) for the proposed South Mountain 202 Freeway Project (Project). The Community is a Federally-recognized Indian Nation located south of Phoenix, Arizona, with reservation lands encompassing approximately 372,000 acres and approximately 21,000 enrolled members. The Eastern Section of the proposed Project is adjacent to the Community's Reservation border.

2

In February 2012, the Community held a referendum to allow tribal members to vote on whether the eastern portion of the Project should be built on Community land, be built off Community land, or not be built at all. Community members voted in favor of the Arizona Department of Transportation (ADOT) not building the Project. Therefore, it is the firm position of the Community that ADOT should select the No-Action Alternative to avoid irreversible impacts to cultural resources and Traditional Cultural Properties (TCPs) and to protect the health, safety, welfare, and environment of the Community and its members.

3

While the Community maintains its position that ADOT should not build the Project, as discussed in more detail in sections II and III below, the Community also believes that the DEIS is deficient in several key respects. First, ADOT has failed to adequately analyze an alternative that avoids impacts to South Mountain. Second, the DEIS fails, in many environmental resource areas, to adequately analyze the impacts of the Project on the Community's Reservation and its members.

I. GRIC SUPPORTS THE NO ACTION ALTERNATIVE.

4

The Community has significant concerns regarding the impacts of the Eastern Section of the Project on the Community's environment, cultural resources and TCPs. Unlike the Western Section of the Project, where ADOT studied five alternative alignments, the DEIS studies only one alignment in the Project's Eastern Section. The Eastern Alignment alternative, known as E-1, travels along the northern boundary of the Community's Reservation. Because the DEIS fails to include any other build alternatives in the Eastern Section, the No Action Alternative is the only alternative evaluated in the DEIS that will provide adequate protections to the Community and its resources.

Alternative E-1 will have an unacceptable impact on South Mountain, one of the Community's most significant and important TCPs that figures prominently in oral traditions of the Community. Traditional cultural properties are defined as historic sites that are important because of "their association with cultural practices or beliefs of a living community that (a) are rooted in the community's history, and (b) are important in maintaining the continuing cultural identity of the community" (National Register Bulletin 38). In addition, as identified in the DEIS, the cultural significance of South Mountain causes it to be protected under Section 106 of the National Historic Preservation Act.

Code	Issue	Response
2		Comment noted. Specific comments are addressed below.
3	**Alternatives**	Several action alternatives were subject to the alternatives development and screening process; not just the E1 Alternative and alternatives located on the Community (Figure 3-6 on page 3-10 of the Final Environmental Impact Statement illustrates a representation of such alternatives). Ultimately, the other alternatives (besides the E1 Alternative) were eliminated from further study in the screening process and the Gila River Indian Community decided not to give permission to develop alternatives on its land (see Final Environmental Impact Statement page 3-25). The E1 Alternative when combined with the W59, W71, and W101 (and its options) Alternatives in the western section represents three distinct action alternatives from project termini to project termini, and therefore, represents a full range of reasonable alternatives for detailed study in the Draft and Final Environmental Impact Statements. Therefore, the Arizona Department of Transportation, with concurrence from the Federal Highway Administration, identified the E1 Alternative as the eastern section of the Preferred Alternative (which includes the W59 Alternative in the western section of the Study Area). In reaching its determination, the Arizona Department of Transportation sought to balance its responsibilities to address regional mobility needs while being fiscally responsible and sensitive to local communities The comment stating the Draft Environmental Impact Statement's failure to address many environmental resource areas is addressed by specific comments appearing below.
4	**Alternatives**	The No-Action Alternative was included in the Draft and Final Environmental Impact Statements for detailed study to compare impacts of the action alternatives with the consequences of doing nothing (impacts can result from choosing to do nothing). As stated on page 3-40 of the Final Environmental Impact Statement, the No-Action Alternative would not satisfy the purpose and need of the proposed action because it would result in further difficulty in gaining access to adjacent land uses, increased difficulty in gaining access to Interstate and regional freeway systems from the local arterial street network, increased levels of congestion-related impacts, continued degradation in performance of regional freeway-dependent transit services, increased trip times, and higher user costs. Further, the No-Action Alternative would be inconsistent with Maricopa Association of Governments' and local jurisdictions' long-range planning and policies.

COMMENTS OF THE GILA RIVER INDIAN COMMUNITY ON THE SOUTH MOUNTAIN 202 FREEWAY DRAFT ENVIRONMENTAL IMPACT STATEMENT

July 03, 2013

The Gila River Indian Community (Community or GRIC) submits its comments on the Draft Environmental Impact Statement (DEIS) for the proposed South Mountain 202 Freeway Project (Project). The Community is a Federally-recognized Indian Nation located south of Phoenix, Arizona, with reservation lands encompassing approximately 372,000 acres and approximately 21,000 enrolled members. The Eastern Section of the proposed Project is adjacent to the Community's Reservation border.

In February 2012, the Community held a referendum to allow tribal members to vote on whether the eastern portion of the Project should be built on Community land, be built off Community land, or not be built at all. Community members voted in favor of the Arizona Department of Transportation (ADOT) not building the Project. Therefore, it is the firm position of the Community that ADOT should select the No-Action Alternative to avoid irreversible impacts to cultural resources and Traditional Cultural Properties (TCPs) and to protect the health, safety, welfare, and environment of the Community and its members.

While the Community maintains its position that ADOT should not build the Project, as discussed in more detail in sections II and III below, the Community also believes that the DEIS is deficient in several key respects. First, ADOT has failed to adequately analyze an alternative that avoids impacts to South Mountain. Second, the DEIS fails, in many environmental resource areas, to adequately analyze the impacts of the Project on the Community's Reservation and its members.

I. GRIC SUPPORTS THE NO ACTION ALTERNATIVE.

The Community has significant concerns regarding the impacts of the Eastern Section of the Project on the Community's environment, cultural resources and TCPs. Unlike the Western Section of the Project, where ADOT studied five alternative alignments, the DEIS studies only one alignment in the Project's Eastern Section. The Eastern Alignment alternative, known as E-1, travels along the northern boundary of the Community's Reservation. Because the DEIS fails to include any other build alternatives in the Eastern Section, the No Action Alternative is the only alternative evaluated in the DEIS that will provide adequate protections to the Community and its resources.

5

Alternative E-1 will have an unacceptable impact on South Mountain, one of the Community's most significant and important TCPs that figures prominently in oral traditions of the Community. Traditional cultural properties are defined as historic sites that are important because of "their association with cultural practices or beliefs of a living community that (a) are rooted in the community's history, and (b) are important in maintaining the continuing cultural identity of the community" (National Register Bulletin 38). In addition, as identified in the DEIS, the cultural significance of South Mountain causes it to be protected under Section 106 of the National Historic Preservation Act.

Code	Issue	Response
5	**Cultural Resources**	Since the beginning of the environmental impact statement process, the Federal Highway Administration and Arizona Department of Transportation have been carrying out cultural resources studies and engaging in an ongoing, open dialogue with the Gila River Indian Community Tribal Historic Preservation Office regarding the identification and evaluation of places of religious and cultural importance to the tribe that may be adversely affected by the proposed freeway. Such places are referred to as traditional cultural properties. As a result of these discussions and of studies conducted by the Gila River Indian Community's Cultural Resource Management Program, the Gila River Indian Community has identified traditional cultural properties that are eligible for listing in the National Register of Historic Places. In certain cases, listing these properties on the National Register of Historic Places may offer them protection under Section 4(f) of the Department of Transportation Act. The traditional cultural properties identified are culturally important to other Native American tribes as well. For more discussion of traditional cultural properties, see the section, *Cultural Resources*, beginning on page 4-140 of the Final Environmental Impact Statement and pages 5-26 through 5-28. Section 106 of the National Historic Preservation Act requires a government-to-government relationship between the Federal Government and Indian tribes as described beginning on page 4-140 of the Final Environmental Impact Statement. Section 106 requires that federal agencies take into account the effects of their undertakings on historic properties. This process requires consultation with tribal authorities. Consultation has occurred with Gila River Indian Community government officials, the Tribal Historic Preservation Officer, the Cultural Resource Management Program, many different tribal authorities, and the State Historic Preservation Office. The consultation has resulted in concurrence from the Gila River Indian Community Tribal Historic Preservation Office and the State Historic Preservation Office on National Register of Historic Places eligibility recommendations (including traditional cultural properties), project effects, and proposed mitigation and measures to minimize harm. This consultation has been ongoing and will continue until any commitments in a record of decision are completed. If feasible, avoidance of historic properties is always the Federal Highway Administration and Arizona Department of Transportation's first option. As summarized in Figure 5-2 on page 5-4 of the Final Environmental Impact Statement, numerous alignment adjustments were made to avoid use of existing and planned Section 4(f) resources such as the South Mountains Traditional Cultural Property. Additional information on the South Mountains Traditional Cultural Property (Muhadagi Doag) is provided in the Section 106 consultation letters in Appendix 2-1. This information was included in the confidential traditional cultural property technical report prepared for the study that was not made available to the public. As discussed on page 5-18 of the Final Environmental Impact Statement, many alternatives were examined to avoid the use of the South Mountains Traditional Cultural Property; however, only the E1 Alternative was deemed to be prudent and feasible by the Federal Highway Administration. The U.S. Department of the Interior reviewed the Draft Environmental Impact Statement and commented, "Following our review of the Section 4(f) Evaluation, we concur that there is no feasible or prudent alternative to the Preferred Alternative selected in the document, and that all measures have been taken to minimize harm to these resources. Please note, however, that this concurrence is contingent upon successful completion of the Programmatic Agreement among the consulting parties." (See page B4 in Appendix 7, Volume III, of the Final Environmental Impact Statement.)

GRIC's Comments on the South Mountain 202 Freeway DEIS
Page 2 of 9

South Mountain (also known as *Muhadagi Doag*, South Mountain's traditional name from the story of creation) stands prominently within the landscape of the Community's Reservation, and is central to the Community's traditional and spiritual respect for the natural resources and vast ecosystem. Community culture recognizes this unique relationship, which enabled the Community's ancestors to live harmoniously within this desert environment from time immemorial and is essential to the continued survival of the Community's culture. Community elders have re-affirmed valuable cultural information regarding tribal member's use of the South Mountain area through oral tradition, which continuously reiterates and renews the tribe's ties with the land through stories and songs.

Muhadagi Doag has been well documented by several researchers in published literature as a traditional cultural property of central importance to the *Akimel O'Odham* and *Pee Posh* of the Gila River Indian Community. South Mountain has also been documented as a traditional cultural property known as *Avikwax'os*, which is documented in published literature, as well (Harrington 1908:33; Rea 1996; Spier 1933:252-253). *Muhadagi Doag* is one of the mountain homes of *Se'ehe*, also known as *I'itoi*, an ancient deity of the *O'Odham*. Due to the sacred nature of the area, private traditional religious activities are still conducted in various forms by individual Community members today.

The Community's actions to protect South Mountain demonstrate the great importance of this TCP to the Community. As stated in the DEIS: "Throughout the course of preparing the DEIS, the Community has continually expressed to ADOT its concerns about the roadway going through the South Mountains and the possible irreversible impacts on the South Mountains from the proposed action." DEIS, at 4-129. In April 2007, the Community's Council, which is the governing body of the Community, passed a resolution that "recognized that the South Mountain Range in its entirety is a sacred place/traditional cultural property [that] must be kept inviolate" and "strongly opposed any alteration of the South Mountain Range for any purpose [because such alteration] would be a violation of the cultural and religious beliefs of the Gila River Indian Community and would have a negative cumulative effect on the continuing lifeways of the people of the Gila River Indian Community." Further, in February 2012, the Community voted, via a referendum, in favor of the No Build option for the Project due, in part, to its cultural impacts.

In addition to the impacts to South Mountain generally, Alternative E-1 would also affect sites that contribute to the South Mountain's historic and cultural significance. The Community's Tribal Historic Preservation Officer (GRIC-THPO) identified specific contributing components of the South Mountains TCP that the Project would impact. These include sites AZ T:12:197 (ASM) and AZ T:12:198 (ASM), both of which continue to function in the traditions of the *Akimel O'odham* and *Pee Posh* communities and serve as spiritual places. GRIC-THPO also noted that, while tribes consider all prehistoric sites to be sacred, these sites, known today as Villa Buena and Pueblo del Alamo, were TCPs with elevated importance. Both sites were important prehistoric Hohokam villages that play a role in the Community's culture, identity, history, and oral traditions. For these reasons, ADOT has found that these sites are eligible for listing on the National Register of Historic Places, and would be affected by the Project.

Although some modern impacts have occurred since the establishment of the City of Phoenix, the South Mountain range continues to hold its religious and cultural significance. Each of the

Code	Issue	Response
5 (cont.)		The physical impact on land designated as part of the South Mountains has been minimized through design, and much has already been done to mitigate that effect. Access to the mountain would be maintained and multiple other mitigation measures would be implemented due in part to suggestions made by the Gila River Indian Community itself. The proposed mitigation for the South Mountains Traditional Cultural Property is discussed in the Final Environmental Impact Statement on page 4-134, and measures to minimize harm to the South Mountains Traditional Cultural Property are discussed on page 5-27 of the Final Environmental Impact Statement.
6	**Tribal Involvement**	The Gila River Indian Community coordinated referendum and its results are described on page 2-8 of the Final Environmental Impact Statement. Section 106 of the National Historic Preservation Act requires a government-to-government relationship between the Federal Government and Indian tribes as described beginning on page 4-140 of the Final Environmental Impact Statement. Section 106 requires that federal agencies take into account the effects of their undertakings on historic properties. This process requires consultation with tribal authorities. Consultation has occurred with Gila River Indian Community government officials, the Tribal Historic Preservation Officer, the Cultural Resource Management Program, many different tribal authorities, and the State Historic Preservation Office. The consultation has resulted in concurrence from the Gila River Indian Community Tribal Historic Preservation Office and the State Historic Preservation Office on National Register of Historic Places eligibility recommendations (including traditional cultural properties), project effects, and proposed mitigation and measures to minimize harm. This consultation has been ongoing and will continue until any commitments in a record of decision are completed. The Final Environmental Impact Statement, after consultation and coordination efforts, accommodates and preserves (to the fullest extent possible from the available alternatives) access to the South Mountains for religious practices. A very small portion of the mountain would be impacted by the proposed freeway (less than 0.03 percent of the total area). Although the Final Environmental Impact Statement describes the impact on the South Mountains as adverse, Native Americans would not be kept from practicing their beliefs, access to the mountain would be maintained, and mitigation measures would be implemented based on input from members of the Community. As discussed on page 4-186 of the Final Environmental Impact Statement, the proposed action may contribute to cumulative cultural resources impacts. However, the proposed action and other major planned transportation projects would potentially create preservation in place (enhancement) opportunities not typically associated with private-sector development projects. The opportunity to preserve in place would be the result of federal and State regulations promoting preservation of such resources when associated with a publicly funded project; these federal and State regulations generally are not applied to privately funded projects. Although the types of impacts would be typical of those experienced in constructing and operating other parts of the region's freeway system, some of these impacts would be effectively mitigated through the implementation of enhancement and management plans and other strategies.

GRIC's Comments on the South Mountain 202 Freeway DEIS
Page 2 of 9

South Mountain (also known as *Muhadagi Doag*, South Mountain's traditional name from the story of creation) stands prominently within the landscape of the Community's Reservation, and is central to the Community's traditional and spiritual respect for the natural resources and vast ecosystem. Community culture recognizes this unique relationship, which enabled the Community's ancestors to live harmoniously within this desert environment from time immemorial and is essential to the continued survival of the Community's culture. Community elders have re-affirmed valuable cultural information regarding tribal member's use of the South Mountain area through oral tradition, which continuously reiterates and renews the tribe's ties with the land through stories and songs.

Muhadagi Doag has been well documented by several researchers in published literature as a traditional cultural property of central importance to the *Akimel O'Odham* and *Pee Posh* of the Gila River Indian Community. South Mountain has also been documented as a traditional cultural property known as *Avikwax'os*, which is documented in published literature, as well (Harrington 1908:33; Rea 1996; Spier 1933:252-253). *Muhadagi Doag* is one of the mountain homes of *Se'ehe*, also known as *I'itoi*, an ancient deity of the *O'Odham*. Due to the sacred nature of the area, private traditional religious activities are still conducted in various forms by individual Community members today.

The Community's actions to protect South Mountain demonstrate the great importance of this TCP to the Community. As stated in the DEIS: "Throughout the course of preparing the DEIS, the Community has continually expressed to ADOT its concerns about the roadway going through the South Mountains and the possible irreversible impacts on the South Mountains from the proposed action." DEIS, at 4-129. In April 2007, the Community's Council, which is the governing body of the Community, passed a resolution that "recognized that the South Mountain Range in its entirety is a sacred place/traditional cultural property [that] must be kept inviolate" and "strongly opposed any alteration of the South Mountain Range for any purpose [because such alteration] would be a violation of the cultural and religious beliefs of the Gila River Indian Community and would have a negative cumulative effect on the continuing lifeways of the people of the Gila River Indian Community." Further, in February 2012, the Community voted, via a referendum, in favor of the No Build option for the Project due, in part, to its cultural impacts.

7

In addition to the impacts to South Mountain generally, Alternative E-1 would also affect sites that contribute to the South Mountain's historic and cultural significance. The Community's Tribal Historic Preservation Officer (GRIC-THPO) identified specific contributing components of the South Mountains TCP that the Project would impact. These include sites AZ T:12:197 (ASM) and AZ T:12:198 (ASM), both of which continue to function in the traditions of the *Akimel O'odham* and *Pee Posh* communities and serve as spiritual places. GRIC-THPO also noted that, while tribes consider all prehistoric sites to be sacred, these sites, known today as Villa Buena and Pueblo del Alamo, were TCPs with elevated importance. Both sites were important prehistoric Hohokam villages that play a role in the Community's culture, identity, history, and oral traditions. For these reasons, ADOT has found that these sites are eligible for listing on the National Register of Historic Places, and would be affected by the Project.

Although some modern impacts have occurred since the establishment of the City of Phoenix, the South Mountain range continues to hold its religious and cultural significance. Each of the

Code	Issue	Response
7	**Cultural Resources**	The Federal Highway Administration and Arizona Department of Transportation have listened closely to members of the Gila River Indian Community and their concerns. A summary of this information is provided in the Final Environmental Impact Statement on page 4-141. As acknowledged in the comment, the identification of the two prehistoric villages, Villa Buena [AZ T:12:9 (ASM)] and Pueblo del Alamo [AZ T:12:52 (ASM)], and the South Mountains Traditional Cultural Property and contributing components, the assessment of the importance of these properties to the Gila River Indian Community, and the assessment of impacts on these properties included consultation with staff from the Gila River Indian Community's Tribal Historic Preservation Office and Cultural Resource Management Program and resulted in the concurrence of the Gila River Indian Community at each of these steps (see Table 4-47 beginning on page 4-145 of the Final Environmental Impact Statement). Adverse effects on Villa Buena and Pueblo del Alamo, two traditional cultural properties in the western portion of the Study Area, would be prevented through implementation of an enhancement and management plan developed in consultation with the Gila River Indian Community's Tribal Historic Preservation Officer and Cultural Resource Management Program (see 4-143 of the Final Environmental Impact Statement). Although Villa Buena and Pueblo del Alamo would be adversely affected as archaeological sites, the National Register of Historic Properties-eligible traditional cultural property attributes of Villa Buena and Pueblo del Alamo would not be adversely affected. Impacts on prehistoric sites, including trails and shrines, are documented beginning on page 4-142 of the Final Environmental Impact Statement, while impacts on the South Mountains Traditional Cultural Property are documented on page 4-143. As acknowledged in the comment, the Draft Environmental Impact Statement noted on page 5-28 that the proposed action might be perceived as severing the Gila River Indian Community's spiritual connection to the mountains. The Arizona Department of Transportation and Federal Highway Administration have respected the Gila River Indian Community's spiritual connection with these cultural resources throughout the environmental impact statement process, as evidenced by consultation efforts, mitigation measures, and a discussion of cultural resources issues in the Final Environmental Impact Statement. Members of the Gila River Indian Community would not be prohibited from continuing to practice their beliefs should the project go forward because access to the mountain would be maintained, impacts would be mitigated based on input by the Gila River Indian Community and others, and only a small fraction of the mountains would be affected. The comment's reference to "isolate the Community" on page S-27 of the Draft Environmental Impact Statement is taken out of context. On page S-27 the "isolation of the Gila River Indian Community from culturally important places" is identified as an "impact to be mitigated." The potential isolation would be mitigated by providing access through proposed crossings under the freeway. These multifunctional crossings are proposed near the cultural resources sites and would facilitate pedestrian access to these sites. So, the E1 Alternative would not isolate the Gila River Indian Community from culturally important places.

Code	Comment Document
8	
GRIC's Comments on the South Mountain 202 Freeway DEIS
Page 3 of 9

Project's build alternatives will be intrusive to the spiritual connections associated with the people of the Community and it will forever alter the landscape and view-shed of South Mountain as they are experienced by the people of the Community. Trails and shrines located within the proposed corridor will be destroyed, further diminishing the Community's traditional way of life. Archeological sites will also be impacted. In addition, as the DEIS notes, Alternative E-1 will isolate the Community from these culturally important places. (*See* DEIS at S-27).

The first step in addressing adverse impacts to protected resources under the Section 106 process is avoidance. Nothing short of avoidance would sufficiently mitigate the impacts that Alternative E-1 would have on the South Mountain Range. As part of the Section 106 consultation process, in 2010, the Community's Lieutenant Governor proposed mitigation efforts for the adverse impacts to South Mountain, which FHWA subsequently accepted. This should not be viewed as either an express or implied concurrence with Alternative E-1 under NEPA or with ADOT's/FHWA's determination under Section 4(f) that there are no practicable or feasible alternatives that avoid impacts to South Mountain. Since the time of the Lieutenant Governor's letter, the Community voted via referendum in favor of the No Action Alternative. Thus, this remains the primary position of the Community.

II. THE DEIS SHOULD STUDY IN DETAIL AN ALTERNATIVE THAT AVOIDS SOUTH MOUNTAIN.

Section 1505.1(e) of NEPA's implementing regulations requires agencies to rigorously explore and objectively evaluate a reasonable range of alternatives for a proposed action. While there is no set number of alternatives that must be evaluated in an EIS (*see* NEPA 40 Questions, Question 1b), "what constitutes a reasonable range of alternatives depends on the nature of the proposal and the facts in each case." *Id.* In the case of this Project, where there will be very significant adverse effects on South Mountain – a resource of great cultural and religious significance to the Community – the range of alternatives that are evaluated in detail in the DEIS should include one or more South Mountain avoidance alternatives.

The Community recognizes that in certain cases, alternatives can be eliminated from detailed study, or screened out and disposed of with only a brief discussion in the EIS. The Project that is the subject of this DEIS, however, is not such a case. ADOT owes it to the Community – and NEPA demands in these circumstances – that the DEIS analyze, in detail, at lease one alternative in the Eastern Section of the Project that avoids bisecting South Mountain.

Instead of including the required rigorous and objective study of a South Mountain avoidance alternative, however, the DEIS summarily rejected all but one alternative in the Eastern Section of the Project. The alternative that was carried forward for detailed study in the DEIS, E-1, is the alternative with the most significant environmental impacts on the Community and South Mountain. All but two of the Eastern Section alternatives cut directly through the South Mountain Range. The two alternatives that are located north of South Mountain, the US 60 Extension and the I-10 Spur, were summarily rejected with an explanation consisting of just a few bullet points. While the DEIS did include a section labeled "South Mountain Avoidance Options," this consisted only of the design options of building a bridge over the South Mountains

Code	Issue	Response
8	**Cultural Resources**	Section 106 requires federal agencies to consider the effects of their actions on historic properties (such as the South Mountains Traditional Cultural Property) and provide the Advisory Council on Historic Preservation an opportunity to comment on federal projects prior to implementation. As outlined in Title 36 of the Code of Federal Regulations, Part 800, "Protecting Historic Properties," the National Historic Preservation Act Section 106 review process encourages, but does not mandate, protection or preservation. Sometimes there is no way for a needed project to proceed without harming historic properties (such as the South Mountains Traditional Cultural Property). As described in the Final Environmental Impact Statement in Chapters 2, 3, and 5, the examination of possible avoidance alternatives was comprehensive. Section 106 review does, however, ensure that preservation values are factored into federal agency planning and decisions. Because of Section 106, federal agencies must assume responsibility for the consequences of their actions on historic properties and be publicly accountable for their decisions. The Final Environmental Impact Statement fully discloses those consequences in Chapter 4, *Affected Environment, Environmental Consequences,* and *Mitigation,* and in Chapter 5, *Section 4(f) Evaluation*. If feasible, avoidance of historic properties is always the Federal Highway Administration and Arizona Department of Transportation's first option. As summarized in Figure 5-2 on page 5-4 of the Final Environmental Impact Statement, numerous alignment adjustments were made to avoid use of existing and planned Section 4(f) resources such as the South Mountains Traditional Cultural Property. As discussed on page 5-18 of the Final Environmental Impact Statement, many alternatives were examined to avoid the use of the South Mountains Traditional Cultural Property; however, none of these alternatives were deemed to be prudent and feasible by the Federal Highway Administration. The Department of the Interior reviewed the Draft Environmental Impact Statement and commented, "Following our review of the Section 4(f) Evaluation, we concur that there is no feasible or prudent alternative to the Preferred Alternative selected in the document, and that all measures have been taken to minimize harm to these resources. Please note, however, that this concurrence is contingent upon successful completion of the Programmatic Agreement among the consulting parties." (See page B4 in Appendix 7, Volume III, of the Final Environmental Impact Statement.) The physical impact on land designated as part of the South Mountains has been minimized through design and much has already been done to mitigate that effect. Access to the mountain would be maintained and multiple other mitigation measures would be implemented due in part to suggestions made by the Gila River Indian Community itself. For example, the Federal Highway Administration and Arizona Department of Transportation made a commitment to provide funds for the Gila River Indian Community to conduct a full evaluation of the South Mountains Traditional Cultural Property (see pages 4-147 and 4-158 of the Draft and Final Environmental Impact Statements, respectively). Documentation of these efforts is in a letter from the Lieutenant Governor of the Gila River Indian Community to the Administrator of the Arizona Division of the Federal Highway Administration, dated June 23, 2010 (see page A348 of Appendix 2-1 of the Final Environmental Impact Statement). In this letter, the Gila River Indian Community submitted a proposal for the "Evaluation of Traditional Cultural Property and Adverse Effects of Transportation Corridor Development posed by the proposed construction of the current Pecos Alignment of the South Mountain Freeway." The proposed mitigation for the South Mountains Traditional Cultural Property is discussed in the Final Environmental Impact Statement on page 4-143, and measures to minimize harm to the South Mountains Traditional Cultural Property are discussed on page 5-27 of the Final Environmental Impact Statement.

GRIC's Comments on the South Mountain 202 Freeway DEIS
Page 3 of 9

Project's build alternatives will be intrusive to the spiritual connections associated with the people of the Community and it will forever alter the landscape and view-shed of South Mountain as they are experienced by the people of the Community. Trails and shrines located within the proposed corridor will be destroyed, further diminishing the Community's traditional way of life. Archeological sites will also be impacted. In addition, as the DEIS notes, Alternative E-1 will isolate the Community from these culturally important places. (*See* DEIS at S-27).

The first step in addressing adverse impacts to protected resources under the Section 106 process is avoidance. Nothing short of avoidance would sufficiently mitigate the impacts that Alternative E-1 would have on the South Mountain Range. As part of the Section 106 consultation process, in 2010, the Community's Lieutenant Governor proposed mitigation efforts for the adverse impacts to South Mountain, which FHWA subsequently accepted. This should not be viewed as either an express or implied concurrence with Alternative E-1 under NEPA or with ADOT's/FHWA's determination under Section 4(f) that there are no practicable or feasible alternatives that avoid impacts to South Mountain. Since the time of the Lieutenant Governor's letter, the Community voted via referendum in favor of the No Action Alternative. Thus, this remains the primary position of the Community.

II. THE DEIS SHOULD STUDY IN DETAIL AN ALTERNATIVE THAT AVOIDS SOUTH MOUNTAIN.

9

Section 1505.1(e) of NEPA's implementing regulations requires agencies to rigorously explore and objectively evaluate a reasonable range of alternatives for a proposed action. While there is no set number of alternatives that must be evaluated in an EIS (*see* NEPA 40 Questions, Question 1b), "what constitutes a reasonable range of alternatives depends on the nature of the proposal and the facts in each case." *Id.* In the case of this Project, where there will be very significant adverse effects on South Mountain – a resource of great cultural and religious significance to the Community – the range of alternatives that are evaluated in detail in the DEIS should include one or more South Mountain avoidance alternatives.

9

The Community recognizes that in certain cases, alternatives can be eliminated from detailed study, or screened out and disposed of with only a brief discussion in the EIS. The Project that is the subject of this DEIS, however, is not such a case. ADOT owes it to the Community – and NEPA demands in these circumstances – that the DEIS analyze, in detail, at lease one alternative in the Eastern Section of the Project that avoids bisecting South Mountain.

Instead of including the required rigorous and objective study of a South Mountain avoidance alternative, however, the DEIS summarily rejected all but one alternative in the Eastern Section of the Project. The alternative that was carried forward for detailed study in the DEIS, E-1, is the alternative with the most significant environmental impacts on the Community and South Mountain. All but two of the Eastern Section alternatives cut directly through the South Mountain Range. The two alternatives that are located north of South Mountain, the US 60 Extension and the I-10 Spur, were summarily rejected with an explanation consisting of just a few bullet points. While the DEIS did include a section labeled "South Mountain Avoidance Options," this consisted only of the design options of building a bridge over the South Mountains

Code	Issue	Response
9	**Alternatives**	Several action alternatives were subject to the alternatives development and screening process; not just the E1 Alternative and alternatives located on the Community (Figure 3-6 on page 3-10 of the Final Environmental Impact Statement illustrates a representation of such alternatives). Ultimately, the other alternatives (besides the E1 Alternative) were eliminated from further study in the screening process and the Gila River Indian Community decided not to give permission to develop alternatives on its land (see Final Environmental Impact Statement page 3-25). The E1 Alternative when combined with the W59, W71, and W101 (and its options) Alternatives in the western section represents three distinct action alternatives from project termini to project termini, and therefore, represents a full range of reasonable alternatives for detailed study in the Draft and Final Environmental Impact Statements. Therefore, the Arizona Department of Transportation, with concurrence from the Federal Highway Administration, identified the E1 Alternative as the eastern section of the Preferred Alternative (which includes the W59 Alternative in the western section of the Study Area). In reaching its determination, the Arizona Department of Transportation sought to balance its responsibilities to address regional mobility needs while being fiscally responsible and sensitive to local communities. In addition, throughout the study process, the No-Action Alternative was studied in detail. The No-Action Alternative would avoid the types of impacts the action alternatives would cause on the South Mountains. If feasible, avoidance of historic properties is always the Federal Highway Administration and Arizona Department of Transportation's first option. As summarized in Figure 5-2 on page 5-4 of the Final Environmental Impact Statement, numerous alignment adjustments were made to avoid use of existing and planned Section 4(f) resources. As discussed on page 5-18 of the Final Environmental Impact Statement, many alternatives were examined to avoid the use of the South Mountains Traditional Cultural Property; however, none of these alternatives were deemed to be prudent and feasible by the Federal Highway Administration. The Department of the Interior reviewed the Draft Environmental Impact Statement and commented, "Following our review of the Section 4(f) Evaluation, we concur that there is no feasible or prudent alternative to the Preferred Alternative selected in the document, and that all measures have been taken to minimize harm to these resources. Please note, however, that this concurrence is contingent upon successful completion of the Programmatic Agreement among the consulting parties." (See page B4 of Appendix 7, Volume III, of the Final Environmental Impact Statement.) The physical impact on land designated as part of the South Mountains has been minimized through design, and much has already been done to mitigate that effect. Access to the mountain would be maintained, and multiple other mitigation measures would be implemented due in part to suggestions made by the Gila River Indian Community itself. For example, the Federal Highway Administration and Arizona Department of Transportation made a commitment to provide funds for the Gila River Indian Community to conduct a full evaluation of the South Mountains Traditional Cultural Property (see page 4-159 of the Final Environmental Impact Statement). Documentation of these efforts is in a letter from the Lieutenant Governor of the Gila River Indian Community to the Administrator of the Arizona Division of the Federal Highway Administration, dated June 23, 2010 (see page A348 of Appendix 2-1 of the Final Environmental Impact Statement). In this letter, the Gila River Indian Community submitted a proposal for the "*Evaluation of Traditional Cultural*

(Response 9 continues on next page)

Code	Comment Document

Project's build alternatives will be intrusive to the spiritual connections associated with the people of the Community and it will forever alter the landscape and view-shed of South Mountain as they are experienced by the people of the Community. Trails and shrines located within the proposed corridor will be destroyed, further diminishing the Community's traditional way of life. Archeological sites will also be impacted. In addition, as the DEIS notes, Alternative E-1 will isolate the Community from these culturally important places. (*See* DEIS at S-27).

The first step in addressing adverse impacts to protected resources under the Section 106 process is avoidance. Nothing short of avoidance would sufficiently mitigate the impacts that Alternative E-1 would have on the South Mountain Range. As part of the Section 106 consultation process, in 2010, the Community's Lieutenant Governor proposed mitigation efforts for the adverse impacts to South Mountain, which FHWA subsequently accepted. This should not be viewed as either an express or implied concurrence with Alternative E-1 under NEPA or with ADOT's/FHWA's determination under Section 4(f) that there are no practicable or feasible alternatives that avoid impacts to South Mountain. Since the time of the Lieutenant Governor's letter, the Community voted via referendum in favor of the No Action Alternative. Thus, this remains the primary position of the Community.

II. THE DEIS SHOULD STUDY IN DETAIL AN ALTERNATIVE THAT AVOIDS SOUTH MOUNTAIN.

Section 1505.1(e) of NEPA's implementing regulations requires agencies to rigorously explore and objectively evaluate a reasonable range of alternatives for a proposed action. While there is no set number of alternatives that must be evaluated in an EIS (*see* NEPA 40 Questions, Question 1b), "what constitutes a reasonable range of alternatives depends on the nature of the proposal and the facts in each case." *Id.* In the case of this Project, where there will be very significant adverse effects on South Mountain – a resource of great cultural and religious significance to the Community – the range of alternatives that are evaluated in detail in the DEIS should include one or more South Mountain avoidance alternatives.

9

The Community recognizes that in certain cases, alternatives can be eliminated from detailed study, or screened out and disposed of with only a brief discussion in the EIS. The Project that is the subject of this DEIS, however, is not such a case. ADOT owes it to the Community – and NEPA demands in these circumstances – that the DEIS analyze, in detail, at lease one alternative in the Eastern Section of the Project that avoids bisecting South Mountain.

Instead of including the required rigorous and objective study of a South Mountain avoidance alternative, however, the DEIS summarily rejected all but one alternative in the Eastern Section of the Project. The alternative that was carried forward for detailed study in the DEIS, E-1, is the alternative with the most significant environmental impacts on the Community and South Mountain. All but two of the Eastern Section alternatives cut directly through the South Mountain Range. The two alternatives that are located north of South Mountain, the US 60 Extension and the I-10 Spur, were summarily rejected with an explanation consisting of just a few bullet points. While the DEIS did include a section labeled "South Mountain Avoidance Options," this consisted only of the design options of building a bridge over the South Mountains

Code	Issue	Response
9 (cont.)		*Property and Adverse Effects of Transportation Corridor Development* posed by the proposed construction of the current Pecos Alignment of the South Mountain Freeway."The proposed mitigation for the South Mountains Traditional Cultural Property is discussed in the Final Environmental Impact Statement on page 4-143, and measures to minimize harm to the South Mountains Traditional Cultural Property are discussed on page 5-27 of the Final Environmental Impact Statement. Chapter 1, *Purpose and Need*, of the Final Environmental Impact Statement examines the purpose and need for the proposed action in terms of defining a transportation problem. In doing so, assumptions associated with the past need for the freeway were discounted as part of the environmental impact statement process. The results of the purpose and need analyses included the determination that a transportation problem (similar to the type of problem that has been represented in past Regional Transportation Plans) still exists in the area and that this problem is similar to transportation problem that existed in prior years. The alternatives analyses considered numerous modal alternatives, and it was concluded through the screening process that a road facility would be the appropriate modal choice to address the transportation problem defined. The analyses in the Draft Environmental Impact Statement used socioeconomic and traffic projections at the regional analysis zone and traffic analysis zone levels. At the time of publication of the Draft Environmental Impact Statement, Census 2010-based socioeconomic data at the regional analysis zone and traffic analysis zone levels had not been adopted by the Maricopa Association of Governments and were not available to the project team. Therefore, the data used in the Draft Environmental Impact Statement were the most appropriate information available. The Maricopa Association of Governments approved new population, employment, housing, and traffic projections in June 2013. The new data are presented in the Final Environmental Impact Statement beginning on page 1-11. While new projections based on the 2010 Census showed lower anticipated population and vehicle miles traveled in 2035 than the previous projections, the need for the freeway has not changed. The traffic analysis demonstrated that the proposed project is needed today and will continue to be needed into the future. Although the comment indicates that the discussion in the Draft Environmental Impact Statement is too brief, the document is a summary of a series of technical reports that provide sufficient information to convey the process of screening and reasons for elimination consistent with Federal Highway Administration for National Environmental Policy Act implementation. Technical reports are also available for public examination upon request. The alternative development and screening process as described in Chapter 3 was comprehensive in its nature. While alternatives eliminated are summarized in the chapter, the analyses as documented in the supporting project files and Appendices were appropriate and comprehensive. The complete list of avoidance alternatives for the Section 4(f) resources associated with the South Mountains includes the No-Action Alternative, Gila River Indian Community Alternatives, U.S. Route 60 Extension Alternative, Interstate 10 Spur Alternative (and Options), Riggs Road Alternative, and State Route 85/Interstate 8 Alternative in addition to the Bridge and Tunnel Alternatives. Descriptions of these can be found in the context of the alternatives development and screening process beginning on page 3-9 of the Final Environmental Impact Statement and in the context of avoidance alternatives for the Section 4(f) resources associated with the South Mountains beginning on page 5-16 of the Final Environmental Impact Statement).

Code	Comment Document

or building a tunnel under the South Mountains, both of which the DEIS rejected. *See* DEIS at 3-13 – 3-14.

ADOT attempts to justify its decision to not study in detail an alternative located north of South Mountain by claiming that such alternatives "would not meet the purpose and need of the proposed action and/or would create impacts of extraordinary magnitude." (DEIS at S-39-40). Bisecting and limiting access to one of its most important TCPs is an "impact of extraordinary magnitude," and thus ADOT must at least study an avoidance alternative in detail in the EIS.

9 In addition to the obligation under NEPA to look at avoidance alternatives, Section 4(f) of the Department of Transportation Act also requires the analysis of avoidance alternatives. Pursuant to Section 4(f), before approving a project that "uses" a Section 4(f) resource, FHWA must find that there is no prudent and feasible alternative to that use, and that the selected alternative minimizes harm to the resource. If there is a prudent and feasible alternative that completely avoids 4(f) resources, then it must be selected. As the DEIS concedes, South Mountain is a Section 4(f) resource, and locating a highway through South Mountain constitutes a "use" of South Mountain. The rejection of an avoidance alternative, without sufficient detailed study, does not demonstrate that there is no "prudent and feasible alternative" to the use of South Mountain.

10 Indeed, a glaring omission that ADOT should have studied is an alternative that followed one of the Western Section alternatives south from I-10, and then traveled east to I-10 south of Phoenix, somewhere between the US 60 Extension and the I-10 Spur alternatives and north of the South Mountains. Figure 3-5 of the DEIS appears to show such an alternative, but, again, this alternative was not evaluated in the DEIS and there is no explanation in the DEIS as to why that particular alternative was not carried forward. The DEIS does not indicate that this South Mountain avoidance alternative fails to meet the Project's purpose and need, has adverse environmental impacts, is cost prohibitive or is otherwise not feasible. As such, this is a prime example of an alternative that would have avoided South Mountain and should have been studied.

III. THE DEIS FAILS TO ADEQUATELY ASSESS ENVIRONMENTAL IMPACTS ON THE COMMUNITY'S RESERVATION

11 The DEIS also fails to adequately assess impacts from the Project that would occur on the Community's Reservation. While the proposed roadway is located outside of the Reservation boundaries, NEPA requires that ADOT identify and study on-Reservation direct impacts, indirect impacts and cumulative impacts. The most significant omissions include the failure of ADOT to identify and analyze impacts to or impacts associated with air quality, water quality, biological resources and hazardous materials.

1. Air Quality

12 The Project is being proposed for construction just north of Community lands and south of South Mountain. Since the freeway will be built on the south side of the South Mountain Range, air pollution emissions from vehicle traffic are expected to be trapped on the south side of the mountain and directly impact air quality at GRIC. This is especially true during periods o

Code	Issue	Response
10	**Alternatives**	Based on the comment received, the proposed alternative is considered in the alternative screening process presented in the Final Environmental Impact Statement (see text beginning on page 3-7). The proposed alternative, named the US 60 Extension to Interstate 10 (Papago Freeway) in the Final Environmental Impact Statement, would result in similar benefits and impacts as the U.S. Route 60 Extension and Interstate 10 Spur, which were presented in the Draft Environmental Impact Statement. The project team subjected the proposed alternative to the screening process and criteria applied to other alternatives as described in beginning on page 3-3 of the Final Environmental Impact Statement. The project team found the alternative presented in the comment would cause substantial traffic performance impacts on Interstate 10 (Maricopa Freeway) and U.S. State Route 60 (Superstition Freeway), would not address the needs based on regional travel demand and existing and projected transportation system deficiencies (which were updated with Census 2010-based socioeconomic data presented in the Final Environmental Impact Statement beginning on page 1-11), would result in thousands of residential displacements and over one hundred business displacements, would adversely affect the communities in the South Mountain Village by constructing a barrier between schools, parks, and residences, and would not be consistent with local or regional planning. For these reasons, the alternative was eliminated from detailed study (see Table 3-5 on page 3-12 of the Final Environmental Impact Statement).
11	**Alternatives**	As noted in the sidebar on page 4-3 of the Final Environmental Impact Statement, impacts on the Gila River Indian Community from the proposed action as presented in the Final Environmental Impact Statement are based on data available to the general public and on field observation as appropriate. Discussions in the Final Environmental Impact Statement are limited to only those areas where impacts would occur. This condition was agreed upon by the Gila River Indian Community and is a response to the level of information made available to the project team by the Gila River Indian Community (see page 2-10 of the Final Environmental Impact Statement).
12	**Air Quality**	The Draft and Final Environmental Impact Statements present information and analyses about the proposed action and the enhanced conditions when compared against the No-Action Alternative and document that the proposed action would not cause substantial adverse air quality effects. The Draft and Final Environmental Impact Statements account for potential effects when considering both adverse and beneficial impacts. The Draft and Final Environmental Impact Statements provide in-depth discussion of potential air quality impacts of the proposed alternatives. The carbon monoxide analysis presented on page 4-65 of the Draft Environmental Impact Statement and updated on page 4-75 of the Final Environmental Impact Statement represents projected carbon monoxide concentrations along the project corridor, including those proposed interchange locations along the South Mountain Freeway corridor. The Arizona Department of Transportation also conducted a quantitative particulate matter (PM_{10}) hot-spot analysis that is discussed on page 4-76 of the Final Environmental Impact Statement. The carbon monoxide and particulate matter (PM_{10}) analyses demonstrated that the proposed freeway would not contribute to any new localized violations, increase the frequency or severity of any existing violation, or delay timely attainment of the National Ambient Air Quality Standards or any required interim emissions reductions or other milestones. The Draft Environmental Impact Statement provided the results of modeling for each of the seven priority mobile source air toxics, in both the Eastern and Western Subareas, and compared relative mobile source air toxics emissions that would result

GRIC's Comments on the South Mountain 202 Freeway DEIS
Page 5 of 9

inversion and stagnant air conditions. The DEIS indicates that the Project will improve air quality in the Phoenix Metro area, but the DEIS does not address the adverse impacts on air quality within the Community. The DEIS should be revised to specifically evaluate the adverse impacts on air quality on the GRIC Reservation.

During early public meetings with ADOT and other agencies, GRIC Air Quality Program personnel requested, on multiple occasions, total estimated air pollution emissions from the Project. More specifically, GRIC requested information on estimated Vehicle Miles Travelled (VMT) per day and the total annual tonnages for criteria pollutants and Hazardous Air Pollutants (HAPs) resulting from construction and operation of the freeway. While ADOT indicated that this information would be provided in the EIS, the DEIS does not contain such emission calculations or total tonnages of pollutants. The EIS should be supplemented to include this information.

The EIS indicates on page 4-65 that the Mobile 6.2 Modeling Program was run for carbon monoxide (CO), however, as ADOT has indicated, project specific total tonnages for CO and other criteria pollutants are not included in the EIS. Once the Mobile 6.2 Modeling Program is run, total tonnages for criteria pollutants are easily calculated. Total tonnages of air pollution emissions for the entire freeway project should be included in the EIS to provide full disclosure of the adverse impacts that can be expected from the entire project. These totals should also include total tonnages for MSATs (on-road Mobile Source Air Toxics). This is especially important for Diesel Particulate Matter (DPM) due to the fact that it does not break down readily and may accumulate/concentrate on the south side of South Mountain and adversely impact air quality on the GRIC Reservation.

The EIS includes modeling of estimated concentrations of air pollutants at arterials on the west side of Phoenix and the east side of the Project in the Chandler area. The EIS does not include modeling, however, of estimated concentrations of air pollutants along the stretch of freeway bordering the GRIC Reservation between I-10 on the east near Chandler and the point where the proposed freeway will cross the point parallel with the western border of the Community. Concentrations of air pollutants should be modeled along this stretch of the Project. The EIS should be revised to include modeling of current concentrations of criteria pollutants and MSATs (background concentrations) and concentrations of criteria pollutants and MSATs after construction of the freeway. This will provide information on what the expected increased concentrations of pollutants will be as a result of the proposed freeway construction.

Page 4-65 of the EIS indicates that a PM-10 qualitative analysis was conducted, but a PM-2.5 qualitative analysis was not conducted. This omission is particularly troubling because a large portion of Diesel Particulate Matter (DPM) is PM-2.5. In addition, the EIS states that the analysis for PM-10 was performed for the Project to examine the areas that may be adversely affected by the proposed South Mountain Freeway. Again, however, the analysis omitted impacts to GRIC lands. The analysis only addressed the arterials on the west side of Phoenix. The EIS should be revised to include a qualitative analysis for both PM-10 and PM-2.5 on Community lands.

Pages 4-70 thru 4-71 of the EIS indicate that emissions of on-road MSATs will be reduced as a result of the Project. This is somewhat misleading because it assumes reduced vehicle emissions

Code	Issue	Response
12 (cont.)		from three different potential alternatives (W59, W71, W101) as compared with the No-Action Alternative. It also included modeling of mobile source air toxics emissions in the overall mobile source air toxics study area assuming the W59 Alternative (see pages 4-70 to 4-74 of the Draft Environmental Impact Statement) along with implementation of recent U.S. Environmental Protection Agency mobile source air toxics rules. This analysis was also updated beginning on page 4-77 of the Final Environmental Impact Statement. Based on the carbon monoxide, particulate matter (PM_{10}), and mobile source air toxics analyses, the Federal Highway Administration concluded that the project would not cause substantial adverse impacts on air quality. The carbon monoxide and particulate matter (PM_{10}) analyses demonstrated that the proposed freeway would not contribute to any new localized violations, increase the frequency or severity of any existing violation, or delay timely attainment of the National Ambient Air Quality Standards or any required interim emissions reductions or other milestones. For mobile source air toxics, the analysis showed that for the Study Area, constructing the freeway would have a marginal effect on annual emissions in 2025 and 2035 (less than a 1 percent difference in total annual emissions between the Preferred Alternative and No-Action Alternative). With the Preferred Alternative in 2035, modeled mobile source air toxics emissions would decrease by 57 percent to more than 90 percent, depending on the pollutant, despite a 47 percent increase in vehicle miles traveled in the Study Area compared with 2012 conditions. The air quality technical report can be reviewed on the project Web site at <southmountainfreeway.com>. Meteorological information was considered in the air quality analyses [*Air Quality Assessment: South Mountain Freeway (SR 202L)*, dated March 1, 2013] conducted for the proposed action. Data from the Maricopa County Air Quality Department and from the Gila River Indian Community monitoring station were compared with two, 1-month studies conducted during the winter of 2006 and the spring of 2007 along Pecos Road in the Study Area. According to the Arizona Department of Transportation, 2013, *Air Quality Assessment South Mountain Freeway 202L Draft Report*, review of wind data from the Gila River Indian Community monitoring site at St. Johns suggests that during the morning hours and associated with mountain-drainage air flows and stable atmospheric conditions, the wind flows from the southeast and follows the Gila River channel to the north. Locations to the east of St. Johns will tend to have a flow from the easterly component as the air flows from the east to the lower elevations along the Gila River. During the warmer hours with improved mixing, the flows typically follow the river channel and come from the north and northwest toward the south and southeast. Although these warmer-hour flows would move pollutants toward the Gila River Indian Community, as noted earlier, the pollutants would be below the National Ambient Air Quality Standards at their highest concentrations and these low levels of pollutants would continue to disperse as they moved toward the Gila River Indian Community.
13	**Air Quality**	The carbon monoxide analysis presented on page 4-65 of the Draft Environmental Impact Statement and updated on page 4-75 of the Final Environmental Impact Statement represents projected carbon monoxide concentrations along the project corridor, including those proposed interchange locations along the South Mountain Freeway corridor and near the Gila River Indian Community. This also applies to the particulate matter (PM_{10}) hot-spot analysis that is discussed on page 4-76 of the Final Environmental Impact Statement.

GRIC's Comments on the South Mountain 202 Freeway DEIS
Page 5 of 9

inversion and stagnant air conditions. The DEIS indicates that the Project will improve air quality in the Phoenix Metro area, but the DEIS does not address the adverse impacts on air quality within the Community. The DEIS should be revised to specifically evaluate the adverse impacts on air quality on the GRIC Reservation.

During early public meetings with ADOT and other agencies, GRIC Air Quality Program personnel requested, on multiple occasions, total estimated air pollution emissions from the Project. More specifically, GRIC requested information on estimated Vehicle Miles Travelled (VMT) per day and the total annual tonnages for criteria pollutants and Hazardous Air Pollutants (HAPs) resulting from construction and operation of the freeway. While ADOT indicated that this information would be provided in the EIS, the DEIS does not contain such emission calculations or total tonnages of pollutants. The EIS should be supplemented to include this information.

14 The EIS indicates on page 4-65 that the Mobile 6.2 Modeling Program was run for carbon monoxide (CO), however, as ADOT has indicated, project specific total tonnages for CO and other criteria pollutants are not included in the EIS. Once the Mobile 6.2 Modeling Program is run, total tonnages for criteria pollutants are easily calculated. Total tonnages of air pollution emissions for the entire freeway project should be included in the EIS to provide full disclosure of the adverse impacts that can be expected from the entire project. These totals should also include total tonnages for MSATs (on-road Mobile Source Air Toxics). This is especially important for Diesel Particulate Matter (DPM) due to the fact that it does not break down readily and may accumulate/concentrate on the south side of South Mountain and adversely impact air quality on the GRIC Reservation.

The EIS includes modeling of estimated concentrations of air pollutants at arterials on the west side of Phoenix and the east side of the Project in the Chandler area. The EIS does not include modeling, however, of estimated concentrations of air pollutants along the stretch of freeway bordering the GRIC Reservation between I-10 on the east near Chandler and the point where the proposed freeway will cross the point parallel with the western border of the Community. Concentrations of air pollutants should be modeled along this stretch of the Project. The EIS should be revised to include modeling of current concentrations of criteria pollutants and MSATs (background concentrations) and concentrations of criteria pollutants and MSATs after construction of the freeway. This will provide information on what the expected increased concentrations of pollutants will be as a result of the proposed freeway construction.

Page 4-65 of the EIS indicates that a PM-10 qualitative analysis was conducted, but a PM-2.5 qualitative analysis was not conducted. This omission is particularly troubling because a large portion of Diesel Particulate Matter (DPM) is PM-2.5. In addition, the EIS states that the analysis for PM-10 was performed for the Project to examine the areas that may be adversely affected by the proposed South Mountain Freeway. Again, however, the analysis omitted impacts to GRIC lands. The analysis only addressed the arterials on the west side of Phoenix. The EIS should be revised to include a qualitative analysis for both PM-10 and PM-2.5 on Community lands.

Pages 4-70 thru 4-71 of the EIS indicate that emissions of on-road MSATs will be reduced as a result of the Project. This is somewhat misleading because it assumes reduced vehicle emissions

Code	Issue	Response
13 (cont.)		The mobile source air toxics analysis presented beginning on page 4-70 of the Draft Environmental Impact Statement and updated beginning on page 4-77 of the Final Environmental Impact Statement is an estimated inventory of mobile source air toxics emissions for the entire Study Area. The requested information on vehicle miles traveled may be found in the Draft Environmental Impact Statement in Tables 4-34 and 4-35 on pages 4-72 and 4-73, respectfully. The vehicle miles traveled presented in the Draft Environmental Impact Statement were revised with traffic projections provided by the Maricopa Association of Governments in November 2013. These revised vehicle miles traveled are presented in the Final Environmental Impact Statement in Tables 4-34 through 4-36 on pages 4-80 and 4-81.
14	**Air Quality**	As discussed on page 4-76 of the Final Environmental Impact Statement, federally funded or approved transportation projects must meet applicable air quality analyses requirements of Section 176(c) of the Clean Air Act. The results of the analysis are summarized in the prologue to the Final Environmental Impact Statement (page xiii) and are more fully described beginning on page 4-68 of the Final Environmental Impact Statement. The carbon monoxide and particulate matter (PM_{10}) analyses demonstrated that the proposed freeway would not contribute to any new localized violations, increase the frequency or severity of any existing violation, or delay timely attainment of the National Ambient Air Quality Standards or any required interim emissions reductions or other milestones. The analysis performed for mobile source air toxics used an inventory approach, and total tonnages for mobile source air toxics emissions (including diesel particulate matter) may be found in the Draft Environmental Impact Statement, in Tables 4-34 and 4-35 on pages 4-72 and 4-73, and in the Final Environmental Impact Statement in Tables 4-34 through 4-36 on pages 4-80 and 4-81.
15	**Air Quality**	As noted on page 4-65 of the Draft Environmental Impact Statement, over 700 locations within the Study Area were modeled at various distances from the proposed road's centerline for existing traffic conditions and roadway configurations for Interstate 10, for major arterial street intersections near the proposed action alternatives, and for areas located at the proposed action alternatives' interchanges. These locations were chosen to meet the criteria for selecting modeling locations as specified in Title 40 Code of Federal Regulations § 93.123(a) and to represent the areas of highest concentrations. The analysis demonstrated that none of the action alternatives would violate the National Ambient Air Quality Standards, including those modeled locations at proposed fully directional interchanges along the Gila River Indian Community boundary. The air quality analyses were updated for the Final Environmental Impact Statement, including a quantitative particulate matter (PM_{10}) analysis, and are more fully described beginning on page 4-68 of the Final Environmental Impact Statement. Despite including conservative background levels, concentrations of air pollutants violating National Ambient Air Quality Standards were not predicted. The carbon monoxide analysis results presented in Table 4-32 on page 4-76 of the Final Environmental Impact Statement and the particulate matter (PM_{10}) analysis results presented in Table 4-33 on page 4-77 of the Final Environmental Impact Statement show concentrations at the proposed freeway. Existing levels are represented by the background levels.

inversion and stagnant air conditions. The DEIS indicates that the Project will improve air quality in the Phoenix Metro area, but the DEIS does not address the adverse impacts on air quality within the Community. The DEIS should be revised to specifically evaluate the adverse impacts on air quality on the GRIC Reservation.

During early public meetings with ADOT and other agencies, GRIC Air Quality Program personnel requested, on multiple occasions, total estimated air pollution emissions from the Project. More specifically, GRIC requested information on estimated Vehicle Miles Travelled (VMT) per day and the total annual tonnages for criteria pollutants and Hazardous Air Pollutants (HAPs) resulting from construction and operation of the freeway. While ADOT indicated that this information would be provided in the EIS, the DEIS does not contain such emission calculations or total tonnages of pollutants. The EIS should be supplemented to include this information.

The EIS indicates on page 4-65 that the Mobile 6.2 Modeling Program was run for carbon monoxide (CO), however, as ADOT has indicated, project specific total tonnages for CO and other criteria pollutants are not included in the EIS. Once the Mobile 6.2 Modeling Program is run, total tonnages for criteria pollutants are easily calculated. Total tonnages of air pollution emissions for the entire freeway project should be included in the EIS to provide full disclosure of the adverse impacts that can be expected from the entire project. These totals should also include total tonnages for MSATs (on-road Mobile Source Air Toxics). This is especially important for Diesel Particulate Matter (DPM) due to the fact that it does not break down readily and may accumulate/concentrate on the south side of South Mountain and adversely impact air quality on the GRIC Reservation.

15 The EIS includes modeling of estimated concentrations of air pollutants at arterials on the west side of Phoenix and the east side of the Project in the Chandler area. The EIS does not include modeling, however, of estimated concentrations of air pollutants along the stretch of freeway bordering the GRIC Reservation between I-10 on the east near Chandler and the point where the proposed freeway will cross the point parallel with the western border of the Community. Concentrations of air pollutants should be modeled along this stretch of the Project. The EIS should be revised to include modeling of current concentrations of criteria pollutants and MSATs (background concentrations) and concentrations of criteria pollutants and MSATs after construction of the freeway. This will provide information on what the expected increased concentrations of pollutants will be as a result of the proposed freeway construction.

16 Page 4-65 of the EIS indicates that a PM-10 qualitative analysis was conducted, but a PM-2.5 qualitative analysis was not conducted. This omission is particularly troubling because a large portion of Diesel Particulate Matter (DPM) is PM-2.5. In addition, the EIS states that the analysis for PM-10 was performed for the Project to examine the areas that may be adversely affected by the proposed South Mountain Freeway. Again, however, the analysis omitted impacts to GRIC lands. The analysis only addressed the arterials on the west side of Phoenix. The EIS should be revised to include a qualitative analysis for both PM-10 and PM-2.5 on Community lands.

Pages 4-70 thru 4-71 of the EIS indicate that emissions of on-road MSATs will be reduced as a result of the Project. This is somewhat misleading because it assumes reduced vehicle emissions

Code	Issue	Response
15 (cont.)		The mobile source air toxics analysis conducted for the Final Environmental Impact Statement demonstrated that total mobile source air toxics emissions would decline by 57 percent to more than 90 percent between 2012 and 2035 even though traffic is expected to increase by 47 percent (Final Environmental Impact Statement Table 4-36 on page 4-81). The mobile source air toxics analysis results presented in Tables 4-34 through 4-36 on pages 4-80 and 4-81 of the Final Environmental Impact Statement show emissions predicted with the Preferred (W59/E1) and No-Action Alternatives.
16	**Air Quality**	As noted on page 4-62 of the Draft Environmental Impact Statement, the Maricopa County 2008 Periodic Emissions Inventory attributes only 34 percent of particulate matter ($PM_{2.5}$) emissions to on-road mobile sources. Also on page 4-62 of the Draft Environmental Impact Statement, the Federal Highway Administration attributed less than 40 percent of national diesel particulate matter emissions in 1999 to on-road sources. Although the qualitative particulate matter (PM_{10}) hot-spot analysis performed in the Draft Environmental Impact Statement met 40 Code of Federal Regulations § 93.111(c), the Arizona Department of Transportation and Federal Highway Administration have updated the qualitative analysis to a particulate matter (PM_{10}) quantitative analysis for the Final Environmental Impact Statement to ensure that a state-of-the-art analysis is completed for the proposed action. The quantitative project-level particulate matter (PM_{10}) hot-spot analysis prepared for the proposed project is summarized in the prologue to the Final Environmental Impact Statement (page xiii) and is more fully described beginning on page 4-68 of the Final Environmental Impact Statement. The carbon monoxide and particulate matter (PM_{10}) analyses demonstrated that the proposed freeway would not contribute to any new localized violations, increase the frequency or severity of any existing violation, or delay timely attainment of the National Ambient Air Quality Standards or any required interim emissions reductions or other milestones. A particulate matter ($PM_{2.5}$) analysis (qualitative or quantitative) is not required and was not performed because the area is in attainment for the particulate matter ($PM_{2.5}$) National Ambient Air Quality Standards.

Code	Comment Document

inversion and stagnant air conditions. The DEIS indicates that the Project will improve air quality in the Phoenix Metro area, but the DEIS does not address the adverse impacts on air quality within the Community. The DEIS should be revised to specifically evaluate the adverse impacts on air quality on the GRIC Reservation.

During early public meetings with ADOT and other agencies, GRIC Air Quality Program personnel requested, on multiple occasions, total estimated air pollution emissions from the Project. More specifically, GRIC requested information on estimated Vehicle Miles Travelled (VMT) per day and the total annual tonnages for criteria pollutants and Hazardous Air Pollutants (HAPs) resulting from construction and operation of the freeway. While ADOT indicated that this information would be provided in the EIS, the DEIS does not contain such emission calculations or total tonnages of pollutants. The EIS should be supplemented to include this information.

The EIS indicates on page 4-65 that the Mobile 6.2 Modeling Program was run for carbon monoxide (CO), however, as ADOT has indicated, project specific total tonnages for CO and other criteria pollutants are not included in the EIS. Once the Mobile 6.2 Modeling Program is run, total tonnages for criteria pollutants are easily calculated. Total tonnages of air pollution emissions for the entire freeway project should be included in the EIS to provide full disclosure of the adverse impacts that can be expected from the entire project. These totals should also include total tonnages for MSATs (on-road Mobile Source Air Toxics). This is especially important for Diesel Particulate Matter (DPM) due to the fact that it does not break down readily and may accumulate/concentrate on the south side of South Mountain and adversely impact air quality on the GRIC Reservation.

The EIS includes modeling of estimated concentrations of air pollutants at arterials on the west side of Phoenix and the east side of the Project in the Chandler area. The EIS does not include modeling, however, of estimated concentrations of air pollutants along the stretch of freeway bordering the GRIC Reservation between I-10 on the east near Chandler and the point where the proposed freeway will cross the point parallel with the western border of the Community. Concentrations of air pollutants should be modeled along this stretch of the Project. The EIS should be revised to include modeling of current concentrations of criteria pollutants and MSATs (background concentrations) and concentrations of criteria pollutants and MSATs after construction of the freeway. This will provide information on what the expected increased concentrations of pollutants will be as a result of the proposed freeway construction.

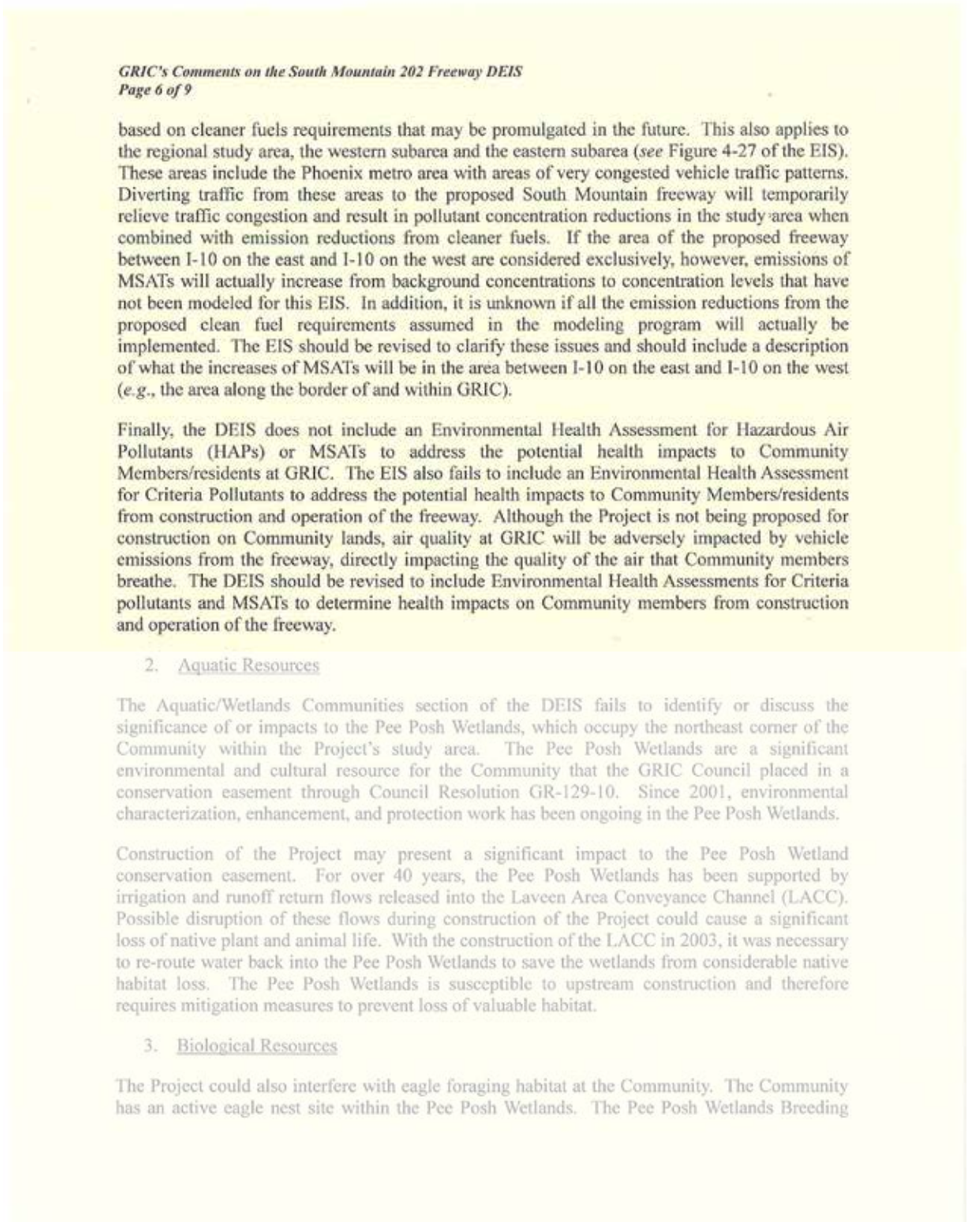
Page 4-65 of the EIS indicates that a PM-10 qualitative analysis was conducted, but a PM-2.5 qualitative analysis was not conducted. This omission is particularly troubling because a large portion of Diesel Particulate Matter (DPM) is PM-2.5. In addition, the EIS states that the analysis for PM-10 was performed for the Project to examine the areas that may be adversely affected by the proposed South Mountain Freeway. Again, however, the analysis omitted impacts to GRIC lands. The analysis only addressed the arterials on the west side of Phoenix. The EIS should be revised to include a qualitative analysis for both PM-10 and PM-2.5 on Community lands.

17 Pages 4-70 thru 4-71 of the EIS indicate that emissions of on-road MSATs will be reduced as a result of the Project. This is somewhat misleading because it assumes reduced vehicle emissions

Code	Issue	Response
17	**Air Quality**	The mobile source air toxics emissions information presented in the Draft and Final Environmental Impact Statements demonstrates that mobile source air toxics emissions at the Study Area level would be much lower in the future. The U.S. Environmental Protection Agency's MOVES model also predicts lower mobile source air toxics emissions in the future. This model includes the effects of various control programs in the generation of emission factors for future years that are considered "reasonably foreseeable" future actions. Because the model includes these emission control programs in the generation of emission factors, it is not possible, and would be unacceptable to the U.S. Environmental Protection Agency, to disable these control program assumptions in the model. Increases in traffic volumes attributable to a project do not necessarily result in an increase in emissions over time because the U.S. Environmental Protection Agency's emissions control regulations and fleet turnover also play a role. In the U.S. Environmental Protection Agency's MOVES model, emissions rates for mobile source air toxics drop by 80 to 90 percent between 2012 and 2025. The effects of these reductions are apparent from the mobile source air toxics analysis conducted for the Final Environmental Impact Statement; in the mobile source air toxics study area, total mobile source air toxics emissions would decline by 57 to more than 90 percent even though traffic is expected to increase by 47 percent (Final Environmental Impact Statement Table 4-36 on page 4-81). The Draft Environmental Impact Statement provided the results of modeling for each of the seven priority mobile source air toxics, in both the Eastern and Western Subareas, and compared relative mobile source air toxics emissions that would result from three different potential alternatives (W59, W71, W101) as compared with the No-Action Alternative. It also included modeling of mobile source air toxics emissions in the overall mobile source air toxics study area assuming the W59 Alternative (see pages 4-70 to 4-74 of the Draft Environmental Impact Statement) along with implementation of recent U.S. Environmental Protection Agency mobile source air toxics rules. During the period when the project has been under review, the U.S. Environmental Protection Agency has issued two rules on controlling mobile source air toxics emissions from motor vehicles (66 *Federal Register* 17229 [March 29, 2001] and 72 *Federal Register* 8427 [February 26, 2007]). In those rules, the U.S. Environmental Protection Agency examined the impacts of existing and newly promulgated mobile source control programs, including its reformulated gasoline program, its national low emission vehicle standards, its Tier 2 motor vehicle emissions standards and gasoline sulfur control requirements, and heavy duty engine and vehicle standards and on-highway diesel fuel sulfur control requirements. As a result, the U.S. Environmental Protection Agency adopted controls on gasoline and passenger vehicles that significantly reduce emissions of benzene and other mobile source air toxics such as 1,3-butadiene; formaldehyde; acetaldehyde; acrolein; and naphthalene; as well as significant reductions in emissions of particulate matter from passenger vehicles. On March 3, 2014, the U.S. Environmental Protection Agency also promulgated new "Tier 3" vehicle and fuel regulations, which will produce additional reductions of mobile source air toxics pollutants. Since these reductions have not yet been incorporated into the U.S. Environmental Protection Agency's emissions model, they are not accounted for in the South Mountain Freeway analysis. While the Federal Highway Administration did not produce stand-alone emissions estimates for the South Mountain Freeway corridor, the carbon monoxide analysis presented on page 4-65 of the Draft Environmental Impact Statement and updated

(Response 17 continues on next page)

Code	Comment Document



GRIC's Comments on the South Mountain 202 Freeway DEIS
Page 6 of 9

based on cleaner fuels requirements that may be promulgated in the future. This also applies to the regional study area, the western subarea and the eastern subarea (*see* Figure 4-27 of the EIS). These areas include the Phoenix metro area with areas of very congested vehicle traffic patterns. Diverting traffic from these areas to the proposed South Mountain freeway will temporarily relieve traffic congestion and result in pollutant concentration reductions in the study area when combined with emission reductions from cleaner fuels. If the area of the proposed freeway between I-10 on the east and I-10 on the west are considered exclusively, however, emissions of MSATs will actually increase from background concentrations to concentration levels that have not been modeled for this EIS. In addition, it is unknown if all the emission reductions from the proposed clean fuel requirements assumed in the modeling program will actually be implemented. The EIS should be revised to clarify these issues and should include a description of what the increases of MSATs will be in the area between I-10 on the east and I-10 on the west (*e.g.*, the area along the border of and within GRIC).

18

Finally, the DEIS does not include an Environmental Health Assessment for Hazardous Air Pollutants (HAPs) or MSATs to address the potential health impacts to Community Members/residents at GRIC. The EIS also fails to include an Environmental Health Assessment for Criteria Pollutants to address the potential health impacts to Community Members/residents from construction and operation of the freeway. Although the Project is not being proposed for construction on Community lands, air quality at GRIC will be adversely impacted by vehicle emissions from the freeway, directly impacting the quality of the air that Community members breathe. The DEIS should be revised to include Environmental Health Assessments for Criteria pollutants and MSATs to determine health impacts on Community members from construction and operation of the freeway.

2. Aquatic Resources

The Aquatic/Wetlands Communities section of the DEIS fails to identify or discuss the significance of or impacts to the Pee Posh Wetlands, which occupy the northeast corner of the Community within the Project's study area. The Pee Posh Wetlands are a significant environmental and cultural resource for the Community that the GRIC Council placed in a conservation easement through Council Resolution GR-129-10. Since 2001, environmental characterization, enhancement, and protection work has been ongoing in the Pee Posh Wetlands.

Construction of the Project may present a significant impact to the Pee Posh Wetland conservation easement. For over 40 years, the Pee Posh Wetlands has been supported by irrigation and runoff return flows released into the Laveen Area Conveyance Channel (LACC). Possible disruption of these flows during construction of the Project could cause a significant loss of native plant and animal life. With the construction of the LACC in 2003, it was necessary to re-route water back into the Pee Posh Wetlands to save the wetlands from considerable native habitat loss. The Pee Posh Wetlands is susceptible to upstream construction and therefore requires mitigation measures to prevent loss of valuable habitat.

3. Biological Resources

The Project could also interfere with eagle foraging habitat at the Community. The Community has an active eagle nest site within the Pee Posh Wetlands. The Pee Posh Wetlands Breeding

Code	Issue	Response
17 (cont.)		on page 4-75 of the Final Environmental Impact Statement represents projected carbon monoxide concentrations along the project corridor, including those proposed interchange locations along the South Mountain Freeway corridor. This also applies to the particulate matter (PM_{10}) hot-spot analysis that is discussed on page 4-76 of the Final Environmental Impact Statement. The carbon monoxide and particulate matter (PM_{10}) analyses demonstrated that the proposed freeway would not contribute to any new localized violations, increase the frequency or severity of any existing violation, or delay timely attainment of the National Ambient Air Quality Standards or any required interim emissions reductions or other milestones. The mobile source air toxics analysis presented beginning on page 4-70 of the Draft Environmental Impact Statement and updated beginning on page 4-77 of the Final Environmental Impact Statement is an estimated inventory of mobile source air toxics emissions for the entire Study Area. Such an inventory would be incomplete without the inclusion of emissions from other Study Area roads because these roads are within the Study Area and human exposure would be a combination of the emissions from all roads in the Study Area. It is stated on page S-14 of the Final Environmental Impact Statement that "For all action alternatives, increased traffic volumes would produce elevated mobile source air toxic emissions near the proposed action. The action alternatives would reduce congestion and improve regional traffic conditions, which would reduce regional mobile source air toxic emissions. Additionally, overall mobile source air toxic levels would decline from existing levels because of compliance with strategies identified by the U.S. Environmental Protection Agency's national control programs."
18	**Health Risk Assessment**	The Federal Highway Administration's National Environmental Policy Act documents are developed under two guiding regulations: the Council on Environmental Quality's National Environmental Policy Act regulations applicable to all federal agencies (40 Code of Federal Regulations Parts 1500–1508) and the Federal Highway Administration's implementing regulations governing Federal Highway Administration National Environmental Policy Act documents (23 Code of Federal Regulations Part 771). In its mobile source air toxics guidance, the Federal Highway Administration discusses 40 Code of Federal Regulations Part 1502.22 and acknowledges that while much work has been done to assess the overall health risk of mobile source air toxics, analytical tools and techniques for assessing project-specific health outcomes as a result of lifetime exposures to mobile source air toxics remain limited. These limitations impede the ability to evaluate the potential health risks attributable to exposure to mobile source air toxics as part of the decision-making process in the National Environmental Policy Act context. However, as with any analysis that the Federal Highway Administration conducts for National Environmental Policy Act purposes, the Federal Highway Administration's approach for mobile source air toxic analysis in National Environmental Policy Act documents is informed not just by 40 Code of Federal Regulations Part 1502.22, but by all applicable Council on Environmental Quality requirements. The appropriateness of air toxics health risk assessment as an analysis method for National Environmental Policy Act documents is discussed below, in the context of Council on Environmental Quality requirements for these documents. In addition to the 40 Code of Federal Regulations Part 1502.22 provisions regarding uncertainty and limitations discussed in the Federal Highway Administration's MSAT Interim Guidance Appendix C, three other provisions of the Council on Environmental Quality regulations are particularly relevant to the topic of health risk assessment:

(Response 18 continues on next page)

Code	Comment Document

Code	Issue	Response
18 (cont.)		*40 Code of Federal Regulations § 1500.1(b): NEPA procedures must insure that environmental information is available to public officials and citizens before decisions are made and before actions are taken. The information must be of high quality. Accurate scientific analysis, expert agency comments, and public scrutiny are essential to implementing NEPA. Most important, NEPA documents must concentrate on the issues that are truly significant to the action in question, rather than amassing needless detail.* *40 Code of Federal Regulations § 1502.1: An environmental impact statement is more than a disclosure document. It shall be used by Federal officials in conjunction with other relevant material to plan actions and make decisions.* *40 Code of Federal Regulations § 1502.2: (a) Environmental impact statements shall be analytic rather than encyclopedic. (b) Impacts shall be discussed in proportion to their significance.(c) Environmental impact statements shall be kept concise and shall be no longer than absolutely necessary to comply with NEPA and with these regulations.* Section 1500.1(b) states that information for decision making must be of high quality and based on accurate scientific analysis. Air toxics health risk assessments can involve large uncertainties. The mobile source air toxic health risk assessment uncertainty builds on itself—each step of the analysis involves uncertainties, including modeling traffic and then modeling emissions, and using this estimated output to model dispersion/concentrations, which provide information for estimating or assuming exposures to those concentrations, and finally predicting health outcomes. Major uncertainties are associated with traffic and emissions projections over a 70-year period, and dispersion models are typically held to a "factor of 2" performance standard. Health impacts of mobile source air toxics in the U.S. Environmental Protection Agency Integrated Risk Information System are based on a 70-year lifetime exposure, which introduces significant uncertainty (e.g., on average, people in the United States change residence approximately once every 8 years and change jobs once every 3). Finally, as noted above, the U.S. Environmental Protection Agency's Integrated Risk Information System provides toxicity (risk) values for various pollutants and routes of exposure; in a health risk assessment, the Federal Highway Administration would compare calculated concentrations of mobile source air toxic pollutants to the Integrated Risk Information System values to estimate health risk. In the Integrated Risk Information System, the U.S. Environmental Protection Agency states the toxicity values are believed to be accurate to within an order of magnitude (a factor of 10). The total cumulative uncertainty involved in highway project health risk assessment is much larger than the change in emissions attributable to projects (typically a few percentage points). In this context, the information would not necessarily have a strong nexus to the requirements for high-quality information and accurate scientific analysis. Section 1500.1(b) also directs agencies to focus their National Environmental Policy Act analysis and documentation on issues that are truly significant to the action in question. In the context of mobile source air toxics, the Federal Highway Administration must consider whether changes in mobile source air toxic emissions attributable to a project have the potential for significant health risk. Using cancer risk as an example, the U.S. Environmental Protection Agency estimates that the overall risk of cancer in the United States is approximately 330,000 in a million, and that air toxics (from all sources) are responsible for a risk of approximately 50 in a million. In its most recent mobile source air toxics rule-making, the U.S. Environmental Protection Agency estimated mobile source air toxic cancer risk, after implementation of emissions controls, at approximately 5 in a million

(Response 18 continues on next page)

Code	Comment Document

Code	Issue	Response
18 (cont.)		(or 0.0015 percent of overall cancer risk from any cause). For the Preferred Alternative, the mobile source air toxic emissions analysis for the Study Area found little difference in total annual emissions of mobile source air toxic emissions between the Preferred and No-Action Alternatives (less than a 1 percent difference) in 2025 and 2035. With the Preferred Alternative in 2035, modeled mobile source air toxic emissions would decrease by more than 80 percent, depending on the pollutant, despite a 47 percent increase in vehicle miles traveled in the Study Area compared with 2012 conditions (see the discussion beginning on page 4-77 of the Final Environmental Impact Statement). In summary, available information from the U.S. Environmental Protection Agency indicates that mobile source air toxics are a small component of overall cancer risk, and the analysis for the Final Environmental Impact Statement indicates both that the Preferred Alternative would result in a small change in the emissions contributing to this risk and that emissions will decline by a large amount regardless of alternative. As discussed above and in the air quality technical report, results from the health risk assessment would be influenced more by the uncertainty introduced into the process through assumptions and speculations rather than by genuine insight into the actual health impacts directly attributable to mobile source air toxic exposure associated with a project. Therefore, outcomes of such a health risk assessment do not provide useful information for decision makers, as required by Section 1502.1. The Federal Highway Administration emissions analysis meets the requirement to produce information that is useful for both disclosure and decision making because it allows the public and decision makers to see which alternative has less mobile source air toxic emissions, with much less uncertainty than a health risk assessment. Given the uncertainty of a mobile source air toxic health risk assessment, the Federal Highway Administration instead addresses the potential impacts of mobile source air toxics through an emissions assessment in its National Environmental Policy Act documents. For smaller projects with a lower likelihood of a meaningful impact, this discussion is qualitative. For larger projects, emissions analysis is conducted. The Federal Highway Administration approach is consistent with the Council on Environmental Quality's direction in Section 1502.2(b) to discuss impacts in proportion to their significance. The results of an emissions analysis can be summarized concisely in a National Environmental Policy Act document and provide useful information for decision makers (e.g., an alternative that has lower emissions is likely to be "better" from a mobile source air toxics health risk standpoint than one that has higher emissions). While the U.S. Environmental Protection Agency and the Federal Highway Administration both agree on the usefulness of addressing mobile source air toxics in National Environmental Policy Act documents for highway projects, the agencies disagree about the value of health risk assessment as a method for doing so.

(Response 18 continues on next page)

Code	Comment Document

Code	Issue	Response
18 (cont.)		Another consideration with respect to health impacts is that the Preferred Alternative would also reduce in-vehicle mobile source air toxics exposure as opposed to the No Action Alternative. The U.S. Environmental Protection Agency has found that in-vehicle benzene concentrations were between 2.5 and 40 times higher than nearby ambient concentrations, based on a review of studies discussed in the Regulatory Impact Analysis for the U.S. Environmental Protection Agency's 2007 mobile source air toxics rule-making (Final Regulatory Impact Analysis, Environmental Protection Agency 420-R-07-002, 3-17 [February 2007]). Construction of the Preferred Alternative would result in a reduction in benzene exposure to drivers and passengers for two reasons: decreased travel times (motorists would spend less time in traffic to reach their destinations) and lower emissions rates (attributable to speed improvements). Reducing on-road exposure would provide a health benefit for motorists using the roadway network. Congestion relief resulting from the proposed freeway would provide localized air quality emissions reductions on area freeways and arterial streets and at interchanges, benefiting users of area highways and those living near congested roads.

GRIC's Comments on the South Mountain 202 Freeway DEIS
Page 6 of 9

based on cleaner fuels requirements that may be promulgated in the future. This also applies to the regional study area, the western subarea and the eastern subarea (*see* Figure 4-27 of the EIS). These areas include the Phoenix metro area with areas of very congested vehicle traffic patterns. Diverting traffic from these areas to the proposed South Mountain freeway will temporarily relieve traffic congestion and result in pollutant concentration reductions in the study area when combined with emission reductions from cleaner fuels. If the area of the proposed freeway between I-10 on the east and I-10 on the west are considered exclusively, however, emissions of MSATs will actually increase from background concentrations to concentration levels that have not been modeled for this EIS. In addition, it is unknown if all the emission reductions from the proposed clean fuel requirements assumed in the modeling program will actually be implemented. The EIS should be revised to clarify these issues and should include a description of what the increases of MSATs will be in the area between I-10 on the east and I-10 on the west (*e.g.*, the area along the border of and within GRIC).

Finally, the DEIS does not include an Environmental Health Assessment for Hazardous Air Pollutants (HAPs) or MSATs to address the potential health impacts to Community Members/residents at GRIC. The EIS also fails to include an Environmental Health Assessment for Criteria Pollutants to address the potential health impacts to Community Members/residents from construction and operation of the freeway. Although the Project is not being proposed for construction on Community lands, air quality at GRIC will be adversely impacted by vehicle emissions from the freeway, directly impacting the quality of the air that Community members breathe. The DEIS should be revised to include Environmental Health Assessments for Criteria pollutants and MSATs to determine health impacts on Community members from construction and operation of the freeway.

2. Aquatic Resources

19

The Aquatic/Wetlands Communities section of the DEIS fails to identify or discuss the significance of or impacts to the Pee Posh Wetlands, which occupy the northeast corner of the Community within the Project's study area. The Pee Posh Wetlands are a significant environmental and cultural resource for the Community that the GRIC Council placed in a conservation easement through Council Resolution GR-129-10. Since 2001, environmental characterization, enhancement, and protection work has been ongoing in the Pee Posh Wetlands.

Construction of the Project may present a significant impact to the Pee Posh Wetland conservation easement. For over 40 years, the Pee Posh Wetlands has been supported by irrigation and runoff return flows released into the Laveen Area Conveyance Channel (LACC). Possible disruption of these flows during construction of the Project could cause a significant loss of native plant and animal life. With the construction of the LACC in 2003, it was necessary to re-route water back into the Pee Posh Wetlands to save the wetlands from considerable native habitat loss. The Pee Posh Wetlands is susceptible to upstream construction and therefore requires mitigation measures to prevent loss of valuable habitat.

3. Biological Resources

20

The Project could also interfere with eagle foraging habitat at the Community. The Community has an active eagle nest site within the Pee Posh Wetlands. The Pee Posh Wetlands Breeding

Code	Issue	Response
19	**Water Resources**	As described in the Final Environmental Impact Statement in Chapter 2 and elaborated on in appropriate sections of Chapter 4, evaluation of impacts on resources located on Gila River Indian Community land were limited to visual inspection as permitted and as restricted by the Gila River Indian Community. As to drainage, as noted in Chapter 3 of the Final Environmental Impact Statement, the design of the proposed action is such as to not alter drainage onto Gila River Indian Community land. Further, the Rio Salado Oeste restoration project will restore habitat and flow conditions within the Salt River channel, including beneath the freeway bridge. The Pee Posh wetland area is discussed in the Draft Environmental Impact Statement on page 4-124, but not by name. A discussion of the Pee Posh wetlands was added to the Final Environmental Impact Statement on page 4-126. The Pee Posh wetlands would not be directly affected by any of the alternatives, and the future condition of the Pee Posh wetlands is likely to improve as a result of the restoration project.
20	**Biology**	The Pee Posh bald eagle breeding area is discussed in the Draft Environmental Impact Statement on page 4-124, but not by name. The information provided in the comment was taken into consideration in the development of a Biological Evaluation that was prepared and submitted to the U.S. Fish and Wildlife Service, Arizona Game and Fish Department, and Gila River Indian Community Department of Environmental Quality. The Biological Evaluation addresses threatened and endangered species and the breeding eagles in the Pee Posh wetlands, in conformance to the Bald and Golden Eagle Protection Act. The action alternatives are not expected to affect the eagles' nesting activities because of the project's distance from the nest. The project may affect the eagles' foraging behavior along the Salt River when foraging opportunities exist near action alternatives. The Federal Highway Administration and Arizona Department of Transportation have committed to continue coordination with the Arizona Game and Fish Department, Gila River Indian Community Department of Environmental Quality, and U.S. Fish and Wildlife Service regarding wildlife concerns as a result of the freeway (see *Mitigation*, beginning on page 4-138 of the Final Environmental Impact Statement).

Code	Comment Document

Areas is listed with the Southwestern Bald Eagle Management Committee's (SWBEMC) list of state-wide eagle Breeding Areas (BA). Since 2010, the site has been cooperatively managed by the Community and the SWBEMC.

Breeding is currently occurring at the Pee Posh Wetlands BA site. Two nestling eagles were hatched in early February 2013. In late April, both nestlings successfully fledged from the nest. Currently, the fledglings are going out daily to actively forage with the adult eagles. The eagles' primary foraging areas at this time are the sand and gravel lakes immediately east of the nest site area. Community Department of Environmental Quality staff have observed eagle activity throughout the 2013 breeding season.

Field observations this year indicate that the eagles are doing a significant portion of their foraging at the sand and gravel lakes located along the Salt River and the 75th Avenue alignment. These considerably large lakes are immediately accessible for foraging in comparison to other water bodies in the area, including the Tres Rios Wetlands and downstream perennial reaches of the Salt and Gila Rivers. Observation showed that the eagles, throughout the breeding season, consistently flew in prey deliveries directly from the sand and gravel lake sources. In addition to being observed flying directly to and from these sources, the eagles were also observed flying over these areas. Although direct access to the lake areas is restricted, visual observations were made using spotting scopes and binoculars. It can be estimated through observations over the course of this year's breeding season that 40 to 60 percent of the prey deliveries made by the eagles came from the sand and gravel lake sources to the east.

The sand and gravel lakes east of the Pee Posh Wetlands BA are therefore considered to be a significant foraging source for the Pee Posh Wetlands eagles. Tres Rios and downstream perennial reaches of the Salt and Gila River confluence area represent the only other significant forging areas. However, these areas are characterized by high human activity produced by Tres Rios, PIR, and the Base and Meridian Wildlife Area, and high prey competition produced by osprey and other fish eating birds, including other eagles. Human activity and strong prey competition are known to cause stress to normal foraging activity in nesting eagle populations. Furthermore, prey delivery distance to the nest site is considerably farther from downstream foraging areas (approximately 4 miles) than it is from the sand and gravel lakes foraging areas (approximately 1.3 miles). In comparison to the downstream foraging sources, the sand and gravel lakes currently provide close accessible foraging for the eagles that is relatively free of human activity. The loss of these foraging sources due to the possible construction of the Project would significantly interfere with normal foraging activity and therefore could cause a loss of eagle productivity for the Pee Posh Wetlands BA. The Community recommends that measures be put in place to mitigate any loss of important eagle foraging habitat due to construction of the Project.

4. Hazardous Waste

21 Table 4-*50 Hazardous Materials Impacts, Action Alternatives* lists the E-1 Alignment as not impacting any Hazardous Materials Sites. The Boundary Site, a former pesticide airstrip, is located at the intersection of 51st Avenue and the Northern boundary and extends into the proposed E-1 Alignment. While the Boundary Site was remediated in 2004, it is worth noting in the DEIS, and would qualify as a low priority site.

Code	Issue	Response
21	**Hazardous Materials**	The Boundary Site was investigated and included in early drafts of the Initial Site Assessment, when the E1 Alternative and the on-Gila River Indian Community Alignment were both still under consideration. The limits of the remediated site overlapped the on-Gila River Indian Community Alignment. The E1 Alternative, however, is located farther north and east than the on-Gila River Indian Community Alignment and does not share any footprint with the Boundary Site. Given the remediated nature of the site, its distance from the Preferred Alternative, and its position downgradient (downhill) from the Preferred Alternative, the Boundary Site was not included in the final Initial Site Assessment or the Draft Environmental Impact Statement.

Code	Comment Document
22	
GRIC's Comments on the South Mountain 202 Freeway DEIS
Page 8 of 9

The transport of hazardous materials continues to be a topic of discussion for the Project. While the E-1 Alignment is not located on the Community, it parallels the northern boundary of the Community and has the real potential to create impacts on Community lands. The DEIS briefly explains the transport of hazardous materials on the Regional Freeway System and the procedures ADOT incorporates to restrict hazardous material transport through particular areas. The transport of hazardous materials at or near the Community's boundary will continue to be of concern, and potential impacts on the Community were not adequately addressed in the DEIS. Further hazardous waste transport studies conducted by ADOT will serve as the basis for improved emergency response planning as well as increase safety for the Community.

22

The Hazardous Materials section beginning on page 4-152 specifically addresses the potential interaction with known hazardous waste sites during the construction phase of the Project. The Draft EIS does not address the transportation of hazardous materials during the operational phase of the proposed freeway. Mitigation measures should be addressed to avoid, reduce and ultimately mitigate environmental impacts should there be an incident involving hazardous materials/hazardous waste.

5. General Environmental Comments

In addition to the environmental comments included above, the Community would also like to call special attention to what may be seen as common public and private nuisance issues such as noise and light pollution and visibility issues that may impact residents and wildlife in the Community areas along the proposed highway corridor. While the impacts may seem minimal based on ADOT standards, the true impacts may be much more significant in this area of the Community, which in many cases is pristine undisturbed desert. The Project will likely increase the potential for encroachment, trespassing, illegal dumping, etc. on Community lands. These impacts are not specifically addressed in the DEIS.

6. Public Safety / Emergency Response

Related to the Community's hazardous materials comments in sub-section 4 above, the Community has public safety concerns that were not adequately addressed in the DEIS regarding the potential impacts from routing hazardous materials and other cargo so close to the Community's Reservation boundary.

Routing all of the West Valley's hazardous cargo along the proposed route to gain access to I-10 South and East presents the potential for hazardous material incidents, which, by their very nature – *i.e.*, spill, fire, or explosion – will affect surrounding lands. Similarly, this routing could result in increased vehicular accidents along the Reservation boundary. The State does not have the resources to adequately respond to such incidents without the use of local jurisdictions; while the state has experts and responders, these responders cannot handle these incidents alone. Despite the fact that the E-1 alignment is located within the City of Phoenix, the Community would be one of the first responders to any incident along the extension from the east to the west up to 51st Avenue and Dobbins based upon the Community's mutual aide partnership with Phoenix.

Code	Issue	Response
22	**Hazardous Materials**	The Final Environmental Impact Statement discloses the context and intensity of the perceived impact noted in the comment. Arizona highways, as are most highways across the United States, are open to all kinds of traffic, so long as the cargo being carried is in accordance with U.S. Department of Transportation regulations for the specific type of cargo. The Arizona Department of Transportation has a few locations in the state with hazardous cargo restrictions, but these restrictions are based on emergency response issues or roadway design limitations specific to that location. For example, the Interstate 10 Deck Park Tunnel has certain hazardous cargo transport restrictions because of the limited ability for emergency responders to address a hazardous materials incident in the tunnel. The South Mountain Freeway, if implemented, is expected to operate under the same rules as other similar facilities in the state; transport of hazardous cargo would be expected to be permissible (see text box on page 4-166 of the Final Environmental Impact Statement). Hazardous materials commodity flow studies and other information are used by emergency response planners (such as the Arizona State Emergency Response Commission statewide and the Maricopa County Local Emergency Planning Commission for Maricopa County) as one of the elements considered when developing emergency response plans. If the plan were amended, it would be made available to the Arizona Department of Transportation. In the event of an incident with a hazardous materials issue on a State or federal highway, the emergency responders contact the Arizona Department of Transportation's Traffic Operations Center to report the incident. The Traffic Operations Center then contacts the Arizona Department of Transportation's Safety and Risk Management group, which responds to the accident scene and assesses needs in concert with the Incident Commander from the responding agency with jurisdiction. If requested, the Arizona Department of Transportation can assist cleanup activities by engaging specialty subcontractors with whom the Arizona Department of Environmental Quality has contracts for such support. The Arizona Department of Transportation's Safety and Risk Management group's charge is primarily public health protection, with cleanup support being secondary.

GRIC's Comments on the South Mountain 202 Freeway DEIS
Page 8 of 9

The transport of hazardous materials continues to be a topic of discussion for the Project. While the E-1 Alignment is not located on the Community, it parallels the northern boundary of the Community and has the real potential to create impacts on Community lands. The DEIS briefly explains the transport of hazardous materials on the Regional Freeway System and the procedures ADOT incorporates to restrict hazardous material transport through particular areas. The transport of hazardous materials at or near the Community's boundary will continue to be of concern, and potential impacts on the Community were not adequately addressed in the DEIS. Further hazardous waste transport studies conducted by ADOT will serve as the basis for improved emergency response planning as well as increase safety for the Community.

The Hazardous Materials section beginning on page 4-152 specifically addresses the potential interaction with known hazardous waste sites during the construction phase of the Project. The Draft EIS does not address the transportation of hazardous materials during the operational phase of the proposed freeway. Mitigation measures should be addressed to avoid, reduce and ultimately mitigate environmental impacts should there be an incident involving hazardous materials/hazardous waste.

5. General Environmental Comments

In addition to the environmental comments included above, the Community would also like to call special attention to what may be seen as common public and private nuisance issues such as noise and light pollution and visibility issues that may impact residents and wildlife in the Community areas along the proposed highway corridor. While the impacts may seem minimal based on ADOT standards, the true impacts may be much more significant in this area of the Community, which in many cases is pristine undisturbed desert. The Project will likely increase the potential for encroachment, trespassing, illegal dumping, etc. on Community lands. These impacts are not specifically addressed in the DEIS.

23

6. Public Safety / Emergency Response

Related to the Community's hazardous materials comments in sub-section 4 above, the Community has public safety concerns that were not adequately addressed in the DEIS regarding the potential impacts from routing hazardous materials and other cargo so close to the Community's Reservation boundary.

Routing all of the West Valley's hazardous cargo along the proposed route to gain access to I-10 South and East presents the potential for hazardous material incidents, which, by their very nature – *i.e.*, spill, fire, or explosion – will affect surrounding lands. Similarly, this routing could result in increased vehicular accidents along the Reservation boundary. The State does not have the resources to adequately respond to such incidents without the use of local jurisdictions; while the state has experts and responders, these responders cannot handle these incidents alone. Despite the fact that the E-1 alignment is located within the City of Phoenix, the Community would be one of the first responders to any incident along the extension from the east to the west up to 51st Avenue and Dobbins based upon the Community's mutual aide partnership with Phoenix.

Code	Issue	Response
23	**Noise**	Noise and visual resources are addressed in the *Noise* and *Visual Resources* sections of Chapter 4 of the Draft Environmental Impact Statement on pages 4-80 and 4-155, respectively, and on pages 4-88 and 4-167 of the Final Environmental Impact Statement, respectively. The noise analysis conducted for and documented in the Draft and Final Environmental Impact Statements complied with the Federal Highway Administration's regulations for conducting noise analyses in 23 Code of Federal Regulations § 772. The noise analysis was updated for the Final Environmental Impact Statement using the most recent Federal Highway Administration and Arizona Department of Transportation policy and traffic projections provided by the Maricopa Association of Governments. No substantial differences between the analyses presented in the Draft and the Final Environmental Impact Statements resulted. This report may also be found on the project Web site at <azdot.gov/southmountainfreeway>. Without noise mitigation, noise levels from the proposed South Mountain Freeway are predicted to range from 61 A-weighted decibels to 78 A-weighted decibels at the nearest homes, depending on the distance from the freeway. Noise mitigation was estimated to reduce those noise levels to a range of 55 A-weighted decibels to 64 A-weighted decibels for most of the areas (see Final Environmental Impact Statement beginning on page 4-91). Because of topography, local street traffic, or other engineering constraints in a few areas, estimated noise levels would not be reduced as much and would be as high as 64 A-weighted decibels to 70 A-weighted decibels in those areas. As discussed on page 4-136 of the Final Environmental Impact Statement, most impacts on wildlife would occur in the Eastern Section of the Study Area where there is more undeveloped land and more natural habitat. During construction activities, noise disturbance would represent a short-term impact on wildlife that would vary by location and intensity and that may affect bird and mammal activities such as nesting and foraging. During freeway operation, the increase in traffic noise would be a long-term impact on wildlife that would vary in intensity depending on factors such as time of day and day of the week. The long-term increase in traffic noise may affect the ability of some animals to avoid predators, communicate, and find food when near the proposed action. Impacts on biological resources during operation of the proposed freeway would also include vehicle-wildlife collisions and an increase in the effects of habitat fragmentation attributable to wildlife avoidance of activity associated with the freeway. Although not recognized by the Federal Highway Administration as mitigation, rubberized asphalt would be used as the top level of paving; it is discussed on Final Environmental Impact Statement beginning on page 4-91. As discussed on page 4-169 of the Final Environmental Impact Statement, in determining visual impacts of the proposed freeway, attention was given to sensitive views along the E1 Alternative, including views from Phoenix South Mountain Park/Preserve, views from residential areas in Ahwatukee Foothills Village, views from the Gila River Indian Community, and views of the major road cuts at the western end of Phoenix South Mountain Park/Preserve. Page 4-170 of the Final Environmental Impact Statement discusses a host of mitigation measures that the Arizona Department of Transportation might employ to avoid creating visual impacts, reduce such impacts, or otherwise mitigate visual impacts associated with the proposed project.

In addition to the environmental comments included above, the Community would also like to call special attention to what may be seen as common public and private nuisance issues such as noise and light pollution and visibility issues that may impact residents and wildlife in the Community areas along the proposed highway corridor. While the impacts may seem minimal based on ADOT standards, the true impacts may be much more significant in this area of the Community, which in many cases is pristine undisturbed desert. The Project will likely increase the potential for encroachment, trespassing, illegal dumping, etc. on Community lands. These impacts are not specifically addressed in the DEIS.

24

6. Public Safety / Emergency Response

Related to the Community's hazardous materials comments in sub-section 4 above, the Community has public safety concerns that were not adequately addressed in the DEIS regarding the potential impacts from routing hazardous materials and other cargo so close to the Community's Reservation boundary.

25

Routing all of the West Valley's hazardous cargo along the proposed route to gain access to I-10 South and East presents the potential for hazardous material incidents, which, by their very nature – *i.e.*, spill, fire, or explosion – will affect surrounding lands. Similarly, this routing could result in increased vehicular accidents along the Reservation boundary. The State does not have the resources to adequately respond to such incidents without the use of local jurisdictions; while the state has experts and responders, these responders cannot handle these incidents alone. Despite the fact that the E-1 alignment is located within the City of Phoenix, the Community would be one of the first responders to any incident along the extension from the east to the west up to 51st Avenue and Dobbins based upon the Community's mutual aide partnership with Phoenix.

Code	Issue	Response
24	**Design**	As discussed in several locations within the Final Environmental Impact Statement (see, for example, page 4-178), the Arizona Department of Transportation would provide and maintain right-of-way fencing between the proposed freeway and the Gila River Indian Community boundary. This fencing would likely minimize any encroachment, trespassing, and illegal dumping on Gila River Indian Community land.
25	**Traffic**	Creating a truck bypass is not a goal of the proposed action. The proposed freeway is part of a transportation system developed to improve mobility in the region by increasing capacity and allowing traffic—including truck traffic—to access a segment of the "loop" system (see pages 1-21, 1-22, 3-1, and 3-3 of the Final Environmental Impact Statement) in the Phoenix metropolitan area. The proposed South Mountain Freeway would be a commuter corridor, helping to move local traffic. As with all other freeways in the region, trucks would use it for the through-transport of freight, for transport to and from distribution centers, and for transport to support local commerce. Nevertheless, the primary user vehicles of the proposed freeway would be automobiles. The Maricopa Association of Governments regional travel demand model projects that truck traffic would represent approximately 10 percent of the total traffic on the proposed freeway, similar to what is currently experienced on other regional freeways such as Interstate 10, State Route 101L, and U.S. Route 60. As disclosed in the Final Environmental Impact Statement, it is expected that "true" through-truck traffic (not having to stop in the metropolitan area) would continue to use the faster, designated, and posted bypass system of Interstate 8 and State Route 85 (see page 3-64 of the Final Environmental Impact Statement). Hazardous materials commodity flow studies and other information are used by emergency response planners (such as the Arizona State Emergency Response Commission statewide and the Maricopa County Local Emergency Planning Commission for Maricopa County) as one of the elements considered when developing emergency response plans. If the plan were amended, it would be made available to the Arizona Department of Transportation. In the event of an incident with a hazardous materials issue on a State or federal highway, the emergency responders contact the Arizona Department of Transportation's Traffic Operations Center to report the incident. The Traffic Operations Center then contacts the Arizona Department of Transportation's Safety and Risk Management group, which responds to the accident scene and assesses needs in concert with the Incident Commander from the responding agency with jurisdiction. If requested, the Arizona Department of Transportation can assist cleanup activities by engaging specialty subcontractors with whom the Arizona Department of Environmental Quality has contracts for such support. The Arizona Department of Transportation's Safety and Risk Management group's charge is primarily public health protection, with cleanup support being secondary. If the Gila River Indian Community were unprepared to respond to emergency situations on the proposed facility, the Arizona State Emergency Response Commission could coordinate regional responses from other Local Emergency Planning Commissions in the region that may have more resources.

Code	Comment Document
26	
GRIC's Comments on the South Mountain 202 Freeway DEIS
Page 9 of 9

Thus, while some of this responsibility will fall on the Community, the DEIS neither identifies the need for, nor assesses whether the Community has the resources to provide for, such assistance. It is significant to note that the Community receives no funding to respond to such incidents and Fire Districts and Municipalities are prohibited from charging for or recuperating costs associated with providing such emergency services.

Finally, the DEIS does not adequately analyze impacts on the Community's Reservation based upon the potential for increased traffic on the Reservation due to a partial or full closure of the Loop 200 extension. Such an increase in the amount and duration of traffic on the Reservation could increase demands on Community public safety officers and first responders, as well as create environmental impacts on the Reservation. Planning for such situations is a must, and should have been studied in the DEIS.

Code	Issue	Response
26	**Traffic**	The Arizona Department of Transportation has developed an "Alternate Route Plan" for all State-operated roads, including highways, freeways, and Interstate highways. The plan is amended prior to opening of a new facility to include alternate routes for incidents on the new facility as well as conditions in which the new facility would be the alternate route for incidents on other State-operated roads. The alternate route plan is reviewed by Arizona Department of Public Safety, Arizona Department of Transportation, and local agencies. The Arizona Department of Transportation is not permitted to identify a local road as an alternate route on a dynamic message sign without an agreement from the agency that operates that road. At this time, there are no agreements in place with any local agencies. However, the use of local roads to avoid an incident is permitted and occurs regularly at the discretion of the motorist. If a local agency would like to encourage the use of a specific road during an incident on a State road, it would need to provide this information to the Arizona Department of Transportation and formally agree to allow the Arizona Department of Transportation to display the local road as an alternate route on a dynamic message sign. The primary goal of the Arizona Department of Transportation and the Arizona Department of Public Safety is to clear the road and open it back to normal traffic operation as soon as possible. The South Mountain Freeway project includes funding for the full array of intelligent transportation system infrastructure (cameras, loop detectors, ramp meters, etc.). This would allow the Arizona Department of Transportation to quickly respond to incidents and notify members of the traveling public of downstream conditions so they can use an alternate State road to avoid the incident. The effects of the proposed action on the local roadway network are accounted for in Chapters 1 and 3 of the Draft Environmental Impact Statement. Cut-line analysis was undertaken to assess the effects of the action and No-Action alternatives on the existing and reasonably foreseeable future road network (as conveyed in jurisdictional long-range plans). The Gila River Indian Community opted not to disclose plans for any roadway network plans now or in the future.

Phoenix, Arizona 85007

Re: Salt River Pima-Maricopa Indian Community comments for the Loop 202 South Mountain Freeway Study Draft Environmental Impact Study (EIS)

Dear Mr. Halikowski,

The Salt River Pima-Maricopa Indian Community (the "Community"), a federally recognized Indian tribe, has a longstanding relationship with the Arizona Department of Transportation (ADOT) that originated because of transportation planning and development in the East Valley that affected lands within and adjacent to the Community's borders. As a business and land owner in the West Valley, we are aware of the changes in the region that require additional transportation planning and development. Although we support ADOT's long range transportation planning with the Loop 202 South Mountain project the Community is aware that such plans and decisions will have impacts to one of our businesses and lands in the West valley and that it is necessary to express our views.

1

The Community owns and operates the Phoenix Cement Company ("PCC") which has operated a facility at 67th Avenue and Southern Avenue since 1987. PCC is a division of tribal government and the Community directly benefits from its business operations. We have a full scale mining operation at this location, inclusive of aggregates crushing, screening, washing operations as well as scale facilities and ready mixed concrete batching and mixing plants. This operation is PCC's sole operation for servicing its west side customer base. Importantly, revenue generated from PCC helps to provide for the welfare of our members.

The Community has reviewed the Loop 202 South Mountain Freeway Study Draft EIS with interest and we would like to share our comments to be included in the public record and to be given consideration by ADOT before any final decision is issued.

2

First, the Community recognizes that the W59 Alternative, designated as the Preferred Alternative, will directly impact all or a portion of our business operations at 67th Avenue and Southern Avenue. As a result, the Community would like the opportunity to communicate more directly with you,

Code	Issue	Response
1	**Acquisitions and Relocations**	Property acquisition and relocation assistance to displaced individuals and businesses is governed in accordance with the Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970. This process outlines determination of property values through the acquisition process. The process requires government agencies to provide just compensation (fair market value) for any acquired property. The acquisition process includes consideration of impacts to access, partial acquisitions, determining values of remaining parcels, and special needs of relocated businesses or individuals (e.g., elderly or disabled). For example, if a relocated business required specific zoning, approvals or permits, permit fees, or closure or abandonment processes, these would be considered in property negotiations. Property acquisition procedures are described in detail on the Arizona Department of Transportation's Web site, in the Right-of-Way Group Acquisition Section, at <azdot.gov>. This section of the Arizona Department of Transportation Web site includes a link to the Arizona Department of Transportation's *Right-of-Way Procedures Manual*, which has an extensive discussion of the whole process. For further discussion, see page 4-51 of the Final Environmental Impact Statement. For questions on specific properties, contact the Arizona Department of Transportation Right-of-Way Group at (602) 712-6922.
2	**Alternatives**	The Arizona Department of Transportation has designated the 59th Avenue connection (W59 Alternative) with Interstate 10 (Papago Freeway) as the Preferred Alternative for the proposed freeway in the Western Section of the Study Area. The project team considered the input of all stakeholders—including regional leaders, municipalities, members of the public, and members of the South Mountain Citizen's Advisory Team—before identifying the W59 Alternative as the Preferred Alternative (see pages 3-65 and 3-68 of the Final Environmental Impact Statement). The W59 Alternative was seen as the best option to balance fiscal responsibility, regional mobility needs, community sensitivity, and additional considerations such as consistency with long-range planning goals, economic and environmental impacts, and public and agency input. Precise areas of impacts would be determined as the project design progresses, if an action alternative were to be the Selected Alternative. The Arizona Department of Transportation has met with the Salt River Pima-Maricopa Indian Community to discuss its concerns, and these meetings would continue.

Code	Comment Document

as an impacted stakeholder, on the specific land acquisition along 59th Avenue for the W59 Alternative to better understand the direct impacts to our business. Based on the information we have to date, we are not opposed to the W59 Alternative as long as we are given the opportunity to consult with you about this preferred route and consider options, including whether a soil cement berm in the river bed could allow us to salvage a portion of our operations.

Second, the Community supports the W71 Alternative as our most favored route. Due to the potential impact the W59 may have on the operations of PCC we believe this route to be more suitable while still providing a viable option for a southern corridor.

Third, the Community would support the W101 Alternative Route as our second choice.

These brief comments are intended to give the general position of the Salt River Pima-Maricopa Indian Community during this 90-day public comment period to review the Draft EIS of the Loop 202 South Mountain Freeway Study and we look forward to working with you to achieve a mutually beneficial solution.

Sincerely,

Diane Enos

Diane Enos
President

RE: South Mountain (Loop 202) Freeway Draft Environmental Impact Statement

Dear Study Team,

1

The Arizona Game and Fish Department (Department) has reviewed the Draft Environmental Impact Statement (DEIS) for the South Mountain Freeway (Loop 202) and Section 4(f) Evaluation. The Department continues to understand the need for such a project with the continued growth occurring in our state and within Maricopa County, facilitating the need for more and/or modified infrastructure. The Department was involved in the initial stages of the process and periodically consulted over the years as concerns and/or questions arose. The Department appreciates the opportunity to review the DEIS and would like to coordinate further as the project progresses. If executed appropriately, we believe this project has the potential to be an opportunity to restore rather than threaten ecological viability. Achieving such an objective will require substantial additions to mitigation requirements, but these additions would generate support for a project with such heightened public interest. We provide the following general comments for consideration with page specific comments on the DEIS in the attachment.

Background

2

The Desert Spaces: An Open Space Plan (Plan) for the Maricopa Association of Governments includes South Mountain as "providing local identity and for wildlife relief from urban development patterns". The general policies include: conserving mountainous areas containing important wildlife habitats through implementation of various open space protection tools. South Mountain was identified in the plan as a retention area. The policies related to retention areas include: allowance of development that retains the integrity of and public access to regionally and locally significant natural features, wildlife habitats, etc.; ensuring that protection of resources is integral to the project and low impact construction technology is utilized from initiation through site restoration. Included was the recognition that all native animal species are essential components of healthy ecosystems, and a directive to conserve existing habitat, recreate it where destroyed, and provide new habitat where appropriate. The Sierra Estrella Mountains

AN EQUAL OPPORTUNITY REASONABLE ACCOMMODATIONS AGENCY

Code	Issue	Response
1	**Biology, Plants, and Wildlife**	As noted on page 4-1 of the Final Environmental Impact Statement, during the design stage of project development, changes in regulatory requirements may occur or changes to previously assessed resource impacts could be discovered that would require modifications to mitigation. Final commitment to mitigation measures would be made in a record of decision and would include the commitment for the Arizona Department of Transportation and Federal Highway Administration to continue to coordinate with the Arizona Game and Fish Department during the design phase to develop appropriate measures to mitigate potential impacts related to the project; however, any additional efforts would be beyond the scope of the National Environmental Policy Act.
2	**Biology, Plants, and Wildlife**	The proposed freeway is consistent with maps included in the referenced Maricopa Association of Governments *Desert Spaces: An Open Space Plan for the Maricopa Association of Governments* and with regional planning efforts, as discussed in Chapter 5 of the Final Environmental Impact Statement (see Phoenix South Mountain Park/Preserve section beginning on page 5-14 of the Final Environmental Impact Statement). We perceive the comment to mean that the project does not conform to the goals stated in the Maricopa Association of Governments *Desert Spaces: An Open Space Plan for the Maricopa Association of Governments*, such as the use of low-impact construction technology in the South Mountains area and maintaining wildlife connectivity across the network of identified open spaces. The Arizona Game and Fish Department requests that additional mitigation considerations be given to habitat loss and/or degradation resulting from the project. It is also important to understand that the City of Phoenix planning efforts since the mid-1980s illustrate an awareness of the potential for the proposed South Mountain Freeway to affect Phoenix South Mountain Park/Preserve. In 1989, the South Mountain Park Master Plan was adopted by the Phoenix City Council. The master plan shows the freeway alignment as adopted by the State Transportation Board in 1988. In 1990, the South Mountain Preserve Act was ratified by the Arizona Legislature. The Act did not apply to roadways through a designated mountain preserve if the roadway was in the State Highway System prior to August 15, 1990. The proposed South Mountain Freeway was in the State Highway System prior to 1990. Records prior to the Act suggest a primary reason for the exception was to allow the proposed freeway to go through Phoenix South Mountain Park/Preserve (see Final Environmental Impact Statement page 5-14). The project team examined alternatives to avoid the Phoenix South Mountain Park/Preserve, but did not identify any feasible and prudent alternatives to avoid the use of the park. The portion of the park that would be used for the proposed freeway would be 31.3 acres, or approximately 0.2 percent of the park's approximately 16,600 acres (see Final Environmental Impact Statement pages S-38 and 5-31). The Arizona Department of Transportation continues to work with park stakeholders to minimize use of park resources. The *Measures to Minimize Harm* section beginning on page 5-23 of the Final Environmental Impact Statement includes measures addressing concerns raised in the comment. The Arizona Department of Transportation and Federal Highway Administration would continue to work with partners including the U.S. Fish and Wildlife Service, Arizona Game and Fish Department, and the Gila River Indian Community's Department of Environmental Quality, during the design phase to continue to develop these measures (including the provision of replacement lands and the design of multifunctional crossings that would allow wildlife passage across the proposed freeway alignment at natural drainages and that would allow Gila River Indian Community members to gain access to important traditional locations within the South Mountains). Given these considerations, the proposed freeway is consistent with regional planning efforts.

Code	Comment Document

were identified as conservation areas within the Plan. The policies associated with those areas consider species diversity and states that overall populations of wildlife should not be reduced. If connections from South Mountain to the Sierra Estrella Mountains are cut off, populations would be impacted. In addition, a number of drainage features coming off South Mountain serve as wildlife corridors. Washes are identified in the plan with policies to include: development of roads and utility corridors parallel to but not in the washes. Community buffer zones are addressed with policies including: protection of lands containing natural resources, nearly pristine desert vegetation, agricultural land and wildlife habitat that lie between rural communities, unincorporated areas and expanding urbanizing areas. South Mountain provides a good example of where this is occurring with the Gila River Indian Community lands (GRIC), agriculture to the south and urbanization to the north and east. The agriculture use on GRIC lands and desert vegetation on the west/north side of the mountain provide vital components for wildlife. Benefits of regional planning that were identified included interconnected systems and wildlife corridors; thus avoiding preserved islands of habitat and low biodiversity. The proposed freeway is not consistent with this regional planning effort. Additional mitigation considerations should be given to habitat loss/degradation resulting from the project.

Wildlife and Connectivity

South Mountain and the surrounding study area contain a diversity of species (please refer to the extensive lists in the attachments) likely to include, but not limited to: Harris's hawk, northern harrier, peregrine falcon, bald eagle, western burrowing owl, Gambel's quail, greater road runner, black-tailed jackrabbit, javelina, mule deer, desert bighorn sheep, coyote, gray fox, badger, bobcat, mountain lion, western yellow bat, western red bat, Sonoran desert toad, Sonoran Desert Tortoise, Gila monster, desert iguana, chuckwalla, Sonoran Whipsnake, western lyresnake, Tucson shovel-nosed snake, tiger, black-tailed and western diamond-backed rattlesnakes. South Mountain in particular contains one of the largest known populations of chuckwallas in the state. The DEIS addressed special status species: desert tortoise, bald eagle, Yuma clapper rail, Tucson shovel-nosed snake and others. We recommend inclusion of the Species of Greatest Conservation Need (SGCN) (see attachment) along with preserving connectivity to the Sierra Estrella Mountains in order to preserve biodiversity on South Mountain.

3

The Department is primarily concerned with wildlife connectivity opportunities between South Mountain and the Sierra Estrella Mountains, and maintaining and enhancing the crossing at the Salt River. These wildlife linkages have been identified within the 2006 Statewide Linkages Assessment and the Maricopa County Stakeholders Assessment 2012. The recommended E1 eastern alignment would cut-off the movement corridors between South Mountain and the Sierra Estrella Mountains, impacting the long-term diversity on South Mountain. This alternative would cut through the mountain across two ridgelines. This may create an island effect as the project area is the last remaining connection for wildlife to move between South Mountain park and GRIC, agricultural lands and ultimately the Sierra Estrella Mountains. The western portions of

4

Code	Issue	Response
3	**Biology, Plants, and Wildlife**	The section, *General Impacts on Vegetation, Wildlife, and Wildlife Habitat*, beginning on page 4-136 of the Final Environmental Impact Statement, respectively, discloses the effects of the proposed action and its alternatives on vegetation, wildlife, and wildlife habitat. The conclusion for diminished wildlife resources accounts for general effects that would also apply to species of greatest conservation need. Those species of greatest conservation need that have the potential to occur in the Study Area have been added to Table 4-43 that begins on page 4-129 of the Final Environmental Impact Statement. These species were also addressed in a Biological Evaluation that was submitted to the U.S. Fish and Wildlife Service, Arizona Game and Fish Department, and Gila River Indian Community Department of Environmental Quality. The U.S. Fish and Wildlife Service concurred with the species determinations in the Biological Evaluation (see Appendix 1-1 of the Final Environmental Impact Statement). Connectivity is planned to allow wildlife movement beneath the freeway in multiuse crossings (see page 4-137 of the Final Environmental Impact Statement). The Federal Highway Administration and Arizona Department of Transportation have committed to providing mitigation by including multifunctional crossing structures designed for wildlife and for limited human use, potential fencing to guide wildlife to the crossing structures, and culverts designed for connectivity for smaller species. Wildlife-friendly design information would be considered during the design of drainage and crossing structures for the freeway (see *Mitigation*, beginning on page 4-138 of the Final Environmental Impact Statement).
4	**Biology, Plants, and Wildlife**	Connectivity is planned to allow wildlife movement beneath the freeway. This is described in the text box, "*Habitat Connectivity and the Proposed Action*," on page 4-125 and in the section, *Habitat Connectivity*, on page 4-137 of the Final Environmental Impact Statement. Crossing structures are planned along major movement corridors (see Figure 4-38, on page 4-126, and the discussion on page 4-137 of the Final Environmental Impact Statement) and would maintain connectivity between the South Mountains and the Sierra Estrella. The comments on the Draft Environmental Impact Statement contradict previous communication with the Arizona Game and Fish Department for the project. The last formal communication received from the Arizona Game and Fish Department in 2006 (see page A139 in Appendix 1-1 of the Final Environmental Impact Statement) stated that the movement corridor between the South Mountains and the Sierra Estrella is degraded by the 51st Avenue travel corridor as well as by planned development in that area. Data presented in the Draft and Final Environmental Impact Statements corroborate this statement (see the sidebar, "*Existing versus planned land use,*" on page 4-3 of both documents); a large percentage of the land in the Study Area is projected to be converted to nonagricultural uses in the foreseeable future. The above-referenced 2006 letter from the Arizona Game and Fish Department also stated that mule deer are believed to have been extirpated from the area. There was no mention of concerns regarding bighorn sheep. The Federal Highway Administration and Arizona Department of Transportation have committed to providing mitigation by including multifunctional crossing structures designed for wildlife such as mule deer and for limited human use, potential fencing to guide wildlife to the crossing structures, and culverts designed for connectivity for smaller species.

Code	Comment Document

South Mountain are mostly undisturbed as opposed to the eastern portions and provide habitat for larger species like mule deer and bighorn sheep. Bighorn sheep are historic to this area and are currently found in the adjacent Sierra Estrella Mountains. This is a potential opportunity where the project could actually restore diversity by taking measures to preserve and improve connectivity between these mountain ranges, promoting mule deer movement and helping return bighorn sheep to historic habitat and providing watchable wildlife opportunities that would have tremendous support from the viewing public.

5

The DEIS presents plans for multi-functional crossings using underpasses; however, "multi-functional" crossings fail to facilitate movement for many wildlife species. Previous (Arizona State Route 68, ADOT SPR588: http://www.azdot.gov/TPD/ATRC/publications/project_reports/PDF/AZ588.pdf) and current studies (U.S. Highway 93, Twin Peaks) on Arizona highways show that high human use of underpasses inhibit the realization of intended wildlife connectivity and permeability. A 2011 study in the Netherlands had limited success with overpasses designed specifically with segregated pedestrian and wildlife channels. However there was clear indication that human use was inhibiting wildlife utilization of monitored overpasses and significantly impacting behavior of target species. The Department supports placing crossing underpasses in the drainage areas (washes, etc.) for facilitating movement for wildlife only, not constructing multi-use crossings. Underpasses may accommodate a diversity of species; however, allowing or promoting human, equestrian, and/or OHV use would severely limit wildlife connectivity. The crossings (and crossing approaches) for hiking, equestrian, and mountain bicyclists should be located in a different area or separated from the wildlife crossing and crossing approach areas.

6

The Department recommends overpasses where the proposed alignment intersects the major ridgelines of South Mountain to allow for movement of larger game and other species, while decreasing risk to public safety. Overpasses are proving to be successful in moving larger species, as documented in the US Highway 93 study. Single span bridges have been shown to improve connectivity for deer in Arizona (SR 260: http://ntl.bts.gov/lib/46000/46600/46644/AZ603.pdf), but fall short of mitigating the fragmentation effects that roads have on the deer. Underpasses improved the deer passage rate on SR 260 from 3% to 16%, but 84% of crossing attempts remained unsuccessful. Bighorn sheep have been documented using underpasses opportunistically, but again they do not alleviate the barrier effects of roads on bighorn sheep. . On SR 68, 20 months of monitoring 3 underpasses revealed only 32 bighorn sheep ram crossings (none by ewes or lambs). Over 1200 crossings by rams, ewes, and lambs were documented on the US 93 overpasses during a similar 20 month period. Such functionality falls far short of movement requirements to maintain viable bighorn sheep and mule deer populations in the South Mountain area. Overpasses in Arizona have been shown to pass large numbers of bighorn sheep and deer, along with other species, safely across highways thereby maintaining a permeable landscape.

Code	Issue	Response
5	**Biology, Plants, and Wildlife**	The intended uses of the multifunctional crossings would vary by location within the Study Area. If the crossings were near existing recreational features or trails, more human use would be expected. However, multifunctional crossings in remote areas through the South Mountains would allow limited use by people. Use of the crossings by people in this area is proposed solely to accommodate those members of the Gila River Indian Community who wish to gain access to areas of the South Mountains for ceremonies important for their culture (see Final Environmental Impact Statement page 4-151). A right-of-way fence would limit access to these areas by freeway users, but would allow Gila River Indian Community members to gain access to the area (see page 5-27 of the Final Environmental Impact Statement). The underpasses would not be associated with trailheads into the park and would not be designated as such for pedestrian, equestrian, off-highway vehicle, or bicyclist use. Other use of the underpasses by humans would be neither actively promoted nor encouraged through the signs posted. The Federal Highway Administration and Arizona Department of Transportation have committed to providing mitigation by including multifunctional crossing structures designed for wildlife such as mule deer and for limited human use, potential fencing to guide wildlife to the crossing structures, and culverts designed for connectivity for smaller species (see *Mitigation*, beginning on page 4-138 of the Final Environmental Impact Statement).
6	**Biology, Plants, and Wildlife**	Wildlife connectivity across the proposed project corridor is a concern, and multifunctional crossing structures are planned at locations where natural movement corridors occur along major drainages. The U.S. Route 93 study area is not similar to the South Mountains in that the undeveloped land along U.S. Route 93 provided habitat for an existing population of large mammals. For the U.S. Route 93 project, the largest remaining population of desert bighorn sheep in the Southwest occurred in the area and would have been adversely affected by the highway unless mitigation measures were in place. In that instance, the overpass mitigation was in direct response to a known large mammal population that would be adversely affected. The mitigation was justified in terms of the degree of impact that would have resulted from the highway's construction and operation. In the case of the South Mountains, communication from the Arizona Game and Fish Department in 2006 (see page A139 in Appendix 1-1 of the Final Environmental Impact Statement) states that mule deer are believed to have been extirpated from the area; bighorn sheep are not mentioned and are known to not occur in Phoenix South Mountain Park/Preserve. Further, historic habitat has already been adversely affected in the area; therefore, the current state of habitat limits the baseline condition under consideration. The Federal Highway Administration and Arizona Department of Transportation have committed to providing mitigation by including multifunctional crossing structures designed for wildlife such as mule deer and for limited human use, potential fencing to guide wildlife to the crossing structures, and culverts designed for connectivity for smaller species (see *Mitigation*, beginning on page 4-138 of the Final Environmental Impact Statement).

General Recommendations

The Department recommends research and monitoring of wildlife movement within the study area to provide the information necessary to inform the design of crossings, bridges, culverts and fencing. Research may include but not be limited to telemetry and big game/tortoise/bats/snake surveys. For example, mule deer are known to occur in the area and survey/movement information would be important before designing any crossing structures. Mitigation should include survey costs. Mitigation should also consider wildlife specific fencing, culvert, vegetation and crossing structure design, loss of water sources in and adjacent to the project, direct habitat loss and roadway grading.

Funnel fencing is a critical component of successful wildlife crossings and the Department strongly recommends it be applied in conjunction with all wildlife crossing structures designed as mitigation. In the absence of funnel fencing research has shown wildlife will continue to cross the roadway at grade. Fencing is generally placed to compliment natural topographic features and encourage wildlife to move through a crossing structure and to prevent entrapment along medians. Escape mechanisms (such as fencing that leads to a slope and allows an animal to jump down but not up) are often used to compliment funnel fencing objectives and prevent roadway entrapment. Funnel fences turn the target animals along the fence before they can be repelled by traffic, preventing collisions, and directing them to crossing structures where they can safely continue in the desired direction. The keys to improved or successful fencing are extending far enough along the road corridor to capture all target species without creating an end-run effect, having enough crossings interspersed to minimize breach attempts; having tall enough fences to prevent scaling or jumping, and small enough webbing to deter ingress by smaller target species. Fencing extents are best derived from empirical target species movement data. When such data is missing, fencing the full extent of the highway is an acceptable alternative as long as sufficient passage structures, less than 1.5 miles apart, are included in the comprehensive mitigation plan. Further information on specific fencing for species can be found on the attachment.

For culverts, the Department recommends avoiding long, dark and narrow pipes and culverts, as they may discourage species from entering. Utilize straight culverts through which approaching animals can see light. Avoid turns and curves in culvert layout. For longer culverts, use vertical pipes or slotted drains to illuminate the interior of the culvert. Avoid extreme slopes as they prevent effective movement; maintain 5-10% slopes for multiple species.

Design all drainage structures to maintain a natural substrate. Avoid rip-rap as it would prevent or discourage entrance into the culvert for many species. If an energy dissipation structure is necessary, a flatter side ramp could be constructed to facilitate movement. Measures should be taken to make drainage structures as short as possible, if necessary cut the slopes closer to the roadway and use guard rails.

Code	Issue	Response
7	**Biology, Plants, and Wildlife**	We do not dispute the potential benefit of conducting a "multi-year" study to locate wildlife mitigation measures. However, it is also important to recognize that such studies need to be conducted in areas exhibiting priority wildlife-related highway safety and connectivity issues; the section of the highway corridor proposed parallel to Pecos Road was not identified as a linkage zone within the 2006 Arizona Wildlife Linkages Assessment or the 2012 Maricopa County Wildlife Connectivity Assessment. It would likely exhibit relatively low wildlife-vehicle collision incidence in the future given the low wildlife densities found within this portion of the corridor. The 2012 Maricopa County Wildlife Connectivity Assessment did identify a movement corridor at the southwestern end of Phoenix South Mountain Park/Preserve. Multifunctional crossing structures proposed in this area would allow continued wildlife connectivity in this area. Wildlife species in the Study Area (including mule deer, mountain lion, and javelina) are commonly found in the urban interface. They are generally not reluctant to use structures crossing beneath roadways; this is partially attributable to the fact that the most common times of use for humans and wildlife tend to occur at different times of the day. The proposed crossings would be located at washes, which are the most likely wildlife movement corridors given topography and resources. In addition to these larger crossings, culverts at smaller washes would serve as connection points for smaller wildlife. Culverts would generally be placed in natural drainage areas that are not heavily used by humans. Some past research indicates that human use of wildlife passages may affect wildlife use to varying degrees. The most well-known example of this research focused on crossings of the Trans-Canada Highway in Banff National Park. The results of the extensive research on the Trans-Canada Highway did not show that human use has a dramatic impact on wildlife use of the Banff structures, which has been substantial and continues to increase. In Arizona, research by the Arizona Game and Fish Department along State Route 260 found highly compatible use of a dual-use (multifunctional) underpass that linked the communities of Christopher Creek and Hunter Creek. This particular underpass exhibited some of the most diverse and substantial wildlife use of the underpasses monitored during the long-term project (Dodd et al. 2012). Along State Route 77, a Wildlife Technical Advisory Committee closely scrutinized this issue for the two planned wildlife passages that will be built within a similar urban-influenced landscape in and adjacent to Oro Valley. The Wildlife Technical Advisory Committee evaluated all available information and determined that the temporal patterns of human (daytime) versus wildlife (crepuscular and nocturnal) use are not expected to result in a significant degree of incompatibility. Furthermore, such dual-use, multifunctional structures situated within urban-influenced landscapes, in this instance adjacent to Phoenix South Mountain Park/Preserve with its extensive trail network, offer effective and efficient use of limited taxpayer funds.
8	**Biology, Plants, and Wildlife**	Specific design features of the proposed action would be established during the final design process. The Federal Highway Administration and Arizona Department of Transportation have committed to providing mitigation by including multifunctional crossing structures designed for wildlife such as mule deer and for limited human use, potential fencing to guide wildlife to the crossing structures, and culverts designed for connectivity for smaller species. Wildlife-friendly design information would be considered during the design of drainage and crossing structures for the freeway (see *Mitigation*, beginning on page 4-138 of the Final Environmental Impact Statement).

In Closing
The Department appreciates the opportunity to provide comment on the DEIS. We look forward to working closely with the project team for further discussion on comprehensive mitigation and design plans for the structures necessary to facilitate connectivity and permeability for wildlife. If you have questions about this letter, please contact Kelly Wolff-Krauter @ 480-324-3550 or kwolff-krauter@azgfd.gov.

Sincerely,

Joyce M. Francis

South Mountain (Loop 202) July 11, 2013

General

We recommend consideration be provided for the "Arizona's Species of Greatest Conservation Need (SGCN)" (see below table). These species have historic, present, or potential distributions within the project area. The SGCN are species that the State has identified as most in need of conservation actions in Arizona's State Wildlife Action Plan: 2012-2022 (SWAP), and those that are indicative of the diversity and health of the State's wildlife (AGFD 2012). Many of these species are currently listed as Threatened or Endangered under the ESA, and many have low and declining populations. We recommend consideration of the SWAP as part of the DEIS and analysis. Additional information related to the stressors affecting wildlife, conservation actions, and each SGCN vulnerability ratings can be found in the plan. Please refer to the SWAP document for additional information.

12

The Department's newest tool, the HabiMap (http://www.azgfd.gov/w_c/WildlifePlanning.shtml) is intended to display the spatial components of the SWAP and can be used to view the potential habitat distributions of SGCN, as well as economically important game species, and information from Arizona's Breeding Bird Atlas. Within HabiMap you can also view the Species and Habitat Conservation Guide (SHCG) (see below screenshot of project area). The guide can be used to visually explore how wildlife is distributed throughout the State and where conservation can have the greatest impact. Areas categorized 5 and 6, as areas of the "highest conservation potential" (darker blue); mean the importance of the landscape for maintaining biodiversity is highest at the statewide scale.

Abert's Towhee	Melozone aberti	1b
American Beaver	Castor canadensis	1b
American Bittern	Botaurus lentiginosus	1b
American Peregrine Falcon	Falco peregrinus anatum	1a
Antelope Jackrabbit	Lepus alleni	1b
Arizona Bell's Vireo	Vireo bellii arizonae	1b
Arizona Myotis	Myotis occultus	1b
Arizona Pocket Mouse	Perognathus amplus	1b
Bald Eagle	Haliaeetus leucocephalus	1a
Banner-tailed Kangaroo Rat	Dipodomys spectabilis	1b
California Leaf-nosed Bat	Macrotus californicus	1b
Cave Myotis	Myotis velifer	1b

Code	Issue	Response
12	**Biology, Plants, and Wildlife**	The section, *General Impacts on Vegetation, Wildlife, and Wildlife Habitat*, beginning on page 4-136 of the Final Environmental Impact Statement, explains that the project would result in a decrease in resources for species that occur in and adjacent to the Study Area. It also describes additional short-term impacts related to construction. The analysis generally describes the effects on species of greatest conservation need that may occur in the vicinity. Most of the Study Area has a moderate-to-low value for species of greatest conservation need on HabiMap, including the western end of the South Mountains. The exception is the area along the Salt River corridor, where there are higher values for riparian species. The project is designed with a bridge over the Salt River to minimize effects on riparian habitat. Those species of greatest conservation need that have the potential to occur in the Study Area have been added to Table 4-43 that begins on page 4-129 of the Final Environmental Impact Statement. These species were also addressed in a Biological Evaluation that was submitted to the U.S. Fish and Wildlife Service, Arizona Game and Fish Department, and Gila River Indian Community's Department of Environmental Quality. The U.S. Fish and Wildlife Service concurred with the species determinations in the Biological Evaluation (see Appendix 1-1 of the Final Environmental Impact Statement).

12	Attachment South Mountain (Loop 202) July 11, 2013 13	**Barriers and Fencing** The only viable wildlife option for a road with a projected Average Annual Daily Traffic (AADT) volume exceeding 10,000 is to prevent wildlife access to the corridor while maintaining permeability across it, and the DEIS suggests that the AADT for the proposed highway is expected to surpass 50,000 by the year 2035. This means exclusion fencing with crossing structures interspersed at appropriate intervals. While the specifications required to achieve such mitigation are not as numerous and varied as the full range of species present, there are different mitigation components and/or characteristics that are vital for success with different clades or taxa of wildlife species. Given the potential for intentional vehicle-reptile collisions (Ashley *et al* 2007) and the looming potential of Tucson shovel-nosed snake and Sonoran Desert tortoise Federal status upgrades to Threatened or Endangered, snake and tortoise mitigations should be given a high priority by the design team. Incorporating appropriate connectivity mitigation would preclude the need for redesign if/when these candidate species are listed. **Fence/Barrier Design Requirements for various taxa**

Code	Issue	Response
13	**Biology, Plants, and Wildlife**	As noted on page 4-138 of the Final Environmental Impact Statement, during the design phase, if an action alternative were to become the Selected Alternative, the threatened and endangered species list would be reviewed to determine whether an update to address species would be needed. The wildlife connectivity is recognized (see "*Habitat Connectivity and the Proposed Action*" text box and *Habitat Connectivity section* on page 4-137 as well as the *Mitigation* section beginning on page 4-138 of the Final Environmental Impact Statement). The Federal Highway Administration and Arizona Department of Transportation have committed to providing mitigation by including multifunctional crossing structures designed for wildlife and for limited human use, potential fencing to guide wildlife to the crossing structures, and culverts designed for connectivity for smaller species. Wildlife-friendly design information would be considered during the design of drainage and crossing structures for the freeway (see *Mitigation*, beginning on page 4-138 of the Final Environmental Impact Statement). The Sonoran desert tortoise and Tucson shovel-nosed snake were analyzed in the Biological Evaluation and coordination on mitigation of impacts would occur during the design phase. Discussion of the Tucson shovel-nosed snake is included on page 4-135 in the Final Environmental Impact Statement.

Code	Comment Document
14	Attachment South Mountain (Loop 202) July 11, 2013 **Ungulate** and **medium to large mammal** exclusion/funnel fencing requires standard woven-wire game fencing with 8' above ground and 12" below ground (Dodd *et al* 2007, Grandmaison 2012). This design should be sufficient to direct ringtail, jackrabbit, badger, kit fox, bobcat, coyote, mountain lion, mule deer, javelina, bighorn sheep, and similar mammal species away from the highway and toward crossing structures. **Amphibian** exclusion/funnel barriers can be fine mesh (1/4") 16-guage or heavier galvanized, welded wire, or they can be solid materials such as concrete barrier, rusticated steel, or guard rail materials. Regardless of material type, the barrier should extend from 12" below ground to at least 36" above ground (Grandmaison 2012). **Tortoise** exclusion/funnel fencing should be 12" below ground and at least 24" above ground of 16-guage or heavier galvanized welded wire mesh with holes no larger than 1" horizontal by 2" vertical (see USFWS *Recommended Specifications for Desert Tortoise Exclusion Fencing* 2005 and USFWS *Desert Tortoise Field Manual* 2009), although 1/4" square mesh is preferred (Grandmaison 2012). **Lizard** exclusion calls for solid barrier materials from 12" underground up to 42" above ground. Acceptable designs include concrete barrier with a 4" overhang, rusticated steel, or guard rail material (Grandmaison 2012). **Snake** and **small mammals** exclusion calls for a solid barrier of guard rail material extending from 12" below ground up to at least 42" above ground (Grandmaison 2012). **Livestock** exclusion from wildlife crossing structures should be attained using wildlife friendly right-of-way (ROW) fencing (http://www.azgfd.gov/hgis/pdfs/FencingGuidelines.pdf). This should be set back at least 50 yards from the entrance to the crossing structure and comprised of 3 or 4 wire strands with a total height of no more than 42". The bottom strand should be smooth wire between 16" and 20" off the ground. There should be one or two barbed wire strands above the bottom wire with 5" to 8" separating each of these strands. The top wire should be smooth with at least 12" between in and the next highest strand, but not more than 42" above the ground. PVC-pipe "jumps" should be installed across the top and bottom strands of these fences to promote wildlife crossings. Due to anticipated traffic volume, no ROW fence should be constructed with the intention of encouraging wildlife ingress into the freeway corridor. Any sections of freeway where wildlife barriers are deemed unnecessary (movement data shows avoidance by all target species) but livestock are present should be fenced according to standard ADOT ROW fence specifications (not wildlife-friendly game fence). **Combination and extent of Fence/Barrier Designs** Effective mitigation must combine the most restrictive funnel fence/barrier requirements for all of the taxa present or potentially present in a given area. Barrier extents and spatial distribution of taxa-specific design characteristics should be derived from empirical resident target species

Code	Issue	Response
14	**Biology, Plants, and Wildlife**	The need for maintaining wildlife connectivity is recognized (see "*Habitat Connectivity and the Proposed Action*" text box and *Habitat Connectivity section* on page 4-137 as well as the *Mitigation* section beginning on page 4-138 of the Final Environmental Impact Statement). The Federal Highway Administration and Arizona Department of Transportation have committed to providing mitigation by including multifunctional crossing structures designed for wildlife and for limited human use, potential fencing to guide wildlife to the crossing structures, and culverts designed for connectivity for smaller species. Wildlife-friendly design information would be considered during the design of drainage and crossing structures for the freeway (see *Mitigation*, beginning on page 4-138 of the Final Environmental Impact Statement).

South Mountain (Loop 202) July 11, 2013

movement data. Absent such data, the assumption must be that all local species exist across the full extent of the project area, regardless of habitat assessments or modeling output. Under this assumption, the new freeway corridor design should include guard rail barrier from 12" below ground to 42" above ground and woven-wire fence from the top of the guard rail barrier up to 96" that extends the length of the freeway and ties into crossing structures including the recommended overpasses, underpasses and culverts. If wildlife movement investigations of target species are included as mitigation, the resulting data can be used to reduce the required barrier design by eliminating/reducing stretches through avoided areas.

Vegetation and Crossing Structure Design recommendations:

To promote wildlife connectivity and achieve true mitigation of the freeway, crossing structures, culverts in partuclar, should be as large as possible. They should have natural native substrate floors with low stature vegetative cover at openings and natural lighting through as much of the structure as possible. Grated slots can boost ambient light in smaller culverts (Grandmaison 2012).

Maintaining natural vegetation along the approach and exits of structures and natural substrates through culverts has demonstrated increased wildlife use. Vegetation provides wildlife with security cover (Grandmaison 2012). The Department recommends a non-clear cut approach to wash habitats during construction and post-construction restoration.

Scouring is common on the downstream side of concrete or pipe culverts along washes. The changes in elevation from floodway bottom to culvert/pipe bottom often compromise wildlife access through the culverts/pipe. Tortoises have been shown to be particularly sensitive to this situation on Highway 87. The Department recommends design solutions that prevent scour and promote access and safe passage by small mammals, reptiles and amphibians.

Wildlife Monitoring/Research:
The Department recommends research on wildlife movement to optimize design and placement of crossing structures that fit the need of the local wildlife and their movement patterns and reduce impact to and address human health and safety issues. Evaluation of crossing structure utilization is critical to determine effectiveness and to identify any design modifications that would increase effectiveness. Such assessments also allow the determination of suitability as a future mitigation measure for additional roadway expansions and new projects.

Information gained from evaluation should be used to help decide timing and future steps towards mitigating increasing levels of development and traffic volume in the planning area as it relates to managing connectivity for the long-term. There are several approaches that should be

Code	Issue	Response
15	**Biology, Plants, and Wildlife**	The issue of wildlife connectivity is recognized (see "*v*" text box and *Habitat Connectivity section* on page 4-137 as well as the *Mitigation* section beginning on page 4-138 of the Final Environmental Impact Statement). The Federal Highway Administration and Arizona Department of Transportation have committed to providing mitigation by including multifunctional crossing structures designed for wildlife and for limited human use, potential fencing to guide wildlife to the crossing structures, and culverts designed for connectivity for smaller species. Wildlife-friendly design information would be considered during the design of drainage and crossing structures for the freeway.
16	**Biology, Plants, and Wildlife**	We do not dispute the potential benefit of conducting a "multi-year" study to locate wildlife mitigation measures. However, it is also important to recognize that such studies need to be conducted in areas exhibiting priority wildlife-related highway safety and connectivity issues. The section of the highway corridor where the multiuse crossings are proposed was not identified as a linkage zone within the 2006 Arizona Wildlife Linkages Assessment; however, it was identified as a movement corridor in the 2012 Maricopa County Wildlife Connectivity Assessment. Wildlife species in the Study Area (including mule deer, mountain lion, and javelina) are commonly found in the urban interface and are generally not reluctant to use structures crossing beneath roadways. This is partially attributable to the fact that the most common times of use for humans and wildlife tend to occur at different times of the day. The proposed crossings are located at washes, which are the most likely wildlife movement corridors given topography and resources. In addition to these larger crossings, culverts at smaller washes would serve as connection points for smaller wildlife. Culverts would generally be placed in natural drainage areas that are not heavily used by humans. Some past research indicates that human use of wildlife passages may affect wildlife use to varying degrees. The most well-known example of this research focused on crossings of the Trans-Canada Highway in Banff National Park. The results of the extensive research on the Trans-Canada Highway did not show that human use has a dramatic impact on wildlife use of the Banff structures, which has been substantial and continues to increase. In Arizona, research by the Arizona Game and Fish Department along State Route 260 found highly compatible use of a dual-use (multifunctional) underpass that linked the communities of Christopher Creek and Hunter Creek. This particular underpass exhibited some of the most diverse and substantial wildlife use of the underpasses monitored in the long-term project (Dodd et al. 2012). Along State Route 77, a Wildlife Technical Advisory Committee closely scrutinized this issue for the two planned wildlife passages that will be built within a similar urban-influenced landscape in and adjacent to Oro Valley. The Wildlife Technical Advisory Committee evaluated all available information and determined that the temporal patterns of human (daytime) versus wildlife (crepuscular and nocturnal) use are not expected to result in a significant degree of incompatibility. Furthermore, such dual-use, multifunctional structures situated within urban-influenced landscapes, in this instance adjacent to Phoenix South Mountain Park/ Preserve with its extensive trail network, offer effective and efficient use of limited taxpayer funds.

Code	Comment Document

explored and partnerships should be developed to find the resources to accomplish this through shared commitments.

Approaches to consider for citing and evaluation of mitigation components:

- Track, Scat and road-kill surveys to identify "hot spots" for mortality and vehicle collisions
- Wildlife movement studies (telemetry) to identify movement patterns
- Traffic Volume using traffic counters to examine the potential influence of traffic volume on wildlife movement and mortality across the parkway and in response to phase implementation of wildlife crossing structures
- Post-construction monitor of crossing structures using integrated digital video surveillance systems and digital trail cameras to evaluate success and/or need for adaptive management measures.

Loss of Water Sources/Riparian Habitat (or access to them):

17

Local wildlife is extremely dependent on stock tanks in the area as an ephemeral and/or semi-permanent source of water. If freeway construction would eliminate existing stock tanks or access to them, along the project alignment, we recommend replacement of in-kind values and redevelopment at the nearest alternate location. Currently, there is a not a comprehensive knowledge of water sources available to wildlife on GRIC lands adjacent to the project area. However, the agricultural land adjacent to the project area contains and/or produces water sources important to wildlife. For example, just south of Pecos Road there is a large agricultural field that feeds a riparian corridor utilized by a diverse array of species.

Any loss of riparian habitat, including changes to the gravel pit ponds or other water sources within or around the Salt River, may impact the occupancy and productivity of the adjacent Pee Posh bald eagle breeding area. The Pee Posh breeding area has been highly successful with five nestlings fledged in the four years since its discovery in 2010. The only failure was due to a fire that consumed the two near-fledging age nestlings in 2011. Although the Pee Posh breeding area has been highly successful, foraging areas for the breeding birds have been very limited. Any anticipated loss to riparian/wetland habitats due to this project should be replaced.

In addition, the Department recommends further consultation with the US Fish and Wildlife Service (USFWS) and AGFD over the potential for impacts to bald eagle productivity and the possible need for a Bald and Golden Eagle Protection Act permit with an associated impact reducing eagle conservation plan.

Roadway Grading:

18

Research suggests that road-kill of small terrestrial vertebrate species decreased by 93% on roads raised on embankments compared to roads at natural grades (Clevenger et al. 2003). This roadway design may be beneficial to small mammals, reptiles and amphibians throughout

Code	Issue	Response
17	**Biology, Plants, and Wildlife**	No stock tanks have been identified near the action alternative corridors; therefore, none would be removed nor would access to stock tanks be affected by the proposed action. The Draft Environmental Impact Statement addressed the Pee Posh eagles, although not by name, on page 4-124. A Biological Evaluation was submitted to the U.S. Fish and Wildlife Service, Arizona Game and Fish Department, and the Gila River Indian Community Department of Environmental Quality that addressed threatened and endangered species. The U.S. Fish and Wildlife Service concurred with the species determinations in the Biological Evaluation (see Appendix 1-1 of the Final Environmental Impact Statement). The Biological Evaluation also addressed the breeding eagles in the Pee Posh wetlands in conformance to the Bald and Golden Eagle Protection Act.
18	**Biology, Plants, and Wildlife**	As noted on page 3-41 of the Final Environmental Impact Statement, a rolling profile would be used for the proposed freeway. Page 3-47 of the Final Environmental Impact Statement shows the proposed profile for the E1 Alternative. The proposed profile would be elevated above the existing ground level throughout most of this section of the proposed project. A rolling profile is preferable economically for balancing construction cut and fill material. It provides operational benefits because it is the type of freeway drivers are familiar with and it also permits efficient drainage solutions, thereby reducing the amount of land needed. The Federal Highway Administration and Arizona Department of Transportation have committed to providing mitigation by including multifunctional crossing structures designed for wildlife such as mule deer and for limited human use, potential fencing to guide wildlife to the crossing structures, and culverts designed for connectivity for smaller species. Wildlife-friendly design information would be considered during the design of drainage and crossing structures for the freeway (see *Mitigation*, beginning on page 4-138 of the Final Environmental Impact Statement).

Rainbow Valley and through the Linkage Zone. Used in combination with wildlife friendly bridge and culvert designs, this design strategy may be an effective way to minimize impacts, while enhancing permeability.

Page Specific Comments

Chapter 4: Affected Environment, Environmental Consequences and Mitigation

Page 4-14, 15

19

The Rio Salado Oeste project is one in a chain of major river restoration projects that would result in continuous riparian corridor that would connect riparian and wetland habitats downstream with similar areas upstream. This would also result in connectivity in habitats creating a synergism in habitat values and wildlife populations where each of the projects would add to the other. The Department strongly supported this concept of recycled or conserved water and the Rio Salado Oeste project within the larger context of these other projects and connectivity that would result from their implementation. Several of the other projects have been completed and/or are still in implementation. The Department would like to see any actions involving this project contribute to its progress rather than detract from the potential landscape level connectivity that could result. Effects of actions within this area should be minimized with the least invasive structures possible (large open span bridges carrying traffic far above the wildlife habitat in the riverbed below) and offset with contributions to the restoration of this area and connecting lands.

Page 4-19

Conclusions

20

The E1 Alternative was found to be incompatible with the natural land and primarily residential areas immediately north of the alignment. This conclusion seems contradictory and may require clarification.

Page 4-112

Conclusions

21

The E1 Alternative would alter the drainage patterns through use of a series of drainage detention basis directing runoff to community lands. It is not disclosed as to how this runoff would impact those adjacent lands.

Code	Issue	Response
19	**Biology, Plants, and Wildlife**	As noted on page 4-15 of the Final Environmental Impact Statement, the City of Phoenix is aware of, has planned for, and has incorporated the proposed South Mountain Freeway in the City of Phoenix General Plan and in conceptual plans for the Rio Salado Oeste project (see Project Features Map in Appendix 4-8 of the Final Environmental Impact Statement). As noted on page 4-15 of the Final Environmental Impact Statement and as agreed upon by the Bureau of Land Management, U.S. Army Corps of Engineers, and City of Phoenix, the project team would continue to consult with those entities to coordinate design efforts with the Rio Salado Oeste project.
20	**Biology, Plants, and Wildlife**	As noted on page 4-16 of the Final Environmental Impact Statement, single-family residential uses were generally not considered compatible with transportation corridors because the action alternatives would introduce visual, air quality, noise, and other intensive impacts on a comparatively sensitive land use; may isolate portions of planned communities; or may limit access to infrastructure and services. Undeveloped land near a transportation corridor was deemed compatible or incompatible largely based on its planned land use, determined by zoning and the jurisdiction's adopted general plan.
21	**Biology, Plants, and Wildlife**	Drainage patterns would not be diverted from their downstream connection on the Gila River Indian Community. The drainage features of the E1 Alternative would be designed such that drainage basins and channels on the north side of the freeway would collect runoff from the freeway and allow suspended sediment to settle. As the system continues to receive runoff, the basins and channels would overflow into channels that would direct flows under the freeway and onto Gila River Indian Community land in the same location as existing drainages from the South Mountains (see page 4-106 of the Final Environmental Impact Statement).

Page 4-119

Aquatic/Wetland Communities

Please cite literature that supports the claim that concrete-lined irrigation canals do not offer significant value to wildlife. Without empirical data and targeted research, this is not a sound assumption. Aquatic species (vertebrates and invertebrates) may inhabit the irrigation canals. They may also sustain insect populations that in turn support bird, bat, and other mammal populations. Bats and birds may also rely heavily on these canals as a water source.

Wildlife Resources

22 There is an underlying implication that wildlife diversity outside of SMPP is low due to the few observations of the project team. Incidental observations are a valid record of presence, but not of absence. Unless targeted surveys for various clades are undertaken, there should be no implication of low diversity.

The Department recommends including the additional species mentioned in our letter above. In addition, clarification in use of the agricultural fields should include that they not only provide habitat, but also provide forage for larger game species, such as mule deer and habitat for predators such as coyotes.

Please clarify the distinction between "riparian vegetation" in this Wildlife Resources section versus the "wetland vegetation" referenced in the Aquatic/Wetland Community section relative to the gravel pits in question.

Page 4-120

23 The Department has more recent information on predators adjacent to the study area and recommends further discussion. As a point of clarification, the potential for mountain lions to occur within South Mountain is a factor of the potential for South Mountain to represent a portion of a mountain lion home range. It is unlikely that SMPP is large enough to alone sustain a mountain lion and so there are likely no resident lions that remain within the SMPP boundary. In addition, wild horses and burros occur on the GRIC lands adjacent to the study area. These animals would be of concern for potential wildlife collisions within the proposed freeway corridor. Table 4-44

Page 4-120

24 There is strong evidence that forage habitat critical to the success of a nearby bald eagle nest exists within the study area in close proximity to some action alternatives, including but not limited to the gravel operation ponds. Any alteration of this riparian forage habitat should be addressed appropriately as outlined above.

Page 4-121

Code	Issue	Response
22	**Biology, Plants, and Wildlife**	The concrete-lined irrigation canals in the Study Area are typically narrow and steep-sided and contain water for only short periods during field irrigation. The water velocity, steep sides, and short duration of water delivery in the concrete-lined canals do not constitute a reliable or appropriate water source for wildlife compared with unlined canals or standing water sources that may be available. The steep canal sides and velocities can be a danger to wildlife. This was clarified in the Final Environmental Impact Statement on page 4-127. We agree that a lack of observations does not equate to absence. The Draft Environmental Impact Statement lists numerous species and habitat types found in the Study Area and also states that wildlife abundance and diversity are related to the extent and variety of habitats in the area, implying that habitat variability in the area outside of Phoenix South Mountain Park/Preserve could support species diversity. The list of species was expanded in the Final Environmental Impact Statement and text was added to reflect that agricultural fields provide habitat for additional species (see pages 4-127 and 4-128, respectively).
23	**Biology, Plants, and Wildlife**	The description of the mountain lion was changed in the Final Environmental Impact Statement on page 4-127 to read, "AGFD has stated that lions should be considered an animal with the potential to occur in SMPP, which could represent a portion of its home range, but not a resident animal." As noted on page 4-128 of the Final Environmental Impact Statement, although wild horses are present on Gila River Indian Community land, the habitat assessment concluded no suitable habitat for wild horses exists within the Study Area. However, like Interstate 10, which passes through the Gila River Indian Community and where wild horses are known to occur, the proposed freeway would be lined with right-of-way fencing that would prevent vehicular collisions with wild horses and burros.
24	**Biology, Plants, and Wildlife**	The Draft Environmental Impact Statement addressed the Pee Posh eagles, but not by name, on page 4-124. A Biological Evaluation was submitted to the U.S. Fish and Wildlife Service, Arizona Game and Fish Department, and the Gila River Indian Community Department of Environmental Quality that addressed threatened and endangered species. The U.S. Fish and Wildlife Service concurred with the species determinations in the Biological Evaluation (see Appendix 1-1 of the Final Environmental Impact Statement). The Biological Evaluation also addressed the breeding eagles in the Pee Posh wetlands in conformance with the Bald and Golden Eagle Protection Act.

Sonoran desert toad occurs in the area and was seen in a recent field investigation (Marshall and Wolff-Krauter 2013).

25

The California leaf-nosed bat, western red bat, and western yellow bat are all likely to occur in and around the study area. Pre-design surveys should be conducted to determine presence and distribution of bat species across the study area so that construction can avoid sensitive areas both spatially and temporally. These surveys should include deployment of radio transmitters to locate roosts for all bat species present. Maternity roosts would be of particular interest, but an effort should be made to identify roosts across all seasons. In addition, the EIS should commit to incorporating design features on all bridges (including wildlife underpasses and overpasses) to accommodate bat day-roosts: greater than 10' above ground, vertical crevices 0.5 to 1.25" wide and 12" deep, sealed from rainwater and debris from entering from above, full sun exposure of the structure, not situated over busy roads or high human traffic underneath the structure (http://www.azgfd.gov/hgis/pdfs/BridgeGuidelines.pdf).

Page 4-122

26

Lack of documentation in not an accurate indication of **Yuma clapper rail** absence. Prior to construction, a series of targeted surveys should be completed at all water bodies for Yuma clapper rail to verify presence/absence. As with the impacts to wetlands and bald eagle foraging habitat, and impacts to potential Yuma clapper rail habitat should be avoided when possible, and minimized and mitigated for (offset) when impacts are unavoidable.

27

Yellow-billed cuckoo (YBCU) occurrence data should be updated to include recent (summer 2013) documentation along the restored riparian habitat on the Salt River proximal to the Audubon Rio Salado center on Central Avenue. Given the close documented occurrences on either side of the study area and the suitable habitat within the study area, the Department would like to see the project specify mitigation for YBCU habitat including the preservation of any existing mature riparian trees (cottonwoods and willow in particular), planting additional cottonwoods and willows, and securing water availability in perpetuity so that these riparian communities will persist and thrive.

28

In June of 2011, the **Sonoran desert tortoise** was designated as *Gopherus morafkai* a separate species from *Gopherus agassizii* rather than merely a distinct population. While predation is certainly a factor in population trends for long-lived species like tortoises, and coyotes have been a factor in some Mohave desert tortoise populations, there is no indication that predation rates on Sonoran desert tortoises have increased above historic rates (unless considering conflicts with domestic and feral dogs). Nor have studies shown predation to cause Sonoran tortoise population crashes or declines in systems without significant anthropogenic impacts. So predation probably doesn't belong on the list of threats to the species. However, Upper Respiratory Tract Disease is a significant concern for Sonoran desert tortoises. The disease can

Code	Issue	Response
25	**Biology, Plants, and Wildlife**	The Sonoran Desert toad was added to the list of species occurring in the Study Area in the Biological Evaluation. Table 4-44 of the Draft Environmental Impact Statement indicates that these bat species may occur throughout the Study Area; this was updated to "may occur" in the Final Environmental Impact Statement (see Table 4-43 on pages 4-129 to 4-132). Surveys to determine the presence and distribution of the wide range of species, including bat species, is beyond the scope of the proposed project. Designing bridges for bat habitat is not a standard accommodation that the Arizona Department of Transportation currently provides. The Federal Highway Administration and Arizona Department of Transportation have committed to continue coordination with the Arizona Game and Fish Department through the design process (see *Mitigation*, beginning on page 4-138 of the Final Environmental Impact Statement).
26	**Biology, Plants, and Wildlife**	As noted on page 4-126 of the Final Environmental Impact Statement, suitable habitat did not exist within the right-of-way of or immediately adjacent to any action alternative at the time the study was completed. If conditions change over time and suitable habitat for the Yuma clapper rail were to exist within the right-of-way of or immediately adjacent to a Selected Alternative—should it be an action alternative—surveys would be completed and, if appropriate, consultation with the U.S. Fish and Wildlife Service would occur. The Federal Highway Administration and Arizona Department of Transportation have committed to continue coordination with the Arizona Game and Fish Department, Gila River Indian Community Department of Environmental Quality, and U.S. Fish and Wildlife Service through the design process (see *Mitigation*, beginning on page 4-138 of the Final Environmental Impact Statement).
27	**Biology, Plants, and Wildlife**	A Biological Evaluation was submitted to the U.S. Fish and Wildlife Service, Arizona Game and Fish Department, and the Gila River Indian Community Department of Environmental Quality that addressed threatened, endangered, and candidate species, including the yellow-billed cuckoo. The potential for impacts on suitable habitat for the yellow-billed cuckoo within the right-of-way of the Preferred Alternative was addressed in the Biological Evaluation. The U.S. Fish and Wildlife Service concurred with the species determinations in the Biological Evaluation (see Appendix 1-1 of the Final Environmental Impact Statement). If appropriate, surveys would be completed and consultation with the U.S. Fish and Wildlife Service would occur as the project progresses through design. The Federal Highway Administration and Arizona Department of Transportation have committed to continue coordination with the Arizona Game and Fish Department, Gila River Indian Community Department of Environmental Quality, and U.S. Fish and Wildlife Service through the design process (see *Mitigation*, beginning on page 4-138 of the Final Environmental Impact Statement).
28	**Biology, Plants, and Wildlife**	A Biological Evaluation was submitted to the U.S. Fish and Wildlife Service, Arizona Game and Fish Department, and the Gila River Indian Community Department of Environmental Quality that addressed threatened, endangered, and candidate species, including the Sonoran desert tortoise. The information used to prepare the analysis in the Draft Environmental Impact Statement (page 4-122) was based on 2011 information retrieved from the Arizona Game and Fish Department (*Gopherus agassizii*, draft unpublished abstract compiled and edited by the Heritage Data Management System, Phoenix). Current information

(Response 28 continues on next page)

Attachment
South Mountain (Loop 202) July 11, 2013

be introduced into a population via interaction with humans. So, an increase in the frequency of human-tortoise interactions will raise the potential for both disease introduction and illegal collection. Multi-functional crossing structures intended for use by both humans and tortoises (along with other wildlife) could pose significant risks to the local tortoise population through such increased potential. Grandmaison, et. al (2010) provided results with insight into the habitat components important for considerations in maintaining habitat connectivity for desert tortoise. The maintaining of desert washes for providing shelter sites and natural vegetation important for preservation of a linkage.

Desert tortoises are known to occur in the study area. It is recommended surveys be performed prior to construction and long-term measures to prevent road mortality while maintaining permeability should be implemented to prevent population declines in such a long-lived species. These measures should include further analyses of all types of crossing structures and fencing since limited desert tortoise use of retro-fitted culverts has been documented. Fencing should be implemented to keep as many small reptiles, amphibians, and mammals off of the road surface as possible while funneling them to appropriately designed underpasses and culverts. Roads impede tortoise movements and have been identified as a significant threat to tortoise populations throughout their distribution (AGFD unpublished data, AIDTT 2000, Berry 1986a, Berry 1986b, Boarman 1991, Boarman et al. 1993, Nicholson 1979, von Seckendorff Hoff and Marlow 2002). Desert tortoises occur at relatively low density, have low reproductive rates, and low mobility, three characteristics that heighten their sensitivity to road-induced habitat loss (Trombulak and Frissell 2000, Gibbs and Shriver 2002). Culverts should be large, lighted, with a natural substrate floor and approach (not rip rap which will preclude use by most species). Innovative designs are emerging to meet hydrological scour needs as well as wildlife connectivity for structure approach areas. These designs should be investigated and eventually incorporated into standard design specifications. During construction a trained biologist from ADOT or the Department should also be on site to oversee any potential tortoise encounters and relocations.

Table 4-45

Page 4-123

While no suitable habitat for the **southwestern willow flycatcher** currently exists, it is likely that they historically nested along both the Gila and Salt Rivers when perennial water supply sustained more robust riparian habitat. The Department is excited that the project has this opportunity to improve habitat conditions rather than merely trying to avoid, minimize, and mitigate the threats that transportation infrastructure poses to wildlife. The Department would like to see the project commit to restoring sections of former riparian habitat within the study area. Such efforts would gain ADOT substantial public support on a project with very high public interest.

29

Code	Issue	Response
28 (cont.)		on threats and connectivity strategies was included in the Biological Evaluation. The U.S. Fish and Wildlife Service concurred with the species determinations in the Biological Evaluation (see Appendix 1-1 of the Final Environmental Impact Statement). The intended uses of the multifunctional crossings would vary by location within the Study Area. If the crossings were near existing recreational features or trails, more human use would be expected. However, multifunctional crossings in remote areas through the South Mountains would allow limited use by people. Use of the crossings by people in this area is proposed solely to accommodate those members of the Gila River Indian Community who wish to gain access to areas of the South Mountains for ceremonies important for their culture (see Final Environmental Impact Statement page 4-151). A right-of-way fence would limit access to these areas by freeway users, but would allow Gila River Indian Community members to gain access to the area (see page 5-27 of the Final Environmental Impact Statement). The underpasses would not be associated with trailheads into the park and would not be designated as such for pedestrian, equestrian, off-highway vehicle, or bicyclist use. Other use of the underpasses by humans would be neither actively promoted nor encouraged through the signs posted. The Federal Highway Administration and Arizona Department of Transportation have committed to continue coordination with the Arizona Game and Fish Department, Gila River Indian Community Department of Environmental Quality, and U.S. Fish and Wildlife Service regarding wildlife concerns as a result of the freeway's potential implementation. Wildlife-friendly design information would be considered during the design of drainage and crossing structures for the freeway (see *Mitigation*, beginning on page 4-138 of the Final Environmental Impact Statement). A mitigation measure to conduct a preconstruction survey for the Sonoran desert tortoise, where appropriate and according to the most recent guidelines from the Arizona Game and Fish Department or U.S. Fish and Wildlife Service, has been added to the Final Environmental Impact Statement on page 4-138.
29	**Biology, Plants, and Wildlife**	If an action alternative were to be selected that includes a bridge within the limits of the Rio Salado Oeste restoration project (between 19th and 83rd avenues), the project team would continue to consult with the Bureau of Land Management, U.S. Army Corps of Engineers, and City of Phoenix to coordinate design efforts (see page 4-15 of the Final Environmental Impact Statement). However, it is important to note that it is not the obligation of the proposed action to mitigate impacts caused by other unrelated actions. The need for mitigation related to impacts on waters of the United States has not been determined, but could involve payment of in-lieu fees for use in restoration of habitat within the Salt River.

South Mountain (Loop 202) July 11, 2013

See above comments regarding **yellow-billed cuckoo** and **Sonoran desert tortoise**.

In addition, clarification is needed for the **Tucson shovel-nosed snake** (TSNS). as the habitat description in the DEIS:

30

The Tucson shovel-nosed snake is known in all directions of South Mountain. The absence of documented occurrences within the project area is likely due to the lack of surveys and the difficulty associated with surveying and documenting these snakes. However the Department's HabiMap tool (http://www.habimap.org/habimap/) shows swaths of modeled TSNS habitat traversing the project area in several locations with large patches immediately adjacent to the project area. This is inconsistent with the DEIS implication that no TSNS habitat exists in the study area: TSNS habitat is described as "sonoran desertscrub; soft sandy soils with sparse gravel; creosotebush-mesquite floodplains;" and TSNS occurrence is described as "No soft, sandy soils with sparse gravel within the floodplains in the study area." This purported habitat requirement is inaccurate, and reflects a widely perpetuated misconception that the soils are always soft and sandy where this species occurs. Shovel-nosed snakes also occur on firm soils in creosote bush flats, where they apparently use small mammal burrows frequently, rather than "swimming" through sand, for which they are well known. They don't appear to be completely restricted to creosote flats, either, so it would be reasonable to assume they might also occupy habitats adjacent to major flood plains (e.g., sandy soils associated with the inactive floodplain). If there are *any* creosote flats within the project area, there is the potential for Tucson shovel-nosed snakes.. The study area is traversed by large swaths of flat creosote – bursage communities, so there is a distinct possibility that TSNS occur within these areas of overlap. Since there is potential for TSNS within the study area and survey methods are unproven, ADOT mitigation should include working with the Department to establish appropriate pre-construction survey methods and road-mortality prevention measures such as funneling barrier, culvert lighting, underpass and culvert substrate, and structure approach substrate.

Page 4-124

Bald and Golden Eagle Protection Act

31

See above comments regarding nesting bald eagle forage habitat and updated fledging statistics for the Pee Posh nest. Also, one photo in the June (the driest month of the year) does not sufficiently indicate typical availability of water during January – May which are most critical for nesting eagles.

Environmental Consequences

The Tucson shovel-nosed snake has been documented north, south, east and west of the study area. The yellow-billed cuckoo has now been documented to the east and west of the study area.

Code	Issue	Response
30	**Biology, Plants, and Wildlife**	A summary of potential impacts to the Tucson shovel-nosed snake has been added to the Final Environmental Impact Statement on page 4-135. Table 4-44 has been updated, and a mitigation measure to conduct a preconstruction survey for the Tucson shovel-nosed snake has been added to the Final Environmental Impact Statement on page 4-138. A Biological Evaluation was submitted to the U.S. Fish and Wildlife Service, Arizona Game and Fish Department, and the Gila River Indian Community Department of Environmental Quality that addressed threatened, endangered, and candidate species, including the Tucson shovel-nosed snake. The U.S. Fish and Wildlife Service concurred with the species determinations in the Biological Evaluation (see Appendix 1-1 of the Final Environmental Impact Statement). The Federal Highway Administration and Arizona Department of Transportation have committed to continue coordination with the Arizona Game and Fish Department, Gila River Indian Community Department of Environmental Quality, and U.S. Fish and Wildlife Service regarding wildlife concerns as a result of the freeway's potential implementation. Wildlife-friendly design information would be considered during the design of the drainage and crossing structures for the freeway (see *Mitigation*, beginning on page 4-138 of the Final Environmental Impact Statement).
31	**Biology, Plants, and Wildlife**	A Biological Evaluation was submitted to the U.S. Fish and Wildlife Service, Arizona Game and Fish Department, and the Gila River Indian Community Department of Environmental Quality that addressed threatened, endangered, and candidate species. The U.S. Fish and Wildlife Service concurred with the species determinations in the Biological Evaluation (see Appendix 1-1 of the Final Environmental Impact Statement). The Biological Evaluation also addressed the breeding eagles in the Pee Posh Wetlands in conformance with the Bald and Golden Eagle Protection Act. During the design phase, surveys for listed species may be undertaken if suitable habitat were to be located within or immediately adjacent to right-of-way of the Selected Alternative (if it were an action alternative). A description of riparian plant communities was added in the *Plant Community* section of the Final Environmental Impact Statement (see page 4-126). The Federal Highway Administration and Arizona Department of Transportation have committed to continue coordination with the Arizona Game and Fish Department, Gila River Indian Community Department of Environmental Quality, and U.S. Fish and Wildlife Service through the design process (see *Mitigation*, beginning on page 4-138 of the Final Environmental Impact Statement).

South Mountain (Loop 202) July 11, 2013

The assumption should be reflected in the document of the potential suitable habitat and potential for occurrences. The assumption that the project would not affect candidate species other than Sonoran desert tortoises is flawed because it is based on opportunistically gathered occurrence data and faulty habitat parameter assumptions. A series of targeted surveys should be conducted for each candidate species (Tucson shovel-nosed snake, yellow-billed cuckoo, Yuma clapper rail) along with validation of survey methods in areas with known populations of these species before arriving at this conclusion.

The Department agrees that the project has the potential to impact foraging for nesting bald eagles since foraging opportunities exist in and adjacent to the study area. Please specify the mitigation actions to be taken relative to potential impacts to foraging bald eagle behavior.

When discussing the areas adjacent to the study area, please include agricultural fields and riparian corridors.

Page 4-125

Text box – Habitat Connectivity and the Proposed Action

The Department recommends further discussion of the movement between the Sierra Estella's and South Mountain. As the Maricopa County report indicated the need for additional expert input and research for assessing wildlife movement, the Department does have recent data for the area of the Estrella's, including mountain lion and bighorn sheep. The Department would like to see a stronger commitment in the EIS, including funding of needed research to ensure that connectivity mitigations are appropriately and effectively implemented.

32

The discussion regarding potential wildlife crossings should reflect our above discussion in the letter about the different requirements based on the species. For example, underpasses may not facilitate movement for large game species like big horn sheep and mule deer.

Runoff directed from bridges over the Salt River would amount to approximately the same amount of water that would have fallen to the habitat if the bridges were not present. Runoff from highways often contains oil, antifreeze, and other chemical pollutants that can compromise the quality or even completely eliminate surrounding habitat (Forman et al 2003). Diverting runoff directly to riparian systems as a source of additional water could actually result in the complete loss of that habitat from the pollutants that the water carries. Direct application of this water should be avoided, and unless treatment is possible, this water should be diverted away from habitat.

The picture of the "typical large-animal crossing" is misleading because it shows a bus present in a location that renders the structure completely ineffective. This bus was part of a tour and

Code	Issue	Response
32	**Biology, Plants, and Wildlife**	We do not dispute the potential benefit of conducting a "multi-year" study to locate wildlife mitigation measures. However, it is also important to recognize that such studies need to be conducted in areas exhibiting priority wildlife-related highway safety and connectivity issues. The section of the highway corridor where the multiuse crossings are proposed was not identified as a linkage zone within the 2006 Arizona Wildlife Linkages Assessment or the 2012 Maricopa County Wildlife Connectivity Assessment, and likely would exhibit relatively low wildlife-vehicle collision incidence in the future given low wildlife densities found within this portion of the corridor. The 2012 Maricopa County Wildlife Connectivity Assessment did identify a movement corridor at the southwestern end of Phoenix South Mountain Park/Preserve. A large bridge proposed for the roadway in this area would allow continued wildlife connectivity in this area. Depending on the design of the proposed road drainage system, the amount of water entering the Salt River can be greater using roadside channels that collect and direct water that would otherwise infiltrate soils or collect in natural depressions. Highway runoff is generally not harmful compared with general urban runoff (Federal Highway Administration 2012) that also flows into the Salt River; however, there can still be a potential threat to the surrounding ecosystem. With proper treatments such as detention and vegetated treatments, runoff has the potential to benefit habitat in the Salt River. The picture of the "typical large-animal crossing" was replaced in the Final Environmental Impact Statement (see page 4-137). A noise wall along the entire length of the project would not be feasible. The impact on wildlife hearing would be similar to other freeway facilities in the Phoenix metropolitan area.

Code	Comment Document

allowed special access for a very limited time. AGFD would gladly provide a more appropriate picture of this or another crossing structure for inclusion in the EIS if desired.

General Impacts on Wildlife and Wildlife Habitat

Noise retention walls along the length of the freeway could mitigate the deafening effects on wildlife and double as exclusion barrier to funnel wildlife to appropriate crossing structures.

Page 4-126

The discussion regarding modification to former gravel pits, specifically the water sources associated with these ponds, would also impact potential foraging by bald eagles. Therefore, further down in paragraph 5, the project would potentially impact foraging behavior of bald eagles. Please see previous comments regarding recommendations for Bald Eagle considerations including consultation with USFWS.

33

There is some inconsistency about the presence of suitable habitat for Yuma clapper rail and yellow-billed cuckoo in and around the study area. There is an indication that breeding Yuma clapper rails were documented from 91st avenue west along the Salt River. And it was also indicated that there was suitable habitat for the yellow-billed cuckoo in and adjacent to the study area. Please clarify these apparent contradictions.

Please provide additional information regarding the impacts of highway noise. Lack of occurrence records does not conclusively indicate absence (from a given area) without extensive survey efforts or additional information on precluding factors. Also, what is the maximum decibel level at the cited distances of occurrence? Please indicate if there is empirical evidence to suggest that these sound levels do not impact wildlife species.

Given the planned habitat restoration projects along the Salt River from 91st avenue to the west (Tres Rios demonstration wetlands project) and 83rd avenue to the east (Rio Salado Oeste), the stretch of 91st avenue to 83rd avenue becomes substantial value. This are now becomes a vital connection between these two restoration efforts and should be considered a priority for maintaining wildlife connectivity.

Habitat Connectivity

Impacts on biological resources during freeway operation would not be mostly limited to vehicle collisions and noise disturbance, but would also include reduced permeability and habitat fragmentation for many species (unless cost-prohibitive measures such as elevated or subterranean grades were utilized for virtually the enitre extent of the freeway). These effects may be reduced by appropriate mitigation measures, and might help protect against more

Code	Issue	Response
33	**Biology, Plants, and Wildlife**	The reference to "former gravel pits" was changed to "gravel pits" on page 4-127 in the Final Environmental Impact Statement because these are still in operation with active mining permits. Since the final design of the proposed freeway has not begun, it is not known what specific modifications would be made to a particular gravel pit; however, it is anticipated that modifications could include partial filling if the pit is not bridged or avoided. The text on page 4-126 of the Draft Environmental Impact Statement regarding use of the pits by birds refers to the pits being used as a water source, not to potential modification of the water source for the pits or channel of the Salt River. A Biological Evaluation was submitted to the U.S. Fish and Wildlife Service, Arizona Game and Fish Department, and the Gila River Indian Community Department of Environmental Quality that addressed threatened, endangered, and candidate species, including the Yuma clapper rail and yellow-billed cuckoo. The U.S. Fish and Wildlife Service concurred with the species determinations in the Biological Evaluation (see Appendix 1-1 of the Final Environmental Impact Statement). The Biological Evaluation also addressed the breeding eagles in the Pee Posh wetlands in conformance to the Bald and Golden Eagle Protection Act. While there is suitable habitat for the Yuma clapper rail and yellow-billed cuckoo in the Study Area, no suitable habitat was identified within or immediately adjacent to the anticipated right-of-way for any of the action alternatives. This discrepancy was corrected in the Final Environmental Impact Statement on page 4-134. Limited research has been conducted on the relationships of highways, traffic volume, noise, and impacts on wildlife. Some studies have alluded to noise as being harmful to wildlife populations, but most information to date has documented impacts on songbirds (Reijnen et al. 1995a, 1996) where densities next to highways were lower for 60 percent of the species, and species richness was a third lower. The "noise effect zone" adjacent to highways varied greatly by vegetative type (Reijnen et al. 1995b) as well as traffic volume (Reijnen et al. 1995a). These factors then relate to the noise impact distance on wildlife, extending 0.25 mile (1,320 feet) with 8,000 to 15,000 vehicles per day, 0.40 mile (2,112 feet) with 15,000 to 30,000 vehicles per day, and 0.75 mile (3,960 feet) with greater than 30,000 vehicles per day (Forman and Deblinger 2000; Forman et al. 1997). As such, with the projected high use of the corridor, noise impacts from traffic are anticipated to have a considerable effect on all species of wildlife, ranging from song birds to eagles to large mammals including mule deer, and may limit their use of adjacent habitats. As noted above, potential impacts on habitat in the Salt River channel would be associated with construction of a bridge if an action alternative were to become the Selected Alternative. There would be short-term impacts associated with construction, but long-term impacts on connectivity are unlikely because the bridge design would be similar to existing bridges constructed across the Salt River channel in terms of a high openness ratio and natural substrate.

34

Code	Issue	Response
34	**Biology, Plants, and Wildlife**	The text box on page 4-137 of the Final Environmental Impact Statement has been updated to include discussion of reduced permeability and habitat fragmentation. The comments on the Draft Environmental Impact Statement contradict previous communication with the Arizona Game and Fish Department for the project. The last formal communication from the Arizona Game and Fish Department in 2006 (see page A139 in Appendix 1-1 of the Final Environmental Impact Statement) stated that the movement corridor between the South Mountains and the Sierra Estrella is degraded by the 51st Avenue travel corridor and planned development in the Study Area. Data presented in the Draft and Final Environmental Impact Statements corroborate this statement (see the sidebar, "*Existing versus planned land use*," on page 4-3 of both documents). A large percentage of the land in the Study Area is projected to be converted to nonagricultural uses in the foreseeable future. The above-referenced 2006 letter from the Arizona Game and Fish Department also stated that mule deer are believed to have been extirpated from the area. There was no mention of concerns with bighorn sheep. The Federal Highway Administration and Arizona Department of Transportation have committed to providing mitigation by including multifunctional crossing structures designed for wildlife such as mule deer and for limited human use, potential fencing to guide wildlife to the crossing structures, and culverts designed for connectivity for smaller species. The intent of the term "migration" was to make the distinction between true seasonal migration versus dispersal or movement within a home range, for which there was public confusion early in the study process. However, the sentence, "With respect to vehicle-wildlife collisions, no major migration corridors were documented in the Study Area" which appears on page 4-126 of the Draft Environmental Impact Statement was removed from the Final Environmental Impact Statement. See Figure 3-25 on page 3-47 of the Draft Environmental Impact Statement for the location of the structures. Figure 4-38 on page 4-126 of the Final Environmental Impact Statement also includes the multifunctional structures. The intended uses of the multifunctional crossings would vary by location within the Study Area. If the crossings were near existing recreational features or trails, more human use would be expected. However, multifunctional crossings in remote areas through the South Mountains would allow limited use by people. Use of crossings by people in this area is proposed solely to accommodate those members of the Gila River Indian Community who wish to gain access to areas of the South Mountains for ceremonies important for their culture (see Final Environmental Impact Statement page 4-151). A right-of-way fence would limit access to these areas by freeway users, but would allow Gila River Indian Community members to gain access to the area (see page 5-27 of the Final Environmental Impact Statement). The underpasses would not be associated with trailheads into the park and would not be designated as such for pedestrian, equestrian, off-highway vehicle, or bicyclist use. Other use of the underpasses by humans would be neither actively promoted nor encouraged through signs posted.

Code	Comment Document

substantial fragmentation under other scenarios, but they will still substantially reduce the ability of many species to move freely across the landscape.

, etc.Historic data provides information for bighorn sheep and mule deer utilizing the area. South Mountain has the potential to provide seasonal habitat for mule deer and possibly bighorn sheep. Migration of species such as bats is largely unknown in the state. The claim that "no important migration corridors were documented" carries an implication that movements across this area are not important. And while seasonal migrations are indeed critical to many species, daily and opportunistic movements among various blocks of habitat to avoid isolated climatic events, predation pressure, and availability of localized food resources are just as essential to population viability. So the term migration corridor should be clarified and phrasing should be selected that avoids the implication of prioritizing migratory movements over access among vital resources and habitat blocks.

Please include identified tentative mitigation structure locations in EIS figures.

Please see above comments for information on why referenced crossings should exclusively target wildlife and not be multifunctional/multiuse.

No-Action Alternative

While the projections of increased urban development under the No-Action Alternative are possible, the potential for increased development pressure on GRIC lands under one or more of the Action Alternatives is equally possible unless no interchanges are included on the freeway within several miles of the critical linkage pathway. So it is concevable that the No-Action Alternative could retain existing connectivity for a longer duration. Given the uncertainty of these predictions, the Department feels that the most responsible approach is to avoid speculation on the degree of fragmentation due to factors beyond the scope of this project and therefore remove the suggestion that the No-Action Alternative will result in greater fragmentation, habitat loss, and animal-vehicle collisions.

Mitigation

The Department appreciates mention of further coordination and looks forward to expanding and/or providing additional specific measures, some of which were mentioned in the attached letter.

Design Responsibilities

The Department appreciates mention of further coordination. Please also refer to our previous discussion in the letter regarding multi-functional crossing.

Code	Issue	Response
35	**Biology, Plants, and Wildlife**	The statement regarding the potential for the No-Action Alternative to result in greater fragmentation, habitat loss, and animal-vehicle collisions was removed from the text of the Final Environmental Impact Statement.
36	**Biology, Plants, and Wildlife**	Comment noted.
37	**Biology, Plants, and Wildlife**	Comment noted and discussed earlier. Wording was changed as suggested (see page 4-138 of the Final Environmental Impact Statement). The intended uses of the multifunctional crossings would vary by location within the Study Area. If the crossings were near existing recreational features or trails, more human use would be expected. However, multifunctional crossings in remote areas through the South Mountains would allow limited use by people. Use of crossings by people in this area is proposed solely to accommodate those members of the Gila River Indian Community who wish to gain access to areas of the South Mountains for ceremonies important for their culture (see Final Environmental Impact Statement page 4-151). A right-of-way fence would limit access to these areas by freeway users, but would allow Gila River Indian Community members to gain access to the area (see page 5-27 of Final Environmental Impact Statement). The underpasses would not be associated with trailheads into the park and would not be designated as such for pedestrian, equestrian, off-highway vehicle, or bicyclist use. Other use of the underpasses by humans would be neither actively promoted nor encouraged through signs posted. The Federal Highway Administration and Arizona Department of Transportation have committed to continue coordination with the Arizona Game and Fish Department, Gila River Indian Community Department of Environmental Quality, and U.S. Fish and Wildlife Service regarding wildlife concerns as a result of the freeway's potential implementation. Wildlife-friendly design information would be considered during the design of the drainage and crossing structures for the freeway (see *Mitigation*, beginning on page 4-138 of the Final Environmental Impact Statement).

South Mountain (Loop 202) July 11, 2013

Please consider rewording "The proposed action would be designed to provide opportunities for wildlife movement…" to "…designed to protect and maintain opportunities…"

Please see above comments for information on why referenced crossings should exclusively target wildlife and not be multifunctional/multiuse.

Page 4-127

Various wildlife taxa (herpetofauna, mammals) should be surveyed in addition to birds prior to design and construction.

The contractor should employ a biologist to survey for Sonoran desert tortoises immediately prior to construction as with the listed burrowing owl mitigation. Also a trained biologist should be present during construction activities to implement Department handling procedures.

Conclusions

Construction of the E1 Alternative may also affect the Tucson shovel-nosed snake. Please see previous comments for explanation of faulty TSNS habitat assessment.

Please see previous comments regarding the removal of the claim that "no major migration corridors are known."

Noise disturbance would be long-term because of sustained traffic on the in-use freeway. Sound retention walls should be implemented for the length of the freeway and can also be used to funnel wildlife to appropriate crossing structures.

See above comments for an explanation of why during operation impacts should also include wildlife habitat fragmentation.

Best management practices are mentioned but not explained and do not represent any inherent mitigation. Please outline what best management practices will be implemented to mitigate for wildlife resource impacts.

Please remove speculative claim that the No-Action Alternative would result in worsened conditions for wildlife via accelerated conversion of habitat to human-oriented uses. (see the Department's No-Action Alternative comments for an explanation).

Page 4-171

Cumulative Impacts

Habitat Loss

Code	Issue	Response
38	**Biology, Plants, and Wildlife**	A mitigation measure to conduct a preconstruction survey for the Tucson shovel-nosed snake and Sonoran desert tortoise, where appropriate and according to the most recent guidelines from the Arizona Game and Fish Department or U.S. Fish and Wildlife Service, was added to the Final Environmental Impact Statement on page 4-138. The Federal Highway Administration and Arizona Department of Transportation are committed to continuing coordination during the design process with the Arizona Game and Fish Department, Gila River Indian Community Department of Environmental Quality, and U.S. Fish and Wildlife Service regarding wildlife concerns related to the proposed project (see *Mitigation*, beginning on page 4-138 of the Final Environmental Impact Statement). Specific mitigation measures related to treatment of Sonoran desert tortoises during construction would be developed during the design phase of the project as more became known about likely construction methods and the likely frequency of encountering tortoises and other species during construction.
39	**Biology, Plants, and Wildlife**	A mitigation measure to conduct a preconstruction survey for the Tucson shovel-nosed snake, where appropriate and after consultation with the Arizona Game and Fish Department, was added to the Final Environmental Impact Statement on page 4-138. The Federal Highway Administration and Arizona Department of Transportation have committed to continue coordination with the Arizona Game and Fish Department, Gila River Indian Community Department of Environmental Quality, and U.S. Fish and Wildlife Service regarding wildlife concerns as a result of the freeway's potential implementation. Wildlife-friendly design information would be considered during the design of drainage and crossing structures for the freeway (see *Mitigation*, beginning on page 4-138 of the Final Environmental Impact Statement). The intent of the term "migration" was to make the distinction between true seasonal migration versus dispersal or movement within a home range, for which there was public confusion early in the study process. However, the sentence, "With respect to vehicle-wildlife collisions, no major migration corridors were documented in the Study Area" that appears on page 4-126 of the Draft Environmental Impact Statement was removed from the Final Environmental Impact Statement. The *Conclusions* section, on page 4-127 of the Draft Environmental Impact Statement, included the statement that "construction" would cause short-term noise disturbance. The following sentence indicated that "operation" of the freeway would cause noise disturbance to wildlife. A noise wall along the entire length of the project would not be feasible. The impact on wildlife hearing would be similar to that of other freeway facilities in the Phoenix metropolitan area. No justification for this request is provided in the comment. The *Conclusions* section, on page 4-127 of the Draft Environmental Impact Statement, included habitat fragmentation as an impact that would result from operation of the freeway. The Arizona Department of Transportation's best management practices for erosion and pollution control such as revegetation, which are part of the Arizona Department of Transportation's standard practices, affect all levels of biological concern in general, not just wildlife.

(Response 39 continues on next page)

Code	Comment Document
40 41 41	Attachment South Mountain (Loop 202) July 11, 2013 The category of land in human-related does not define the wildlife value of those lands. While natural lands are ideal for wildlife habitat, agricultural lands also provide significant resources for wildlife persistence. The conversion of agricultural lands into urban use is an even more significant loss for some species than conversion from natural to agricultural. So the implication that the "pre-freeway" development period resulted in greater wildlife habitat loss than the "with-freeway" period in not valid without additional support data. Page 4-172 Habitat Connectivity While the Department is very supportive of the project's consideration of the compounded effects of multiple development projects which are substantially greater than the effects of the individual developments, the Department would like to clarify that without mitigation most of the planned residential, commercial, and transportation developments will individually have substantive negative impacts on wildlife connectivity. Please see above comments for information on why referenced crossings should exclusively target wildlife and not be multifunctional/multiuse. Vehicle-animal Collisions Please see above comments for information on why referenced crossings should exclusively target wildlife and not be multifunctional/multiuse. Please consider including language that commits the project to including funnel fence/barrier that will exclude wildlife species from the freeway corridor and funnel them to wildlife crossings and please include explicit reference to target fauna: mule deer, desert bighorn sheep, javelina, Sonoran desert tortoise, Tucson shovel-nosed snake, etc. The final sentence of this section seems to contradict the claims of the mitigation efforts of the rest of the DEIS as it suggests that collisions will decrease because the fragmentation and habitat loss will render this land uninhabitable by wildlife species. This outcome represents the failure of all mitigation efforts. Instead, collisions can be mitigated and managed by appropriate exclusionary infrastructure that links appropriate crossings at adequate intervals. Page 4-173Threatened and Endangered Species Please expand on the anticipated cumulative impacts of development that is likely to occur as a result of the proposed project. Page 4-176

Code	Issue	Response
39 (cont.)		The No-Action Alternative discussion on page 4-126 of the Draft Environmental Impact Statement referred to private property (non-Gila River Indian Community land). All property along the E1 Alternative is private property with the exception of an approximately 0.3-mile segment of Phoenix South Mountain Park/Preserve that borders the Gila River Indian Community along a section of creosote flats. These private properties, including the ridges on the western end of the South Mountains, are zoned for residential land use. Recent development history in this area of the South Mountains strongly suggests a potential for the trend to continue and the possibility of greater wildlife impacts.
40	**Biology, Plants, and Wildlife**	The Draft Environmental Impact Statement does not conclude that the "pre-freeway" development period resulted in greater habitat loss than would be the case in the "with-freeway" period. The text indicated when the greatest loss occurred during the "pre-freeway" period, implying that this loss continued in the "with-freeway" period. The text in the Final Environmental Impact Statement has been revised to clarify this point (see page 4-183).
41	**Biology, Plants, and Wildlife**	The intended uses of the multifunctional crossings would vary by location within the Study Area. If the crossings were near existing recreational features or trails, more human use would be expected. However, multifunctional crossings in remote areas through the South Mountains would allow limited use by people. Use of crossings by people in this area is proposed solely to accommodate those members of the Gila River Indian Community who wish to gain access to areas of the South Mountains for ceremonies important for their culture (see Final Environmental Impact Statement page 4-151). A right-of-way fence would limit access to these areas by freeway users, but would allow Gila River Indian Community members to gain access to the area (see page 5-27 of the Final Environmental Impact Statement). The underpasses would not be associated with trailheads into the park and would not be designated as such for pedestrian, equestrian, off-highway vehicle, or bicyclist use. Other use of the underpasses by humans would be neither actively promoted nor encouraged through signs posted. The Federal Highway Administration and Arizona Department of Transportation have committed to continue coordination with the Arizona Game and Fish Department, Gila River Indian Community Department of Environmental Quality, and U.S. Fish and Wildlife Service regarding wildlife concerns as a result of the freeway's potential implementation. Wildlife-friendly design information would be considered during the design of drainage and crossing structures for the freeway (see *Mitigation*, beginning on page 4-138 of the Final Environmental Impact Statement). As suggested in an earlier comment by the Arizona Game and Fish Department, "... the Department would like to clarify that without mitigation, most of the planned residential, commercial, and transportation developments will individually have substantive negative impacts on wildlife connectivity." Because this mitigation is not guaranteed, and because of development trends noted in earlier responses, it is reasonable to assume that continued development of this urban landscape will result in reduced wildlife populations.

South Mountain (Loop 202) July 11, 2013

The category of land in human-related does not define the wildlife value of those lands. While natural lands are ideal for wildlife habitat, agricultural lands also provide significant resources for wildlife persistence. The conversion of agricultural lands into urban use is an even more significant loss for some species than conversion from natural to agricultural. So the implication that the "pre-freeway" development period resulted in greater wildlife habitat loss than the "with-freeway" period in not valid without additional support data.

Page 4-172

Habitat Connectivity

While the Department is very supportive of the project's consideration of the compounded effects of multiple development projects which are substantially greater than the effects of the individual developments, the Department would like to clarify that without mitigation most of the planned residential, commercial, and transportation developments will individually have substantive negative impacts on wildlife connectivity.

Please see above comments for information on why referenced crossings should exclusively target wildlife and not be multifunctional/multiuse.

Vehicle-animal Collisions

Please see above comments for information on why referenced crossings should exclusively target wildlife and not be multifunctional/multiuse.

Please consider including language that commits the project to including funnel fence/barrier that will exclude wildlife species from the freeway corridor and funnel them to wildlife crossings and please include explicit reference to target fauna: mule deer, desert bighorn sheep, javelina, Sonoran desert tortoise, Tucson shovel-nosed snake, etc.

The final sentence of this section seems to contradict the claims of the mitigation efforts of the rest of the DEIS as it suggests that collisions will decrease because the fragmentation and habitat loss will render this land uninhabitable by wildlife species. This outcome represents the failure of all mitigation efforts. Instead, collisions can be mitigated and managed by appropriate exclusionary infrastructure that links appropriate crossings at adequate intervals.

Page 4-173Threatened and Endangered Species

42 Please expand on the anticipated cumulative impacts of development that is likely to occur as a result of the proposed project.

Page 4-176

Code	Issue	Response
42	**Biology, Plants, and Wildlife**	Cumulative impacts on wildlife are discussed beginning on page 4-174 of the Final Environmental Impact Statement. Induced growth is discussed as a secondary impact on page 4-173. The discussion concludes that the proposed action would occur in an area planned for urban growth as established in local jurisdictions' land use planning activities for the last 25 years. As such, the proposed action would not provide new or substantially improved access to a large, undeveloped geographic area. Therefore, the action alternatives are not expected to induce growth in the region.

Code	Comment Document

Attachment
South Mountain (Loop 202) July 11, 2013

Table 4-58

Please include the following in the Biological resources Mitigation Measures box:

43

1) ungulate/ tortoise/snake funnel/exclusion barrier
2) Pre-design wildlife movement investigations
3) Pre-design & pre-construction surveys for listed, candidate, SGCN, & SERI with potential habitat in or around the study area.
4) Inclusion of bat day roost design parameters in all bridge structures.

Page 4-177

Conclusions

44

Unless the proposed freeway does not include any transportation interchanges or exits, it would seem by basic definition that the freeway will substantially improve access to undeveloped and agricultural areas to the south and southwest of the proposed project. This is in conflict with the claim in the Cumulative Effects Conclusions.

Please elucidate expected positive consequences for wildlife of contribution to overall traffic use by induced travel.

Page 4-178

CONCLUSIONS

45

Please see previous comments regarding the potential for this project to promote development in and around the study area.

The Western Section alternatives do not appear to be equal in terms of disruption to nesting bald eagle foraging. Please include this summary in the Chapter 4 CONCLUSIONS.

The alteration of drainage patterns on the Eastern Section may substantially impact wildlife habitat and wildlife access to water resources. This was not addressed in terms of wildlife impacts. Please expand the EIS to include such discussion.

Code	Issue	Response
43	**Biology, Plants, and Wildlife**	The mitigation measures for biological resources are presented in greater detail beginning on page 4-138 of the Final Environmental Impact Statement. Additional mitigation measures for the Sonoran desert tortoise and the Tucson shovel-nosed snake have been included. More detailed mitigation measures would be developed during the design process in coordination with agency partners, including the U.S. Fish and Wildlife Service, Arizona Game and Fish Department, and the Gila River Indian Community's Department of Environmental Quality, as described in the mitigation measures. Regarding wildlife concerns as a result of the freeway's potential implementation, the Federal Highway Administration and Arizona Department of Transportation have committed to continue coordination with the Arizona Game and Fish Department, Gila River Indian Community Department of Environmental Quality, and U.S. Fish and Wildlife Service through the design process (see *Mitigation*, beginning on page 4-138 of the Final Environmental Impact Statement).
44	**Biology, Plants, and Wildlife**	It may seem counter intuitive that constructing a new freeway in an area would not provide substantially improved access to areas along the freeway. However, when the area where the freeway and interchanges would be constructed is in an area that is already planned for development and the existing road network is established, the access conditions would be similar since the land use plan directs the opportunity for access. In this case, the City of Phoenix General Plan has defined the future land uses and roadway system in the Study Area adjacent to the action alternatives outside Gila River Indian Community land. The Gila River Indian Community also has a development plan that identifies development along the northern border of the Gila River Indian Community, regardless of the proposed freeway. The *Cumulative Impacts* section on page 4-183 of the Final Environmental Impact Statement reiterates the finding that the freeway would not substantially improve access to the geographic area as substantiated in those future development plans. The text of the Draft Environmental Impact Statement does not state or infer that there would be positive consequences for wildlife from overall traffic use by induced travel.
45	**Biology, Plants, and Wildlife**	As the previous comment response on potential induced development described, the existing future plans for development from the City of Phoenix and the Gila River Indian Community will guide the future development of the Study Area. Each of the Western Section action alternatives would cross the dry Salt River where mining pits are located. Some of these pits are in active mining areas and have changed over time, including becoming completely dewatered, and it is therefore difficult to assess the existence and value of those pits for bald eagle foraging. A Biological Evaluation was submitted to the U.S. Fish and Wildlife Service, Arizona Game and Fish Department, and the Gila River Indian Community Department of Environmental Quality that addressed threatened, endangered, and candidate species. The U.S. Fish and Wildlife Service concurred with the species determinations in the Biological Evaluation (see Appendix 1-1 of the Final Environmental Impact Statement). The Biological Evaluation also addressed the breeding eagles in the Pee Posh wetlands in conformance to the Bald and Golden Eagle Protection Act. Drainage patterns would not be diverted from their downstream connection on the Gila River Indian Community. The drainage features of the E1 Alternative would be designed such that drainage basins and channels on the north side of the freeway would collect runoff from the freeway and allow suspended sediment to settle. As the system continues to receive runoff, the basins and channels would overflow into channels that would direct flows under the freeway and onto Gila River Indian Community land in the same location as existing drainages from the South Mountains are occurring (see page 4-98 of the Final Environmental Impact Statement).

forum open, so no build. Do not build Loop 202. Thank you.

THE FACILITATOR: Thank you.

If there's anyone in the auditorium that would like to speak, please make sure you're registered at the front desk. Your name will appear on the screen and we'll call you up in the order that you register.

Again, if there's anyone in the ballroom who would like to speak, please make sure you register at the front desk. Thank you.

Ruben Gallego.

MR. GALLEGO: Hello.

THE FACILITATOR: Mr. Gallego, you have three minutes, here's the timer. Please begin.

MR. GALLEGO: Thank you. My name is Ruben Gallego, I'm a resident of South Mountain, I live right next to the mountain, I'm also the state representative for the area that would be impacted by this freeway. I represent the Laveen area, South Mountain, Gila River Indian Community, as well as portions of the west side of Phoenix. I'm here in support of the 202 highway, not only as a resident, but also as a representative of the people in the district. For years I've been hearing about complaints in terms of traffic and traffic congestion. A lot of the jobs that are currently being

created in this area -- I'm sorry, that are currently being created in Arizona, especially in Maricopa County, are not in this area and a lot of my families have to drive long ways to get to work, and right now the way to do that is through surface streets and a lot that is taking up a lot of their time in stop-and-go traffic. This highway would make it a lot more convenient for them to actually get to the places of work, employment, as well as healthcare opportunities, which aren't available in this -- right currently in this area.

I have ran for office twice and have always talked about the highway and from my understanding of at least the electorate, they are in the positive manner for the construction of this highway. And my personal experience just living down there, we do need the highway to, you know, for one, just for me trying to get in and out of this area is very difficult. If there is any kind of car accident on the I-10 to I-17, a lot of times those state troopers or police will send traffic -- will end up using our roads as traffic relievers, so our roads end up getting congested every time something does happen and, you know, that's not very fair to us. We're trying to live normal lives, but it'll happen at least once a week that if there's a rollover by a truck or something else of that nature, they will be using our surface streets to

Code	Issue	Response

Code	Comment Document

be moving east to west, which would not happen if we had another reliever such as the Loop 202 around the mountain. With that, again, I strongly speak in support of the South Mountain freeway and I hope that we can get it done as soon as possible. Thank you.

THE FACILITATOR: Thank you.

Rohno Geppert.

Mr. Geppert, you have three minutes, here's the timer.

MR. GEPPERT: Hello. Thank you for allowing public comment. I appreciate the opportunity to speak. I am in favor of the alternative that connects to the west 101, any of those three alternatives just from a traffic flow perspective. The preferred alternative goes directly into where everything gridlocks at both rush hours, so I would appreciate if it could be moved as far west as possible so that trucks needing to bypass the downtown area won't be a part of the congestion so much as the ones that are currently going to bottleneck if it goes through the 51 corridor. Thank you for the time and I appreciate you taking those thoughts into consideration.

THE FACILITATOR: Thank you, sir.

Arthur Bivvins.

Mr. Bivvins, you have three minutes, here's the

Phoenix, Arizona 85007

Re: South Mountain Freeway
Comments on Environmental Impact Statement

Dear Sirs:

1

The City of Chandler would like to express our support for the proposed South Mountain Freeway between Chandler and the West Valley. Chandler residents would benefit greatly by the completion of this Freeway. We believe that is an excellent regional project that has significant congestion and air quality benefits to the entire Phoenix region. Given the magnitude of the regional benefits we fully support the immediate advancement of the design and construction of the South Mountain Freeway.

The South Mountain Freeway would provide an alternate route for Chandler and other East Valley drivers to get to the West Valley. Currently, the only choice is to use I-10 through central Phoenix. This section of I-10 is already at or near capacity, resulting in significant traffic delays and a negative impact on regional air quality.

The South Mountain Freeway would provide an excellent alternative to the using I-10 through central Phoenix. It is estimated that about 140,000 vehicles per day will utilize the South Mountain Freeway. This shift in traffic will ease congestion on I-10, thus reducing commute times and improve air quality for the entire Valley.

This project was approved by the voters in Maricopa County in 1985 and again in 2004, and has been studied for several years. This construction will create over 10,000 jobs and have $2 billion investment in the local economy.

With the environmental documents concluding that this project benefits the region, it is now time to build the South Mountain Freeway.

Respectfully,

Jay Tibshraeny
Mayor

THE CITY OF
Litchfield Park

Office of the Mayor

RECEIVED
JUN 14 2013
AZ Dept of Transportation
Director's Office

June 13, 2013

Mr. John Halikowski
ADOT Director
206 South 17th Avenue, MD 100A
Phoenix, Arizona 85007-3213

Dear Mr. Halikowski:

Please accept this letter and the attached resolution as the City of Litchfield Park's participation in the public comment of the South Mountain review process.

1 On May 15, 2013, the City of Litchfield Park City Council adopted Resolution 13-345 to support the citizens of Maricopa County and the passage of Prop 300 and Prop 400 for construction of the South Mountain Freeway. As stated in the Resolution, the Litchfield Park City Council supports the construction of the South Mountain Freeway for the mobility and economic development of the region for future generations. As a personal note, I support the W59 Alternative (Preliminary Preferred) route as the location of the South Mountain Freeway.

Thank you for the opportunity to express the views of the Litchfield Park City Council and that of mine as Mayor of Litchfield Park.

Sincerely,

Thomas L. Schoaf
Mayor

cc: Members of Council

CITY OF LITCHFIELD PARK
RESOLUTION NO. 13-345

A RESOLUTION OF THE MAYOR AND COMMON COUNCIL OF THE CITY OF LITCHFIELD PARK, ARIZONA, SUPPORTING THE CITIZENS OF MARICOPA COUNTY AND THE PASSAGE OF PROP 300 AND PROP 400 FOR CONSTRUCTION OF THE SOUTH MOUNTAIN FREEWAY.

WHEREAS, the South Mountain Freeway has received overwhelming support by the citizens of Maricopa County as part of two regional elections; the Proposition 300 election in 1985 and the Proposition 400 election in 2001, and

WHEREAS, the South Mountain Freeway is a legacy project in the Regional Transportation Plan with identified funding in the Transportation Improvement Program, and

WHEREAS, a design concept report was completed by the Arizona Department of Transportation (ADOT) in 1988 defining the alignment for the freeway, and

WHEREAS, in 2001, the Federal Highway Administration and ADOT embarked on an Environmental Impact Statement to analyze the purpose and need for the proposed freeway and to study alignments and associated environmental impacts for the freeway and the Draft EIS is now complete for public review and comment; and

WHEREAS, the Draft EIS indicates that the freeway will carry traffic in the range of 137,000 to 142,000 vehicles per day by 2030, which is comparable to current use on the Loop 101 and existing segments of the Loop 202, and

WHEREAS, the South Mountain Freeway will provide an important link for the Southeast and Southwest Valleys, promoting commerce in both regions of the Valley and helping to avoid the current bottleneck at the Broadway curve on Interstate 10, and

WHEREAS, many West Valley local municipalities, businesses, and residents have been proactive participants and supporters of the South Mountain Freeway project which will mitigate traffic congestion and stimulate economic growth in the Region, and

WHEREAS, not building the South Mountain Freeway will contribute to increased congestion on local arterial roadways such as Baseline, Southern and Broadway Roads, and

WHEREAS, an alternative route is needed to Interstate 10 when accidents occur which occasionally close Interstate 10 for several hours at a time,

NOW THEREFORE, BE IT RESOLVED THAT THE CITY OF LITCHFIELD PARK supports the construction of the South Mountain Freeway for the mobility and economic development of the region for future generations.

PASSED AND ADOPTED by the Common Council of the City of Litchfield Park, Maricopa County, Arizona, this 15th day of MAY, 2013.

Thomas L. Schoaf, Mayor

June 13, 2013

Mr. John Halikowski
ADOT Director
206 South 17th Avenue, MD 100A
Phoenix, Arizona 85007-3213

Dear Mr. Halikowski:

As City Manager for the City of Litchfield Park, I want to express my appreciation for the opportunity to participate in the public comment for the support of the South Mountain Freeway.

1 The South Mountain Freeway will provide an important link for the Southeast and Southwest Valleys, promoting commerce in both regions of the Valley and help to resolve the current bottleneck at the Broadway curve and Interstate 10. Upon reviewing the proposed alternations for the South Mountain Freeway, I believe that the W59 Alternative (Preliminary Preferred) best suits the needs of the region and is the best alignment when considering all the contributing factors.

Thank you for the opportunity to participate in the public comment for the support of the South Mountain Freeway.

Sincerely,

Darryl H. Crossman

City of Phoenix

Street Transportation Department, 200 W. Washington St., Phoenix, AZ 85003
Phone: (602) 262-6284 Fax: (602) 495-2016

To: South Mountain Study Team
Arizona Department of Transportation
1655 West Jackson Street, MD 126F
Phoenix, Arizona 85007

Date: June 12, 2013

From: Ray Dovalina, P.E.
Assistant Director
Street Transportation Department
200 W. Washington Street Fifth Floor
Phoenix, AZ 85003

Subject: REVIEW OF THE LOCATION/DCR AND EIS FOR THE SR LOOP 202 (SOUTH MOUNTAIN FREEWAY)

The City of Phoenix has reviewed the Initial Location/Design Concept Report (DCR) and Draft Environmental Impact Statement (EIS) for State Route Loop 202 (South Mountain Freeway) Interstate 10 (Maricopa Freeway) to Interstate 10 (Papago Freeway) and has prepared a list of questions, comments and concerns that address public transportation and development of this freeway.

1

In general, the City of Phoenix concurs with the overall findings in the Initial DCR and Draft EIS and fully supports the recommended Preferred Alternative W59 Alignment for the proposed SR Loop 202. There are, however, specific areas of concern along the preferred alignment that impact various upcoming City funded projects and Phoenix area residents that should be considered and factored into the project as the final reports are developed. These include the following:

SR Loop 202 (South Mountain Freeway): Location/Design Concept Report
Street Transportation Department

General Comments

2

- Proposed traffic interchanges should be consistant with the most current City Street Classification Map, lane assignments, and cross sections.

3

- Procurement of the overall project, should consider possible City interaction for planning, designing and constructing cross roads to accommodate new traffic

RECEIVED
JUL 18 2013

Code	Issue	Response
1	**Design**	Comments received that are specific to the South Mountain Freeway Location/ Design Concept Report have been forwarded to the design team for response in the South Mountain Freeway Location/Design Concept Report comment resolution process. As appropriate, responses to these comments are included in this document. Draft Environmental Impact Statement comments are addressed below.
2	**Design**	Page 3-51 of the Final Environmental Impact Statement includes information related to proposed traffic interchanges. Coordination with the City would continue through final design to ensure consistency between the proposed freeway and City road network.
3	**Design**	Coordination with the City would continue through final design to ensure consistency between the proposed freeway and City road network. Enhancement opportunities are discussed on page 3-60 of the Final Environmental Impact Statement.

Code	Comment Document

Review of Initial Location/DCR and DEIS for State Route 202L
(South Mountain Freeway) Interstate 10 (Maricopa Freeway)
to Interstate 10 (Papago Freeway)

Page 2

interchanges. City would coordinate with ADOT and the selected project delivery team to accommodate cross street improvements at the proposed interchanges.

4 • Provide pedestrian connectivity where possible across the proposed freewway.
1) Area Bounded By: 63rd Ave and 59th Ave, and Broadway Rd to Elwood St
2) Pedestrian/Bicycle connection to the Laveen Convenyance Channel (LACC)

Street Transportation – Design and Construction Management Division

5 The City has a programmed construction project FY 2014/2015 at Baseline and Buckeye Road that may conflict with the SR Loop 202 alignnment at 56th Avenue. At Baseline Road, there may be some encroachment in the ADOT Right of Way. At Buckeye Road, there are utility conflicts with Maricopa County land and Salt River Project and close coordination will be needed to construct these projects.

SR Loop 202 (South Mountain Freeway): Location/Design Concept Report
Public Transit Department

6 • (Page ES-3) DHOV flyover ramps at the I-10 Papago Freeway) will provide direct HOV access to Downtown Phoenix and the Capitol for buses, carpools, and vanpools.

7 • (Plan Sheet, I-10 Sta. 7284+00 to 7340+00) It appears that access to a future station and park-and-ride for the Capitol/I-10 West LRT line at 59th Avenue/I-10 can be achieved by using the small off-ramp at Roosevelt to connect with Roosevelt Street and NB 59th Avenue. Please verify.

8 • (Page 2-16) Develop a DHOV ramp at 40th Street to provide a stronger, more convenient connection to SR Loop 202 and I-10 NB for RAPID I-10 East buses traveling from the Pecos/40th Street Park-and-Ride. In addition, if spacing does not permit a DHOV ramp, provide a bus-only bypass through any on-ramp metering.

9 • A future park-and-ride at Baseline Road and SR Loop 202 is a key component of future commuter service in this part of Phoenix. The facility is currently in the Transportation Improvement Plan and the City of Phoenix Capital Improvement Plan. Close coordination should occur between City of Phoenix Street Transportation and Public Transit departments and ADOT to secure land as part of this project. This park-and-ride would service the far western leg of the South Mountain RAPID bus rapid transit corridor. It could also provide connections to local bus service as well as a connector route to the future 59th Avenue/I-10 LRT station. A DHOV connection to NB SR Loop 202 should augment the development of this facility to provide a convenient route for buses and eliminate the need to weave through traffic into the HOV lane.

Code	Issue	Response
4	**Design**	Coordination with the City would continue through final design to ensure consistency between the proposed freeway and City road network. Enhancement opportunities are discussed on page 3-60 of the Final Environmental Impact Statement.
5	**Design**	Coordination with the City would continue through final design to ensure consistency between the proposed freeway and City road network. Potential utility impacts are discussed beginning on page 4-175 of the Final Environmental Impact Statement.
6	**Design**	Yes, more information related to the system traffic interchange is provided beginning on page 3-48 of the Final Environmental Impact Statement.
7	**Design**	Currently, no off-ramps are planned at Roosevelt Street. Coordination with the City and Valley Metro would continue through final design. Enhancement opportunities are discussed on page 3-60 of the Final Environmental Impact Statement.
8	**Design**	Currently, there are not plans for direct high-occupancy vehicle ramps connecting to the 40th Street park-and-ride lot due to right-of-way constraints. There is a planned connection from the westbound on-ramp to the south entrance. Coordination with the City and Valley Metro would continue through final design to identify opportunities for integrating transit facilities. Enhancement opportunities are discussed on page 3-60 of the Final Environmental Impact Statement.
9	**Design**	Currently, there are not plans for direct high-occupancy vehicle ramps connecting to the future Baseline Road park-and-ride lot. Coordination with the City and Valley Metro would continue through final design to identify opportunities for coordinating land acquisition and integrating transit facilities. Enhancement opportunities are discussed on page 3-60 of the Final Environmental Impact Statement.

Code	Comment Document

Review of Initial Location/DCR and DEIS for State Route 202L
(South Mountain Freeway) Interstate 10 (Maricopa Freeway)
to Interstate 10 (Papago Freeway)

Page 3

10
- (Page 3-14) Provisions should be made for a DHOV connection to link SR Loop 202 with I-10 (Maricopa Freeway). These improvements should be made all at once to minimize disruption and address community concerns (Page 1-1).

11
- (Page 3-14) Provide more description, location and results of the coordination activity between ADOT and METRO in the I-10 (Papago Freeway) corridor.

11
- (Page 3-15) Proposed system interchange modification should correspond with future Capitol/I-10LRT improvements to the interchanges (67th, 59th and 51st avenues) to minimize future disruption. This would impact the north portion of the interchanges and potentially bridges.

9
- Develop a DHOV ramp at Baseline Road to provide a stronger, more convenient connection to NB SR Loop 202 for buses traveling from the future 59th Avenue Park-and-Ride. In addition, if spacing does not permit a DHOV ramp, provide a bus-only bypass through any on-ramp metering for NB buses.

12
- (Guide Signing Plan) Provide appropriate overhead structure and way finding signage for the Pecos/40th Street Park-and-Ride (existing) and the future Baseline Road/SR Loop 202 Park-and-Ride. The overhead would be placed in the freeway and the smaller green way finding signs would be located on the off ramps and adjacent major streets. This is a similar scenario found in other areas of Phoenix.

SR Loop 202 (South Mountain Freeway): Draft Environmental Impact Statement and Section 4(f) Evaluation

13
- Pg. 1-14, Will this be a truck bypass route in lieu of all the truck accidents in the Central City? Could this section reference 3-64 "Trucking in the MAG region".

14
- Pg. 3-6, Regarding the light rail being eliminated from further study. With savings from the W59 Alternate (Pg. 3-69 Estimated Costs) can this study be furthered due to the public comments on Pg. 6-22, multimodal options, Consideration of multimodal alternatives, to include Bus Rapid Transit (bus only lane) and other options?
- Pg. 3-23, Regarding W59 Alternate frontage road sections. How would business access on the frontage roads be determined? Is an Access Control determination required?
- Pg. 4-28, "The ADOT Right-of-Way Group would coordinate the design phase to designate necessary utility corridors…" Is there potential to designate excess land in utility corridors for transit uses? (Example: Happy Valley Road/I-17 Park and Ride).

Code	Issue	Response
10	**Design**	Currently, there are not plans for direct high-occupancy vehicle ramps connecting the South Mountain Freeway to Interstate 10 (Maricopa Freeway). There are direct ramps from the Santan Freeway to Interstate 10, as planned in the *Regional Transportation Plan*. Coordination with the City and Valley Metro would continue through final design to identify opportunities for integrating transit facilities. Enhancement opportunities are discussed on page 3-60 of the Final Environmental Impact Statement.
11	**Agency Coordination**	Coordination has included attendance at agency progress meetings, review and comment on planning documents, and sharing of design layouts. Coordination is ongoing and would continue through final design to identify opportunities for integrating transit facilities. However, no high occupancy vehicle lane connections are planned at 67th, 59th, and 51st avenues.
12	**Agency Coordination**	As design progresses, details such as these would be finalized in coordination with local and regional agencies. Information related to signs is provided on page 3-58 of the Final Environmental Impact Statement.
13	**Trucks**	As pointed out on page 3-64 of the Draft and Final Environmental Impact Statements, in the section entitled, *Trucking in the MAG Region*, and supported by conclusions throughout Chapter 1, *Purpose and Need*, the proposed action is needed to address regional traffic congestion attributable to all vehicular types using the regional travel network. As noted on page 3-64 of the Draft and Final Environmental Impact Statements, it is recognized that trucks would use the proposed action to move the goods and services necessary for the region's economy. As described, a truck bypass route of the metropolitan area is signed and posted using Interstate 8, State Route 85, and Interstate 10.
14	**Alternatives**	Public comment pertinent to multimodal options as referenced on page 6-22 of the Draft and Final Environmental Impact Statements does not reference specific consideration of bus rapid transit (bus-only lane) and other options as implied in the comment. The text actually references light rail as a consideration. The reasons for elimination of this option as well as other modal alternatives are presented in Table 3-2, *Nonfreeway Alternatives Considered and Reasons for their Elimination from Further Study*, on page 3-5 of the Draft and Final Environmental Impact Statements, in related text on pages 3-5 and 3-6, and in supporting appendices. The transit alternatives accounted for expanded services beyond those provided under programmed funding in the *Regional Transportation Plan* to account for consideration of best-case transit scenarios. Alternative represented a range of reasonable alternatives that were the subject of detailed study in the Draft Environmental Impact Statement and subsequent Final Environmental Impact Statement. The new Maricopa Association of Governments socioeconomic and traffic projections for Maricopa County were used to determine whether the proposed freeway was still the type and mode of transportation improvement that would best meet the purpose and need criteria for the proposed action. The modeling analysis conducted for the Draft Environmental Impact Statement was updated using 2013 Maricopa Association of Governments projections for 2035. Traffic volumes, traffic conditions, travel distribution, capacity deficiencies, and travel time were reanalyzed to evaluate the alternatives considered in terms of responsiveness to purpose and need criteria. The new socioeconomic and traffic projections, while generally lower than what was previously predicted, still support

- (Page 3-14) Provide more description, location and results of the coordination activity between ADOT and METRO in the I-10 (Papago Freeway) corridor.
- (Page 3-15) Proposed system interchange modification should correspond with future Capitol/I-10LRT improvements to the interchanges (67th, 59th and 51st avenues) to minimize future disruption. This would impact the north portion of the interchanges and potentially bridges.
- Develop a DHOV ramp at Baseline Road to provide a stronger, more convenient connection to NB SR Loop 202 for buses traveling from the future 59th Avenue Park-and-Ride. In addition, if spacing does not permit a DHOV ramp, provide a bus-only bypass through any on-ramp metering for NB buses.
- (Guide Signing Plan) Provide appropriate overhead structure and way finding signage for the Pecos/40th Street Park-and-Ride (existing) and the future Baseline Road/SR Loop 202 Park-and-Ride. The overhead would be placed in the freeway and the smaller green way finding signs would be located on the off ramps and adjacent major streets. This is a similar scenario found in other areas of Phoenix.

SR Loop 202 (South Mountain Freeway): Draft Environmental Impact Statement and Section 4(f) Evaluation

- Pg. 1-14, Will this be a truck bypass route in lieu of all the truck accidents in the Central City? Could this section reference 3-64 "Trucking in the MAG region".
- Pg. 3-6, Regarding the light rail being eliminated from further study. With savings from the W59 Alternate (Pg. 3-69 Estimated Costs) can this study be furthered due to the public comments on Pg. 6-22, multimodal options, Consideration of multimodal alternatives, to include Bus Rapid Transit (bus only lane) and other options?

15

- Pg. 3-23, Regarding W59 Alternate frontage road sections. How would business access on the frontage roads be determined? Is an Access Control determination required?

16

- Pg. 4-28, "The ADOT Right-of-Way Group would coordinate the design phase to designate necessary utility corridors…" Is there potential to designate excess land in utility corridors for transit uses? (Example: Happy Valley Road/I-17 Park and Ride).

Code	Issue	Response
14 (cont.)		the overall conclusions of the Draft Environmental Impact Statement in terms of purpose and need, evaluation of lane and alignment changes, responsiveness of the proposed freeway to purpose and need, and traffic conditions with the action and No-Action alternatives. The W59 Alternative in combination with the E1 Alternative was identified as the Preferred Alternative. The analyses and conclusions are reflected in the Final Environmental Impact Statement (see Chapter 3, *Alternatives*).
15	**Design**	As described in the Draft and Final Environmental Impact Statements on page 3-23 in the section, *Alignment Description*, the frontage roads would allow direct access to properties, which would include business properties. The specifics of how access would be provided would be determined during the final design process on a property-by-property basis in collaboration with City of Phoenix staff, property owners, and other appropriate stakeholders. Generally, the description of alternatives must be developed to a sufficient level to allow for meaningful comparison of alternatives but not be so specific in design as to limit flexibility in minor changes in design after completion of the environmental impact statement process. In text beginning on pages 4-45 and page 4-51 of the Draft and Final Environmental Impact Statements, respectively, under the section, *Displacements and Relocations*, further information is provided describing the Arizona Department of Transportation responsibilities in providing access to adjacent properties.
16	**Design**	Yes, there is a potential to examine the possibility of using excess lands for transit uses. Consideration of this possibility has been a common practice for other major transportation facilities in the metropolitan area. In text beginning on pages 4-45 and page 4-51 of the Draft and Final Environmental Impact Statements, respectively, under the section, *Displacements and Relocations*, mitigation is presented to coordinate with local jurisdictions to use excess lands for alternative public uses. The discussion of enhancement opportunities is further described in the Draft and Final Environmental Impact Statements on page 3-60 in the section, *Enhancement Opportunities*.

Code	Comment Document

Review of Initial Location/DCR and DEIS for State Route 202L
(South Mountain Freeway) Interstate 10 (Maricopa Freeway)
to Interstate 10 (Papago Freeway)

Page 4

17
- Include car ownership and transit-dependency in the demographic figures in maps 4-10 through 4-14.

18
- Pg. S-36 and 3-69 "The W59 Alternative would provide more direct access to downtown Phoenix." Add to this point, ability to make convenient connections to all transit modes and routes in the central city.

19
- Pg. 3-38 Decisional Criterion, "What other general transportation effects would the proposed freeway have?" Can this bullet point be expounded on, possibly adding specifics to the opportunities for freeway transit services, such as specific locations for park-and-ride lots adjacent to the freeway, addition of HOV lane access for express/rapid bus routes, further study of ROW for rail, etc.

20
- Table 1-2 under Transit, provide a summary of the T2000 Tax/Plan, include detailed language such as 4/10 of a percent sales tax, 20 year life of tax, Federal Funding match, and estimated $200 million for bus and $600 million for light rail.

21
- Pg. 3-52 Right-of-way needed for Action Alternatives, add a point about right-of-way for transit purposes.

22
- Figure 3-29 add dashed line depicting future Capital /I-10 LRT on north side of I-10.
- Pg. 3-60 Enhancement Opportunities, this area should be expanded with more detail about how the excess R/W may be suitable for other public infrastructure projects such as park-and-ride lots.
- Figure 4-4 Planned Developments 2009 map shows the abundance of Residential near the W59 Alternative and Baseline Road. A park-and-ride in the area works well with the General Plan by focusing park-and-ride location near residential use and the Laveen Village Core.

- Page 5-15 Figure 5-8 graphics are located in the wrong areas in numerous instances and some a noted as being outside the park. The trails represented on this figure are not accurate or current.
- Page 5-20 Center column, second paragraph should read: "The Tunnel Alternatives do not…"

Code	Issue	Response
17	**Social Conditions**	The maps were created to represent environmental justice populations as defined by Arizona Department of Transportation policy (see page 4-29 of the Final Environmental Impact Statement). These populations include concentrations of minority, low-income, elderly, disabled, and female head-of-household populations. In addition, minority populations as defined by Title VI of the Civil Rights Act of 1964 are represented in the maps.
18	**Alternatives**	Text repeated on pages S-36, 3-68, and 3-69 of the Draft Environmental Impact Statement and pages S-35, 3-68 and 3-69 of the Final Environmental Impact Statement presents the logic supporting the identification of the W59 Alternative as the Preferred Alternative. Other points are made in support of the identification, specifically, "The W59 Alternative would better link the southern areas of the region with the central metropolitan area and would provide an alternative route to I-10 [Interstate 10] for regional connectivity" and "The W59 Alternative would be more consistent with local and regional transportation plans, including the RTP [*Regional Transportation Plan*]." Both points directly imply benefits for transit modes and routes. Further, discussion on pages 4-167 and 4-179 of the Draft and Final Environmental Impact Statements, respectively, under the section, *Induced Travel*, discusses cyclical benefits to transit modes resulting from the proposed action.
19	**Alternatives**	On page 3-38 of the Draft and Final Environmental Impact Statements, Table 3-9, *Implementation of the Proposed Freeway as the Appropriate Modal Alternative to Satisfy Purpose and need Criteria, 2035*, concludes that the proposed freeway, "Would provide opportunities for freeway-dependent transit services." This is an encompassing statement and addresses the comment sufficiently. The discussion of enhancement opportunities is further described on page 3-60 in the section, *Enhancement Opportunities,* in the Draft and Final Environmental Impact Statements.
20	**Purpose and Need**	The suggested language to be added is not consistent with the table subject matter of *Regional Transportation Plan* highlights.
21	**Alternatives**	Right-of-way needed for the proposed action would be used for the purpose of placing a freeway through the Study Area. The acquisition of additional right-of-way beyond that needed for the freeway for the purposes of transit use (beyond the high-occupancy lanes in the proposed action) as implied in the comment is beyond the scope of the proposed action.
22	**Alternatives**	The comment refers to the Location/Design Concept Report prepared for the proposed freeway. The 2014 Maricopa Association of Governments *Regional Transportation Plan 2035*, pages 10 to 14, includes regional funding for the completion of five additional light rail transit segments on the system. The figure will be modified in the Location/Design Concept Report to show the planned improvement accordingly.

Code	Issue	Response
23	**Design**	Sufficient detail is provided in the Draft and Final Environmental Impact Statements regarding the subject matter. The possibility of using excess lands for transit uses would be considered through the design process. Consideration of this possibility has been a common practice for other major transportation facilities in the metropolitan area. In text beginning on page 4-45 and page 4-51 of the Draft and Final Environmental Impact Statements, respectively, under the section, *Displacements and Relocations*, mitigation is presented to coordinate with local jurisdictions to use excess lands for alternative public uses. The discussion of enhancement opportunities is further described on page 3-60 in the section, *Enhancement Opportunities,* in the Draft and Final Environmental Impact Statements.
24	**Design**	Compatibility of a public land use such as a park-and-ride facility with other land uses (both existing and planned) is a local jurisdictional issue associated with land use planning. The possibility of using excess lands for transit uses would be considered through the design process. Consideration of this possibility has been a common practice for other major transportation facilities in the metropolitan area. In text beginning on page 4-45 and page 4-51 of the Draft and Final Environmental Impact Statements, respectively, under the section, *Displacements and Relocations*, mitigation is presented to coordinate with local jurisdictions to use excess lands for alternative public uses. Also, text in the section, *Enhancement Opportunities*, on page 3-60 of the Draft and Final Environmental Impact Statements, provides additional information regarding enhancement opportunities associated with the proposed action.
25	**Section 4(f) and Section 6(f)**	The reference on page 5-1 of the Draft Environmental Impact Statement is correct. The reference to Section 4(f) is referring to the situation where a Section 4(f) resource, such as the Phoenix South Mountain Park/Preserve, received Land and Water Conservation Fund Act assistance.
26	**Section 4(f) and Section 6(f)**	The Laveen Area Conveyance Channel's primary purpose is not recreation, but flood control; therefore, the channel does not qualify for protection under Section 4(f).
27	**Section 4(f) and Section 6(f)**	These undeveloped parks were added to Figure 5-7 on pages 5-12 and 5-13 of the Final Environmental Impact Statement. As noted on page 5-13 of the Final Environmental Impact Statement, these parks would be avoided by the proposed freeway.
28	**Section 4(f) and Section 6(f)**	The trail information shown in Figure 5-8 on page 5-15 of the Draft Environmental Impact Statement was digitized from a City of Phoenix pamphlet obtained at Phoenix South Mountain Park/Preserve. Information in Figure 5-8 on page 5-15 of the Final Environmental Impact Statement was obtained from a detailed Phoenix South Mountain Park/Preserve hiking map. On August 15, 2013, a Phoenix South Mountain Park/Preserve Ranger confirmed that this information reflects current conditions.
29	**Section 4(f) and Section 6(f)**	On page 5-20 of the Final Environmental Impact Statement, the sentence was changed from: "The Tunnel Alternatives do no avoid direct use of a resource afforded protection under Section 4(f), the desired outcome of this alternative development." to: "The Tunnel Alternatives would not avoid direct use of a resource afforded protection under Section 4(f), the desired outcome of this alternative development."

General Comments

37

- ADOT has a noise mitigaion program and the City request that noise mitigation measuses are taken with the new consturction of SR Loop 202 (South Mountain Freeway). The City received several resident complaints regarding noise when the north SR Loop 202 (Red Mountain Freeway) was built.

38

- An outreach line for the community during the construction of the SR Loop 202 is requested and should be seamless and response turnaround times swift. Also, conducting public outreach during various phases of the project is recommended.

39

- Public art should be incorporated with public involvement on the selection of the art.

Code	Issue	Response
36	**Section 4(f) and Section 6(f)**	In Figure 5-4 of the Final Environmental Impact Statement, on page 5-7, the last bullet in the Description column has been changed from: "Owned by FCDMCe" to: "Owned by the City of Phoenix" In addition, the footnote "Flood Control District of Maricopa County" was removed and the footnote for "Arizona Department of Transportation" was changed from an "f" to an "e."
37	**Noise**	As noted on pages 4-161 and 4-173 of the Draft and Final Environmental Impact Statements, respectively, steps would be taken to minimize noise impacts from construction activities, if an action alternative were selected. These measures would include: · All equipment exhaust systems would be in good working order. · Properly designed engine enclosures and intake silencers would be used. · Equipment would be maintained on a regular basis. · New equipment would be subject to new product emission standards. · Stationary equipment would be located as far away from sensitive receivers as possible. · Construction-related noise generators would be shielded from noise receivers (e.g., use temporary enclosures to shield generators or crushers, take advantage of site conditions to provide topographic separation). · Construction alerts would be distributed to keep the public informed of construction activities and a toll-free number for construction-related complaints would be provided. · During the design phase, hours of operation would be evaluated to minimize disruptions during construction.
38	**Public Involvement**	During construction, the Arizona Department of Transportation would hold information meetings at the beginning of construction activities regarding the upcoming improvements and work schedules. The public can be informed through construction updates/newsletters, project information hotlines, Web sites, periodic meetings, project offices, and radio and newspaper.
39	**Visual**	The Arizona Department of Transportation Roadside Development Section is responsible for assigning a wide range of standard treatment applications and wall materials, including color, to noise barriers and other structures. Typically the community where the wall would be constructed would work closely with its City Architect or planning department to decide on a theme for the wall. Usually, this can be accomplished by using the Arizona Department of Transportation's standard applications. As an example, for State Route 101 Loop (Pima Freeway) in Scottsdale, the City of Scottsdale chose to add public art to the noise barriers. The City's intent went above and beyond the Arizona Department of Transportation's guidelines of reasonable aesthetic treatment and, therefore, the Arizona Department of Transportation did not fund the aesthetic portion of the project. The Arizona Department of Transportation and the City of Scottsdale entered into an intergovernmental agreement for the purposes of allowing Scottsdale rights to design and construct artistic embellishment on the Arizona Department of Transportation-supplied noise barrier. The Arizona Department of Transportation provided the funds for construction of the noise barriers themselves, but the City of Scottsdale provided the funds to cover the aesthetic portion of the walls. Draft Environmental Impact Statement pages 4-158 and 4-159 and pages 4-170 and 4-171 of the Final Environmental Impact Statement explain the process municipalities might take to achieve the desired aesthetic treatment for noise barriers or other structures.

Letters from Rio Dell Rey Phase I Community & Riverside Elementary School District No.2

June 24, 2013

RE: Safe Path to School

Chaun Hill
ADOT
1611 West Jackson Street
Phoenix, AZ 85007

By way of introduction, my name is Jose Vejar and I am 10 year resident of the Rio Del Rey community located on 62nd Avenue and Broadway. I would like to express my concern for the safety of the children in our community. With the expansion of the new freeway coming through our community very soon, the freeway will divide both of the communities and will create a hardship for children to get to school safely. I am asking if the ADOT agency to consider the placement of a pedestrian bridge so that children in both Rio Del Rey communities can safely travel from home to school.

You consideration and attention to this issue is greatly appreciated.

Respectfully,

Jose Vejar

Rio Del Rey Phase I Community, 6222 W. Encinas Lane, Phoenix, AZ 85043, (602) 818-4792

Code	Issue	Response
40	**Neighborhoods/ Communities**	The comment reflects a concern regarding possible impacts on neighborhood cohesion of the Rio Del Rey community in the vicinity of 62nd Avenue and Broadway Road. After passage of Proposition 300 in 1985 (information about Proposition 300 is presented on page 1-9 of the Final Environmental Impact Statement), local jurisdictions, through planning efforts, sought to preserve corridors where segments of the Regional Freeway and Highway System freeways were to be located. As shown in Detail B of Figure 3-32 on page 3-56 of the Final Environmental Impact Statement, *Local Street Realignments, W59 Alternative (Preferred Alternative), Western Section*, such a swath of land was set aside with the intention that a freeway would pass through the area. The land has been vacant for almost 30 years. The referenced community developed around the planned freeway corridor in phases between 2001 and 2005. This suggests in approving the subdivision, the developers were made aware of the future freeway development and should have disclosed this information to potential homebuyers. Text in the text box entitled *Freeway Awareness*, beginning on page 4-12 of the Final Environmental Impact Statement, describes the obligation of the local jurisdictions, land developers, and the Arizona Department of Transportation in disclosing information about planned transportation facilities near proposed developments. Therefore, through the phased development of the community on each side of a known, planned-for freeway location, the project developers created a basis for community separation. The corridor is fenced off between 61st and 62nd avenues, and the conversion to the freeway use would not occur until sometime after 2014, if an action alternative were the Selected Alternative. There are two bus routes with stops at 60th Avenue and Elwood Street and 60th Avenue and Warner Street. It is the policy of the school district to discourage children from walking to school (although it is reported that some children still do walk to school) and to bus all the children to school using routes along the major arterial streets. Table 4-9, *Impacts on Community Character and Cohesion, Action Alternatives*, beginning on page 4-24 of the Final Environmental Impact Statement, addresses community cohesion impacts. Criteria for determining such impacts are presented in the sidebar entitled, *Cohesion and character of communities*, on page 4-21 of the Final Environmental Impact Statement. It is noted therein that one form of cohesion impact is the elimination of neighborhood access to commercial areas, schools, parks, or other community amenities. In this case, alternative pedestrian access would be provided at the service traffic interchanges and arterial street crossings at Broadway and Lower Buckeye roads (although children walking to school would be discouraged and bus routes provided). Pedestrian facilities provided at those crossings would be designed to meet applicable design standards established in part for the safe use of those facilities, and, therefore, access would not be eliminated. This alternative pedestrian access would be provided during construction and after the freeway were built, if an action alternative were to become the Selected Alternative; however, pedestrian facilities near potential freeway construction would be closed for limited periods of time for safety reasons. Such closures would be temporary and would occur only during construction activities.

(Response 40 continues on next page)

Code	Comment Document

Code	Issue	Response
40 (cont.)		Regardless of the subdivision development history and the alternative pedestrian access, additional text was added into Final Environmental Impact Statement Table 4-9 on page 4-24 for the W59 Alternative in the heading column, *Effect on Community Cohesion*, to read "Would displace residences within the Rio Del Rey subdivision, an area of census blocks that contain minority populations." In the section, *Mitigation*, beginning on page 4-23 of the Final Environmental Impact Statement, a measure was added to the text to read "ADOT would coordinate with appropriate City of Phoenix officials during the final design process to consider and identify, if appropriate, enhancements such as a pedestrian overpass to reduce possible pedestrian-related impacts. During that process, if mitigation is warranted, the operations, maintenance, and liabilities of the facilities would be passed on to the local jurisdictions." The following was added to Table S-4 on page S-18 of the Final Environmental Impact Statement: "ADOT would coordinate with the City of Phoenix to consider and identify, if appropriate, measures to reduce possible pedestrian-related impacts."

RE: Safe Bridge to School

To whom it may concern:

40

By way of introduction, my name is Patty Lopez-Vejar and I am 10 year resident of the Rio Del Rey community located on 62nd Avenue and Broadway. I would like to express my concern for the safety of the children in our community. With the expansion of the new freeway coming through our community very soon, I am asking if the ADOT, City of Phoenix and any other interested agencies/stakeholders will consider the placement of a pedestrian bridge so that children in both Rio Del Rey communities can safely travel from home to school.

You consideration and attention to this issue is greatly appreciated.

Respectfully,

Patty Lopez-Vejar

Rio Del Rey Phase I Community, 6222 W. Encinas Lane, Phoenix, AZ 85043, (602) 818-4792

Subject Letter for ADOT

40

Good day,
I see a couple major concerns when the 202 goes through our subdivision. One, it the safety of the school children or anyone else that would like to cross the highway. Many student attend school just west of the subdivision. They would have to find a way to walk to school safely. It would create a hardship for students and parents I believe that ADOT should include the SRTS as part of the 202 project. Another concern is the freeway will divide the community. Rio Del Rey is made up of different Phases. Board members of our HOA board come from both Phases. We have community cookouts and gathering that would create problems if one phases couldn't cross the highway safely. Please consider some form of walkway to go over the highway.
Thank you
Resident of Rio Del Rey subdivision.

To whom it may concern. My son is going to be going to school during the construction of the new freeway and my concern is that during this time there is no safe path for the kids to travel. Being the President of the HOA this is a very big concern for the community. Is there anything that can be constructed to help us such as a walk way over the freeway and a temporary path during the construction. Please feel free to contact me at any time.

Subject request for loop 202 SRTS for Rio Del Rey

40

Dear Ms. Soto,

I am writing to request a "safe route to school" bridge be included by ADOT in the loop 202 construction between Broadway and Lower Buckeye.

I am a resident of the Rio Del Rey community. The construction of the freeway will divide the community and impede traffic between the school and residences. A bridge would allow students to continue their education services uninterrupted and alleviate some of the hardships borne during construction of the freeway..

I appreciate your consideration in this matter.

Sincerely,
John Tyler

We have been the center of our community and continue to provide services to our students and parents that reside within our boundaries. As the city has approved additional housing developments within our school boundaries it is imperative that we plan accordingly in the design of the proposed freeway. Our student population will increase twofold by 2014. This will increase pedestrian traffic to and from Kings Ridge Preparatory Academy. The proposed freeway will cut through our Rio Del Rey Community leaving a major portion of our students crossing the freeway. We are recommending that ADOT consider the safety of our students by locating a pedestrian bridge within the vicinity of 62nd Avenue and Broadway. This will ensure a safe transit point for our students to and from school. Please feel to contact me if you need any additional information to support this recommendation. Sincerely, Jaime A. Rivera, Superintendent of Schools Riverside Elementary School District #2

RE: Opposition to proposed South Mountain Loop 202 Pecos Alignment

The South Mountain Freeway is the most important issue affecting the quality of life in Ahwatukee. I am strongly opposed to the South Mountain Loop 202 Freeway, in particular, the Pecos Road alignment. I am on record, since the 90's, opposing this due to the damage it will cause.

Ahwatukee is home to me and my family. We love this community dearly and it is my goal to preserve the quality of life we have all come to enjoy.

1 The proposed Loop 202 alignment will have a dramatic affect on our community. The loss of over 250 houses, churches and vital water resources that impact huge communities like the Lakewood development and the Foothills development, whose well water will be lost in the construction, are just some of the reasons to oppose the Pecos Road alignment. In addition, it is unimaginable that a proposed route would cut through one of our state treasures – South Mountain Park. As an avid hiker of this park, the prospect of any portion of it being blasted apart to make way for a freeway shows a total lack of understanding of this area and the importance South Mountain Park plays in our way of life in Ahwatukee.

2 I have fought hard to seek alternative routes and I will continue to do so. I have made a commitment to protect our community and make sure all options are explored. However, I will continue to oppose the Pecos Road alignment, as it is not the right choice for our community.

3 Sincerely,

4 Sal DiCiccio

Recycled Paper

Code	Issue	Response
1	**Neighborhoods/ Communities**	While the E1 Alternative is adjacent to the largely residential areas of Ahwatukee Foothills Village (to the north), a freeway has been planned in this location for many years (see pages 4-17 and 4-21 of the Final Environmental Impact Statement). Where existing residential uses are adjacent to the proposed freeway, noise mitigation would be implemented according to the Arizona Department of Transportation policy (see page 4-88 of the Final Environmental Impact Statement).
2	**Neighborhoods/ Communities**	Prospective home buyers and members of the church built after the freeway was conceived, according to State law, should have been informed of the proposed facility. (Sellers are obligated by Arizona common law to disclose all known material facts about a property to the buyer.)
3	**Groundwater**	If a well were adversely affected by construction activities, the well might need to be abandoned or the well owner would be compensated by drilling a new well according to State regulations/standards. (See text box on page 4-108 of the Final Environmental Impact Statement.) The well replacement program as outlined by State law would be implemented by the Arizona Department of Transportation to effectively mitigate well impacts associated with its projects throughout the region.
4	**Section 4(f) and Section 6(f)**	The proposed South Mountain Freeway would pass through the park's southwestern edge. Section 4(f) of the Department of Transportation Act extends protection to significant publicly owned public parks, recreation areas, and wildlife and waterfowl refuges, as well as significant historic sites, whether they are publicly or privately owned. This protection stipulates that those facilities can be used for transportation projects only if there is no prudent and feasible alternative to using the land and the project includes all possible planning to minimize harm to the land [see Final Environmental Impact Statement, Chapter 5, *Section 4(f) Evaluation*]. The project team examined alternatives to avoid the Phoenix South Mountain Park/Preserve, but did not identify any feasible and prudent alternatives to avoid impacts on the park. The Arizona Department of Transportation continues to work with park stakeholders to minimize impacts and address concerns. Measures to minimize harm to the park were developed (see Final Environmental Impact Statement, starting on page 5-23). The portion of the park that would be used for the proposed freeway would be 31.3 acres, or approximately 0.2 percent of the park's approximately 16,600 acres (see Draft and Final Environmental Impact Statements page 5-31). Phoenix South Mountain Park/Preserve would remain the largest municipally owned park in the United States. Nine-tenths of a mile of the proposed freeway would pass through the park's southwestern edge (see page 5-14 of the Final Environmental Impact Statement). The activities that make the park a highly valued resource (recreational activities, interaction with the Sonoran Desert) would remain.

me because I'm over on 74th Avenue. That's pretty much all I have.

* * *

UNIDENTIFIED SPEAKER: I think they're a little late in doing this, but I hope they do do this at some point. I don't see any reason not to do this. I think in Phoenix, in general, they wait until it's too late to do some of this planning. So I think with all the information available, it's very overwhelming. But this project is definitely needed and just to alleviate some of the stress downtown with traffic and help have alternative ways of getting to West Phoenix other than driving through Central Phoenix.

So I'm a native to Ahwatukee, and this has been something on the burner for a while now and hasn't come to fruition, so I think that's my statement.

I don't see any reason why they haven't built it around. I think of all the new opportunities, it will -- housing and jobs and stuff, just "build it and they will come" kind of thing. If they build a freeway, there might not be anything there now, but why wait until everything is there and then build it -- not aggressive or proactive, but that's basically it.

a city councilman for the City of Phoenix for District 7, which happens to be in the location of the South Mountain Freeway. And one of the concerns I have here is that the Valley commuters have to wait a long time in traffic jams; that the I-10 is hours and hours of waiting, and coming in and out of town, that we're going to end up being another Los Angeles and that we need to complete the 202; that putting in the so-called South Mountain Freeway will relieve all of that; that we need to make sure that traffic moves smoothly and that it's not congested.

We're also looking at two different votes. People voted back in, I think it was 1985 and in 2004, to build the freeway, and it's about time that we do so; that people were promised in 2001 that it was -- the freeway, that they would break ground on the freeway. Now we're at 2013 and it hasn't broken ground, and it's impacting in the City of Phoenix because of our infrastructure. Our infrastructure is all based on the freeway itself, so we can't complete all of our streets and sidewalks and connect the west to east boundaries.

It was completed in the Laveen area, the north to south; but there is a delay on the east to west because we're not sure if the freeway is going in. If it does go in, we want to make sure we're not building

recommending -- or that's why I as a city council member are recommending to build it on city property.

Pecos Road has already been cleared for that, the majority has already been bought. If you drive down the I-10, you will see the stack for the Pecos Road and the rest of the 202. The 202 will -- this portion of the South Mountain Freeway will connect what is the missing link between the East Valley and the West Valley. It will complete the whole 202.

We're the 6th largest city in the country and not having a freeway that's connected creates this congestion and has motorists on freeways for hours just idling, and I think that's worse for our environment than not building a freeway.

On top of all of that, we're looking at 30,000 jobs, and it'll probably be the biggest stimulus project in the state of Arizona that we're going to have, close to almost $2 billion. So it's something that's going to bring revenues for the state, something that's going to bring jobs for the state, and the other thing is it's going to basically relieve the traffic that we have and reduce the air pollution and that's one of the things that we need.

Also, if you look in the Laveen and South Phoenix areas, we have low income individuals that have

Code	Issue	Response

Code	Comment Document

streets in the wrong area.

The other thing is that the residents out in the Laveen area are still waiting for all the different amenities, like restaurants, hospitals, things for families, just movie theaters and all of that. And every time we try to advocate for businesses to move to Laveen, they're saying that once the freeway is decided that's when they'll make the decision to bring in those types of businesses, hospitals, and other things that are needed.

If you look at the City of Phoenix, south of the Rio Salado, there's not a hospital. And shame on us that we don't have a hospital south of the river. And this freeway will bring a hospital south of the river, if it's built.

The other concerns we're hearing out there is the whole concern of the residency, that they don't want the freeway to be built on the reservation, so that means that we have to build it on the foothills of the South Mountain. And basically we're looking at about a 17,000-acre park, and we're going to probably touch about 30 acres of that park or of the mountain, because we can't build it on the reservation.

They have taken some of the votes and they have been voted down. That's why the City of Phoenix is

Code	Issue	Response

Code	Comment Document

no ways to get to a hospital if there's a emergency. So having a freeway will bring a hospital closer to individuals. Instead of driving at least 20 minutes away, you'll have a hospital within five to ten minutes. You'll just have people with disabilities that have no way of getting to a hospital also, and this will bring a hospital for that. So for low income people, people from disability, and for minorities, it'll bring not only a hospital but good paying jobs also. That's it. Just build that damn freeway.

* * *

PAULA FLECK: Paula Fleck. I just wanted to add that I heard a woman get up and speak and mention that she believed that adding the 202 would cause emphysema. And I'm a respiratory therapist, and I can tell you that emphysema is not caused by pollution from the 202. Over 90 percent of it is caused by smoke like cigarettes or any kind of thing you would smoke. About, I'd say, five percent would be from secondhand smoke or working in a job where you're around a lot of chemicals, directly exposed and not protecting yourself with the mask, and about one percent of it is caused by alpha 1-antitrypsin. Those are rough numbers.

But I'll tell you this is from my schooling, as well as what I've seen working in a

The Arizona Chamber of Commerce and Industry strongly supports the construction of the South Mountain Freeway. We believe that this freeway addition will cut traffic congestion across the metro area, reduce air pollution, and have a positive impact on Arizona's economy.

Arizona's workers rely on our roads and freeways as an efficient way to get to and from their workplace. If we don't build the South Mountain Freeway, traffic in the region will get much worse over the next two decades. According to a study conducted by the Arizona Department of Transportation, morning and evening commute times will increase 39% to 82% over the next twenty years and traffic congestion on city streets will increase by 46%. This means vehicles will spend longer periods of time idling in traffic, consequently increasing air pollution in the area.

The South Mountain Freeway project is also crucial to Arizona's economic recovery. The project will create 30,000 jobs during the five to six year construction period and result in a $2 billion investment in the Phoenix economy.

Furthermore, The South Mountain Freeway is welcomed with broad support across Maricopa County by a near 2-1 margin according to a poll commissioned by We Build Arizona. The poll also revealed that voters in Ahwatukee and Laveen, who would be directly affected by the construction, view the freeway project with 59% support.

ADOT Loop 202 South Mountain Freeway Study
1655 W. Jackson Street
MC 126F
Phoenix, AZ 85007

To Whom It May Concern:

On behalf of the Arizona PIRG Education Fund, I am writing to respond to the Arizona Department of Transportation's draft Environmental Impact Statement (EIS) for the South Mountain Freeway. In our opinion, there is a critical flaw in the draft EIS and its assumptions on recent driving data and driving trends.

South Mountain Freeway was originally proposed in 1985, so three decades later, Arizona's policy makers should be evaluating if this project still makes sense given current transportation trends. Investing taxpayer money in the construction of a major highway deserves thorough examination.

1 For the first time in two generations, there has been a significant shift in how many miles Americans are driving each year. A report that the Arizona PIRG Education Fund released last year demonstrates that young people in particular are decreasing the amount they drive and increasing their use of transportation alternatives.[1]

2 Since transportation infrastructure lasts for decades, the investments we make in transportation infrastructure should be based not only on what is required to meet our needs today, but also on anticipated future needs. For decades, it was assumed that we would drive more miles, necessitating new highways to alleviate the crippling congestion that was sure to follow. For at least the past five years, though, those anticipated increases in driving have failed to materialize in Arizona. It does not appear that this draft EIS has taken these changes into account and instead assumes that Arizonans will continue to drive more and more. Our research indicates that a return to the previous patterns of driving ever more miles is unlikely.[2]

1	**Purpose and Need**	The analyses in the Draft Environmental Impact Statement used socioeconomic and traffic projections at the regional analysis zone and traffic analysis zone levels. At the time of publication of the Draft Environmental Impact Statement, Census 2010-based socioeconomic data at the regional analysis zone and traffic analysis zone levels had not been adopted by the Maricopa Association of Governments and were not available to the project team. Therefore, the data used in the Draft Environmental Impact Statement were the most appropriate information available. The Maricopa Association of Governments approved new population, employment, housing, and traffic projections in June 2013. The new data are presented in the Final Environmental Impact Statement beginning on page 1-11. The purpose and need and analysis of alternatives were updated and reevaluated using these new socioeconomic projections and corresponding projections related to regional traffic. While new projections based on the 2010 Census showed a lower anticipated population and vehicle miles traveled in 2035 than the previous projections, the conclusions reached in the Draft Environmental Impact Statement were validated in the Final Environmental Impact Statement (see Chapter 3, *Alternatives*). The traffic analysis demonstrated that the proposed project is needed today and will continue to be needed into the future. The traffic analysis used the Maricopa Association of Governments travel demand model (TransCAD software platform), as certified by the Federal Highway Administration and reviewed by the U.S. Environmental Protection Agency for air quality conformity (see Final Environmental Impact Statement page 3-27). The model projects demand for multiple modes of travel, including automobile, bus, and light rail. Driving patterns and alternative modes of transportation are among the key model inputs used to forecast travel demand in the Study Area.
2	**Purpose and Need**	The proposed freeway is part of a multimodal transportation plan, the *Regional Transportation Plan*, that includes substantial investments in transit, nonmotorized travel, and system management and demand management strategies. The proposed freeway is part of the system needed in the region to address future travel needs for the movement of people, goods, and services. The comment relies on national trends for travel; however the local conditions and setting of the Phoenix metropolitan area are not consistent with areas of high-density cities in other parts of the country. In Maricopa County, daily vehicle miles traveled levels increased by almost 2 percent between 2011 and 2012 and the 2012 daily vehicle miles traveled is approaching the prerecession peak in 2007. (*Source*: Arizona Department of Transportation Multimodal Planning Division Highway Performance Monitoring System Data for the Calendar Year 2012 and 2011). Even if the trend of vehicle miles traveled "per capita" decreasing continues, the total vehicle miles traveled in the region would still increase along with increases in total population.

Code	Comment Document

According to Federal Highway Administration data, total vehicle-miles travelled (VMT) for Arizona is last reported for 2011 at 59,574 million annually,[3] which is a decline of more than 5 percent from the peak year of 2007 when Arizona topped out at 62,963 million miles.[4] Furthermore, a graphic in the summary of the draft EIS places an unnecessarily large arrow covering what has happened to VMT since 2005,[5] thus obscuring how post-2005 data actually assumes reversal of current trends.

The VMT projected in the draft EIS are, at best, out-of-date, and at worst, inaccurate and could greatly overstate future driving patterns.

Please do not hesitate to contact me if you have any questions. I can be reached at sunrein@arizonapirg.org or at 602-252-1184.

Sincerely,

Serena Unrein
Public Interest Advocate

ARPA ARIZONA ROCK PRODUCTS ASSOCIATION

May 17, 2013

Arizona Department of Transportation
Attn: South Mountain Study Team
1655 W. Jackson St. MD 126F
Phoenix, AZ 85007

RE: Support of the 202 South Mountain Freeway Project

Members of the ADOT South Mountain Study Team:

1 The Arizona Rock Products Association (ARPA) supports moving forward expeditiously with the 202 Freeway Project. The South Mountain 202 freeway project will significantly reduce traffic congestion across the Phoenix metro area, reduce air pollution, create jobs and save drivers' time and money.

ARPA has been providing representation for 38 member companies involved with the production of aggregates, asphaltic concrete, ready mix concrete, asphalt, lime products, and portland cement. ARPA members, include over 53 associate members providing related transportation, contracting, and consulting services to vital state infrastructure projects like these.

The Traffic

The Valley's freeways, especially I-10, are congested throughout different times of the day. Traffic on Interstate 10 is projected to grow significantly between now and 2035. According to an ADOT study we may be facing a 28% increase in volumes. Specific locations within the Phoenix Metropolitan area could see increases of 103,000 cars every day. Travel times will increase without the South Mountain Freeway and commutes can be expected to take from 39% to 82% longer if nothing is done to relieve congestion. As a result, traffic on surface streets will grow 46% by 2035. Something can and must be done.

The Environment

The same report indicates the project also will positively impact air pollution by reducing the time vehicles spend stuck in traffic. Valley commuters spend inordinate amounts of time in traffic jams throughout the valley which exacerbate our current air quality issues and business, industry and taxpayers pay for dearly in the form of additional measures to reduce emissions. Likewise, we risk loss of further transportation funding if we fail to attain at the air quality monitors. It is incumbent on us to pursue transportation options that reduce emissions.

The Economy

There is no more important transportation project to the area's commuters and workers than the South Mountain Freeway project. The 202 will create 30,000 jobs during the five to six year construction period and result in a $2 billion dollar investment in the Phoenix-area economy.

Let's Go!

Based on recent polls, 64.3% of likely voters in Maricopa County support construction of the freeway. Further, in a separate survey, 59% of likely voters living in Ahwatukee and Laveen support the freeway. The support is there for the project, the money to build the freeway is in the budget and it was approved by voters twice, first in 1985 and again in 2004. It is clearly time to begin construction on the South Mountain 202!

Sincerely,

Steve Trussell
Executive Director

in a separate survey, 59 percent of likely voters living in the Ahwatukee and Laveen area support the freeway as well.

The support is there for the project, and the money to build the freeway is in the budget, as it was approved by voters twice, in '85 and in 2004. It's clearly time to begin construction on the South Mountain. Thank you.

THE FACILITATOR: Thank you, Mr. Trussell.

Ariel LeBarron.

MS. LeBARRON: Hello, my name is Ariel LeBarron, and I am a student at the School of Feasibility. I grew up here, I was born and raised. And I oppose the South Mountain Freeway, just because it would increase air pollution, and I feel there are better alternatives that we could be putting our tax money into, such as public transportation. This would increase our air quality, so that our future generations wouldn't be as affected. And I think by putting a freeway and expanding it outward is going to make people use and buy cars more, instead of trying to switch to public transportation.

I think for our future we should be focusing on better alternatives. Thank you.

I just got a call from the Director's Office. Lila received a call from a Mr. Steve Brittle from Don't Waste Arizona. He is very upset that a number he was given to make a comment on the South Mountain Project 602-712-7767 doesn't work or won't let him leave a comment. He is threatening to escalate his actions if this isn't corrected. I've included the link to the website of the organization he represents. I have not spoken to the gentleman, but I was told he would like to have someone call him ASAP.

Please let me know who can contact Mr. Brittle.

Mr. Brittle is calling the Director's office wondering where to pick up some documents. Apparently someone called him today around 1:00, but he doesn't know where to go and is worried because it's after 4:00. Could whoever called him let me know what's been arranged. The Director's office is confused and has no idea of what he is talking about.

Thanks,

1	**Public Involvement**	The first record of a call placed to the Arizona Department of Transportation Environmental Planning Group by the commenter was Saturday, June 8, 2013. The call was returned to the commenter on Monday, June 10, 2013, and a disc containing the technical reports was provided on the same day. On June 17, 2013, the commenter contacted the Arizona Department of Transportation by e-mail to request a scoping technical report, if one existed. The scoping technical report was provided on June 18, 2013. Two of the technical reports requested [Cultural Resources and Section 4(f)] contained confidential information. After discussion with the Federal Highway Administration, release of the reports, in redacted form, was approved. Additional time was needed for the Arizona Department of Transportation's cultural resources staff to review the documents and to redact the information deemed confidential. However, the redacted technical reports were provided on June 28, 2013. Because the comment period on the Draft Environmental Impact Statement was doubled for this project (90-day comment period instead of the 45-day comment period required by 40 Code of Federal Regulations 1506.10), the commenter had adequate time to prepare comments.

with the panel, they are here to listen to your comments, they are indeed comments.

So at this point I'd like to go ahead and get started, and we have one preregistered person who has arrived and that person is Maxine Lakin -- I'm sorry, Joanne McCarthy will go first.

And as you see your names in the queue, you're welcome to come up to each microphone so we can keep people moving.

We will now proceed to the non-preregistered procedure, so at this point, Steve Brittle, please.

MR. BRITTLE: My name is Steve Brittle, I'm the president of an organization named Don't Waste Arizona. We'll be filing substantive comments later, but I want to put something on the record immediately. Upon review of this wholly inadequate environmental impact statement draft, I have seen many in my life, I've never seen one so wrong and so devoid of real and current information.

The real shocker to me as an expert in Hazmat is the chapter in Hazmat does not talk about the risk of truck transportation of hazardous materials. And when I first looked at that I thought well, certainly HDR, who has done this kind of thing, should know about commodity flow studies done by the state emergency response commission, so I went there to get them and I got them.

1

Page 4

Driver and Nix Court Reporters - (602) 266-6525
www.drivernix.com

Code	Issue	Response
1	**Hazardous Materials**	Arizona highways, as are most highways across the United States, are open to all kinds of traffic, so long as the cargo being carried is in accordance with U.S. Department of Transportation regulations for the specific type of cargo. The Arizona Department of Transportation has a few locations in the state with hazardous cargo restrictions, but these restrictions are based on emergency response issues or roadway design limitations specific to that location. For example, the Interstate 10 Deck Park Tunnel has certain hazardous cargo transport restrictions because of the limited ability for emergency responders to address a hazardous materials incident in the tunnel. The South Mountain Freeway, if implemented, is expected to operate under the same rules as other similar facilities in the state; transport of hazardous cargo would be expected to be permissible (see text box on page 4-166 of the Final Environmental Impact Statement). The project team is aware of the Hazardous Materials Commodity Flow Studies that the Arizona State Emergency Response Commission maintains. These studies are used by emergency response planners (such as the Arizona State Emergency Response Commission statewide and the Maricopa County Local Emergency Planning Commission for Maricopa County) as one of the elements considered when developing emergency response plans. If the plan is amended, it is made available to the Arizona Department of Transportation. In the event of an incident with a hazardous materials issue on a State or federal highway, the emergency responders contact the Arizona Department of Transportation's Traffic Operations Center to report the incident. The Traffic Operations Center then contacts the Arizona Department of Transportation's Safety and Risk Management group, which responds to the accident scene and assesses needs in concert with the Incident Commander from the responding agency with jurisdiction. If requested, the Arizona Department of Transportation can assist cleanup activities by engaging specialty subcontractors with whom the Arizona Department of Environmental Quality has contracts for such support. The Arizona Department of Transportation's Safety and Risk Management group's charge is primarily public health protection, with cleanup support being secondary. According to 46 *Federal Register* 18026 (March 23, 1981), the environmental impact statement must discuss reasonably foreseeable actions. These are actions that are likely to occur or probable, rather than those that are merely possible.

Code	Comment Document

And I also found out that HDR was under contract with ADOT to look at all of that information. Now, in the commodity flow study they talked about what kinds of chemicals are being transported on the highways and all the information is there; but, of course, this was deliberately excluded because it would lead only to the logical conclusion of a no-build.

You would breathe in chemicals that would have never been in that community of Ahwatukee or Laveen ever before; 77,000 people in Ahwatukee, 35,000 people in Laveen will be at imminent risk of death because the area that -- where people would be killed or harmed includes in the case of a worst-case scenario from chlorine release, which is on the highway documented, would kill most people in Ahwatukee within five minutes. There is no way out. This is a unique cul-de-sac-type community and you're even going to remove one of the routes out of there by taking away the 30th exit street alignment on Pecos Road, so it's a death trap. The people in Laveen, 35,000 of them, they don't have this kind of stuff in their community. They would never know and they would be over with.

Now, it's obvious that HDR and ADOT knew about all of this. The warnings are right there even in the executive summaries of these transportation commodity

Code	Issue	Response

Code	Comment Document

flow studies, which means in this case we go beyond the pale of ignorant or a slant. I think we're in the area of felonious behavior, fraud, racketeering, and we're going to be urging the attorney general of this state to do a probe of ADOT and HDR.

You spent $22 million and you didn't do anything with it other than lie, obfuscate, and eliminate anything that might lead to the logical conclusion, which is the no-build option. And we will be waiting for them in court. I have to say, I have to thank them, such a deficient and devoid argument should make it pretty much easier than we had anticipated to litigate this, and hopefully, with any luck, some of these people will actually go to jail. Thank you.

THE FACILITATOR: Thank you, Mr. Brittle.

One more comment before we continue. For those of you who see their name on the screen, if you're in the back part of the room if you want to make your way up so we can get people closer to the microphone, that would help us throughout the day, so feel free to move up.

Just one note for those of you who are -- and we understand it's very difficult sometimes in working with prepared notes, to keep in mind the time here, so if you would from time to time, if you're working from notes please take time out to double-check the time. You're

From: Don"t Waste Arizona
To: Projects
Subject: Comment regarding the South Mountain Freeway DEIS; call for audit of ADOT and federal grand jury
Date: Wednesday, July 24, 2013 5:22:09 PM

Don't Waste Arizona, Inc. (DWAZ) is a non-profit environmental organization dedicated to the protection and preservation of the environment in Arizona. DWAZ is especially concerned about dishonest government agencies that do not do their job, environmental justice, civil rights protections, risks from hazardous materials and toxics, and air pollution. DWAZ has an extensive, successful background in litigation enforcing federal environmental laws and some NEPA cases.

DWAZ is headquartered at 6205 South 12th Street, Phoenix, AZ 85042, and may be reached at (602) 268-6110. DWAZ has members in the affected areas. DWAZ is allied with PARC, et al for the purposes of preparing comments in opposition to the freeway, and the use of these comments by these allies is allowed and unrestricted. Stephen Brittle, President of Don't Waste Arizona, is also a member of PARC.

After reviewing the expert comments and submittals for PARC et al, DWAZ states its opinion in the following comments:

There is no way that the DEIS is valid in any way, and there is no accident that it is a deceitful, deficient, and fraudulent document. This has to be by design; the pattern of errors and miscalculation as presented in this DEIS cannot occur randomly. There is evidence of a pattern of deception and deceit, of what appears to be fraud, of a deliberate withholding of critical information that would put the proposed freeway in a negative light, and of negligence, perhaps criminal intent.

Some examples of what leads DWAZ to this conclusion:

(1) The withholding of the public documents that NEPA requires to be openly available during the time 90-day comment period, and the long delays in responding to public records requests, including the production of some documents without communicating the request for records was incomplete.

(1) The statements in the DEIS about the availability of documents and their being placed at certain public repositories when they were never placed there, and calling the numbers listed in the DEIS to get access or copies were not returned.

(2) The willingness to represent that the South Mountain Freeway would reduce air pollution when it would instead worsen it and harm public health along the freeway route by exceedances of the particulate matter and carbon monoxide standards, which indicates a knowing and informed willingness to put public health and safety at risk.

(3) The misrepresentation of the hazards and risks of Mobile Source Air Toxics along the freeway route, by not stating honestly that there is already a severe problems with high levels of Mobile Source Air Toxics along the freeway route, which indicates a knowing and informed willingness to put public health and safety at risk.

(4) The complete omission of the risks caused by transportation of hazardous materials along the

Code	Issue	Response
1	**Public Involvement**	The Draft Environmental Impact Statement was made available at five public locations throughout the area and was available for purchase at one location. All hard copies of the Draft Environmental Impact Statement placed for public viewing contained the appendices as a compact disc in pockets in the back of the document. The Draft Environmental Impact Statement was also available by compact disc by request, at the public hearing, and on the Web site at <azdot.gov/southmountainfreeway>. These locations were advertised and the public notification history is documented on page 6-23 of the Draft Environmental Impact Statement. Technical reports and other information were available by request. The first record of a call placed to the Arizona Department of Transportation Environmental Planning Group by the commenter, was Saturday, June 8, 2013. The call was returned to the commenter on Monday, June 10, 2013 and a disc containing the technical reports was provided on the same day. On June 17, 2013, the commenter contacted the Arizona Department of Transportation by e-mail to request a scoping technical report, if one existed. The scoping technical report was provided on June 18, 2013. Two of the technical reports requested (Cultural Resources and Section 4[f]) contained confidential information. After discussion with the Federal Highway Administration, release of the reports, in redacted form, was approved. Additional time was required for the Arizona Department of Transportation's cultural staff to review the documents and to redact the information deemed confidential. However, the redacted technical reports were provided on June 28, 2013. Because the comment period on the Draft Environmental Impact Statement was doubled for this project (90-day comment period instead of the 45-day comment period required by 40 Code of Federal Regulations 1506.10), the commenter had adequate time to prepare comments.
2	**Air Quality**	The carbon monoxide analysis presented on page 4-65 of the Draft Environmental Impact Statement and updated on page 4-75 of the Final Environmental Impact Statement represents projected carbon monoxide concentrations along the project corridor, including those proposed interchange locations along the South Mountain Freeway. The Arizona Department of Transportation also conducted a quantitative particulate matter (PM_{10}) hot-spot analysis that is discussed on page 4-76 of the Final Environmental Impact Statement. The carbon monoxide and particulate matter (PM_{10}) analyses demonstrated that the proposed freeway would not contribute to any new localized violations, increase the frequency or severity of any existing violation, or delay timely attainment of the National Ambient Air Quality Standards or any required interim emissions reductions or other milestones.
3	**Air Quality**	The emissions modeling developed for the proposed action showed that for the mobile source air toxics study area, constructing the freeway would have a marginal effect on total mobile source air toxics emissions in 2025 and 2035 (less than a 1 percent difference in total annual emissions between the Preferred Alternative and No-Action Alternative) (see discussion beginning on page 4-77 of the Final Environmental Impact Statement). With the Preferred Alternative in 2035, modeled mobile source air toxics emissions would decrease by 57 percent to more than 90 percent, depending on the pollutant, despite a 47 percent increase in vehicle miles traveled in the Study Area compared with 2012 conditions.

(Response 3 continues on next page)

Code	Comment Document
	South Mountain Freeway and the likelihood that there would be serious loss of life and severe public health impacts in the event of an incident involving the release of hazardous chemicals, especially when ADOT had its contractor for the DEIS review all of the Hazardous Materials Commodity Flow Studies at the Arizona Emergency Response Commission, therefore knowing quite well of the nature and frequency of the transport of these chemicals, which indicates a knowing and informed willingness to put public health and safety at risk.
5	The failure to utilize the most current data and scientific methods in preparing the DEIS, contrary to regulation, and mostly using data, reports, and studies that are eight years old, in violation of NEPA regulations.
6	The expenditure of over $22 million in the preparation of the DEIS as well as the $87 million+ in acquiring properties along the proposed route before the NEPA process was completed; indeed starting 14 years before the NEPA process even began, and purchasing $43 million of properties just along the 59th Avenue alignment, while pretending that there were three alternative routes being examined in the DEIS.
	The strange concoctions of formulas represented to the public as legitimate modeling of data to show the desired outcomes of supporting the freeway, when no capable or competent environmental professional would ever use the data that was used, nor would these calculations ever be conducted in the manner they were, which indicates a knowing and informed willingness to put public health and safety at risk.
7	The omission of any information about the WQARF sites that the western alignment would cross, and the environmental contamination liability and cleanup costs that the public would assume as a result of the condemnation of the affected properties.
	The many unsubstantiated statements and assertions in the DEIS that have no basis in fact or have accompanying documentation.
8	The lack of any discussion of the severe property devaluation that would occur along the freeway route, especially in Ahwatukee Foothills along the Pecos Toad alignment.
9	The arbitrary rejection of alternate routes for the freeway through the years, and the arbitrary rejection of SMCAT's choice, the 101 alignment.
10	The racist and discriminatory dismissal of native American tribal concerns about a mountain that is sacred to them.
	Because of the aforementioned, DWAZ concludes that the proper action should be an audit of ADOT and the convening of a federal-level grand jury investigation of ADOT in these matters, as this DEIS is what appears to be a fraudulent scheme to get federal money for an ill-advised freeway that would solve no problems regarding traffic flow, congestion, and air pollution.
	Stephen M. Brittle
	President

Code	Issue	Response
3 (cont.)		The Preferred Alternative would also reduce in-vehicle mobile source air toxics exposure as opposed to the No-Action Alternative. The U.S. Environmental Protection Agency has found that in-vehicle benzene concentrations were between 2.5 and 40 times higher than nearby ambient concentrations, based on a review of studies discussed in the Regulatory Impact Analysis for the U.S. Environmental Protection Agency's 2007 mobile source air toxics rule-making (Final Regulatory Impact Analysis, Environmental Protection Agency 420-R-07-002, 3-17 [February 2007]). Construction of the South Mountain Freeway would result in a reduction in benzene exposure to drivers and passengers for two reasons: decreased travel times (motorists would spend less time in traffic to reach their destinations) and lower emissions rates (attributable to speed improvements). Reducing on-road exposure would provide a health benefit for motorists using the freeway under consideration. Congestion relief resulting from the proposed freeway would provide localized air quality emissions reductions on area freeways and arterial streets and at interchanges, benefiting users of area highways and those living near congested roads.
4	**Hazardous Materials**	Arizona highways, as are most highways across the United States, are open to all kinds of traffic, so long as the cargo being carried is in accordance with U.S. Department of Transportation regulations for the specific type of cargo. The Arizona Department of Transportation has a few locations in the state with hazardous cargo restrictions, but these restrictions are based on emergency response issues or roadway design limitations specific to that location. For example, the Interstate 10 Deck Park Tunnel has certain hazardous cargo transport restrictions because of the limited ability for emergency responders to address a hazardous materials incident in the tunnel. The South Mountain Freeway, if implemented, is expected to operate under the same rules as other similar facilities in the state; transport of hazardous cargo would be expected to be permissible (see text box on page 4-166 of the Final Environmental Impact Statement). The project team is aware of the Hazardous Materials Commodity Flow Studies that the Arizona State Emergency Response Commission maintains. These studies are used by emergency response planners (such as the Arizona State Emergency Response Commission statewide and the Maricopa County Local Emergency Planning Commission for Maricopa County) as one of the elements considered when developing emergency response plans. Whenever a new road is introduced to an area, the jurisdiction with responsibility for maintaining that area's emergency response plan amends the plan to include the new facility. If the plan is amended, it is made available to the Arizona Department of Transportation. In the event of an incident with a hazardous materials issue on a State or federal highway, the emergency responders contact the Arizona Department of Transportation's Traffic Operations Center to report the incident. The Traffic Operations Center then contacts the Arizona Department of Transportation's Safety and Risk Management group, which responds to the accident scene and assesses needs in concert with the Incident Commander from the responding agency with jurisdiction. If requested, the Arizona Department of Transportation can assist cleanup activities by engaging specialty subcontractors with whom the Arizona Department of Environmental Quality has contracts for such support. The Arizona Department of Transportation's Safety and Risk Management group's charge is primarily public health protection, with cleanup support being secondary. According to 46 *Federal Register* 18026 (March 23, 1981), the environmental impact statement must discuss reasonably foreseeable actions. These are actions that are likely to occur or probable, rather than those that are merely possible.

Code	Issue	Response
5	**Air Quality**	Data and scientific methods used in the Draft Environmental Impact Statement were the most appropriate information available and considered state-of-the-practice respectfully throughout the environmental impact statement process. Beginning as early as 2004, methods, assumptions, and data sources were shared and confirmed with appropriate resource and regulatory agencies for the purposes of study. The dynamic aspect of the process led to modifications in alternatives' design and locations which subsequently led to continuous validation pertinent to data, methods, and assumptions. This normal, accepted, and National Environmental Policy Act "allowed for" process has continued through the Final Environmental Impact Statement as represented in several sections with changed text. For example, Maricopa Association of Governments' approved new population, employment, housing, and traffic projections (June 2013) was used to update information in chapters 1, 3 and 4. Other examples in the Final Environmental Impact Statement of updating methods, assumptions, and data include information associated with particulate matter (PM_{10}) modelling being added to the section, *Air Quality*, beginning on page 4-68, more information regarding special status species being added to the section, *Biological Resources*, beginning on page 4-125, and results from the Jurisdictional Delineation of Waters of the United States being added to the section, *Waters of the United States*, beginning on page 4-116.
6	**Alternatives**	The comment suggests the environmental impact statement process was biased by a history of property acquisitions within the Study Area. More specifically, properties falling within the limits of the Preferred Alternative, as identified in the Final Environmental Impact Statement, were targeted for acquisition. As noted in text on page 3-54 of the Final Environmental Impact Statement, the Arizona Department of Transportation began acquiring land for the original alignment in 1988. Between 1988 and 2001, the Arizona Department of Transportation acquired approximately 293 acres. Most of this land (258 acres) is located in the Eastern Section along Pecos Road. In 2006, the Arizona Department of Transportation began protective and hardship land acquisition in the alignment right-of-way footprint for the W59 and E1 Alternatives. Between 2006 and October 2013, the Arizona Department of Transportation purchased 326 acres (303 in the Western Section and 23 in the Eastern Section). The process for hardship and advanced acquisitions is explained in text on page 4-50. The comment infers that by taking such action, the objective equal consideration of the alternatives studied in detail in the Draft and Final Environmental Impact Statements is tainted. Advanced acquisitions in parallel to a National Environmental Policy Act environmental determination process is not unprecedented and is common practice. In this case, property acquisitions by the Arizona Department of Transportation for purposes of implementing the proposed action are done at risk as communicated to the agency by the Federal Highway Administration. If another action alternative were to be ultimately selected, the agency would likely have to place the acquired properties on the market for sale and purchase. The Arizona Department of Transportation attempts to balance the risk against its mission of timely delivery of transportation infrastructure to the driving public. Further, Federal Highway Administration regulations do not allow the ownership of right-of-way to be a factor in the decision regarding the selection of an alternative.

Code	Comment Document

Code	Issue	Response
7	**Hazardous Materials**	The West Van Buren Water Quality Assurance Revolving Fund site was identified and considered during development of the Draft Environmental Impact Statement (see page 4-165 of the Final Environmental Impact Statement, and the Draft Initial Site Assessment prepared for the proposed project). These sites are primarily groundwater-impact sites, and groundwater is found at a depth of over 60 feet below the footprint of the Preferred Alternative. Given the separation distance between the adversely affected medium (groundwater) and the construction zone (near-surface in these locations), the project team determined that these sites would not pose a risk to construction or to the general public once the facility were completed. This assessment has been clarified in the Final Environmental Impact Statement on page 4-165.
8	**Economics, Socioeconomics**	A review of the literature reveals few detailed and comprehensive analyses of the relationship between transportation infrastructure and residential property values (Transportation Research Record: Journal of the Transportation Research Board, No. 2174, Transportation Research Board of the National Academies, Washington, D.C., 2010, pp. 138–47; "Impact of Highways on Property Values: Case Study of the Superstition Freeway Corridor"). A recent study by the California Department of Transportation concluded that freeway facilities did not substantially affect sales prices in residential areas adjacent to the facility. The study concluded that it is the visibility of the freeway that may influence selling price and not distance or noise. As a result, the researchers generally concluded that the more the visibility of a new freeway is reduced, the less it would determine the sales price of homes sold in the area.
9	**Alternatives**	In accordance with the National Environmental Policy Act, a range of reasonable action alternatives to carry forward for further analysis was determined through application of multidisciplinary criteria in a logical, step-wise progression. Alternatives were not disposed of or dismissed without a thorough evaluation using the multidisciplinary criteria outlined in the systematic alternatives development and screening process presented in Chapter 3 of the Draft and Final Environmental Impact Statements. The Preferred Alternative was the outcome of this process. The 59th Avenue connection (W59 Alternative) with Interstate 10 (Papago Freeway) was seen as the best option to balance fiscal responsibility, regional mobility needs, community sensitivity, and additional considerations such as consistency with long-range planning goals, economic and environmental impacts, and public and agency input. The W101 Alternative would connect with State Route 101L, but would also result in substantial impacts on the community of Tolleson. While the South Mountain Citizens Advisory Team recommended the W101 Alternative, all stakeholders' input was accounted for—including regional leaders, municipalities, members of the public, and members of the South Mountain Citizens Advisory Team—before identifying the W59 Alternative as the Preferred Alternative (see Final Environmental Impact Statement pages 3-62 and 3-68).

Code	Issue	Response
10	**Environmental Justice**	Since the beginning of the environmental impact statement process, the Federal Highway Administration and Arizona Department of Transportation have been carrying out cultural resources studies and engaging in ongoing, open consultation with the Gila River Indian Community Tribal Historic Preservation Office regarding the identification and evaluation of places of religious and cultural importance to the tribe that may be adversely affected by the proposed freeway. Such places are referred to as traditional cultural properties. As a result of these discussions and of studies conducted by the Gila River Indian Community's Cultural Resource Management Program, the Gila River Indian Community has identified traditional cultural properties that are eligible for listing in the National Register of Historic Places and that could be affected by construction of the proposed freeway. In certain cases, listing these properties on the National Register of Historic Places may offer them protection under Section 4(f) of the Department of Transportation Act. The traditional cultural properties identified are culturally important to other Native American tribes as well. For more discussion of traditional cultural properties, see the section, *Cultural Resources*, beginning on page 4-140 of the Final Environmental Impact Statement and pages 5-26 through 5-28. Section 106 of the National Historic Preservation Act requires a government-to-government relationship between the Federal Government and Indian tribes as described beginning on page 4-140 of the Final Environmental Impact Statement. Section 106 requires that federal agencies take into account the effects of their undertakings on historic properties. This process requires consultation with tribal authorities. Consultation has occurred with Gila River Indian Community government officials, the Tribal Historic Preservation Officer, the Cultural Resource Management Program, many different tribal authorities, and the State Historic Preservation Office. The consultation has resulted in concurrence from the Gila River Indian Community Tribal Historic Preservation Office and the State Historic Preservation Office on National Register of Historic Places eligibility recommendations (including traditional cultural properties), project effects, and proposed mitigation and measures to minimize harm. This consultation has been ongoing and will continue until any commitments in a record of decision are completed. The Draft Environmental Impact Statement, after consultation and coordination efforts, accommodates and preserves (to the fullest extent possible from the available alternatives) access to the South Mountains for religious practices. A very small portion of the mountain would be impacted by the proposed freeway (less than 0.03 percent of the total area). Although the Draft Environmental Impact Statement describes the impact on the South Mountains as adverse, Native Americans would not be kept from practicing their beliefs, access to the mountain would be maintained, and mitigation measures would be implemented based on input from members of the Gila River Indian Community.

Okay, thank you.
THE FACILITATOR: Thank you.
If you'd like to speak and haven't registered out front, please do so.
(The proceeding was at recess from 1:21 p.m. to 2:04 p.m.)
THE FACILITATOR: Good afternoon. I'd like to introduce to you our 2:00 to 4:00 p.m. panel. With the Arizona Department of Transportation, Brock Barnhart; with the Federal Highway Administration, Roman Moreno, and with the Arizona Department of Transportation, Brent Cain.
We'd like to remind you that we discourage applause.
Our next speaker is Lori Riddle.
MS. RIDDLE: I guess they had some short people up here.
THE FACILITATOR: Welcome, Ms. Riddle. You have three minutes.
MS. RIDDLE: Thank you. I'll try to talk fast. I am a member of the Gila River Indian Community, I am co-founder of Gila River Alliance for a Clean Environment. I'm the sponsor of Gila River Environmental Youth. I'm also a member of the PARC, Protecting Arizona Resources and Children, as well as a number of other

Code	Comment Document

organizations that is not in support of the freeway.

The points I would like to make is, you know, people have been talking about the need to expand the transportation, when my people have survived centuries without a proper transportation system. Many of our community members don't have vehicles, they help each other out and they rely on other people, other family members for vehicle transportation needs.

1 I feel that the DEIS is not complete, it does not include the J-tap study that the U.S. EPA Region 9 did a few decades ago. It doesn't include the air monitoring study that was done in Gila River. There's a few studies that are mentioned and referred to, but it doesn't include those things, so I feel like it's an incomplete study and I don't feel like we need to comment on an incomplete study. It's biased. As I have always told my community members, these studies usually go favor on the side of where the money is.

2 One of my friends had mentioned about the biocarbon study and the animal-plants study, that's another issue that we've been noticing in Gila River is the disappearance of some of our prominent plants and animals. There's plants that we don't see anymore that used to be abundant on our reservation -- I see my time's winding down.

Code	Issue	Response
1	**Air Quality**	Summary information about the findings of the Joint Air Toxics Assessment Project study is provided as background information in the Draft and Final Environmental Impact Statements, but the study itself is not relevant to the type of analysis done pursuant to the Federal Highway Administration's mobile source air toxics guidance, which is an emissions analysis. Monitored ambient concentrations of mobile source air toxics (the focus of the Joint Air Toxics Assessment Project) do not inform this type of analysis. While monitoring data can be useful for defining current conditions in the affected environment (to the extent that the monitoring data are current), they don't tell us anything about future conditions, or the impacts of the project itself, which is why an emissions analysis was performed. The mobile source air toxic analysis presented beginning on page 4-77 of the Final Environmental Impact Statement is an estimated inventory of mobile source air toxic emissions for the entire Study Area for 2025 and 2035. This approach was used because the inventory estimate accounts for changes in traffic and emissions on all roadways affected by a proposed project, and would, therefore, be a more reliable predictor of changes in exposure to mobile source air toxics. Several studies on the health effects of emissions and traffic are found in the Draft Environmental Impact Statement on page 4-75. The Draft Environmental Impact Statement does not disclose all studies on the subject nor does it disclose the studies in their entirety. As stated in the Council on Environmental Quality's Regulations for Implementing the Procedural Provisions of the National Environmental Policy Act, environmental impact statements should be analytic rather than encyclopedic [40 Code of Federal Regulations Part 1502.2(a)]. The discussion included in the Draft Environmental Impact Statement appropriately illustrates studies on the subject are ongoing and to date, specific subject matter and study findings have varied.
2	**Biology, Plants, and Wildlife**	Within the context of overall vegetation, wildlife, and wildlife habitat, all action alternatives and options would decrease the amount of cover, nesting areas, and food resources for wildlife species caused by habitat loss, fragmentation, and traffic disturbance. See the section, *General Impacts on Vegetation, Wildlife, and Wildlife Habitat*, beginning on page 4-136 of the Final Environmental Impact Statement, for additional details on potential effects on vegetation, wildlife, and wildlife habitat. The Arizona Department of Transportation and Federal Highway Administration completed a Biological Evaluation containing analysis of the project effects on listed and candidate species under the Endangered Species Act. The Biological Evaluation was completed in 2014 following identification of the Preferred Alternative in the Draft Environmental Impact Statement. The Biological Evaluation was sent to the U.S. Fish and Wildlife Service, Arizona Game and Fish Department, and Gila River Indian Community Department of Environmental Quality for technical assistance with assessing the level of project effects on listed and candidate species prior to completion of the Final Environmental Impact Statement. The Arizona Department of Transportation and Federal Highway Administration have committed to continue coordination with the Arizona Game and Fish Department, Gila River Indian Community Department of Environmental Quality, and U.S. Fish and Wildlife Service regarding wildlife concerns as a result of the freeway's potential implementation. The results of the Biological Evaluation may be found beginning on page 4-125 of the Final Environmental Impact Statement. Text beginning on page 4-85 of the Final Environmental Impact Statement discusses the relationship and the contribution of the proposed action to Greenhouse Gas Emissions (Climate Change). In short, Federal Highway Administration has

1 The amount of money that we're spending on this
2 freeway, 100 million per, what was it, mile, that's
3 outrageous, not to mention the $20 million to complete
4 this DEIS. People keep talking about cutting down on
5 pollution, but what about the pollution in our community?
6 Do we not matter? The air that we breathe, is our air
7 any less important than the people of Phoenix? When are
8 we going to actually matter? When are those
9 considerations going to happen?
10 And you're blasting through sacred mountain that
11 is religious and sacred to our people. I can't elaborate
12 on that because my time is out, but I just want to
13 mention that that is significant to our people.
14 THE FACILITATOR: Thank you, Ms. Riddle.
15 Our next speaker is David Martin. We welcome
16 David Martin.
17 Welcome, Mr. Martin.
18 MR. MARTIN: Thank you.
19 THE FACILITATOR: You have three minutes.
20 MR. MARTIN: Thank you. Members of the panel,
21 for the record, my name is David Martin, I sort of have
22 multiple hats here today. I am the president of the
23 Associated General Contractors, I chair an organization
24 called We Build Arizona, and I am an Ahwatukee resident,
25 so I sort of wear three hats.

Page 52

Driver and Nix Court Reporters - (602) 266-6525
www.drivernix.com

Code	Issue	Response
2 (cont.)		concluded, based on the nature of greenhouse gas emissions and the exceedingly small potential greenhouse gas impacts of the proposed action that such emissions from the proposed action would not result in reasonably foreseeable substantial adverse impacts on the human environment.
3	**Air Quality**	The Final Environmental Impact Statement addresses the history of air quality in the region (see text beginning on page 4-68 of the Final Environmental Impact Statement). The Clean Air Act § 109(b)(1) requires the U.S. Environmental Protection Agency to promulgate primary National Ambient Air Quality Standards at levels that allow an adequate margin of safety to protect the public health. Air quality in the Phoenix metropolitan area has improved over time; Phoenix was redesignated to attainment/maintenance for carbon monoxide in 2005, and the U.S. Environmental Protection Agency recently determined that Phoenix has attained the particulate matter (PM_{10}) standard. These improvements are largely associated with cleaner fuels and lower-emission vehicles along with local controls on fugitive dust. Future emissions would also be reduced by the use of cleaner burning fuels, technological advances in automotive design (including the greater use of alternative fuel vehicles), reformulated gasoline, gas can standards, stricter enforcement of emission standards during inspections, heavy-duty diesel engine and on-highway diesel sulfur control programs, dust control programs, and others. The air quality assessment for the proposed freeway analyzed impacts from carbon monoxide and particulate matter (PM_{10}) and followed U.S. Environmental Protection Agency guidelines. The carbon monoxide and particulate matter (PM_{10}) analyses demonstrated that the proposed freeway would not contribute to any new localized violations, increase the frequency or severity of any existing violation, or delay timely attainment of the National Ambient Air Quality Standards or any required interim emissions reductions or other milestones. For mobile source air toxics, the analysis showed that for the Study Area, constructing the freeway would have a marginal effect on annual emissions in 2025 and 2035 (less than a 1 percent difference in total annual emissions between the Preferred Alternative and No-Action Alternative). With the Preferred Alternative in 2035, modeled mobile source air toxics emissions would decrease by 57 percent to more than 90 percent, depending on the pollutant, despite a 47 percent increase in vehicle miles traveled in the Study Area compared with 2012 conditions. The air quality analyses were updated for the Final Environmental Impact Statement, including a quantitative particulate matter (PM_{10}) analysis, and are more fully described beginning on page 4-68 of the Final Environmental Impact Statement. Congestion relief resulting from the proposed freeway would provide localized air quality emissions reductions on area freeways and arterial streets and at interchanges, benefiting users of area highways and those living near congested roads. Fugitive dust and mobile source emissions from construction of the proposed freeway would be controlled by requiring the contractor to comply with the dust-control methods in Arizona Department of Transportation's *Standard Specifications for Road and Bridge Construction* (2008) and Maricopa County Rule 310, Fugitive Dust Ordinance. Disruption to traffic, especially during peak travel periods, would be minimized by a traffic control plan to help reduce impacts of traffic congestion and associated emissions during construction. These methods are discussed on page 4-85 of the Final Environmental Impact Statement.

(Responses continue on next page)

Code	Comment Document

Code	Issue	Response
4	**Cultural Resources**	Since the beginning of the environmental impact statement process, the Federal Highway Administration and Arizona Department of Transportation have been carrying out cultural resource studies and engaging in an ongoing, open dialogue with the Gila River Indian Community Tribal Historic Preservation Office regarding the identification and evaluation of places of religious and cultural importance to the Gila River Indian Community that may be adversely affected by the proposed freeway. Such places are referred to as traditional cultural properties. As a result of these discussions and of studies conducted by the Gila River Indian Community's Cultural Resource Management Program, the Gila River Indian Community has identified traditional cultural properties that are eligible for listing in the National Register of Historic Places and that could be affected by construction of the proposed freeway. In certain cases, listing these properties on the National Register of Historic Places may offer them protection under Section 4(f) of the Department of Transportation Act. The traditional cultural properties identified are culturally important to other Native American tribes as well. For more discussion of traditional cultural properties, see the section, *Cultural Resources*, beginning on page 4-140 of the Final Environmental Impact Statement and pages 5-26 through 5-28. Section 106 of the National Historic Preservation Act requires a government-to-government relationship between the Federal Government and Indian tribes as described beginning on page 4-140 of the Final Environmental Impact Statement. Section 106 requires that federal agencies take into account the effects of their undertakings on historic properties. This process requires consultation with tribal authorities. Consultation has occurred with Gila River Indian Community government officials, the Tribal Historic Preservation Officer, the Cultural Resource Management Program, many different tribal authorities, and the State Historic Preservation Office. The consultation has resulted in concurrence from the Gila River Indian Community Tribal Historic Preservation Office and the State Historic Preservation Office on National Register of Historic Places eligibility recommendations (including traditional cultural properties), project effects, and proposed mitigation and measures to minimize harm. This consultation has been ongoing and will continue until any commitments in a record of decision are completed. Public involvement with the Gila River Indian Community was conducted as requested by the tribal government. Prior to October 2005, early efforts to involve the Gila River Indian Community included attending tribal meetings and monthly meetings with Gila River Indian Community Departments (see discussion beginning on page 2-8 of the Final Environmental Impact Statement). On October 14, 2005, the Gila River Indian Community requested that all project-related communications take place at a government-to-government level (see letter on page A152 of Appendix 1-1). This request was honored by the Arizona Department of Transportation and Federal Highway Administration. All public involvement efforts were implemented by the Gila River Indian Community's public involvement officer.

MS. RIDDLE: Okay. My name is Lori Riddle. I'm the co-founder of Grace Gila River Alliance for a Clean Environment, and I'm sponsored for GREY, that's Gila River Environmental Youth. I'm also a member of PARC, Protecting Arizona Resources and Children. I am a community member that lives here in the community. So just a few things that I'd like to mention, and I'll be doing my own written that I'll e-mail to the address.

Well, the first thing I want to touch on is the fact that the health impacts are not really addressed in this EIS. There are numerous health impacts that studies have shown in other states and other cities. You know, I mean, we're talking about an increase of heart attacks and strokes, we're talking about cancer, we're talking about development issues with unborn babies, miscarriages and stillborns.

So in my written comment, I'll go ahead and reference some things directly related to that. The other thing I would like to mention is the animal impact. We're talking about rains that would wash some of the fluids from vehicles into the pathway or into the areas where animals drink from. And with those -- those different type of fluids would be like

Code	Issue	Response
1	**Health Effects**	Under the Clean Air Act, the U.S. Environmental Protection Agency is responsible for establishing National Ambient Air Quality Standards to protect public health and the environment from adverse effects of air pollutants. Health effects from air pollutants are based on the concentration of the pollutants and the duration of exposure. Concentrations vary with distance from a roadway based on many factors, including background (or ambient) levels of pollution from all sources; the number, speed, and type of vehicles on the roadway; wind speed and direction; topography; and other factors. For the proposed freeway, the Federal Highway Administration conducted modeling for carbon monoxide and particulate matter (PM_{10}) using worst-case (most congested or highest traffic) modeling locations at discrete receptor locations around each analysis location (primarily residences near the interchanges). The carbon monoxide and particulate matter (PM_{10}) analyses demonstrated that the proposed freeway would not contribute to any new localized violations, increase the frequency or severity of any existing violation, or delay timely attainment of the National Ambient Air Quality Standards or any required interim emissions reductions or other milestones. Mobile source air toxics can also have adverse health impacts, but the U.S. Environmental Protection Agency has not established National Ambient Air Quality Standards for these pollutants. As a result, the Federal Highway Administration analyzes these pollutants using emissions analyses. The mobile source air toxics emissions analysis for the Study Area found little difference in total annual emissions of mobile source air toxics emissions between the Preferred and No-Action Alternatives (less than a 1 percent difference) in 2025 and 2035. With the Preferred Alternative in 2035, modeled mobile source air toxics emissions would decrease by 57 percent to more than 90 percent, depending on the pollutant, despite a 47 percent increase in vehicle miles traveled in the Study Area compared with 2012 conditions. Many studies have investigated the prevalence of adverse health effects in the near-road environment. Given concerns about the possibility of air pollution exposure in the near-road environment, the Health Effects Institute has dedicated a number of research efforts toward investigating this issue. In November 2007, the Health Effects Institute published Special Report #16: Mobile-Source Air Toxics: A Critical Review of the Literature on Exposure and Health Effects. This report concluded that the cancer health effects attributable to mobile sources are difficult to discern because the majority of quantitative assessments are derived from occupational cohorts with high concentration exposures and because some cancer potency estimates are derived from animal models. In January 2010, the Health Effects Institute released Special Report #17, investigating the health effects of traffic-related air pollution. The goal of the research was to synthesize available information on the effects of traffic on health. Researchers looked at linkages between: 1) traffic emissions (at the tailpipe) with ambient air pollution in general, 2) concentrations of ambient pollutants with human exposure to pollutants from traffic, 3) exposure to pollutants from traffic with human-health effects and toxicological data, and 4) toxicological data with epidemiological associations. Overall, researchers felt that there was “sufficient” evidence for causality for the exacerbation of asthma. Evidence was “suggestive but not sufficient” for health outcomes such as cardiovascular mortality and others. Study authors also noted that past epidemiological studies may not provide an appropriate assessment of future health associations because vehicle emissions are decreasing over time. Finally, in 2011 three studies were published by the Health Effects Institute evaluating the potential for mobile source air toxics “hot spots.” In general, the

5

1 radiator fluid, oils, anything dripping from the
2 vehicles that will be on the roadway. And once the
3 rains hit that and washes it down into the area where
4 the habitat is, I have a big problem with that. Not
5 to mention that the desert tortoise is up for
6 consideration for under the endangered species.
7 The plant impact, we're talking about
8 plants that we consider are medicinal plants both for
9 our medicine and healing uses, as well as sustenance.
10 You know, things that are edible that we've eaten for
11 -- for years that not only will the waters wash to
12 the animals, it will wash to plants and it would
13 directly impact those things.
14 I have an issue with this so-called
15 consultation with the tribe. In section 2 of the
16 DEIS, there's a list of meetings, but where was the
17 public notification with that? We didn't see
18 posters. We didn't see announcements in our tribal
19 newsletter.
20 So, you know, the other thing too is when
21 we had TTT meetings a month or so ago, technical
22 transportation team meeting, we were told that there
23 was going to be bus -- free bus services for
24 community members. I tried calling the number that's
25 listed for ADOT and I got -- I kept getting a message

Code	Issue	Response
1 **(cont.)**		authors confirmed that while highways are a source of air toxics, they were unable to find that highways were the only source of these pollutants. They determined that near-road exposures were often no different or no higher than background (or ambient) levels of exposure and, hence, no true hot spots were identified. These reports are available from the Health Effects Institute's Web site at <healtheffects.org>. The Federal Highway Administration and U.S. Environmental Protection Agency provide financial support to the Health Effects Institute's research work. Another source of information is the U.S. Environmental Protection Agency's recently released report on Children's Health and the Environment: *The level of knowledge regarding the relationship between environmental exposures and health outcomes varies widely among the topics [presented in this report], and the inclusion of an indicator in the report does not necessarily imply a known relationship between environmental exposure and children's health effects. The report provides data for selected children's health conditions that warrant further research because the causes, including possible contributing environmental factors, are complex and not well understood at this point.* *In the case of asthma, researchers do not fully understand why children develop the condition. However, substantial evidence shows exposure to certain air pollutants, including particulate matter and ozone, can trigger symptoms in children who already have asthma. Although the report found the percentage of children reported to currently have asthma increased from 8.7 percent in 2001 to 9.4 percent in 2010 and that minority populations are particularly affected by asthma, the severity of children's asthma and respiratory symptoms has declined. The rate of emergency room visits for asthma decreased from 114 visits per 10,000 children in 1996 to 103 visits per 10,000 children in 2008. Between 1996 and 2008, hospitalizations for asthma and for all other respiratory causes decreased from 90 hospitalizations per 10,000 children to 56 hospitalizations per 10,000 children.* *The report also looks at trends in other health conditions, such as Attention-Deficit/Hyperactivity Disorder (ADHD) and preterm births, for which rates have increased. There is no conclusive information on the role of environmental contaminants in ADHD or preterm births, and additional research is ongoing.* Finally, the Federal Highway Administration notes that while the incidence of some health effects (such as asthma, autism, and attention deficit/hyperactivity disorder) in the U.S. population appear to have been increasing, motor vehicle emissions have declined. This decline in mobile source air toxics emissions is documented in Figure 4-24 of the Final Environmental Impact Statement and for other pollutants at <epa.gov/ttn/chief/trends/>. This negative correlation between emissions trends and health effects trends illustrates the complexity of the issues.
2	**Biology, Plants, and Wildlife**	Impacts on biological resources are described in text beginning on page 4-125 of the Final Environmental Impact Statement. Various mitigation strategies presented in the Final Environmental Impact Statement will be implemented to reduce water quality impacts. For example, as noted in text on page 3-58 of the Final Environmental Impact statement drainage features will be constructed to specific design standards to reduce and control the amount of pollutant loading in drainage leaving the roadway. Further, the permitting processes described in the sections, *Water Resources* and *Waters of the United States*, beginning on pages 4-101 and 4-116, respectively, outline procedures to mitigate water quality impacts during construction and operation of the freeway. Finally, on page 4-108 of the Final

saying the box is full and if I -- when I finally did leave a message, I left a message for someone to return my call and this was the week prior to the hearing in Phoenix at the convention center. No one returned my call. And when I approached a MAG member, Maricopa Association of Governments member, he shrugged his shoulders like it wasn't important and he said, "Oh, well, it's too late now." So I mean, the consultation and the communication has been a problem.

I do have a problem with the design of the casino. The fact that there are no accessible routes to our community. This is because I sit on the CTERC commission for my community, it's Chemical Tribal Emergency Response Commission. And so the first responders would have a difficult time going into the freeway if there are less exits and entrances to the freeway. So, you know, it would be time-consuming in a life-saving event to try to find which -- which exit is the closest, you know, especially in an area that doesn't have access.

The other thing is, there are no frontage roads provided, you know. No roads that we can utilize as the local community to -- to get from point A to point B without using a freeway itself.

Code	Issue	Response
2 (cont.)		Environmental Impact Statement, to reduce the potential impact of contaminants such as oil, grease, soil, and trash, settling basins would be used to collect water and allow materials to settle. These settling basins would require periodic cleaning and would be accredited as part of the Statewide Stormwater Management Program.
3	**Biology, Plants, and Wildlife**	A Biological Evaluation was submitted to the U.S. Fish and Wildlife Service, Arizona Game and Fish Department, and Gila River Indian Community Department of Environmental Quality that addressed threatened, endangered, and candidate species, including the Sonoran desert tortoise. The U.S. Fish and Wildlife Service concurred with the species determinations in the Biological Evaluation (see Appendix 1-1 of the Final Environmental Impact Statement). The Arizona Department of Transportation and Federal Highway Administration have committed to continue coordination with the Arizona Game and Fish Department, Gila River Indian Community personnel, and U.S. Fish and Wildlife Service regarding wildlife concerns as a result of the freeway's potential implementation.
4	**Biology, Plants, and Wildlife**	Within the context of overall vegetation, wildlife, and wildlife habitat, all action alternatives and options would decrease the amount of cover, nesting areas, and food resources for wildlife species caused by habitat loss, fragmentation, and traffic disturbance. See the section, *General Impacts on Vegetation, Wildlife, and Wildlife Habitat*, beginning on page 4-136 of the Final Environmental Impact Statement, for additional details on potential effects on vegetation, wildlife, and wildlife habitat. The Arizona Department of Transportation and Federal Highway Administration have committed to continue coordination with the Arizona Game and Fish Department, Gila River Indian Community personnel, and U.S. Fish and Wildlife Service regarding wildlife concerns as a result of the freeway's potential implementation.
5	**Public Involvement**	Public involvement with the Gila River Indian Community was conducted as requested by the tribal government. Prior to October 2005, early efforts to involve the Gila River Indian Community included attending tribal meetings and monthly meetings with Gila River Indian Community Departments (see discussion beginning on page 2-8 of the Final Environmental Impact Statement). In addition, representatives from the Gila River Indian Community participated for years in the South Mountain Citizens Advisory Team. On October 14, 2005, the Gila River Indian Community requested that all project-related communications take place at a government-to-government level (see letter on page A152 of Appendix 1-1). This request was honored by the Arizona Department of Transportation and Federal Highway Administration. All public involvement efforts were implemented by the Gila River Indian Community's public involvement officer. It is also important to note that the Gila River Indian Community's Lieutenant Governor is a member of the Transportation Policy Committee of the Maricopa Association of Governments, which oversees the development of the 20-year *Regional Transportation Plan* and guides transportation planning in the region. See Chapter 6, *Comments and Coordination*, of the Final Environmental Impact Statement for more information related to the outreach to members of the public, including members of the Gila River Indian Community throughout the environmental impact statement process.
6	**Public Involvement**	The Arizona Department of Transportation advertisement efforts of the public hearing and public forums are documented in Chapter 6 of the Final Environmental Impact Statement beginning on page 6-23. The Gila River Indian Community Communication and Public Affairs Office informed the Arizona

1

So, the air impacts. I understand that the air would be cleaner in the Phoenix metropolitan area, but all it's going to do is move the air pollution into our community. It's going to be excessive pollution because of the terrain of the area. Because we have two mountains as walls on the north and south side. So these things, I mean, they're heavy-duty things.

We're talking about dioxin furans which is cancer-causing. It's basically like Agent Orange. We're talking about particulate matter 2.5 microns and 10 microns that causes heart attacks and strokes because you breathe it into your lungs and it gets deep into your lungs and it starts affecting your heart. We're talking about carbon monoxide, we're talking about a multitude of other things and so that concerns me.

Also I mentioned earlier about water -- about the water impact, about the drainage off of the freeway and how it will be accessible for animals and plants to be utilizing that water. There's no catch, you know. And plus too we're talking about having the freeway next to Ahwatukee community. I mean, it's going to eventually get into some water sheds and eventually get into a community drinking system.

Code	Issue	Response
6 (cont.)		Department of Transportation that all communication and distribution of informational materials on Gila River Indian Community land would be handled by the Communication and Public Affairs Office. Advertisement text regarding the project, the public comment period, the public hearing and the various ways for the public to submit comments regarding the South Mountain Freeway Draft Environmental Impact Statement was given to the Gila River Indian Community's Public Information Officer at the Transportation Technical Team meeting on April 30, 2013. Two advertisements regarding the public hearing, information regarding the location and availability of the Draft Environmental Impact Statement, and a map of the alternatives was placed in the May 2013 monthly issue of the *Gila River Indian News*. The Arizona Department of Transportation Community Relations distributed electronic notices (e-newsletters) through the Government Delivery system to over 12,000 constituents who voluntarily signed up for project alerts along the Interstate 10 Papago, Maricopa, and Santan Freeways. These electronic notices included notice of availability of Draft Environmental Impact Statement (distributed on April 26, 2013); public hearing (distributed on May 10, 2013); the community forums (distributed on May 29, 2013) and one in June (close of the Draft Environmental Impact Statement public comment period). In addition, anyone who had attended a previous meeting on the proposed action and signed in received all of this information mailed individually. On May 6, 2013, 73,564 mailers were distributed to addresses within the Study Area. The Arizona Department of Transportation provided vouchers for public hearing parking and for public transit to the hearing. For the first time in the State's history, a shuttle bus to the hearing was provided from six locations in the Phoenix area, including two on the Gila River Indian Community (Komatke Boys & Girls Club and the Governance Center in Sacaton). All ads provided telephone numbers and electronic contact information regarding information on the shuttle schedules and pick-up locations.
7	**Design**	Traffic interchanges (on- and off-ramps) would be located at Van Buren Street, Buckeye Road, Lower Buckeye Road, Broadway Road, Southern Avenue, Baseline Road, Dobbins Road, Elliot Road, 51st Avenue, 17th Avenue, Desert Foothills Parkway, 24th Street, and 40th Street. Emergency responders would address the construction of the proposed freeway by amending the local emergency response plan to include the facility. Information related to this is presented on page 4-166 of the Final Environmental Impact Statement. Local traffic can continue to use existing roads to get from point A to point B. Frontage roads would increase the footprint of the Preferred Alternative and would result in greater social, economic, and environmental impacts. Therefore, frontage roads are not a part of the Preferred Alternative.
8	**Groundwater**	Impacts on groundwater are addressed in the Final Environmental Impact Statement, *Water Resources* section. The Study Area is located within two Active Management Areas that are regulated by the State of Arizona. The Arizona Department of Water Resources administers groundwater use. Water level decline in one subbasin can be offset by recharging water in another subbasin of the Active Management Area. The Arizona Department of Water Resources regulates drilling, installation, and abandonment of groundwater wells. (See Final Environmental Impact Statement page 4-104). If a well were adversely affected by construction activities, the well might need to be abandoned or the well owner would be compensated by drilling a new well according to State regulations/standards. (See the text box on Final Environmental Impact Statement page 4-108.)

The studies regarding health impacts. I mean, there was a study in Utah, the state of Utah. Was done by the Sierra Club and impacts the people there living near freeways. There's also been studies in the L.A. area about the impacts to the people there and to the children. I believe there was even a study in the metropolitan Phoenix area. I believe it was in the north, northwest side of Phoenix, and I'll reference all these in more detail on my -- on my written comment. But just bringing up the fact that there's a multitude of health issues that we need to be looking at. And I think that's it right now.

COMMENTS IN OPPOSITION TO THE PROPOSED SOUTH MOUNTAIN LOOP 202

The Gila River Alliance for a Clean Environment (GRACE), a grassroots organization of the Akimel O'odham, (River People) and Maricopa (Pee Posh) indigenous peoples of the Gila River Indian Community (GRIC), submits these comments to the Arizona Department of Transportation (ADOT) in opposition to the South Mountain Loop on behalf of our tribal members that would be negatively and disparately impacted by the proposed project.

"No person in the United States shall, on the ground of race, color, or national origin, be excluded from participation in, be denied the benefits of, or be subjected to discrimination under any program or activity receiving Federal financial assistance."[1] The GRIC, as a protected class of people, was discriminated against by:

- ADOT knowingly and purposely designing the South Mountain Loop 202 through our sacred South Mountain, recognizing and acknowledging that the South Mountain Loop 202 would have a serious and major disparate impact on us as a nation both culturally and spiritually.

- ADOT's reason a purpose and need for the DEIS with inaccurate estimates of population projections, alleged uses of the South Mountain Loop 202.

- ADOT's failure to analyze the South Mountain Loop 202's disparate environmental, economic, and health impacts on the GRIC.

- ADOT's inadequate consultation and informed consent, notice, and meaningful participation in the DEIS scoping and planning.

We urge ADOT to abide by Title VI and comply with state and federal civil rights mandates, to follow applicable laws, and reject the South Mountain Loop 202.

Gila River Alliance for a Clean Environment; COMPLAINT UNDER TITLE VI OF THE CIVIL RIGHTS ACT OF 1964

Complainant,

v.

Arizona Department of Transportation,

Respondent.

I. INTRODUCTION

1 This is a civil rights complaint by the Gila River Alliance for a Clean Environment (hereinafter "GRACE,"), comprised of Akimel O'odham, (River People) and Maricopa (Pee Posh) indigenous peoples of the Gila River Indian Community (hereinafter "GRIC,") under Title VI of the United States Civil Rights Act[1] against the Arizona Department of Transportation (hereinafter "ADOT") for its discrimination in the form of unequal treatment and unequal impact against GRIC members based on race. As indigenous people of the American Indian race, Complainants are people protected by Title VI.

As a recipient of Federal highway funding, ADOT is subject to Title VI of the United States Civil Rights Act.

2 Complainant alleges that ADOT violated Title VI of the United States Civil Rights Act by the following actions:

3 A. On April 26, 2013 ADOT released a Draft Environmental Impact Study (DEIS) identifying its proposal and preferred alternative for building a major highway –the South Mountain Loop 202- that would go through and desecrate a mountain held sacred by tribal members including members of GRACE, and is taking further action to complete the proposal and approve the project, despite being fully aware of and acknowledging the sacredness and spiritual and cultural significance of the mountain, that if implemented would have a profound negative impact on the cultural and spiritual well-being of the tribal members/indigenous peoples who are members of GRACE and would cause major cumulative health effects from toxic and criteria pollutants emitted by cars and trucks;

4

5 B. discriminated in its public participation process toward tribal members including members of GRACE by providing less public participation opportunities to tribal members than non-tribal members, despite the fact that the proposed highway project would disproportionately impact tribal members.

[1] "No person in the United States shall, on the ground of race, color, or national origin, be excluded from participation in, be denied the benefits of, or be subjected to discrimination under any program or activity receiving Federal financial assistance." 42 U.S.C § 2000d.

Code	Issue	Response
1	**Title VI**	Since Gila River Alliance for a Clean Environment's Title VI complaint was received during the public comment period for the Draft Environmental Impact Statement, it has been included as a part of the Comment and Response appendix. However, it should be noted that the National Environmental Policy Act process is separate from the U.S. Department of Transportation Title VI complaint process.
2	**Title VI**	Specific comments are addressed below.
3	**Cultural Resources**	Since the beginning of the environmental impact statement process, the Federal Highway Administration and Arizona Department of Transportation have been carrying out cultural resource studies and engaging in an ongoing, open dialogue with the Gila River Indian Community Tribal Historic Preservation Office regarding the identification and evaluation of places of religious and cultural importance to the Gila River Indian Community that may be adversely affected by the proposed freeway. Such places are referred to as traditional cultural properties. As a result of these discussions and of studies conducted by the Gila River Indian Community's Cultural Resource Management Program, the Gila River Indian Community has identified traditional cultural properties that are eligible for listing in the National Register of Historic Places and that could be affected by construction of the proposed freeway. In certain cases, listing these properties on the National Register of Historic Places may offer them protection under Section 4(f) of the Department of Transportation Act. The traditional cultural properties identified are culturally important to other Native American tribes as well. For more discussion of traditional cultural properties, see the section, *Cultural Resources*, beginning on page 4-140 of the Final Environmental Impact Statement and pages 5-26 through 5-28. Section 106 of the National Historic Preservation Act requires a government-to-government relationship between the Federal Government and Indian tribes as described beginning on page 4-140 of the Final Environmental Impact Statement. Section 106 requires that federal agencies take into account the effects of their undertakings on historic properties. This process requires consultation with tribal authorities. Consultation has occurred with Gila River Indian Community government officials, the Tribal Historic Preservation Officer, the Cultural Resource Management Program, many different tribal authorities, and the State Historic Preservation Office. The consultation has resulted in concurrence from the Gila River Indian Community Tribal Historic Preservation Office and the State Historic Preservation Office on National Register of Historic Places eligibility recommendations (including traditional cultural properties), project effects, and proposed mitigation and measures to minimize harm. This consultation has been ongoing and will continue until any commitments in a record of decision are completed.
4	**Air Quality**	The air quality assessment for the proposed freeway analyzed impacts from carbon monoxide and particulate matter (PM_{10}) and followed U.S. Environmental Protection Agency guidelines. The carbon monoxide and particulate matter (PM_{10}) analyses demonstrated that the proposed freeway would not contribute to any new localized violations, increase the frequency or severity of any existing violation, or delay timely attainment of the National Ambient Air Quality Standards or any required interim emissions reductions or other milestones. For mobile source air toxics, the analysis showed that for the Study Area, constructing the freeway would have a marginal effect on annual emissions in 2025 and 2035 (less than a 1 percent difference in total annual emissions between the Preferred Alternative and No-Action Alternative). With the Preferred Alternative in 2035, modeled mobile source air toxics emissions would decrease by 57 percent to more than 90 percent, depending on the pollutant, despite a 47 percent increase in vehicle miles traveled in the Study Area compared with 2012

(Response 4 continues on next page)

Code	Comment Document
6	II. TITLE VI OF THE CIVIL RIGHTS ACT OF 1964 To succeed in this Civil Rights complaint, the complainant does not have to show that there was a deliberate, intentional discrimination by ADOT, but rather, that there is a discriminatory effect / disparate impact that gives rise to a section 601 Title VI of the Civil Rights Act of 1964 violation. Section 601 of Title VI of the Civil Rights Act of 1964 states that "No person in the United States shall, on the ground of race, color, or national origin, be excluded from participation in, be denied the benefits of, or be subjected to discrimination under any program or activity receiving Federal financial assistance."[2] Section 602 of Title VI states: "Each Federal department and agency which is empowered to extend Federal financial assistance to any program or activity[3]…is authorized and directed to effectuate the provisions of section 601"[4] Section 602 prohibits recipients of federal funds to engage in any activities that result in discriminatory effect or disparate impact against individuals, groups of people, or whole communities of a certain race, color, or national origin.[5] The discriminatory effect / disparate impact can occur when a seemingly neutral decision or action results in an unjustifiable adverse effect. Or in other words, an inaction or action by a recipient of federal funds that may appear neutral on its face and is not accompanied with any intent to discriminate, but nevertheless negatively affects an individual, groups of people, or a whole community of a certain race, color, or national origin, without any substantial legitimate justification, violates Title VI. The actions of ADOT were clearly not neutral and were made with total awareness and acknowledgement that the proposed freeway route through the sacred mountain would have serious negative cultural, spiritual and health impacts on a protected class of people. III. THE COMPLAINANTS Complainant GRACE is a grassroots organization of the Akimel O'odham, (River People) and Maricopa (Pee Posh) indigenous peoples of the GRIC. The GRIC's reservation abuts the proposed project site, the GRIC and its people including the complainant have strong cultural and spiritual ties to South Mountain and they use the project site for cultural and spiritual purposes. Under Title VI, Native Americans are a protected class and historically have been discriminated against by the US government GRACE advocates for the protection of the environment and the sacred and cultural sites of the Gila River Indian Community and its people.[6] Its mission is "to inform Indigenous peoples on environmental issues affecting their communities."[7] GRACE was formed in the early [2] 42 U.S.C § 2000d. [3] Arizona's transportation system is partly funded by grants from the Federal Highway Administration through the Federal Aid Highway Program. [4] Transcript of Civil Rights Act (1964) http://www.ourdocuments.gov/doc.php?flash=true&doc=97&page=transcript (last visited July 23, 2013). Code	Issue	Response
4 (cont.)		conditions. The air quality analyses were updated for the Final Environmental Impact Statement, including a quantitative particulate matter (PM_{10}) analysis, and are more fully described beginning on page 4-68 of the Final Environmental Impact Statement. Congestion relief resulting from the proposed freeway would provide localized air quality emissions reductions on area freeways and arterial streets and at interchanges, benefiting users of area highways and those living near congested roads.
5	**Environmental Justice, Public Involvement**	The section entitled *Title VI and Environmental Justice*, beginning on page 4-29 in the Draft Environmental Impact Statement, presents acceptable methods, data, and assumptions to assess the potential for disproportionately high and adverse effects from the proposed action on environmental justice populations and disparate impacts to populations protected under Title VI. Based upon the content of the section, no such effects would result from the action alternatives. In light of comments received on the Draft Environmental Impact Statement, the above-referenced conclusions were confirmed in the preparation of the Final Environmental Impact Statement. To provide further clarity, the discussions of environmental justice and Title VI were separated and additional text explaining the relationship of environmental justice and Title VI to various environmental elements was added throughout Chapter 4, *Affected Environment, Environmental Consequences, and Mitigation*, as exemplified by the inserted text on page 4-29 of the Final Environmental Impact Statement. The Arizona Department of Transportation and Federal Highway Administration provided equal access to the public participation process to the Gila River Indian Community and its members. This information has also been added to the *Environmental Justice and Title VI* Section on pages 4-38 and 4-44 of the Final Environmental Impact Statement, respectively. The Arizona Department of Transportation and Federal Highway Administration solicited input from the Gila River Indian Community and other Native American tribes and tribal members and fully considered input and comments that were received. Chapter 2 of the Final Environmental Impact Statement is dedicated to the explanation of the Gila River Indian Community outreach undertaken for the project. Chapter 6 of the Final Environmental Impact Statement further describes Community outreach throughout the process. The Gila River Indian Community was provided equal opportunities to participate in the project as all other populations and agencies. This outreach was undertaken, in part, to ensure all populations had equal access to the process and, in part, to ensure disparate nor disproportionate and highly adverse impacts would result from the construction and operation of the proposed action.
6	**Title VI**	The cultural and religious places of importance, like the South Mountains, are acknowledged in the Draft Environmental Impact Statement in several locations, notably pages 4-132 and 5-26. The proposed project would accommodate and preserve (to the fullest extent possible from the available alternatives) access to the South Mountains for religious practices. The section entitled *Title VI and Environmental Justice,* beginning on page 4-29 in the Draft Environmental Impact Statement, presents acceptable methods, data, and assumptions to assess the potential for disproportionately high and adverse effects from the proposed action on environmental justice populations and disparate impacts to populations protected under Title VI. Based upon the content of the section, no such effects would result from the action alternatives. In light of

Code	Issue	Response
6 (cont.)		comments received on the Draft Environmental Impact Statement, the above-referenced conclusions were confirmed in the preparation of the Final Environmental Impact Statement. A very small portion of the mountain would be impacted by the proposed freeway (less than 0.03 percent of the total area). Although the Draft Environmental Impact Statement describes the impact on the South Mountains as adverse, Native Americans would not be kept from practicing their beliefs, access to the mountain would be maintained, and mitigation measures would be implemented based on input from members of the Gila River Indian Community.
7	**Title VI**	Comment noted. Regulation cited.
8	**Environmental Justice and Title VI, Air Quality**	The Draft Environmental Impact Statement, after consultation and coordination efforts, accommodates and preserves (to the fullest extent possible from the available alternatives) access to the South Mountains for religious practices. A very small portion of the mountain would be impacted by the proposed freeway (less than 0.03 percent of the total area). Although the Draft Environmental Impact Statement describes the impact on the South Mountains as adverse, Native Americans would not be kept from practicing their beliefs, access to the mountain would be maintained, and mitigation measures would be implemented based on input from members of the Gila River Indian Community. The Arizona Department of Transportation and Federal Highway Administration have been attentive to concerns expressed by the Gila River Indian Community and reiterate that position in this comment; the agencies have taken these concerns into account in describing potential impacts in the Draft Environmental Impact Statement, in ensuring that access to South Mountain would be preserved, and in developing and recommending the implementation of numerous mitigation measures. The proposed freeway is not located on Native American land. The South Mountain Park/Preserve is owned by the City of Phoenix. Through many years of transportation planning in the valley and as discussed in Chapter 1, *Purpose and Need*, there is a compelling government interest for the proposed freeway. Consultation has occurred and will continue to occur at all levels of government, including the Gila River Indian Community. Mitigation measures have been identified by the Tribal Historic Preservation Officer that will be implemented. The Preferred Alternative is recognized to have an adverse impact on the South Mountains. Other alternatives that would have avoided the South Mountains were rejected by the Gila River Indian Community or would have had severe social and economic impacts. These alternatives would have increased costs of extraordinary magnitude. The air quality assessment for the proposed freeway analyzed impacts from carbon monoxide and particulate matter (PM_{10}) and followed U.S. Environmental Protection Agency guidelines. The carbon monoxide and particulate matter (PM_{10}) analyses demonstrated that the proposed freeway would not contribute to any new localized violations, increase the frequency or severity of any existing violation, or delay timely attainment of the National Ambient Air Quality Standards or any required interim emissions reductions or other milestones. For mobile source air toxics, the analysis showed that for the Study Area, constructing the freeway would have a marginal effect on annual emissions in 2025 and 2035 (less than a 1 percent difference in total annual emissions between the Preferred Alternative and No-Action Alternative). With the Preferred Alternative in 2035, modeled mobile

(Response 8 continues on next page)

Code	Comment Document
11	2000s when action was needed to stop Stericycle, a medical waste incineration facility, located on the GRIC reservation from continuing to illegally burn medical and non-medical waste imported onto the reservation and emit Hazardous Air Emissions (HAPs).[8] GRACE also led the successful campaign to prevent Romic, another private hazardous waste facility operating on the GRIC reservation without the required federal permits, from continuing to violate hazardous waste laws and pollute the area and residents."[9] GRIC tribal members and the tribe hold the South Mountain sacred and see it as central to its creation story.[10] GRACE opposes the proposed South Mountain Loop 202 because the project would desecrate the South Mountain by going through it, resulting in a disparate impact – culturally and spiritually on the GRIC[11]-- and in disparate cumulative health effects[12] on the GRIC tribal members. Complainant GRACE brings this Civil Rights Complaint on behalf of its GRIC tribal members who have been discriminated against by ADOT's inadequate consultation and unequal public participation process and who would be disparately affected by the implementation of the South Mountain Loop due to devastating cultural, spiritual, health and environmental impacts. The GRIC includes the tribes of the Akimel O'odham, (River People), and the Maricopa (Pee Posh).[13] The Akimel O'odham, who have inhabited the Sonoran Desert long before Europeans settled the Americas, are native to central and southern Arizona and are descendants of the Hohokam, whose artifacts have been dated as far back as 10,000 years ago.[14] Known as the "desert farmers" by some, the Akimel O'odham were sophisticated engineers and farmers, successfully growing a variety of crops in the Sonoran desert landscape.[15] The Maricopa are a Yuman tribal people.[16] As early as the mid-1700s, the Maricopa arrived from their lower Colorado River area homes.[17]

8 (cont.)		source air toxics emissions would decrease by 57 percent to more than 90 percent, depending on the pollutant, despite a 47 percent increase in vehicle miles traveled in the Study Area compared with 2012 conditions. The air quality analyses were updated for the Final Environmental Impact Statement, including a quantitative particulate matter (PM_{10}) analysis, and are more fully described beginning on page 4-68 of the Final Environmental Impact Statement. Congestion relief resulting from the proposed freeway would provide localized air quality emissions reductions on area freeways and arterial streets and at interchanges, benefiting users of area highways and those living near congested roads.
9	**Title VI**	Comment noted.
10	**Cultural Resources**	Comment noted.
11	**Cultural Resources**	Since the beginning of the environmental impact statement process, the Federal Highway Administration and Arizona Department of Transportation have been carrying out cultural resource studies and engaging in an ongoing, open dialogue with the Gila River Indian Community Tribal Historic Preservation Office regarding the identification and evaluation of places of religious and cultural importance to the Gila River Indian Community that may be adversely affected by the proposed freeway. Such places are referred to as traditional cultural properties. As a result of these discussions and of studies conducted by the Gila River Indian Community's Cultural Resource Management Program, the Gila River Indian Community has identified traditional cultural properties that are eligible for listing in the National Register of Historic Places and that could be affected by construction of the proposed freeway. In certain cases, listing these properties on the National Register of Historic Places may offer them protection under Section 4(f) of the Department of Transportation Act. The traditional cultural properties identified are culturally important to other Native American tribes as well. For more discussion of traditional cultural properties, see the section, *Cultural Resources,* beginning on page 4-140 of the Final Environmental Impact Statement and pages 5-26 through 5-28. Section 106 of the National Historic Preservation Act requires a government-to-government relationship between the Federal Government and Indian tribes as described beginning on page 4-140 of the Final Environmental Impact Statement. Section 106 requires that federal agencies take into account the effects of their undertakings on historic properties. This process requires consultation with tribal authorities. Consultation has occurred with Gila River Indian Community government officials, the Tribal Historic Preservation Officer, the Cultural Resource Management Program, many different tribal authorities, and the State Historic Preservation Office. The consultation has resulted in concurrence from the Gila River Indian Community Tribal Historic Preservation Office and the State Historic Preservation Office on National Register of Historic Places eligibility recommendations (including traditional cultural properties), project effects, and proposed mitigation and measures to minimize harm. This consultation has been ongoing and will continue until any commitments in a record of decision are completed. Public involvement with the Gila River Indian Community was conducted as requested by the tribal government. Prior to October 2005, early efforts to involve the Gila River Indian Community included attending tribal meetings and monthly

11 (cont.)		meetings with Gila River Indian Community Departments (see discussion beginning on page 2-8 of the Final Environmental Impact Statement). On October 14, 2005, the Gila River Indian Community requested that all project-related communications take place at a government-to-government level (see letter on page A152 of Appendix 1-1). This request was honored by the Arizona Department of Transportation and the Federal Highway Administration. All public involvement efforts were implemented by the Gila River Indian Community's public involvement officer. No disparate health effects, either direct or cumulative, would result from the implementation of the Preferred Alternative. The air quality assessment for the proposed freeway analyzed impacts from carbon monoxide and particulate matter (PM_{10}) and followed U.S. Environmental Protection Agency guidelines. The carbon monoxide and particulate matter (PM_{10}) analyses demonstrated that the proposed freeway would not contribute to any new localized violations, increase the frequency or severity of any existing violation, or delay timely attainment of the National Ambient Air Quality Standards or any required interim emissions reductions or other milestones. For mobile source air toxics, the analysis showed that for the Study Area, constructing the freeway would have a marginal effect on annual emissions in 2025 and 2035 (less than a 1 percent difference in total annual emissions between the Preferred Alternative and No-Action Alternative). With the Preferred Alternative in 2035, modeled mobile source air toxics emissions would decrease by 57 percent to more than 90 percent, depending on the pollutant, despite a 47 percent increase in vehicle miles traveled in the Study Area compared with 2012 conditions. The air quality analyses were updated for the Final Environmental Impact Statement, including a quantitative particulate matter (PM_{10}) analysis, and are more fully described beginning on page 4-68 of the Final Environmental Impact Statement.
12	**Title VI**	The Arizona Department of Transportation and Federal Highway Administration provided equal access to the public participation process to the Gila River Indian Community and its members. The Arizona Department of Transportation and Federal Highway Administration solicited input from the Gila River Indian Community and other Native American tribes and tribal members and considered fully the substantive input and comments that were received. Chapter 2 of the Final Environmental Impact Statement is dedicated to explaining the Gila River Indian Community outreach undertaken for the project. The Gila River Indian Community was provided the same opportunities to participate in the project as all other populations and agencies. Public involvement with the Gila River Indian Community was conducted as requested by the tribal government. Prior to October 2005, early efforts to involve the Gila River Indian Community included attending tribal meetings and monthly meetings with Gila River Indian Community Departments (see discussion beginning on page 2-8 of the Final Environmental Impact Statement). In addition, representatives from the Gila River Indian Community participated for years in the South Mountain Citizens Advisory Team. On October 14, 2005, the Gila River Indian Community requested that all project-related communications take place at a government-to-government level (see letter on page A152 of Appendix 1-1). This request was honored by the Arizona Department of Transportation and Federal Highway Administration. All public involvement efforts were implemented by the Gila River Indian Community's public involvement officer. It is also important to note, that the Gila River Indian Community's Lieutenant Governor is a member of the Transportation Policy

Code	Comment Document
13	In 1859, GRIC was established as the first reservation in part of what later became Arizona in 1912.[18] In 1862, when water flowed freely, GRIC was growing more than one million pounds of wheat a year; however, between the 1870s and 1880s, water supplies drastically diminished due to upstream diversions by non-Native farmers. These diversions rendered farming almost nonexistent.[19] Between approximately 1880 and 1920, GRIC faced mass famine and starvation.[20] Due to the need for outside assistance, diet and way of life completely changed.[21] Alcoholism became a major problem and the GRIC "experienced the loss of certain cultural and artistic traditions and rituals."[22] "This time became one of…the darkest moment(s) in …their… long history."[23] In the 1930s, circumstances began to improve when the U.S. government completed Coolidge Dam on the upper Gila River, which created the San Carlos Reservoir: this restored some farming practices.[24] Eventually, small businesses, schools, health centers, and new housing began to appear on the reservation.[25] However, GRIC faces one of the highest levels of diabetes in the United States, thought to be directly a result of the disappearance of the traditional lifestyle and diet.[26]
14	The GRIC history also includes forced boarding school for children, which not only was psychologically and physically oppressive but was culturally and socially oppressive, as it was instituted to acculturate Native American children into non-native American Indian speaking and practicing children.
15	Today, encompassing 372,000 acres along the Gila River, GRIC is the seventh largest federally recognized reservation in Arizona.[27] It is in both Pinal and Maricopa counties and is 17 miles south of downtown Phoenix.[28] Approximately 14,000 of the 21,000 enrolled GRIC members live on the reservation.[29] 4,274 or 36% of GRIC tribal members on the reservation are under 18 and 7,438 or 64% are over 18; 675 or 6% of GRIC tribal members are 65 and older.[30] The Akimel O'odham (River People) comprise 90% of the GRIC reservation and the Pee Posh (Maricopa), who live at the west end of the South Mountain, comprise about 10% of the GRIC

[18] In 1846, the territory now known as southern Arizona, came under the control of the US, and in 1854, the entire present day Arizona territory was officially made part of the United States territory. Arizona became a US state in 1912. *Id.*

12 (cont.)		Committee of the Maricopa Association of Governments, which oversees the development of the 20-year *Regional Transportation Plan* and guides transportation planning in the region. The Arizona Department of Transportation advertisement efforts of the public hearing and public forums are documented in Chapter 6 of the Final Environmental Impact Statement beginning on page 6-23. The Gila River Indian Community Communication and Public Affairs Office informed the Arizona Department of Transportation that all communication and distribution of informational materials on Gila River Indian Community land would be handled by the Communication and Public Affairs Office. Advertisement text regarding the project, the public comment period, the public hearing, and the various ways for the public to submit comments regarding the South Mountain Freeway Draft Environmental Impact Statement was given to the Gila River Indian Community's Public Information Officer at the Transportation Technical Team meeting on April 30, 2013. Two advertisements regarding the public hearing, information regarding the location and availability of the Draft Environmental Impact Statement, and a map of the alternatives was placed in the May 2013 monthly issue of the *Gila River Indian News*. The Arizona Department of Transportation Community Relations distributed electronic notices (e-newsletters) through the Government Delivery system to over 12,000 constituents who voluntarily signed up for project alerts along Interstate 10 (Papago, Maricopa, and Santan Freeways). These electronic notices included notice of availability of the Draft Environmental Impact Statement (distributed on April 26, 2013); date of the public hearing (distributed on May 10, 2013); dates of the community forums (distributed on May 29, 2013); and notification in June regarding the close of the Draft Environmental Impact Statement public comment period. In addition, anyone who had attended a previous meeting regarding the proposed action and signed in received all of this information mailed individually. On May 6, 2013, 73,564 mailers were distributed to addresses within the Study Area. The Arizona Department of Transportation provided vouchers for public hearing parking and for public transit to the hearing. For the first time in the State's history, a shuttle bus to the hearing was provided from six locations in the Phoenix area, including two on the Gila River Indian Community (Komatke Boys & Girls Club and the Governance Center in Sacaton). All ads provided telephone numbers and electronic contact information regarding information on the shuttle schedules and pick-up locations. Response to Comment 11 immediately preceding this response addresses cultural, spiritual, health and environmental impacts referenced in the comment.

reservation. GRIC is organized into seven territorial districts.[31] GRIC has an executive branch, comprised of a governor and lieutenant governor; a legislative, made up of a Community Council[32] consisting of members from the seven territorial districts of the reservation; and a judicial branch, with a Community Court of seven judges that provides services to approximately 20,000 members of GRIC.[33]

15 GRIC's economy has been growing via agricultural, gaming, and the development of industrial parks.[34] GRIC is currently one of the largest agricultural producers in the state of Arizona, farming cotton, wheat, millet, alfalfa, barley, melons, pistachios, olives, citrus, and vegetables.[35] Now that it has finally settled an ongoing water dispute and will be receiving enough water to sustain itself, it plans to put in approximately 140,000 more acres of agriculture in the next 20 years.[36] GRIC has three casinos, Wild Horse Pass, Lone Butte, and Vee Quiva.[37] GRIC operates three industrial parks.[38] Like the US states, GRIC has its own transportation and environmental departments.

16 As a Native Nation, the federal government has a direct trust relationship with the GRIC and its people. The basis for this special legal relationship is found directly in the Constitution and memorialized in treaties.[39] This trust relationship applies to all Federal agencies and to Federal action outside Indian reservations.[40] Due to this trust relationship, the government has a special legal responsibility to review this complaint according to the unique requirements owed to the GRIC by the government.

17 Because of the 1992 National Historic Preservation Act (NHPA) Amendments, the GRIC has a Tribal Historic Preservation Officer (THPO) to assist in identifying and nominating historic properties / historic resources on their tribal lands[41] for the National Park Service (NPS) to place

Code	Issue	Response
16	**Title VI**	Since Gila River Alliance for a Clean Environment's Title VI complaint was received during the public comment period for the Draft Environmental Impact Statement, it has been included as a part of the Comment and Response appendix. However, it should be noted that the National Environmental Policy Act process is separate from the U.S. Department of Transportation Title VI complaint process.
17	**Cultural Resources**	Since the beginning of the environmental impact statement process, the Federal Highway Administration and Arizona Department of Transportation have been carrying out cultural resource studies and engaging in an ongoing, open dialogue with the Gila River Indian Community Tribal Historic Preservation Office regarding the identification and evaluation of places of religious and cultural importance to the Gila River Indian Community that may be adversely affected by the proposed freeway. Such places are referred to as traditional cultural properties. As a result of these discussions and of studies conducted by the Gila River Indian Community's Cultural Resource Management Program, the Gila River Indian Community has identified traditional cultural properties that are eligible for listing in the National Register of Historic Places and that could be affected by construction of the proposed freeway. In certain cases, listing these properties on the National Register of Historic Places may offer them protection under Section 4(f) of the Department of Transportation Act. The traditional cultural properties identified are culturally important to other Native American tribes as well. For more discussion of traditional cultural properties, see the section, *Cultural Resources*, beginning on page 4-140 of the Final Environmental Impact Statement and pages 5-26 through 5-28. Section 106 of the National Historic Preservation Act requires a government-to-government relationship between the Federal Government and Indian tribes as described beginning on page 4-140 of the Final Environmental Impact Statement. Section 106 requires that federal agencies take into account the effects of their undertakings on historic properties. This process requires consultation with tribal authorities. Consultation has occurred with Gila River Indian Community government officials, the Tribal Historic Preservation Officer, the Cultural Resource Management Program, many different tribal authorities, and the State Historic Preservation Office. The consultation has resulted in concurrence from the Gila River Indian Community Tribal Historic Preservation Office and the State Historic Preservation Office on National Register of Historic Places eligibility recommendations (including traditional cultural properties), project effects, and proposed mitigation and measures to minimize harm. This consultation has been ongoing and will continue until any commitments in a record of decision are completed.

Code	Comment Document

on the National Register of Historic Places (NRHP) of 1966. The purpose of the NHPA is to "preserve the historical and cultural foundations of the Nation as living parts of community life."[42] The NHPA "established the National Register of Historic Places and the requirements under Section 106 of that Act that require federal agencies to take into account the effects of their actions on historic properties listed on or eligible for inclusion on the National Register."[43] The South Mountain has been approved as a traditional cultural property "eligible for inclusion in the National Register because of its association with cultural practices or beliefs of a living community that (a) are rooted in that community's history, and (b) are important in maintaining the continuing cultural identity of the community."[44]

IV. THE ARIZONA DEPARTMENT OF TRANSPORTATION

ADOT, a state government agency created in 1974, is the sponsor of the proposed construction and operation of the South Mountain Loop 202.[45] It is "responsible for collecting transportation revenues and for planning, constructing and maintaining Arizona's highway infrastructure,"[46] as well as, the state's public transportation and municipal airports.[47] Its mission is "to provide a safe, efficient, cost-effective transportation system."[48] On April 26, 2013, ADOT released a DEIS for the Loop 202 South Mountain Freeway Study.[49]

ADOT is a recipient of federal highway funds and is thus subject to and required to comply with the non-discriminatory requirements of Title VI of the U.S. Civil Rights Act.

V. RIPENESS

18

This complaint is timely filed because it is in response to the improper and discriminatory action taken by ADOT's April 26, 2013 sponsorship and release of the DEIS for the Loop 202 South Mountain Freeway Study that was prepared by the Federal Highway Administration (FHWA), the federal lead agency for the proposed action, in cooperation with the U.S. Army Corps of Engineers (USACE), the U.S. Bureau of Indian Affairs (BIA), and the Western Area

Code	Issue	Response
19	Title VI	The Arizona Department of Transportation and Federal Highway Administration provided equal access to the public participation process to the Gila River Indian Community and its members. The Arizona Department of Transportation and Federal Highway Administration solicited input from the Gila River Indian Community and other Native American tribes and tribal members and considered fully the substantive input and comments that were received. Public involvement with the Gila River Indian Community was conducted as requested by the tribal government. Prior to October 2005, early efforts to involve the Gila River Indian Community included attending tribal meetings and monthly meetings with Gila River Indian Community Departments (see discussion beginning on page 2-8 of the Final Environmental Impact Statement). On October 14, 2005, the Gila River Indian Community requested that all project-related communications take place at a government-to-government level (see letter on page A152 of Appendix 1-1). This request was honored by the Arizona Department of Transportation and Federal Highway Administration. All public involvement efforts were implemented by the Gila River Indian Community's public involvement officer. Chapter 2 of the Final Environmental Impact Statement is dedicated to the explanation of the Gila River Indian Community outreach undertaken for the project. The Gila River Indian Community was provided the same opportunities to participate in the project as all other populations and agencies. The Arizona Department of Transportation advertisement efforts of the public hearing and public forums are documented in Chapter 6 of the Final Environmental Impact Statement beginning on page 6-23. The Gila River Indian Community Communication and Public Affairs Office informed the Arizona Department of Transportation that all communication and distribution of informational materials on Gila River Indian Community land would be handled by the Communication and Public Affairs Office. Advertisement text regarding the project, the public comment period, the public hearing, and the various ways for the public to submit comments regarding the South Mountain Freeway Draft Environmental Impact Statement was given to the Gila River Indian Community's Public Information Officer at the Transportation Technical Team meeting on April 30, 2013. Two advertisements regarding the public hearing, information regarding the location and availability of the Draft Environmental Impact Statement, and a map of the alternatives was placed in the May 2013 monthly issue of the *Gila River Indian News*. The Arizona Department of Transportation Community Relations distributed electronic notices (e-newsletters) through the Government Delivery system to over 12,000 constituents who voluntarily signed up for project alerts along Interstate 10 (Papago, Maricopa, and Santan Freeways). These electronic notices included notice of availability of Draft Environmental Impact Statement (distributed on April 26, 2013); date of the public hearing (distributed on May 10, 2013); dates of the community forums (distributed on May 29, 2013); and notification in June regarding the close of the Draft Environmental Impact Statement public comment period. In addition, anyone who had attended a previous meeting on the proposed action and signed in received all of this information mailed individually. On May 6, 2013, 73,564 mailers were distributed to addresses within the Study Area.

Power Administration.[50] The release of the DEIS began a 90-day public review and comment period that will conclude on July 24, 2013.[51]

This complaint is also timely filed because ADOT conducted a public participation process to receive public input on the proposed project, but conducted it in a way that provided GRIC tribal members, including members of GRACE, less of an opportunity to meaningfully participate in the process than non-Native people.

VI. STATEMENT OF FACTS

A. SOUTH MOUNTAIN (Muhadag, Avikwaxos)

20

The South Mountain, known in the Pima language as the Muhadag and in the Maricopa language, Avikwaxos,[52] consists of the Ma Ha Tauk, Gila, and Guadalupe Mountain Ranges.[53] It abuts the northern territory of the GRIC and consequently, is the immediate landscape of the northern boundary of the GRIC reservation. A portion of Main Ridge North and Main Ridge South of the South Mountain is on the GRIC, and serve as the "Community's main, direct physical link to the South Mountains".[54] The South Mountain "figures prominently in oral traditions of both the Akimel O'Odham (River People) and the Pee Posh (Maricopa)."[55] The Akimel O'odham believe that South Mountain is where their creator immerged.

On January 6, 1982, the Gila River Indian Community Tribal Council adopted an ordinance declaring "as a matter of Community policy and legislative determination, that the public interests of the Pima-Maricopa people and the interests of all other persons living within the jurisdiction of the Gila River Indian Community require that the Community adopt a means whereby all sites, location, structures, and objects of sacred, historical or scientific interest or nature will be protected from desecration, destruction, theft, or other interference."[56]

Then in 1989, the Gila River Indian Community Tribal Council adopted a resolution to preserve the lands of their Hohokam ancestors, by approving the "Policy Statement of the Four Southern Tribes (Salt River Pima-Maricopa Indian Community, Ak Chin Indian Community, Tohono O'odham Nation, and the Gila River Indian Community) which outlines the Four Tribes intent to protect, promote, and preserve cultural affinity to the HuHuKam."[57]

21

On April 4, 2007, the Gila River Indian Community Tribal Council adopted a tribal resolution affirming that the South Mountain is "a sacred place / traditional cultural property …that…must be kept inviolate[58] thereby recording the sacredness and significance of South

Mountain to the people of the GRIC and its tribal government. This important tribal resolution is attached as Exhibit A and incorporated into this complaint. The resolution states the GRIC Community Council "strongly opposes any alteration of the South Mountain Range for any purpose"…and any alteration…"would be a violation of the cultural and religious beliefs of the Gila River Indian Community and would have a negative cumulative effect on the continuing lifeways of the people of the Gila River Indian Community."[59]

22 Not only is South Mountain itself sacred, but there are also numerous sites with highly significant meaning and purpose to GRIC.[60] There are many ancestral burial and archeological sites, and ancient shrines.[61] Further, the Colorado River Indian Tribes[62], Salt River Pima-Maricopa Indian Community[63], the Ak-Chin Indian Community[64], the Tohono O'odham Nation[65], and the Pascua Yaqui Tribe[66] also hold the South Mountain sacred.[67]

23 Much of the South Mountain is within the South Mountain Park Preserve (SMPP),[68] which is a 16,600 mile park preserve in the Sonoran desert[69] in Phoenix, Arizona. First created in 1924 during the New Deal era, 13,000 acres of the land were bought from the federal government by the city of Phoenix for a "scenic/pleasure park."[70] Then, in 1927, the Bureau of Land Management ("BLM") conveyed 9,200 acres of land to the City of Phoenix where some of that land was converted into the SMPP.[71] Then, in April 2009, 247 acres of State Trust Land, were purchased from the Arizona Land Department.[72] SMPP is a historic property and is eligible

23

for listing in the National Register of Historic Places.[73] As stated previously, some of the South Mountain is within the GRIC's northern territorial edge, giving the GRIC a corridor to get to other areas of the South Mountain from the reservation. As the DEIS states, the portions of the South Mountain on Community land are at the western end: the Main Ridge North and Main Ridge South. These ridges "serve as the Community's main, direct physical link to the mountains."[74] The SMPP, which includes the South Mountain, one of their TCPs, preserves cultural, historical, geological, and ecological resources relevant to the GILA tribal members.[75]

For the GRIC, the concept of creation is not something in the past but is an ongoing process, one that they are intrinsically a part of and are obligated to participate in. The GRIC fulfill this duty through ceremonies and rituals designed to preserve and stabilize the earth. Failure to fulfill those obligations is thought to result in great harm to the earth and the people who depend on it. Ceremonies are efforts undertaken for specific purposes in accordance with instructions handed down from generation to generation. Rituals are performed in prescribed locations that are unique and specific sites possess different spiritual properties and significance.

Some traditionalists and Elders of the GRIC use portions of the South Mountain for periodic ceremonies and rituals. These are special people who are keepers of the tribal peoples' heritage and culture who possess an essential role believed to sustain the tribal people as a whole. These ceremonies and rituals have been passed on through the ages and have been performed for ages.

Traditionalists also are people who follow the natural Native American way of living from the earth: picking and harvesting traditional cultural foods like the fruit of the saguaro[76] and medicines, and teaching and guiding the young in the cultural and spiritual ways.

B. SOUTH MOUNTAIN LOOP 202 PROPOSAL

The South Mountain Loop 202 is a proposed eight-lane, 22-mile long highway in southwestern Maricopa County, Arizona.[77] If constructed, it would be the last section of the proposed master plan Regional Freeway and Highway System first proposed in 1985 by

Code	Comment Document

Maricopa Association of Governments ("MAG"),[78] that when connected to a surface transportation system would allegedly: "reduce increasing congestion on the Interstate Highway System in the urban core; facilitate and more effectively distribute the regional movement of goods and delivery of services; more evenly distribute traffic on the major arterial street grid and reduce regional traffic using the grid; better serve already-occurring regional traffic; provide an alternate route for pass-through traffic; provide an integrated intermodal network of freeways strategically located to accommodate local and regional land use planning; enhance local mobility by removing regional traffic from the local road network; create infrastructure to support the regional bus transit system component of the intermodal Long Range Transportation Plan (LRTP) (MAG 2001a); encourage and direct planned growth."[79]

24

Although the master plan Regional Freeway and Highway System has done without this last section, the DEIS asserts that this section is necessary. The DEIS sites that "over the past 40 years, Phoenix-area population, housing, and employment experienced some of the fastest growth in the nation…and from the early 1950s to the mid-1990s, population in the MAG region grew by over 500 percent."[80] The DEIS assumes that population growth will continue at the same rate as it did between the 1950s to mid-1990s and that Maricopa County's population will add an average of 1 million a decade from 2005-2035.[81] The DEIS states that "almost 50 percent of projected increases in population, housing, and employment from 2005 to 2035 for the entire MAG region are expected to occur in the southwestern and southeastern portions of the Phoenix metropolitan area" and would benefit from the highway to get back and forth to central Phoenix.[82] The DEIS cites public support of the South Mountain Loop by "Voter approval of the one-half cent sales tax in 1985 (Proposition 300) and its continued endorsement in 2004 (Proposition 400) for continued public support for investment in regional transportation projects; results from the Maricopa County Official Canvas (Maricopa County 2004a) that show voters in 90 percent of the county's 1,058 voting precincts voted in favor of Proposition 400 and the

(Maricopa Association of Governments, http://www.azmag.gov/). The DEIS relies on MAG's planning from 1985 and its population projections for the proposed South Mountain highway. (Arizona Department of Transportation, Strategic Plan fiscal years 2013-2017 http://www.azdot.gov/Inside_adot/PDF/StrategicPlan.pdf).

[79] ADOT, South Mountain Study Team, chapter 1 *Purpose and Need* p. 4 available at http://www.azdot.gov/Highways/Valley_Freeways/Loop_202/South_Mountain/PDF/FHWA-AZ-EIS/01-SMDEIS-Chapter-1-Purpose-and-Need.pdf; ADOT's Long Range Transportation Plan: 2010-2035 includes a list of roadway projects ordered in importance, with the South Mountain Loop taking third place. The first two are for the Hassayampa Freeway, which is part of the CANAMEX Trade Corridor, route going through Arizona, Nevada, Utah, Idaho, and Montana, and linking to the Canadian province of Alberta and the Mexican states of Sonora, Sinaloa, Nayarit, and Jalisco. It is argued by PARC, and others, that if South Mountain is created, it will be used by truck drivers looking for a bypass to more easily get through the Maricopa area; something ADOT asserts is not the purpose of the loop. Even if it is not the purpose of the loop, it would be a result of the South Mountain Loop: Since the CANAMEX route has not been put in and there is a route put in that is better than the existing roadways, truckers will use it.

[80] ADOT, South Mountain Study Team, *Summary* at 5; Maricopa County is the most populated county in Arizona and it is also one of the largest counties in the United States, and Phoenix, the state's capital, is its largest city. Code	Issue	Response
24	**Socioeconomic Projections**	The analyses in the Draft Environmental Impact Statement used socioeconomic and traffic projections at the regional analysis zone and traffic analysis zone levels. At the time of publication of the Draft Environmental Impact Statement, Census 2010-based socioeconomic data at the regional analysis zone and traffic analysis zone levels had not been adopted by the Maricopa Association of Governments and were not available to the project team. Therefore, the data used in the Draft Environmental Impact Statement were the most appropriate information available. The Maricopa Association of Governments approved new population, employment, housing, and traffic projections in June 2013. The new data are presented in the Final Environmental Impact Statement beginning on page 1-11. The purpose and need and analysis of alternatives were updated and reevaluated using these new socioeconomic projections and corresponding projections related to regional traffic. While new projections based on the 2010 Census showed a lower anticipated population and vehicle miles traveled in 2035 than the previous projections, the conclusions reached in the Draft Environmental Impact Statement were validated in the Final Environmental Impact Statement (see Chapter 3, *Alternatives*). The traffic analysis demonstrated that the proposed project is needed today and will continue to be needed into the future. The comment states in the Draft Environmental Impact Statement support of the freeway project through voter approval of Propositions 300 and 400. To clarify, the text on page 1-9 of the Draft Environmental Impact Statement states, "Voter approval of the one-half cent sales tax in 1985 (Proposition 300) and its continued endorsement in 2004 (Proposition 400) underscore continued public support for investment in regional transportation projects. Results from the Maricopa County Official Canvas (Maricopa County 2004a) indicate voters in 90 percent of the county's 1,058 voting precincts voted in favor of Proposition 400 and the projects it would fund. Voters in 81 percent of the 31 voting precincts in the Study Area favored Proposition 400 and the projects it would fund." The reference to the propositions only states continued voter approval for transportation infrastructure in the region.

Code	Comment Document

25

projects it would fund; and voters in 81 percent of the 31voting precincts in the Study Area favored Proposition 400 and the projects it would fund."[83]

The DEIS also asserts that pollution will actually be reduced, ultimately improving air quality with the South Mountain Loop 202. The stated reason for this viewpoint is that the problem with the existing roadways is traffic and congestion. With the South Mountain Loop 202, some cars would have an alternative route for driving back and forth to downtown Phoenix.

The DEIS lays out several options, called "action alternatives" to choose from for implementing the proposal.[84] One action alternative is a no-build.[85] The DEIS evaluation concluded that the No-Build Alternative would not satisfy the projects purpose and need: the purpose and need are based on socioeconomic factors (population, housing, and employment projections); regional transportation demand (traffic and congestion); and existing and projected transportation system capacity deficiencies (present and future transportation system management, transportation demand management, transit, street network expansion, land use, and a combination of the transportation systems).[86] The DEIS states that with population growth, and its resulting increase in traffic and congestion, and even future alternative freeway modes that have been planned and would likely be funded, like for example, increasing bus routes, could not solve the purpose and need that the South Mountain Loop would fulfill. Chapter 3 states that "These alternatives alone would have limited effectiveness in reducing overall traffic congestion in the Study Area and, therefore, would not meet the purpose and need criteria; specifically, they would not adequately address projected capacity and mobility needs of the MAG region:…Based on projected regional travel demand and the extent of mobility needs of the MAG region and in the Study Area, arterial street network improvements alone would not meet the needs of the MAG region; and The Land Use Alternative is not a viable alternative because no plans exist to alter planned land uses in the region."[87]

The build options consist of choosing one western alternative -W59, W71, and W101- and the one available eastern action alternative – E1.[88] All western alternatives begin at 1-10 (Papago Freeway) and proceed east to a common point to all on an alignment parallel and adjacent to the GRIC boundary. All alternatives would cross Union Pacific RR, Salt River, Roosevelt Canal, Laveen Area Conveyance Channel, and all require 1-10 improvement.[89]

26

There is only one eastern alternative because the only other alternative that ADOT had considered was a route on GRIC land, which the GRIC rejected. DEIS states "the E1 Alternative is the only action alternative developed for the Eastern Section. Despite efforts by ADOT and FHWA to seek permission to study an alternative in detail on Community land, permission has not been granted. Therefore, ADOT, with concurrence from FHWA, identified the E1 Alternative as its Preferred Alternative in the Eastern Section."[90]

Code	Issue	Response
25	**Air Quality**	The Final Environmental Impact Statement addresses the history of air quality in the region (see text beginning on page 4-68 of the Final Environmental Impact Statement). The Clean Air Act § 109(b)(1) requires the U.S. Environmental Protection Agency to promulgate primary National Ambient Air Quality Standards at levels that allow an adequate margin of safety to protect the public health. Air quality in the Phoenix metropolitan area has improved over time; Phoenix was redesignated to attainment/maintenance for carbon monoxide in 2005, and the U.S. Environmental Protection Agency recently determined that Phoenix has attained the particulate matter (PM_{10}) standard. These improvements are largely associated with cleaner fuels and lower-emission vehicles along with local controls on fugitive dust. Future emissions would also be reduced by the use of cleaner-burning fuels, technological advances in automotive design (including the greater use of alternative fuel vehicles), reformulated gasoline, gas can standards, stricter enforcement of emission standards during inspections, heavy-duty diesel engine and on-highway diesel sulfur control programs, dust control programs, and others. The air quality assessment for the proposed freeway analyzed impacts from carbon monoxide and particulate matter (PM_{10}) and followed U.S. Environmental Protection Agency guidelines. The carbon monoxide and particulate matter (PM_{10}) analyses demonstrated that the proposed freeway would not contribute to any new localized violations, increase the frequency or severity of any existing violation, or delay timely attainment of the National Ambient Air Quality Standards or any required interim emissions reductions or other milestones. For mobile source air toxics, the analysis showed that for the Study Area, constructing the freeway would have a marginal effect on annual emissions in 2025 and 2035 (less than a 1 percent difference in total annual emissions between the Preferred Alternative and No-Action Alternative). With the Preferred Alternative in 2035, modeled mobile source air toxics emissions would decrease by 57 percent to more than 90 percent, depending on the pollutant, despite a 47 percent increase in vehicle miles traveled in the Study Area compared with 2012 conditions. The air quality analyses were updated for the Final Environmental Impact Statement, including a quantitative particulate matter (PM_{10}) analysis, and are more fully described beginning on page 4-68 of the Final Environmental Impact Statement. Congestion relief resulting from the proposed freeway would provide localized air quality emissions reductions on area freeways and arterial streets and at interchanges, benefiting users of area highways and those living near congested roads.

27

The DEIS states: "based on the alternatives screening process, environmental impacts assessment, and stakeholder input, ADOT, with the concurrence from FHWA", identified the W59 Alternative as its Preferred Alternative in the Western Section and the E1 Alternative the Eastern Section.[91] This "preferred" route would be down Pecos Road in the Ahwatukee Foothills, through the western portion of the South Mountain Preserve, including through the South Mountain itself, and up 59th Avenue through Laveen.[92] The DEIS approximates that 31.3 of the 16,600 acres of the SMPP would be taken for the proposed highway and 0.9 mile of Loop 202 would pass through the southwestern edge of South Mountain.[93] Cuts to South Mountain would be a 220-foot cut through one ridge, a 190-foot cut to another, and a 70-foot cut to a third for an estimated cost of $30 million.[94]

C. ADOT AND THE DEIS ACKNOWLEDGE SACRED AND CULTURAL SIGNIFICANCE OF SOUTH MOUNTAIN

The DEIS acknowledges that the South Mountain is sacred to the GRIC, is a TCP[95], and further, is National Register of Historic Places ("NRHP")-eligible. The DEIS indicates that ten locations have been identified by GRIC as places of cultural importance: the South Mountains, two prehistoric village sites, an active shrine site, two prehistoric petroglyph sites, and four prehistoric trail sites, which qualify as NRHP-eligible TCPs.[96] The NRHP eligibility of two of the properties was confirmed by FHWA through consultation with the GRIC[97] Five TCPs have been identified within the project area of "potential effects". The DEIS specifically states that the South Mountains were determined eligible for NRHP listing as a TCP under Criteria A and B.[98]

The DEIS states: "the Community has expressed to ADOT and FHWA its concerns about an alignment through the South Mountains and the irreversible impacts on the South Mountains from the proposed action. To the Community, the South Mountains are part of a continuum of life and not an individual entity that can be isolated and analyzed."[99]

The DEIS further acknowledges that the GRIC is opposed to any destruction of the South Mountain. It states "the mountains are considered sacred—playing a role in tribal cultures, identities, histories, and oral traditions—and appear in many creation stories. Many traditional

Code	Issue	Response
26	**Alternatives**	Several action alternatives were subject to the alternatives development and screening process; not just the E1 Alternative and alternatives located on the Gila River Indian Community (Figure 3-6 on page 3-10 of the Final Environmental Impact Statement illustrates a representation of such alternatives). Other alternatives that would have avoided the South Mountains were rejected by the Gila River Indian Community or would have had severe social and economic impacts. These alternatives would have increased costs of extraordinary magnitude Ultimately the other alternatives were eliminated from further study in the screening process and the Gila River Indian Community decided not to give permission to develop alternatives on its land (see Final Environmental Impact Statement page 3-25). The E1 Alternative when combined with the W59, W71, and W101 (and its options) Alternatives in the Western Section represents three distinct action alternatives from project termini to project termini, and therefore, represents a full range of reasonable alternatives for detailed study in the Draft and Final Environmental Impact Statements. Therefore, the Arizona Department of Transportation, with concurrence from the Federal Highway Administration, identified the E1 Alternative as the eastern section of the Preferred Alternative (which includes the W59 Alternative in the Western Section of the Study Area). In reaching its determination, the Arizona Department of Transportation sought to balance its responsibilities to address regional mobility needs while being fiscally responsible and sensitive to local communities.

Code	Comment Document
28	religious and ceremonial activities continue on the mountains."[100] Further, ADOT is aware that GRIC prefers the no-build alternative.[101] The DEIS states that their preferred-action alternative would cut through the South Mountains resulting in removing two archaeological sites identified as contributing components of the South Mountains TCP, (considered NRHP-eligible under Criteria A and D); modif(ying) the spiritual landscape of Native peoples; altering access by Native American groups to culturally important places; interfering with ceremonial practices and religious activities of some Native American groups.[102] The DEIS also states: "two contributing components to the TCP are located within the Study Area, one of which is considered NRHP-eligible under Criterion A. The first site is…unique and possibly associated with traditional religious and ceremonial activities associated with the South Mountains. The second site is situated within the South Mountains TCP. These sites continue to function in the living Akimel O'odham and Pee Posh communities and often serve as spiritual places (Tribal Historic Preservation Officer [THPO] response [not concurrence] regarding NRHP-eligibility of the South Mountains as a TCP and its contributing components was received on August 17, 2011; consultation is ongoing)."[103] Further, the DEIS acknowledges that the portions of the South Mountains on GRIC located on the western end serve as the "Community's main, direct physical link to the mountains."[104] Further, it states, "the E1 Alternative would result in direct use of the TCP. Approximately 3 miles of freeway alignment would pass through the mountains and would affect the southern and southwestern portions of the TCP."[105] Further, the DEIS states "While the conversion and permanent loss of part of the mountains to a transportation use by the proposed action is a concern, related Community-expressed concerns focus on impacts on history, culture, traditions, and the ability to maintain and continue the cultural identity of the communities…Within the context of the TCP, the proposed action would be a physical barrier on the landscape, altering traditional access to sacred sites, disrupting traditional cultural practices, and degrading the overall integrity of the cultural tradition and identity. Even with mitigation, implementation of the proposed action would alter the direct physical connection Community members have between their homeland and the South Mountains and would restrict the ability to visit or use these locations in a traditional cultural manner."[106] After stating all of the above, the DEIS states that "the E1 Alternative was designed in such a way as to avoid a site that is a contributing element to the South Mountains TCP, resulting in no direct use of this TCP element. A R/W fence would limit access to the site by freeway

[100] ADOT, South Mountain Study Team, *Summary* at 39.
[101] In a letter to ADOT's Director John Halikowski in 2010, GRIC stated "despite our desire for a no-build option…the Community is willing to assist ADOT in studying potential On-Reservation alignments" in an effort to "mitigate cultural impacts to Muadag (South Mountain)." (GRIC Executive Office of the Governor & Lieutenant Governor, January 27, 2010 letter to ADOT, John Halikowski).

29

users, but Community members would continue to gain access to the site as they currently do."[107]

Nevertheless, the DEIS then states, "even with mitigation, implementation of the proposed action would alter the direct physical connection Community members have between their homeland and the South Mountains and would restrict the ability to visit or use these locations in a traditional cultural manner."[108]

The DEIS later states, "alternatives to avoid use of the South Mountains TCP were evaluated and determined to be not prudent and feasible."[109]

The DEIS states that besides the South Mountain itself, another TCP would be affected. Although not physically damaged by the construction of the South Mountain Loop, this TCP would abut the highway and would be affected by highway related consequences, i.e. noise. The DEIS states: "AZ T:12:112 (ASM) is used by contemporary Community members actively exercising their traditional religious and ceremonial practices and beliefs. The site and its use are part of a broad pattern of traditional religious and ceremonial practices and beliefs that defined the cultural identity, continuity, and traditions of the Akimel O'odham. Therefore, the site is eligible for listing in the NRHP under Criterion A as a TCP." However, it states, this "resource does not have noise-sensitive activities or viewshed characteristics that contribute to its importance as a Section 4(f) resource. Therefore, according to 23 C.F.R. § 774.15, no further analysis of these proximity impacts to determine whether they would substantially impair the resource is necessary."[110]

The DEIS concludes, "in summary, the intrusion of the proposed freeway into the South Mountains, including especially the cuts into three ridgelines, would likely be perceived as severe by many members of the Community. The above measures have been and/or would be undertaken to avoid, reduce, or otherwise mitigate impacts on the South Mountains TCP and on AZ T:12:112 (ASM). The proposed freeway would be located in an area used frequently by members of the Community, one that provides direct access to the South Mountains. Thus, the proposed action would adversely affect physical access to the TCP and adversely affect another TCP within the South Mountains TCP. Perhaps more important to members of the Community, the proposed action might be perceived as severing the Community's spiritual connection to the mountain."[111]

VII. ARGUMENT

30

Discrimination against people on the basis of color, race, or national origin is prohibited under Title VI. Title VI provides that "No person in the United States shall, on the ground of race, color, or national origin, be excluded from participation in, be denied the benefits of, or be subjected to discrimination under any program or activity receiving Federal financial assistance."[112] One form of discrimination prohibited is action that causes a disparate impact on a protected class of people. For the DEIS to move forward, it cannot violate Title VI.[113] However, if the South Mountain Loop 202 is constructed, the distribution of negative impacts

Code	Issue	Response
29		Information noted
30	**Cultural Resources, Title VI**	The cultural and religious places of importance, like the South Mountains, are acknowledged in the Draft Environmental Impact Statement in several locations, notably pages 4-132 and 5-26. The section entitled *Title VI and Environmental Justice*, beginning on page 4-29 in the Draft Environmental Impact Statement, presents acceptable methods, data, and assumptions to assess the potential for disproportionately high and adverse effects from the proposed action on environmental justice populations and disparate impacts to populations protected under Title VI. Based upon the content of the section, no such effects would result from the action alternatives. In light of comments received on the Draft Environmental Impact Statement, the above-referenced conclusions were confirmed in the preparation of the Final Environmental Impact Statement. To provide further clarity, the discussions of environmental justice and Title VI were separated and additional text explaining the relationship of environmental justice and Title VI to various environmental elements was added throughout Chapter 4, *Affected Environment, Environmental Consequences, and Mitigation*, as exemplified by the inserted text on page 4-29 of the Final Environmental Impact Statement. A representative impact is the Gila River Indian Community member-expressed concern that the E1 Alternative would interfere with ceremonial practices and religious activities of some Native American groups. While impacts on the South Mountains Traditional Cultural Property would be substantial and unique in context, the direct conversion of lands to a transportation use would be limited to less than 0.2 percent of Phoenix South Mountain Park/Preserve and would not prohibit ongoing access and the cultural and religious practices by Native American tribes. Mitigation measures and measures to minimize harm as the result of extensive consultation, avoidance alternatives analyses, and efforts in developing mitigation strategies would accommodate and preserve (to the fullest extent possible from the available alternatives) access to the South Mountains for religious purposes. Text relating to this mitigation can be found on pages 4-38, 4-42, and 4-44 of the Final Environmental Impact Statement. Additionally, the section, *Mitigation*, beginning on page 4-158, presents several measures (e.g., multifunctional crossings, contributing element avoidance) to mitigate effects on cultural resources. The section, *Measures to Minimize Harm*, beginning on page 5-27, presents several measures to reduce effects on the South Mountains Traditional Cultural Property and other cultural resources. Even if one were to reach a contrary conclusion and determine that disproportionately high and adverse and/or disparate effects would occur as a result of the proposed freeway, there is substantial justification for the proposed freeway. It is needed to serve projected growth in population and accompanying transportation demand and to correct existing and projected transportation system deficiencies (see Chapter 1, *Purpose and Need*). There is no feasible and prudent alternative to the use of the South Mountains, as discussed in Chapter 5, *Section 4(f) Evaluation*. The Arizona Department of Transportation and Federal Highway Administration provided equal access to the public participation process to the Gila River Indian Community and its members. The Arizona Department of Transportation and Federal Highway Administration solicited input from the Gila River Indian Community and other Native American tribes and tribal members and fully considered input and comments that were received.

and burdens[114] would be highly unequal to the GRIC and for the foregoing reasons, Title VI was violated by ADOT because:

- the proposed route through South Mountain would knowingly, improperly, and illegally desecrate a site with profound sacred and spiritual significance resulting in an unjustifiable disparate impact on the GRIC;
- construction and the effects of vehicle and truck traffic on the proposed South Mountain Loop 202 would result in pollution causing disproportionate cumulative health effects causing a disparate impact on the GRIC and its tribal members, including members of GRACE, and;
- inadequate consultation and inadequate process was given to the GRIC.

A. SOUTH MOUNTAIN LOOP 202 DISPARATE CUMULATIVE SPIRITUAL AND CULTURAL EFFECTS ON THE GRIC, INCLUDING GRACE COMPLAINANTS

GRIC grievances about the proposed South Mountain Loop 202 have common themes Like the following, they identify the great cultural and spiritual meaning the South Mountain signifies to the GRIC: "our people feel that the mountain is a sacred place and we should respect it,"[115] "we need to protect it because that mountain is sacred to our people,"[116] you don't know what it means to us having the mountain there, it won't be the same if it should be gone,"[117] and "when I was younger I recall being taught about our people's heritage…I remember being taught by my elders that we come from South Mountain."[118] See attachments. Another GRIC tribal member stated "as we were growing up we were taught that our land was sacred and that we need to protect it at all cost. South Mountain…is one of our sacred mountains."[119] See attachment. Plainly put, construction of the South Mountain Loop 202 would desecrate a natural landscape with profound sacred and spiritual significance to the GRIC. One GRIC tribal member wrote that "my connection to South Mountain is that it is a very sacred place to me and my people."[120] See attachment. Another said "it is a sacred mountain to our people…and…it was most sacred to our ancestors…there are stories about that mountain I was told by my elders, and there are plants that grow on this mountain that we use today for healing, eating, and blessings."[121] See attachment.

Cutting and blasting the South Mountain to place a highway through it would result in a major disparate impact on the GRIC. One tribal member stated "the mountain is central to the

[114] This is not the first time that the GRIC would have to carry the burden of a transportation project: Arizona "reneged on promises to build interchanges and frontage roads on Interstate 10, which ADOT had offered in return for allowing an interstate to bisect the reservation." (Sean Holstege, The Republic, *1998 plan for South Mountain Freeway passed*, March 25, 2013 http://www.azcentral.com/community/ahwatukee/articles/20130308south-mountain-freeway-plan-ignored.html (last visited July 11, 2013). Further, the GRIC just recently got reimbursed by ADOT for allowing I-10 on the reservation.

30 (cont.)		Chapter 2 of the Final Environmental Impact Statement is dedicated to the explanation of the Gila River Indian Community outreach undertaken for the project. Chapter 6 of the Final Environmental Impact Statement further describes Gila River Indian Community outreach throughout the process. The Gila River Indian Community was provided equal opportunities to participate in the project as all other populations and agencies. This outreach was undertaken, in part, to ensure all populations had equal access to the process and, in part, to ensure disparate nor disproportionate and highly adverse impacts would result from the construction and operation of the proposed action.
31	**Air Quality**	The section entitled *Title VI and Environmental Justice*, beginning on page 4-29 in the Draft Environmental Impact Statement, presents acceptable methods, data, and assumptions to assess the potential for disproportionately high and adverse effects from the proposed action on environmental justice populations and disparate impacts to populations protected under Title VI. Based upon the content of the section, no such effects would result from the action alternatives. In light of comments received on the Draft Environmental Impact Statement, the above-referenced conclusions were confirmed in the preparation of the Final Environmental Impact Statement. To provide further clarity, the discussions of environmental justice and Title VI were separated and additional text explaining the relationship of environmental justice and Title VI to various environmental elements was added throughout Chapter 4, *Affected Environment*, *Environmental Consequences, and Mitigation*, as exemplified by the inserted text on page 4-29 of the Final Environmental Impact Statement. With respect to air quality, the Final Environmental Impact Statement addresses the history of air quality in the region (see text beginning on page 4-68 of the Final Environmental Impact Statement). The Clean Air Act § 109(b)(1) requires the U.S. Environmental Protection Agency to promulgate primary National Ambient Air Quality Standards at levels that allow an adequate margin of safety to protect the public health. Air quality in the Phoenix metropolitan area has improved over time; Phoenix was redesignated to attainment/maintenance for carbon monoxide in 2005, and the U.S. Environmental Protection Agency recently determined that Phoenix has attained the particulate matter (PM_{10}) standard. These improvements are largely associated with cleaner fuels and lower-emission vehicles along with local controls on fugitive dust. Future emissions would also be reduced by the use of cleaner-burning fuels, technological advances in automotive design (including the greater use of alternative fuel vehicles), reformulated gasoline, gas can standards, stricter enforcement of emission standards during inspections, heavy-duty diesel engine and on-highway diesel sulfur control programs, dust control programs, and others. The air quality assessment for the proposed freeway analyzed impacts from carbon monoxide and particulate matter (PM_{10}) and followed U.S. Environmental Protection Agency guidelines. The carbon monoxide and particulate matter (PM_{10}) analyses demonstrated that the proposed freeway would not contribute to any new localized violations, increase the frequency or severity of any existing violation, or delay timely attainment of the National Ambient Air Quality Standards or any required interim emissions reductions or other milestones. For mobile source air toxics, the analysis showed that for the Study Area, constructing the freeway would have a marginal effect on annual emissions in 2025 and 2035 (less than a 1 percent difference in total annual emissions between the Preferred Alternative and No-Action Alternative). With the Preferred Alternative in 2035, modeled mobile

32 (cont.)		The Arizona Department of Transportation Community Relations distributed electronic notices (e-newsletters) through the Government Delivery system to over 12,000 constituents who voluntarily signed up for project alerts along Interstate 10 (Papago, Maricopa, and Santan Freeways). These electronic notices included notice of availability of Draft Environmental Impact Statement (distributed on April 26, 2013); date of the public hearing (distributed on May 10, 2013); dates of the community forums (distributed on May 29, 2013); and notification in June of the close of the Draft Environmental Impact Statement public comment period. In addition, anyone who had attended a previous meeting on the proposed action and signed in received all of this information mailed individually. On May 6, 2013, 73,564 mailers were distributed to addresses within the Study Area. The Arizona Department of Transportation provided vouchers for public hearing parking and for public transit to the hearing. For the first time in the State's history, a shuttle bus to the hearing was provided from six locations in the Phoenix area, including two on the Gila River Indian Community (Komatke Boys & Girls Club and the Governance Center in Sacaton). All ads provided telephone numbers and electronic contact information regarding information on the shuttle schedules and pick-up locations.
33	**Title VI, Cultural Resources**	The section entitled *Title VI and Environmental Justice*, beginning on page 4-29 in the Draft Environmental Impact Statement, presents acceptable methods, data, and assumptions to assess the potential for disproportionately high and adverse effects from the proposed action on environmental justice populations and disparate impacts to populations protected under Title VI. Based upon the content of the section, no such effects would result from the action alternatives. In light of comments received on the Draft Environmental Impact Statement, the above-referenced conclusions were confirmed in the preparation of the Final Environmental Impact Statement. To provide further clarity, the discussions of environmental justice and Title VI were separated and additional text explaining the relationship of environmental justice and Title VI to various environmental elements was added throughout Chapter 4, *Affected Environment, Environmental Consequences, and Mitigation*, as exemplified by the inserted text on page 4-29 of the Final Environmental Impact Statement. The cultural and religious places of importance, like the South Mountains, are acknowledged in the Draft Environmental Impact Statement in several locations, notably pages 4-132 and 5-26. The proposed project would accommodate and preserve (to the fullest extent possible from the available alternatives) access to the South Mountains for religious practices. Since the beginning of the environmental impact statement process, the Federal Highway Administration and Arizona Department of Transportation have been carrying out cultural resource studies and engaging in an ongoing, open dialogue with the Gila River Indian Community Tribal Historic Preservation Office regarding the identification and evaluation of places of religious and cultural importance to the Gila River Indian Community that may be adversely affected by the proposed freeway. Such places are referred to as traditional cultural properties. As a result of these discussions and of studies conducted by the Gila River Indian Community's Cultural Resource Management Program, the Gila River Indian Community has identified traditional cultural properties that are eligible for listing in the National Register of Historic Places and that could be affected by construction of the proposed freeway. In certain cases, listing these properties on the National Register of Historic Places may offer them protection under Section 4(f) of the Department of Transportation

33	O'odham creation story and continues to be a place to hold ceremonies by and for the O'odham people. The mountain is also sacred to us because of the plant life we use for medicinal and ceremonial purposes and also because of the wildlife we hunt to sustain ourselves. The construction of this freeway would greatly harm the wellbeing of the mountain and therefore will bring harm to the O'odham."[122] See attachment. South Mountain is a very major and significant part of the GRIC spiritual and cultural life. It is a place of importance with esteemed meaning: it is associated with integrity, strength, patience and offers innumerable cultural and spiritual benefits to the GRIC. It has been there on the landscape and has withstood time and the elements in good and bad times with generations of GRIC ancestors. Becoming a major historical and spiritual theme in the GRIC's lives, stories, teachings, rituals, ceremonies, and medicines are derived from South Mountain. One tribal member stated "South Mountain is important to me because it's part of our heritage. There are many teachings that go with that mountain. Stories and songs that our generations to carry on."[123] See attachment. Another stated "according to our oral history South Mountain is a sacred mountain to our people. Akimel O'odham legends and stories talk about South Mountain being the home of the deity for our tribe. There are also stories about artifacts and petroglyphs from our ancestors the Hohokam located on South Mountain."[124] See attachment. Another GRIC tribal member stated "Oral history and legends state that South Mountain is the home of "Elder Brother" (I'itoi) deity of the Akimil O'odham Tribe (Gila River Indian Community Tribe). South Mountain was also once inhabited by our ancestors the Hohokam. The Hohokam has been acknowledged by archeologist, anthropologist and historians to be one of the first settlers of this region. South Mountain is also a place of worship, sacred ceremonies are preformed, prayer and blessings are given and shrines are built to honor I'itoi and our ancestors."[125] See attachment. Disturbing South Mountain would be desecrating it and desecrating it would be harming the GRIC itself –"to take the South Mountain away is a great impact to the Gila River Indian Community. It would be losing a part of us even more."[126] See attachment. "To hear of this mountain being destroyed has put a great hurt in my spiritual life…The mountain has given me much in my life. It has kept me strong, sane, peaceful, and healthy."[127] See attachment. Much harm would occur because this significant historical and cultural site that has been handed down through the generations is rich with the past: its heritage reaches into the present and connects with the GRIC living today. One tribal member stated "I have a very strong connection to South Mountain. In my late teens I left my hometown of Ajo, Arizona to attend Arizona State University. As a young woman far from home it was a difficult adjustment to live in the city, but going to South Mountain helped with this transition…as a young mother raising a child in the late sixties/early seventies, I often went to south Mountain to meditate when times became tough or if I was unable to return to Gila River for family emergencies. South Mountain has always made me feel closer to home and closer to my O'odham Himdag."[128] See attachment.

33 (cont.)		Act. The traditional cultural properties identified are culturally important to other Native American tribes as well. For more discussion of traditional cultural properties, see the section, *Cultural Resources*, beginning on page 4-140 of the Final Environmental Impact Statement and pages 5-26 through 5-28. Section 106 of the National Historic Preservation Act requires a government-to-government relationship between the Federal Government and Indian tribes as described beginning on page 4-140 of the Final Environmental Impact Statement. Section 106 requires that federal agencies take into account the effects of their undertakings on historic properties. This process requires consultation with tribal authorities. Consultation has occurred with Gila River Indian Community government officials, the Tribal Historic Preservation Officer, the Cultural Resource Management Program, many different tribal authorities, and the State Historic Preservation Office. The consultation has resulted in concurrence from the Gila River Indian Community Tribal Historic Preservation Office and the State Historic Preservation Office on National Register of Historic Places eligibility recommendations (including traditional cultural properties), project effects, and proposed mitigation and measures to minimize harm. This consultation has been ongoing and will continue until any commitments in a record of decision are completed. The mitigation measures were suggested in a letter from the Lieutenant Governor of the Gila River Indian Community to the Administrator, Arizona Division, Federal Highway Administration, dated June 23, 2010 (see page A372 of Appendix 2-1 of the Final Environmental Impact Statement). In this letter, the Gila River Indian Community submitted a proposal to address partial measures for the mitigation of adverse effect from the Pecos Road Alignment of the South Mountain Freeway. The Gila River Indian Community's proposal found the engineering solutions acceptable, but stated that implementation and construction of the proposed freeway would require further consultation. In committing to the evaluation of the South Mountains Traditional Cultural Property, the Arizona Department of Transportation and Federal Highway Administration also committed to the Gila River Indian Community's participation in ongoing engineering design refinements and acknowledged the importance of all plants and animals in the traditional culture of the Akimel O'odham and Pee Posh of the Gila River Indian Community.

33

GRIC and GRIC tribal members in GRACE[129] have repeatedly and publicly communicated the sacred significance of South Mountain, while at the same time, opposing ADOT's actions and the South Mountain Loop 202 project. However, ADOT has consistently ignored these communications and continued its efforts to plan the South Mountain Loop 202 through the South Mountain. One tribal member lamented "you may see the Mountain as an obstacle! But we see it as a refuge for our animals, a place where we can take our children and teach them our culture. It may not seem like a lot but the Mountain means so much to our community."[130] See attachment.

In April 29, 2008, the Arizona Republic published an article entitled, *Gila resolution calls freeway path 'sacred land'*.[131] The article reads: "The (GRIC) council in April 2007 designated the South Mountain Range as "a sacred place/traditional cultural property" that must not be violated. The council said any alteration of the range "for any purpose would be a violation of the cultural and religious beliefs of the Gila River Indian Community"[132]

Nevertheless, ADOT's August 2008 Draft Technical Report Summary states "direct impacts on cultural resources from construction could result in their partial or total loss."[133] It goes on to state "archaeological sites and places considered culturally important by Native American groups would be affected by any of the build alternatives. The Gila River Indian Community (GRIC) and the Salt River Pima-Maricopa Indian Community have both passed Tribal Resolutions designating the South Mountains as a TCP and the Colorado River Indian tribes have said that they also consider the South Mountains a TCP. The Federal Highway Administration (FHWA) and the Arizona Department of Transportation (ADOT) recognize the South Mountains as a TCP."[134]

34

During a MAG public comment meeting on the South Mountain Loop 202 on December 21, 2009, GRIC tribal members and supporters pled with the government association to stop their plans to go through the South Mountain and "respect the heritage of their peoples."[135] With a banner outside stating "standing against those who ruin the land" tribal members expressed their "deep and abiding love" for South Mountain and their "responsibility to protect" it for their ancestors and future generations.[136] One youth stated: "this pressure has to stop…we had a river taken away…our lands have been reduced enough…our ancestors should not have had to go through what they did for a highway to go basically past their cemetery."[137] A speaker from Protecting Arizona's Resources and Children ("PARC") pointed out that GRIC at that time was

[129] GRACE has spent extensive time and resources during the planning and preparing of the DEIS by attending the various South Mountain Freeway meetings, speaking out to the media communicating the sacredness of the South Mountain, and urging the government to choose an alternative transportation mode that would not desecrate the GRIC's cultural heritage.

34	**Cultural Resources, No-Action Alternative**	The cultural and religious places of importance, like the South Mountains, are acknowledged in the Draft Environmental Impact Statement in several locations, notably pages 4-132 and 5-26. The proposed project would accommodate and preserve (to the fullest extent possible from the available alternatives) access to the South Mountains for religious practices. The Arizona Department of Transportation and Federal Highway Administration acknowledge the expressed comments of Gila River Indian Community members as referenced in the GRACE comment. Several measures to avoid the use of a portion of the mountains, including tunneling, bridging, and rerouting were fully examined but, for reasons explained fully in Chapters 3 and 5 of the Draft and Final Environmental Impact Statements, were eliminated from detailed study in the environmental impact statement process. Use of the mountains for the purposes of the proposed freeway represents two-tenths of one percent of the total mountain range. Since 1988, and as part of this environmental impact statement process, several measures have been undertaken and will be undertaken to further reduce effects on the mountains. These measures, including narrowing the design footprint, acquiring replacement land immediately adjacent to the mountains, and the provision of highway crossings, are outlined in text beginning on page 5-23 of the Draft Environmental Impact Statement. In addition, Section 106 of the National Historic Preservation Act requires a government-to-government relationship between the Federal Government and Indian tribes as described beginning on page 4-140 of the Final Environmental Impact Statement. Section 106 requires that federal agencies take into account the effects of their undertakings on historic properties. This process requires consultation with tribal authorities as noted in the beginning of this response. Consultation has occurred with Gila River Indian Community government officials, the Tribal Historic Preservation Officer, the Cultural Resource Management Program, many different tribal authorities, and the State Historic Preservation Office. The consultation has resulted in concurrence from the Gila River Indian Community Tribal Historic Preservation Office and the State Historic Preservation Office on National Register of Historic Places eligibility recommendations (including traditional cultural properties), project effects, and proposed mitigation and measures to minimize harm. This consultation has been ongoing and will continue until any commitments in a record of decision are completed.

33

being pressured to permit a highway either through their limited reservation or through sacred ancestral land abutting their reservation –both of which have sacred and traditional values.[138]

Also in that meeting, GRIC tribal members shared how their ancestors are a part of the "sacred territory" of South Mountain and how the tribal members of GRIC continue to be defined by it.[139] One tribal member expressed his concern that this desecration was "just another attempt to take more land" from indigenous people, whose historical legacy was one of losing more and more of their land by non-indigenous people.[140] He furthered shared with the audience how South Mountain is where their "creator started" and reiterated that it is a "sacred area that cannot be touched."[141] Another speaker stated his elders taught him that South Mountain "can't be disturbed and if disturbed, would cause problems" to the world.[142] Another stated that "this (cultural land of his ancestors) is what binds us together"; and another stated that "desecration of the South Mountain would break and kill them."[143] Another pointed out to the audience the compromises the tribal members have already had to make like having to tolerate sacred places in the SMPP being desecrated with graffiti and trash.[144] She said it was unfair and wrong that now they are expected to permit their sacred South Mountain to be bulldozed for a highway.

GRACE co-founder, Lori Riddle, also spoke to the audience during the 2009 MAG public comment meeting. She stated that GRACE was opposed to the project because the proposal "impead(s) on fundamental "cultural sensitivities" of indigenous peoples of the GRIC.[145] Further she said, the GRIC "honor the land…honor the mountains."[146] This is where they "pray…fast…prepare…gather…strength."[147] This is "a heritage that goes back hundreds and thousands of years."[148] Frustrated with ADOT's failure to respect tribal concerns about the proposed desecration of the sacred mountain, Riddle had to say once again "the community has already chose(n) not to have a highway."[149]

34

The November, 11, 2009, Ahwatukee Foothills News article, *Questions remain on blasting into South Mountain*, questioned the soundness of "blasting through…major ridges of South Mountain in the park, which the Gila River Indian Community (GRIC) considers sacred." It went on to quote Shannon Rivers, a member of GRIC, who said that the South Mountain "has burial sites, archeological sites and shrines." The article also quoted Lori Riddle's concerns with cutting into the ridges of the sacred South Mountain. Riddle stated, "when they talk about

Code	Issue	Response
34 (cont.)		In terms of the comment's reference to pressures to locate a freeway on Gila River Indian Community land, as stated on page 3-24 of the Final Environmental Impact Statement, in January 2010, the Arizona Department of Transportation Director received a letter from the Gila River Indian Community Governor, who indicated that the Gila River Indian Community was willing to assist in conducting a study of the proposed South Mountain Freeway on Gila River Indian Community land. In response, the project team conducted preliminary analyses of projected engineering issues, cultural resources impacts, natural resources, multiuse crossings, air quality impacts, noise level impacts, socioeconomic impacts, and Section 4(f) issues. Following this effort, a coordinated referendum of Gila River Indian Community members to favor or oppose construction of the proposed South Mountain Freeway on Gila River Indian Community land or to support a no-build option occurred in February 2012. Gila River Indian Community members voted in favor of the no-build option. The Gila River Indian Community's position regarding a "no-build" option was considered in the Draft and Final Environmental Impact Statements. That position is formally known as the No-Action Alternative and was evaluated in depth in assessments of the impacts of the proposed action on each resource. Any alternative on Gila River Indian Community land must consider tribal sovereignty. Tribal sovereignty is based in the inherent authority of Native American tribes to govern themselves. While this notion of sovereignty is manifested in many areas, generally Native American land is held in trust by the United States. Native American communities have the authority to regulate land uses and activities on their lands. States have very limited authority over activities within tribal land (see page 2-1 of the Final Environmental Impact Statement). From a practical standpoint, this means that the Arizona Department of Transportation and Federal Highway Administration do not have the authority to survey tribal land, make land use (including transportation) determinations directly affecting tribal land, or condemn tribal land for public benefit through an eminent domain process.

Code	Comment Document

blasting the mountain, it hurts… It's totally going to change the area and people don't realize that."[150]

33

In a 2010 Environmental Assessment for a tower site on South Mountain, the Arizona Department of Game and Fish reported the sacredness of the South Mountain. It stated "the Gila River Indian Community and Salt River Pima-Maricopa Indian Community have passed resolutions declaring the South Mountains to be a sacred place/traditional cultural property because of the prominent role the mountains have in oral traditions and songs of the Akimel O'odham (Pima) and Pee Posh (Maricopa) tribes."[151]

On January 21, 2011, the Ahwatukee Foothills News published, *Gila River Tribe: Sacred Sites On South Mountain Top Issue In 202 Debate*, which stated "foremost on the mind of Gila River Indian Community members are the sacred sites and shrines on South Mountain that would be destroyed if plans to blast a freeway through the mountain proceed…The No. 1 concern by far is the desecration of that mountain…there are a number of areas of cultural significance that would be compromised. There are a number of cultural sites throughout the entire mountain." [152]

Further, in a 2012 press release, Lori Riddle of GRACE stated: "This project would harm the physical and spiritual integrity of Muhadag Do'ag (South Mountain) and traditional cultural properties associated with the mountain."[153] "Many of the affected mountains in the South Mountain Range are sacred homelands of the O'odham people."[154] "That is why the people in the Gila River Indian Community voted against having it on our lands and why we oppose the alignment that would cut through the mountain."[155]

35

In 2013, in an interview on 91.5 KJZZ, Riddle spoke again stating: "I know people try to diminish that (sacredness of the mountain to the GRIC tribal members), but it's a freedom of religion that we have all rights to, and we feel like they are taking that freedom away from us."[156]

[155] *Id.*

[156] Steve Shadley, *South Mountain Freeway proposal gets mixed reviews at a public hearing* May 21, 2013 http://www.kjzz.org/content/1305/south-mountain-freeway-proposal-gets-mixed-reviews-public-hearing (last visited July 1, 2013); The Free Exercise Clause of the First Amendment states that Congress shall not pass laws prohibiting the free exercise of religion; GRACE also argues that ADOT's action to desecrate South Mountain is a violation of the United States trust responsibility with the Native Americans based on the fact that no analysis of ADOT's action is made in light of the American Indian Religious Freedom Act ("AIRFA"). The AIRFA of 1978 declares that it is the policy of the United States to protect and preserve for American Indians their inherent right of freedom to believe, express, and exercise the traditional religions of the American Indian, Ekimo, Aleut, and Native Hawaiians, including but not limited to access to sites, use and possession of sacred objects, and the freedom to worship though ceremonials and traditional rites. (Pub. L. No. 95-341 (codified in part at 42 U.S.C. § 1996)). AIRFA provides land managers with the authority to take action to protect sacred lands. (Dean Suagee and Jack Trope, Native Sacred Places Protection Legal workshop, revised 2/11/2008 P. 13). AIRFA requires policies of all governmental agencies to eliminate interference with the free exercise of Native religion, based on the First Amendment, and to accommodate access to and use of religious sites to the extent that the use is practicable and is

Code	Issue	Response
35	**Cultural Resources**	Since the beginning of the environmental impact statement process, the Federal Highway Administration and Arizona Department of Transportation have been carrying out cultural resources studies and engaging in ongoing, open consultation with the Gila River Indian Community Tribal Historic Preservation Office regarding the identification and evaluation of places of religious and cultural importance to the tribe that may be adversely affected by the proposed freeway. Such places are referred to as traditional cultural properties. As a result of these discussions and of studies conducted by the Gila River Indian Community's Cultural Resource Management Program, the Gila River Indian Community has identified traditional cultural properties that are eligible for listing in the National Register of Historic Places and that could be affected by construction of the proposed freeway. In certain cases, listing these properties on the National Register of Historic Places may offer them protection under Section 4(f) of the Department of Transportation Act. The traditional cultural properties identified are culturally important to other Native American tribes as well. For more discussion of traditional cultural properties, see the section, *Cultural Resources*, beginning on page 4-140 of the Final Environmental Impact Statement and pages 5-26 through 5-28. Section 106 of the National Historic Preservation Act requires a government-to-government relationship between the Federal Government and Indian tribes as described beginning on page 4-140 of the Final Environmental Impact Statement. Section 106 requires that federal agencies take into account the effects of their undertakings on historic properties. This process requires consultation with tribal authorities. Consultation has occurred with Gila River Indian Community government officials, the Tribal Historic Preservation Officer, the Cultural Resource Management Program, many different tribal authorities, and the State Historic Preservation Office. The consultation has resulted in concurrence from the Gila River Indian Community Tribal Historic Preservation Office and the State Historic Preservation Office on National Register of Historic Places eligibility recommendations (including traditional cultural properties), project effects, and proposed mitigation and measures to minimize harm. This consultation has been ongoing and will continue until any commitments in a record of decision are completed. The American Indian Religious Freedom Act, 42 United States Code Section 1996, provides a policy statement of the United States to "protect and preserve for American Indians their inherent right of freedom to believe, express, and exercise the traditional religions of the American Indian . . . including but not limited to access to sites, use and possession of sacred objects, and the freedom to worship through ceremonials and traditional rites." The Arizona Department of Transportation and Federal Highway Administration complied with the policy stated in the American Indian Religious Freedom Act throughout the environmental impact statement process, as evidenced by consultation efforts, mitigation measures, and a discussion of cultural resources issues in the Draft Environmental Impact Statement. The study would not violate the American Indian Religious Freedom Act because, as stated above, members of the Gila River Indian Community would not be prohibited from continuing to practice their beliefs even if the project goes forward because access to the mountain would be maintained, impacts would be mitigated based on input by the Gila River Indian Community and others, and only a small fraction of the mountain would be affected.

Code	Comment Document
36	B. SOUTH MOUNTAIN LOOP 202 DISPARATE CUMULATIVE HEALTH AND ENVIRONMENTAL EFFECTS ON THE GRIC, INCLUDING GRACE COMPLAINANTS With approximately 67,000 cars travelling daily between Phoenix and Tucson on Interstate 10 (one of the three interstate highways that serves as the through-routes for nearly all truck traffic) only a small fraction of those cars are driven by tribal members.[157] However, because approximately 25 miles of Interstate 10, two lanes in each direction, is running through the GRIC, pollution is being created and emitted onto the GRIC.[158] The GRIC assert that this is its single biggest source of air pollution in the community.[159] There are also several million cars owned by people who live, work, and commute within the greater Phoenix area, causing pollution, while car ownership in GRIC is low because GRIC members work and live in the same districts.[160] The GRIC even goes as far to encourage customers to its casinos to use buses from the near-by urban areas on a regular basis to reduce single occupancy car traffic to its Casinos.[161] However, even with this proactive approach to the environment, the 2005 Joint Air Toxics Assessment Program (JATAP) report shows that GRIC has high Particulate Matter ("PM") and Volatile organic compounds (VOC) in its air.[162] The South Mountain Loop 202 would be yet another source of pollution not created by the GRIC but affecting the GRIC. Maricopa County has struggled to meet the National Ambient Air Quality Standards (NAAQS) for particulate matter (PM).[163] The American Lung Associations' State of the Air 2013, gave Maricopa County a grade of F for the period between 2009-2011 in High Particle Pollution 24-hr days.[164] It also ranked Phoenix-Mesa-Glendale, AZ 18th in Most Polluted by Year-Round Particle Pollution (Annual PM 2.5) and 21st in Most Polluted by Short Term Particle

not inconsistent with an agency's essential functions. (Canby, John C. Jr., *American Indian Law in a Nutshell*, pg. 339, 340 1988 West Publishing Company). The Merriam Webster dictionary defines practicable as "capable of being put into practice or of being done or accomplished: feasible." (Merriam-Webster, http://www.merriam-webster.com/dictionary/practicable. (last visited June 13, 2013)) Here FDOT and ADOTs essential functions are not compromised by not going through South Mountain. Further, there are practicable and feasible alternatives to going through South Mountain like expanding existing highways and developing the public transit systems.

Code	Issue	Response
36	**Air Quality, Construction**	The Final Environmental Impact Statement addresses the history of air quality in the region (see text beginning on page 4-68 of the Final Environmental Impact Statement). The Clean Air Act § 109(b)(1) requires the U.S. Environmental Protection Agency to promulgate primary National Ambient Air Quality Standards at levels that allow an adequate margin of safety to protect the public health. Air quality in the Phoenix metropolitan area has improved over time; Phoenix was redesignated to attainment/maintenance for carbon monoxide in 2005, and the U.S. Environmental Protection Agency recently determined that Phoenix has attained the particulate matter (PM_{10}) standard. These improvements are largely associated with cleaner fuels and lower-emission vehicles along with local controls on fugitive dust. Future emissions would also be reduced by the use of cleaner-burning fuels, technological advances in automotive design (including the greater use of alternative fuel vehicles), reformulated gasoline, gas can standards, stricter enforcement of emission standards during inspections, heavy-duty diesel engine and on-highway diesel sulfur control programs, dust control programs, and others. In May 2012, the Arizona Department of Environmental Quality submitted a revised Maricopa Association of Governments 2012 Five Percent Plan for the region. On July 20, 2012, the U.S. Environmental Protection Agency made an official finding that the Maricopa Association of Governments 2012 Five Percent Plan was administratively complete. This decision ended the sanctions clocks associated with Arizona's decision to withdraw the Maricopa Association of Governments 2007 Five Percent Plan. On February 6, 2014, the U.S. Environmental Protection Agency published a notice in the *Federal Register* proposing to approve the Maricopa Association of Governments *2012 Five Percent Plan for Attainment of the PM-10 Standard* for the Maricopa County Nonattainment Area. In the same notice, the U.S. Environmental Protection Agency stated that it would concur with exceptional event (as a result of haboobs and dust storms) documentation prepared by the Arizona Department of Environmental Quality, which would give the region the 3 years of clean data needed for attainment of the particulate matter (PM_{10}) 24-hour standard. Finally on May 30, 2014, the U.S. Environmental Protection Agency approved the 2012 Five Percent Plan and found the area in attainment of the 24-hour particulate matter (PM_{10}) standard based on monitoring data for the years 2010 to 2012 (see page 4-72 of the Final Environmental Impact Statement for more information). The transportation conformity rule in 40 Code of Federal Regulations § 93.123(c)(5) states that hot-spot analyses are not required to consider construction-related activities that cause temporary increases in emissions. Temporary increases are defined as those that occur only during the construction phase and last 5 years or less at any individual site. Although the duration of the overall construction period of the entire 22- to 24-mile proposed action would be 5 to 6 years according to page 3-60 of the Final Environmental Impact Statement, any particular portion of the Study Area would not see construction lasting for 5 to 6 years. Construction would be phased based on the factors appearing on page 3-59 of the Final Environmental Impact Statement. Any particular area of the project would not be expected to see construction activities beyond an approximate 2-year period; therefore, the construction effects described above would be temporary and would not require additional analysis.

(Response 36 continues on next page)

Code	Comment Document
36	Pollution (24-hour PM 2.5).[165] According to the EPA Green Book, Maricopa County has been in nonattainment in Particulate Matter (PM)-10 since 1992.[166] PM-10 is a "complex mixture of extremely small particles and liquid droplets…made up of a number of components, including acids…, organic chemicals, metals, and soil or dust particles."[167] PM-10 are "inhalable coarse particles," that can be found near roadways and dusty industries.[168] They can affect the heart and lungs and cause serious health effects.[169] Those most at risk to PM-10 are people with heart or lung disease[170], older adults, children, and physically active people.[171] People with diabetes may also be at risk.[172] Further, new studies suggest that exposure to high particle levels may also be associated with low birth weight in infants, pre-term deliveries, and possibly fetal and infant deaths.[173] Long-term exposures have been associated with problems such as reduced lung function and the development of chronic bronchitis and even premature death.[174] Short-term exposures to particles can aggravate lung disease, causing asthma attacks and acute bronchitis, and may also increase susceptibility to respiratory infections.[175] Almost every one of the PM-10 exceedances has been detected at the air quality monitor at 43rd Avenue and Broadway Road. Because the air is already heavily polluted, the placement of a freeway about a mile and a half upwind from this monitor will have a disparate impact on the health and welfare of the GRIC, who are situated next to the proposed site. The GRIC has the highest level of diabetes in the nation; those with diabetes are more susceptible to irritation from PM-10 and more susceptible to other medical conditions. Additionally, during the construction phase, thousands of tons of dirt would be moved around upwind of the 43rd Avenue and Broadway Road monitor causing increased levels of PM. The proposed path of the South Mountain Loop 202 would cause PM over the Salt River bed, where extensive earthmoving will be necessary for the construction of the bridges. Blasting South Mountain would also release enormous amounts of PM, and the natural wind currents and prevailing wind patterns would push this PM toward the air monitor at 43rd Avenue. Because people are contracting Valley Fever (Coccidioidomycosis) in Southern Arizona (especially in the Phoenix and Tucson areas),[176] Valley Fever is a threat. The two species of coccidioides fungi that cause Valley Fever are commonly found in the soil of specific areas, one of which is Arizona's Sonoran desert, and are stirred into the air by anything that disrupts the soil like construction.[177] Moreover, Native Americans are more susceptible to developing serious

Code	Issue	Response
36 (cont.)		Detecting the fungus responsible for valley fever in soils is not practical at this time. However, to reduce the amount of construction dust generated that could carry the fungus, particulate control measures related to construction activities would be followed. The following mitigation measures would be followed, when applicable, in accordance with the most recently accepted version of the Arizona Department of Transportation *Standard Specifications for Road and Bridge Construction* (2008). Prior to construction and in accordance with Maricopa County Rule 310, Fugitive Dust Ordinance, the contractor shall obtain an approved dust permit from the Maricopa County Air Quality Department for all phases of the proposed action. The permit describes measures to be taken to control and regulate air pollutant emissions during construction (see page 4-173 of the Final Environmental Impact Statement). The air quality assessment for the proposed freeway analyzed impacts from carbon monoxide and particulate matter (PM_{10}) and followed U.S. Environmental Protection Agency guidelines. No violations of either the carbon monoxide or particulate matter (PM_{10}) standards were identified, even at worst-case locations along the project corridor. Thus, the carbon monoxide and particulate matter (PM_{10}) analyses demonstrated that the proposed freeway would not contribute to any new localized violations, increase the frequency or severity of any existing violation, or delay timely attainment of the National Ambient Air Quality Standards or any required interim emissions reductions or other milestones. For mobile source air toxics, the analysis showed that for the Study Area, constructing the freeway would have a marginal effect on annual emissions in 2025 and 2035 (less than a 1 percent difference in total annual emissions between the Preferred Alternative and No-Action Alternative). With the Preferred Alternative in 2035, modeled mobile source air toxics emissions would decrease by 57 percent to more than 90 percent, depending on the pollutant, despite a 47 percent increase in vehicle miles traveled in the Study Area compared with 2012 conditions. The air quality analyses were updated for the Final Environmental Impact Statement, including a quantitative particulate matter (PM_{10}) analysis, and are more fully described beginning on page 4-68 of the Final Environmental Impact Statement. Congestion relief resulting from the proposed freeway would provide localized air quality emissions reductions on area freeways and arterial streets and at interchanges, benefiting users of area highways and those living near congested roads. Summary information about the findings of the Joint Air Toxics Assessment Project study is provided as background information in the Draft and Final Environmental Impact Statements, but the study itself is not relevant to the type of analysis done pursuant to the Federal Highway Administration's mobile source air toxics guidance, which is an emissions analysis. Monitored ambient concentrations of mobile source air toxics (the focus of the Joint Air Toxics Assessment Project) do not inform this type of analysis. While monitoring data can be useful for defining current conditions in the affected environment (to the extent that the monitoring data are current), they don't tell us anything about future conditions, or the impacts of the project itself, which is why an emissions analysis was performed. The mobile source air toxic analysis presented beginning on page 4-77 of the Final Environmental Impact Statement is an estimated inventory of mobile source air toxic emissions for the entire Study Area for 2025 and 2035. This approach was used because the inventory estimate accounts for changes in traffic and emissions on all roadways affected by a proposed project, and would, therefore, be a more reliable predictor of changes in exposure to mobile source air toxics.

Code	Comment Document

infection from it than are whites.[178] If the South Mountain Loop 202 is constructed there would be a real risk to the members of the GRIC.

37 The GRIC would also be disparately affected by negative environmental consequences to its agriculture sector. Agriculture plays an important role for the GRIC and is a major sector in GRIC's economic development plan. "15,000 acres of Community farms on the GRIC support a variety of crops such as cotton, wheat, millet, alfalfa, barley, melons, pistachios, olives, citrus, and vegetables. And independent farming operations cultivate an additional 22,000 acres of similar crops, bringing the total agricultural product value to an excess of $25 million."[179] Now with its newly restored water rights, the GRIC is planning on developing a much larger agricultural industry. However, PM decreases crop production, and because of this, not only will the health of the crops be compromised but the profit from the GRIC's agriculture will be compromised by the air pollution from the South Mountain Loop 202.

38 Maricopa County has also been in nonattainment in 8-Hr ozone 1997 since 2004 and in 8-Hr ozone 2008 since 2012.[180] The American Lung Associations' State of the Air 2013, gave Maricopa County a grade of F for the period between 2009-2011 in High Ozone days[181] and 23rd in Most Ozone-Polluted Cities.[182] Ozone is formed when pollutants emitted by cars, power plants, industrial boilers, refineries, chemical plants, and other sources react chemically in the presence of sunlight.[183] Those most at risk are children, adults who are active outdoors, adults - including older adults- with respiratory diseases, such as asthma, and people with unusual susceptibility to ozone.[184] Ozone can aggravate asthma and inflame and damage the lining of the lungs that can in turn cause long-term health effects and a lower quality of life.[185]

39 Higher ozone levels would have a disparate effect on the people of the GRIC. First, many GRIC members have asthma and other respiratory problems. Ozone increases will exacerbate existing problems. Second, because the Hassayampa Freeway CANAMEX route is not first being built, the South Mountain Loop would be used as a bypass for truck drivers traveling from Canada to Mexico. This would also have a major disproportionate effect on the GRIC. With Interstate 10 already running through the GRIC, more diesel trucks near the GRIC would only increase pollution, some of which are cancer-causing.[186] Diesel from trucks can create the same amount of air pollution as 150 passenger cars[187] and diesel exhaust has been

Code	Issue	Response
37	**Air Quality, Agriculture**	As noted on page 4-68 of the Final Environmental Impact Statement, secondary standards are established for criteria pollutants to minimize environmental and property damage. Primary and secondary standards for particulate matter (PM_{10}) are identical; no threshold is established by the U.S. Environmental Protection Agency for carbon monoxide (CO). The air quality assessment for the proposed freeway revealed no violations of either the carbon monoxide or particulate matter (PM_{10}), even at worst-case locations along the project corridor. Thus, the carbon monoxide and particulate matter (PM_{10}) analyses demonstrated that the proposed freeway would not contribute to any new localized violations, increase the frequency or severity of any existing violation, or delay timely attainment of the National Ambient Air Quality Standards or any required interim emissions reductions or other milestones. Because the secondary standards for particulate matter (PM_{10}) are identical, the proposed project would also not cause a violation of the secondary particulate matter (PM_{10}) standard. Further, the construction and operation of the proposed freeway would not alter agricultural operations on the Gila River Indian Community.
38	**Air Quality**	As noted on page 4-76 of the Final Environmental Impact Statement, since ozone is a regional pollutant, there is no requirement to analyze potential impacts and no possibility of localized violations of ozone to occur at the project level. The Maricopa Association of Governments is responsible for developing plans to reduce emissions of ozone precursors in the Maricopa area. The Preferred Alternative is included in the *Regional Transportation Plan* that has been determined by the U.S. Department of Transportation to conform to the State Implementation Plan on February 12, 2014.
39	**Trucks**	Creating a truck bypass is not a goal of the proposed action. The proposed freeway is part of a transportation system developed to improve mobility in the region by increasing capacity and allowing traffic—including truck traffic—to access a segment of the "loop" system (see pages 1-21, 1-22, 3-1, and 3-3 of the Final Environmental Impact Statement) in the Phoenix metropolitan area. The proposed South Mountain Freeway would be a commuter corridor, helping to move local traffic. As with all other freeways in the region, trucks would use it for the through-transport of freight, for transport to and from distribution centers, and for transport to support local commerce. Nevertheless, the primary vehicles using the proposed freeway would be automobiles. The Maricopa Association of Governments regional travel demand model projects that truck traffic would represent approximately 10 percent of the total traffic on the proposed freeway, similar to what is currently experienced on other regional freeways such as Interstate 10, State Route 101L, and U.S. Route 60. As disclosed in the Final Environmental Impact Statement, it is expected that "true" through-truck traffic (not having to stop in the metropolitan area) would continue to use the faster, designated, and posted bypass system of Interstate 8 and State Route 85 (see page 3-64 of the Final Environmental Impact Statement). The air quality analyses included projected truck traffic. The carbon monoxide and particulate matter (PM_{10}) analyses demonstrated that the proposed freeway would not contribute to any new localized violations, increase the frequency or severity of any existing violation, or delay timely attainment of the National Ambient Air Quality Standards or any required interim emissions reductions or other milestones. For mobile source air toxics, the analysis showed that for the Study Area, constructing the freeway would have a marginal effect on annual emissions in 2025 and 2035 (less than a 1 percent difference in total annual emissions between the Preferred Alternative and No-Action Alternative). With the Preferred Alternative in 2035, modeled mobile source air toxics emissions would decrease by 57 percent to more

(Response 39 continues on next page)

Code	Comment Document

linked to lung cancer and the development of asthma.[188] Moreover, although the United States has implemented national heavy-duty diesel emissions standards and Ultra-low-sulfur diesel ("ULSD") fuel requirements, Mexico has not made significant progress in implementing its heavy-duty diesel emissions standards nor has it transitioned to ULSD.[189] And, although the Arizona Department of Air Quality monitors 1967 through 2008 diesel powered vehicles in the metro Phoenix (Area A) and Tucson (Area B), commercial vehicles that are licensed in multiple states are not.[190] Further, some trucks using the South Mountain Loop 2002 will be carrying hazardous material causing major risks to the GRIC. Although the DEIS admits that the South Mountain Loop 202 will be used to transport hazardous waste, it does not include an emergency plan for the different communities that could be affected by accidents by transporters of hazardous waste.

40

There is also a risk of a pollution hot spot developing in the GRIC because of the leveling of mountain ridges and the placement of a highway with speeding cars and trucks on the flattened area abutting the GRIC. The GRIC reservation is situated between the Sierra Estrella to the west running north and south along the entire distance of the GRIC on the western edge, the South Mountain to its north separating the GRIC from Phoenix and Tempe, and the Santan Mountains on the northeast side, separating the GRIC from Gilbert and Apache Junction.[191] "These natural barriers are large enough and have sufficient altitude to prevent pollution from transporting onto GRIC even during periods of inversions and stagnant air.[192] The South Mountain Loop will eliminate the natural barrier of the South Mountain separating the GRIC from the heavily polluting cities of Phoenix and Tempe. Further, the new car and truck emissions will be emitted near the GRIC. Under certain wind and weather patterns, these emissions will be captured and contained within the remaining ranges on the GRIC causing a hotspot. Like past off-reservation polluting activities, the GRIC will have to bear the consequences of pollution not created by them but migrating to its lands.

41

The GRIC also would be disproportionality affected by other public health concerns, concerns of which were not mentioned in the DEIS. The GRIC struggle with substance abuse, such as alcoholism and methamphetamine addiction, and have been struggling with a high suicide rate.[193] American Indian and Alaska Native (AI/AN) people are significantly more likely to report past-year alcohol and substance use disorders than any other race.[194] And suicide rates for AI/AN people are 1.7 times higher than the U.S. all-races rate.[195] Further, several sources

Code	Issue	Response
39 (cont.)		than 90 percent, depending on the pollutant, despite a 47 percent increase in vehicle miles traveled in the Study Area compared with 2012 conditions. Because Mexican trucks are currently restricted to the border region, they are not operating in the project Study Area and they were not included in the air quality analyses. Arizona highways, as are most highways across the United States, are open to all kinds of traffic, so long as the cargo being carried is in accordance with U.S. Department of Transportation regulations for the specific type of cargo. The Arizona Department of Transportation has a few locations in the state with hazardous cargo restrictions, but these restrictions are based on specific or unique emergency response issues or roadway design limitations specific to that location. For example, the Interstate 10 Deck Park Tunnel has certain hazardous cargo transport restrictions because of the limited ability for emergency responders to address a hazardous materials incident in the tunnel. The South Mountain Freeway, if implemented, is expected to operate under the same rules as other similar facilities in the state; transport of hazardous cargo would be expected to be permissible (see text box on page 4-166 of the Final Environmental Impact Statement). The Arizona Department of Public Safety (which includes the State Highway Patrol) has primary responsibility for enforcing traffic laws. The Arizona Department of Public Safety also has primacy when calling in support for traffic accidents, including hazardous materials accidents (see text box on page 4-166 of the Final Environmental Impact Statement). The Arizona Department of Transportation maintains a list of contractors who provide emergency response services, as well as local municipalities whose fire and police departments operate in cooperation with the Arizona Department of Public Safety on incidents within their jurisdiction. Requirements for shippers are maintained by the Arizona Department of Transportation's Enforcement Compliance Division. In the event of an incident with a hazardous materials issue on a State or federal highway, the emergency responders contact the Arizona Department of Transportation's Traffic Operations Center to report the incident. The Traffic Operations Center then contacts the Arizona Department of Transportation's Safety and Risk Management group, which responds to the accident scene and assesses needs in concert with the Incident Commander from the responding agency with jurisdiction. If requested, the Arizona Department of Transportation can assist cleanup activities by engaging specialty subcontractors with whom the Arizona Department of Environmental Quality has contracts for such support. The Arizona Department of Transportation's Safety and Risk Management group's charge is primarily public health protection, with cleanup support being secondary.
40	**Air Quality**	Air quality depends on several factors such as the area itself (size and topography), the prevailing weather patterns (meteorology and climate) and the pollutants released into the air. Cuts through the South Mountains would be expected to produce microclimate differences similar to those produced by a series of buildings in a large city which produce localized wind tunnel effects. The mountain cuts, however, would not affect regional air quality. Hourly meteorological data used for the dispersion modeling with CAL3QHCR were downloaded from the U.S. Environmental Protection Agency's Support Center for Regulatory Atmospheric Modeling for the Phoenix Sky Harbor International Airport (surface data) and the Tucson International Airport (upper air data) for the 5-year period from 1987 through 1991 (epa.gov/ttn/scram/metobsdata_databases.htm). The 5 years of surface and mixing height data were processed with PCRAMMET to develop meteorological input files compatible with CAL3QHCR and incorporated into the particulate matter (PM_{10}) and carbon monoxide model runs at the

(Response 40 continues on next page)

Code	Comment Document

indicate that AI/ANs are at higher risk for certain mental health disorders than other racial/ethnic groups.[196] The Office of Minority Health reports that AI/ANs experience higher rates than all races in the following areas: serious psychological distress; feelings of sadness, hopelessness, and worthlessness; feelings of nervousness or restlessness; and suicide.[197]

41 The Indian Health Service, the Federal Health Program for American Indians and Alaska Natives, recognizes that one major reason for these higher national rates of substance abuse and psychological problems is historical trauma.[198] Historical trauma describes the cumulative effects of the massive group trauma experienced by AI/AN peoples and nations since the arrival of European settlers on the American continent.[199] This trauma has taken various forms, from outright violence of wars and forced relocation to damaging prohibitions on Native languages and cultural and religious practices. Historical trauma has many dimensions, but one important aspect is that, as with any trauma situation, parents and caregivers who have been traumatized often pass on trauma response patterns to their children.[200] This means that the effects of historical trauma in AI/AN communities include not just past or present acts of oppression and racism that AI/AN people have been victimized by, but also the ways that trauma response behaviors are internalized, repeated, and passed on within AI/AN families and communities.[201]

42 The people of the GRIC, like many other Native Americans in the US, have continued to socially and psychologically struggle to heal from losing traditional ways of life, homeland, language, traditions, etc. due to intrusions on their culture. Because cultural identity and psychological health are related, healing is thwarted by continued marginalization of their culture and worldview. ADOT, deliberately destroying more culture unnecessarily is discriminatory and irresponsible. It is discriminatory because the act destroys an integral part of the GRIC's identity while history shows that Native Americans and the people of the GRIC have lost an incredible amount of their culture already. The GRIC in particular have been embattled in a water right dispute for decades. The loss of water has changed its way of life in very significant ways like food production, diet, independence, etc. And only just recently are the GRIC's water rights being restored after having had to struggle for almost a century with severely reduced water flows. Moreover, ADOT's action is discriminatory because modern psychology shows that cultural identity and environment play a major role in human health, especially for Native Americans who have a unique relationship with their culture and the natural environment.

43 Not only will a sacred mountain be desecrated but access to historical, ancestral land will be more limited, less accessible, and will be disturbed by noise, cars, and pollution. The landscape will be more fragmented and urbanized, qualities not compatible with sacredness. Modern psychology is not the only messenger to ADOT: the GRIC's 2007 Community Council resolution stated that they "strongly oppose(d) any alteration of the South Mountain Range for

Code	Issue	Response
40 (cont.)		three analysis locations described above. The use of Phoenix Sky Harbor International Airport meteorological data is consistent with the Maricopa Association of Government's regional conformity analysis, which was approved by the U.S. Department of Transportation on February 12, 2014, and with the Arizona Department of Environmental Quality's air quality permitting efforts in the region. In addition, the use of these data was agreed to during interagency consultation for the proposed project. The selected 5-year data set is representative of the project area and encompasses the wide variety of weather conditions that are likely to be experienced in the project area. With the Preferred Alternative in 2035, modeled mobile source air toxics emissions would decrease by 57 percent to more than 90 percent, depending on the pollutant, despite a 47 percent increase in vehicle miles traveled in the Study Area compared with 2012 conditions.
41	**Title VI, Cumulative, Social Conditions**	The comment indicates that these impacts have been experienced by the Native American and by the Gila River Indian Community in particular. This comment indicates that these conditions currently exist; therefore, the current state of the public health of the Gila River Indian Community is the baseline condition under consideration. It is not the obligation of the proposed action to mitigate impacts caused by other unrelated actions. Text beginning on page 4-179 of the Final Environmental Impact Statement addresses the proposed freeway's contribution to cumulative impacts. The comment infers the proposed freeway along with future actions would continue to contribute to the struggles referenced in the comment. The suggested cause is a loss of a traditional way of life and a marginalization of related traditions, inferred primarily by loss of natural lands and loss of access to those lands. The Draft and Final Environmental Impact Statements disclose recognition that some populations with environmental justice characteristics have specific needs associated with their identity being tied directly to geographic setting. Text on page 4-187 of the Final Environmental Impact Statement discloses that for the Gila River Indian Community, association with the South Mountains is important to identity and is established through direct spiritual and visual access to the mountains. Land developments in the area have encroached on the South Mountains, and the proposed action would contribute to encroachment on the southern side of the mountains but would be offset by mitigation measures highlighted in text in the section, *Cultural Resources*, beginning on page 4-140 and in Chapter 5 of the Final Environmental Impact Statement. The contribution of the proposed action to this cumulative effect would be negligible when considering land development patterns encroaching on the resource. The Final Environmental Impact Statement, after consultation and coordination efforts, accommodates and preserves (to the fullest extent possible from the available alternatives) access to the South Mountains for religious practices. A very small portion of the mountain would be affected by the proposed freeway (less than 0.03 percent of the total area). Although the Final Environmental Impact Statement describes the impact on the South Mountains as adverse, Native Americans would not be kept from practicing their beliefs, access to the mountain would be maintained, and mitigation measures would be implemented based on input from members of the Gila River Indian Community.
42	**Title VI**	The cultural and religious places of importance, like the South Mountains, are acknowledged in the Draft Environmental Impact Statement in several locations, notably pages 4-132 and 5-26. The proposed project would accommodate and preserve (to the fullest extent possible from the available alternatives) access to the South Mountains for religious practices.

indicate that AI/ANs are at higher risk for certain mental health disorders than other racial/ethnic groups.[196] The Office of Minority Health reports that AI/ANs experience higher rates than all races in the following areas: serious psychological distress; feelings of sadness, hopelessness, and worthlessness; feelings of nervousness or restlessness; and suicide.[197]

The Indian Health Service, the Federal Health Program for American Indians and Alaska Natives, recognizes that one major reason for these higher national rates of substance abuse and psychological problems is historical trauma.[198] Historical trauma describes the cumulative effects of the massive group trauma experienced by AI/AN peoples and nations since the arrival of European settlers on the American continent.[199] This trauma has taken various forms, from outright violence of wars and forced relocation to damaging prohibitions on Native languages and cultural and religious practices. Historical trauma has many dimensions, but one important aspect is that, as with any trauma situation, parents and caregivers who have been traumatized often pass on trauma response patterns to their children.[200] This means that the effects of historical trauma in AI/AN communities include not just past or present acts of oppression and racism that AI/AN people have been victimized by, but also the ways that trauma response behaviors are internalized, repeated, and passed on within AI/AN families and communities.[201]

The people of the GRIC, like many other Native Americans in the US, have continued to socially and psychologically struggle to heal from losing traditional ways of life, homeland, language, traditions, etc. due to intrusions on their culture. Because cultural identity and psychological health are related, healing is thwarted by continued marginalization of their culture and worldview. ADOT, deliberately destroying more culture unnecessarily is discriminatory and irresponsible. It is discriminatory because the act destroys an integral part of the GRIC's identity while history shows that Native Americans and the people of the GRIC have lost an incredible amount of their culture already. The GRIC in particular have been embattled in a water right dispute for decades. The loss of water has changed its way of life in very significant ways like food production, diet, independence, etc. And only just recently are the GRIC's water rights being restored after having had to struggle for almost a century with severely reduced water flows. Moreover, ADOT's action is discriminatory because modern psychology shows that cultural identity and environment play a major role in human health, especially for Native Americans who have a unique relationship with their culture and the natural environment.

Not only will a sacred mountain be desecrated but access to historical, ancestral land will be more limited, less accessible, and will be disturbed by noise, cars, and pollution. The landscape will be more fragmented and urbanized, qualities not compatible with sacredness. Modern psychology is not the only messenger to ADOT: the GRIC's 2007 Community Council resolution stated that they "strongly oppose(d) any alteration of the South Mountain Range for

43

turned against oneself. (Subia BigFoot, D., *History of Victimization in Native Communities*, found at http://icctc.org/History%20of%20Victimization%20Issues-%20Final.pdf).

Code	Issue	Response
42 (cont.)		The section entitled *Title VI and Environmental Justice*, beginning on page 4-29 in the Draft Environmental Impact Statement, presents acceptable methods, data, and assumptions to assess the potential for disproportionately high and adverse effects from the proposed action on environmental justice populations and disparate impacts to populations protected under Title VI. Based upon the content of the section, no such effects would result from the action alternatives. In light of comments received on the Draft Environmental Impact Statement, the above-referenced conclusions were confirmed in the preparation of the Final Environmental Impact Statement. To provide further clarity, the discussions of environmental justice and Title VI were separated and additional text explaining the relationship of environmental justice and Title VI to various environmental elements was added throughout Chapter 4, *Affected Environment*, *Environmental Consequences, and Mitigation*, as exemplified by the inserted text on page 4-29 of the Final Environmental Impact Statement.
43	**Title VI, Cultural Resources**	The section entitled *Title VI and Environmental Justice*, beginning on page 4-29 in the Draft Environmental Impact Statement, presents acceptable methods, data, and assumptions to assess the potential for disproportionately high and adverse effects from the proposed action on environmental justice populations and disparate impacts to populations protected under Title VI. Based upon the content of the section, no such effects would result from the action alternatives. In light of comments received on the Draft Environmental Impact Statement, the above-referenced conclusions were confirmed in the preparation of the Final Environmental Impact Statement. To provide further clarity, the discussions of environmental justice and Title VI were separated and additional text explaining the relationship of environmental justice and Title VI to various environmental elements was added throughout Chapter 4, *Affected Environment*, *Environmental Consequences, and Mitigation*, as exemplified by the inserted text on page 4-29 of the Final Environmental Impact Statement. Since the beginning of the environmental impact statement process, the Federal Highway Administration and Arizona Department of Transportation have been carrying out cultural resources studies and engaging in ongoing, open consultation with the Gila River Indian Community Tribal Historic Preservation Office regarding the identification and evaluation of places of religious and cultural importance to the tribe that may be adversely affected by the proposed freeway. Such places are referred to as traditional cultural properties. As a result of these discussions and of studies conducted by the Gila River Indian Community's Cultural Resource Management Program, the Gila River Indian Community has identified traditional cultural properties that are eligible for listing in the National Register of Historic Places and that could be affected by construction of the proposed South Mountain Freeway. The traditional cultural properties identified are culturally important to other Native American tribes as well. For more discussion of traditional cultural properties, see the section, *Cultural Resources*, beginning on page 4-140 of the Final Environmental Impact Statement and pages 5-26 through 5-28. Section 106 of the National Historic Preservation Act requires a government-to-government relationship between the Federal Government and Indian tribes as described beginning on page 4-140 of the Final Environmental Impact Statement. Section 106 requires that federal agencies take into account the effects of their undertakings on historic properties. This process requires consultation with tribal authorities. Consultation has occurred with Gila River Indian Community government officials, the Tribal Historic Preservation Officer, the Cultural Resource

(Response 43 continues on next page)

Code	Issue	Response
43 (cont.)		Management Program, many different tribal authorities, and the State Historic Preservation Office. The consultation has resulted in concurrence from the Gila River Indian Community Tribal Historic Preservation Office and the State Historic Preservation Office on National Register of Historic Places eligibility recommendations (including traditional cultural properties), project effects, and proposed mitigation and measures to minimize harm. This consultation has been ongoing and will continue until any commitments in a record of decision are completed. The Draft Environmental Impact Statement, after consultation and coordination efforts, accommodates and preserves (to the fullest extent possible from the available alternatives) access to the South Mountains for religious practices. A very small portion of the mountain would be impacted by the proposed freeway (less than 0.03 percent of the total area). Although the Draft Environmental Impact Statement describes the impact on the South Mountains as adverse, Native Americans would not be kept from practicing their beliefs, access to the mountain would be maintained, and mitigation measures would be implemented based on input from members of the Gila River Indian Community. The Arizona Department of Transportation and Federal Highway Administration provided equal access to the public participation process to the Gila River Indian Community and its members. The Arizona Department of Transportation and Federal Highway Administration solicited input from the Gila River Indian Community and other Native American tribes and tribal members and fully considered input and comments that were received. Chapter 2 of the Final Environmental Impact Statement is dedicated to the explanation of the Gila River Indian Community outreach undertaken for the project. Chapter 6 of the Final Environmental Impact Statement further describes Gila River Indian Community outreach throughout the process. The Gila River Indian Community was provided equal opportunities to participate in the project as all other populations and agencies. This outreach was undertaken, in part, to ensure all populations had equal access to the process and, in part, to ensure disparate nor disproportionately high adverse impacts would result from the construction and operation of the proposed action.

Code	Comment Document

any purpose"…and any alteration…"would be a violation of the cultural and religious beliefs of the Gila River Indian Community and would have a negative cumulative effect on the continuing lifeways of the people of the Gila River Indian Community."[202] ADOT's decision is irresponsible because the government is sponsoring a program that significantly reduces Native American culture and identity while at the same time knowing the integral relationship the GRIC has with the South Mountain and possessing all the tools to recognize that Title VI of the Civil Rights Act is being violated.

C. ADOT DISCRIMINATED BY NOT CONDUCTING ADEQUATE CONSULTATION TO PREVENT A DISPARATE IMPACT AND BY PROVIDING INADEQUATE NOTICE, ACCESS, AND PUBLIC PARTICIPATION OPPORTUNITIES FOR GRIC AND GRACE TRIBAL MEMBERS

44

GRIC tribal members are speaking out strongly because GRIC feel that they have not been properly included, consulted, and heard. In analyzing ADOT's procedure and process before and after the release of the DEIS, it is apparent that ADOT did not comply with Title VI's requirement that no person may be excluded from participation in, denied the benefit of, or subjected to discrimination under any program or activity receiving Federal financial assistance on the basis of race, color, or national origin.[203] It is also apparent that ADOT did not comply with NEPA's provision to provide for "all Americans safe, healthful, productive, and esthetically pleasing surroundings", or to take a "systematic, interdisciplinary approach" to aid in considering environmental and community factors in decision making.[204]

45

Ignoring the fact that GRIC, as a Native American peoples with community centered values and a strong sense of responsibility to protect the integrity of the past, present, and future generations, ADOT has embraced MAG's interpretation that the South Mountain Loop 202 is an absolute necessary component of the MAG master-plan. MAG's subcommittee, the Transportation Policy Council (TPC), which plans for and sets aside money for transportation projects in the Maricopa County region and provides the overall plan for all modes of transportation in Maricopa County, is heavily filled with business leaders and corporate executives, who have a bias toward seeing the South Mountain constructed. The GRIC however must make decisions that protect their culturally rich ancestral lands and the health and welfare of present and future generations of GRIC.[205] The TCP includes executives from trucking companies (Swift, Knight), shopping mall owners and operators (Macerich), several realty companies, casino architects (The Killian Companies), and a construction firm that builds freeways (FNF Construction).[206] ADOT, who is captive to MAG"s belief that the project is necessary, has designed the DEIS so as to create the impression that the South Mountain Loop 202 must be built and no other alternatives are prudent or feasible, downplaying and ignoring the disparate impacts that would result if the South Mountain Loop 202 were constructed.

Code	Issue	Response
44	**Title VI**	The Arizona Department of Transportation and Federal Highway Administration provided equal access to the public participation process to the Gila River Indian Community and its members. The Arizona Department of Transportation and Federal Highway Administration solicited input from the Gila River Indian Community and other Native American tribes and tribal members and considered fully the substantive input and comments that were received. Chapter 2 of the Final Environmental Impact Statement is dedicated to the explanation of the Gila River Indian Community outreach undertaken for the project. The Gila River Indian Community was provided the same opportunities to participate in the project as all other populations and agencies. Consultation related to cultural resources followed the requirements of Section 106 of the National Historic Preservation Act. Project communication with Gila River Indian Community officials followed a protocol established for this study, from years of previous consultation and coordination recognizing the sovereign nation status of the Gila River Indian Community and with respect for the Gila River Indian Community's cultural norms (see letter on page A152 of Appendix 1-1). Consultation and coordination occurred one-on-one with the appropriate Gila River Indian Community officials. Representatives from the Gila River Indian Community participated for years in the South Mountain Citizens Advisory Team. During the public comment period, Community members were provided the same opportunities to attend the public hearing and participate in a public forum as all other populations. The Arizona Department of Transportation and Federal Highway Administration did comply with the National Environmental Policy Act's provision to provide for "all Americans safe, healthful, productive, and esthetically pleasing surroundings", or to take a "systematic, interdisciplinary approach" to aid in considering environment and community factors in decision making. The alternatives development and screening process outlined in Chapter 3 of the Final Environmental Impact Statement is one example of the agencies' arduous, exhaustive, and comprehensive systematic and interdisciplinary approach to the National Environmental Policy Act. Further, as shown in Figure 3-41 on page 3-67, the process of identifying a preferred alternative demonstrates the interdisciplinary accounting in decision making in the process.
45	**Purpose and Need**	The Transportation Policy Committee was established by the Maricopa Association of Governments Regional Council in 2002 to oversee the development of the 20-year *Regional Transportation Plan* and to guide transportation planning in the region. The Transportation Policy Committee is made up of 23 members. The membership includes 13 city representatives, a Maricopa County Supervisor, an Arizona Department of Transportation State Transportation Board member, and seven business representatives. The final member, representing Native American Indian Communities is the Gila River Indian Community Lieutenant Governor. So the Gila River Indian Community has a direct voice in the direction of transportation funding in the region. The proposed project is part of the *Regional Transportation Plan* for the Maricopa Association of Governments region. In 2004, the voters of Maricopa County approved the *Regional Transportation Plan* and the extension of a half-cent sales tax to fund its projects. The role of the Arizona Department of Transportation is to implement the freeway program from the voter-approved plan.

Code	Comment Document
46	ADOT has minimally consulted with the GRIC in the scoping and preparing of the DEIS both officially and unofficially. While ADOT indicates that it has conducted 178 meetings with GRIC on its South Mountain Loop 202 proposal between 2001 to 2012, only three, all in 2011, were identified as cultural resource consultation meetings and none were attended by the BIA.[207] Further, these cultural resource consultation meetings were designated as "Meetings Focused on the Proposed On-Community Alignment, 2010-2012 biasing any efforts to satisfy the goals of a cultural resource consultation meeting. The National Park Services' guidance for federal historic preservation programs states: "consultation means the process of seeking, discussing, and considering the views of others, and, where feasible, seeking agreement with them on how historic properties should be identified, considered, and managed. Consultation is built upon the exchange of ideas, not simply providing information.[208] Further, consultation should start early for a proposed project, not 9 years after conducting meetings. And those best equipped to communicate the tribes' sensitivities to cultural places should be consulted with and not just met with so as to satisfy what it believes is its Title VI and EJ requirements.[209] ADOT spent the first 9 years just informing GRIC representatives what its plan were and trying to "coordinate" its agenda -not consulting: ADOT worked mainly with the Natural Resources Standing Committee (NRSC) and the Transportation Technical Team (TTT). The NRSC is a special committee reporting to the Community Council that reviews all land use actions under its jurisdiction, acts as a key decision-making agent in actions pertaining to land use effects on Community land, and issues right-of-entry permits for non-Community members wishing to conduct a survey or other data collection tasks on Community land." And the TTT is a special committee established by the Community Council…to facilitate informed decisions on transportation requests.[210] These two committees do not participate in consultation, which is something very different from making land use decisions, issuing right-of-entry permits for non-Community members, and facilitating informed decisions on transportation requests. Moreover, ADOT didn't conduct the informational scoping meetings itself. The DEIS states that in August 2010 while ADOT believed it still could secure an on-reservation alignment, it presented an environmental and engineering overview outlining the freeway and its

[207] None of these meetings was the one that the Four Southern Tribes of Arizona attended. (ADOT, South Mountain Study Team, Chapter 2 *Gila River Indian Community Coordination* at 4-7); The federal government is obligated by its "trust responsibility" to represent the best interests of tribes and their members. This specific responsibility is delegated to the U.S. Bureau of Indian Affairs (BIA)." (*Id.* at 2); Under Executive Order 13,175, each federal agency must establish a process for consultation with tribal officials in the development and implementation of "policies that have tribal implications" based upon the "unique legal relationship" between the United States and "Indian tribal governments as set forth in the Constitution of the United States, treaties, statutes, Executive Orders, and court decisions." (65 FED. REG. 67249 (Nov. 6, 2000) https://www.federalregister.gov/articles/2000/11/09/00-29003/consultation-and-coordination-with-indian-tribal (last visited July 15, 2013)). With the BIA as one of ADOT's partners, any ADOT action with the South Mountain Freeway is dependent on it complying with Executive Order 13,175.

[208] National Park Service, The Secretary of the Interior's Standards and Guidelines for Federal Agency Historic Preservation Programs pursuant to the National Historic Preservation Act, 63 FED. REG. 20496, 20504 (Apr. 24, 1998).

[209] While the Elderly Concerns Group was met with twice, in 2001 and in then in 2002 by ADOT, nothing came of it. Because their concerns did not influence the DEIS, the Group on June 12, 2013 had to make a formal motion that the Elderly Concerns Group was opposed to the South Mountain Freeway and the destruction of the South Mountain. See attachment.

[210] ADOT, South Mountain Study Team, Chapter 2 *Gila River Indian Community Coordination* p. 3 found at http://www.azdot.gov/Highways/Valley_Freeways/Loop_202/South_Mountain/PDF/FHWA-AZ-EIS/02-SMDEIS-Chapter-2-Gila-River-Indian-Community-Coordination.pdf.

Code	Issue	Response
45 (cont.)		Chapter 1, *Purpose and Need*, was developed based on Federal Highway Administration guidance in terms of complying with the National Environmental Policy Act with respect to the purpose and need for a proposed action. As noted on page 1-1 of the Draft Environmental Impact Statement, "...if the lead agency concludes ... there is no need, an EIS would not be prepared..." The determination of purpose and need in terms of assessing if a transportation problem exists that warrants action was done objectively, defensibly and without pre-determination and in so doing, the Arizona Department of Transportation and Federal Highway Administration facilitated an environmental impact statement process without a determination that the proposed action is "... an absolute necessary component of the Maricopa Association of Governments master-plan..." as is incorrectly stated in the comment. The purpose and need criteria used to define the transportation problem are described (see Figures 1-8, 1-9, 1-10, 1-11, 1-12, and 1-13). The summation of the need for the proposed action is described in the conclusions section, beginning on page 1-21 of the Draft Environmental Impact Statement. In accordance with the National Environmental Policy Act, a range of reasonable action alternatives to carry forward for further analysis was determined through application of multidisciplinary criteria in a logical, step-wise progression. Alternatives were not disposed of or dismissed without a thorough evaluation using the multidisciplinary criteria outlined in the alternatives development and screening process presented in Chapter 3 of the Draft Environmental Impact Statement. The preferred alternative was the outcome to this process. A thorough feasible and prudent avoidance analysis of the South Mountains was conducted as presented in Chapter 5 of the Draft and Final Environmental Impact Statements and concluded avoidance to the direct use of the resource was not feasible and prudent. In support of this response and given the concerns about the South Mountains, consider the following review from the U.S. Department of the Interior on the Draft Environmental Impact Statement: comment: "Following our review of the Section 4(f) Evaluation, we concur that there is no feasible or prudent alternative to the Preferred Alternative selected in the document, and that all measures have been taken to minimize harm to these resources." The complete letter can be found in Appendix 7, Volume III, on page B4 of the Final Environmental Impact Statement.
46	**Tribal Involvement**	Section 106 of the National Historic Preservation Act requires a government-to-government relationship between the Federal Government and Indian tribes as described beginning on page 4-140 of the Final Environmental Impact Statement. Section 106 requires that federal agencies take into account the effects of their undertakings on historic properties. This process requires consultation with tribal authorities. Consultation has occurred with Gila River Indian Community government officials, the Tribal Historic Preservation Officer, the Cultural Resource Management Program, many different tribal authorities, and the State Historic Preservation Office. The consultation has resulted in concurrence from the Gila River Indian Community Tribal Historic Preservation Office and the State Historic Preservation Office on National Register of Historic Places eligibility recommendations (including traditional cultural properties), project effects, and proposed mitigation and measures to minimize harm. This consultation has been ongoing and will continue until any commitments in a record of decision are completed. As noted in Table 4-47 that begins on page 4-145 of the Final

(Response 46 continues on next page)

Code	Comment Document

Code	Issue	Response
46 **(cont.)**		Environmental Impact Statement, the Gila River Indian Community was initially consulted in 2003 with subsequent contact in 2005, 2006, 2007, 2008, 2010, 2011, 2012, and 2013. This supports an early and continued consultation with the Gila River Indian Community related to resources of importance. This consultation has resulted in concurrence from the State Historic Preservation Office and Gila River Indian Community Tribal Historic Preservation Office on National Historic Preservation Act eligibility recommendations, project effects, and proposed mitigation and measures to minimize harm. This consultation has been ongoing and will continue until any commitments in a record of decision are completed. However, there is no requirement to consult with individual tribal members under Section 106. Agency scoping comments from the project initiation in 2001 are presented beginning on page 6-3 of the Draft and Final Environmental Impact Statements. The Gila River Indian Community was part of the agency scoping process. While specific topics are not identified in Table 2-1 of the Draft Environmental Impact Statement, cultural resource-related issues were a standard topic and the Bureau of Indian Affairs were regular attendees at these consultation and coordination meetings. Additionally, Gila River Indian Community concerns are summarized on page 2-10 of the Draft and Final Environmental Impact Statements. As noted in Table 4-47 beginning on page 4-145 of the Final Environmental Impact Statement, the Bureau of Indian Affairs has been consulted over the course of the project on cultural resources-related issues. Also, the Bureau of Indian Affairs, as a cooperating agency, reviewed the Draft Environmental Impact Statement prior to the public release. The Bureau of Indian Affairs approved the document for release with only minor comment. Since the beginning of the environmental impact statement process for the proposed freeway, the Federal Highway Administration and Arizona Department of Transportation have been carrying out cultural resources studies and engaging in an ongoing, open dialogue with the Gila River Indian Community, its Tribal Historic Preservation Officer, and its Cultural Resource Management Program regarding the identification and evaluation of places of religious and cultural importance to the tribe that may be adversely affected by the proposed freeway. Such places are referred to as traditional cultural properties. The Gila River Indian Community's own Cultural Resource Management Program performed the cultural field investigations and developed recommendations for mitigation for project impacts. As a result of these discussions and of studies conducted by the Gila River Indian Community's Cultural Resource Management Program, the Gila River Indian Community has identified traditional cultural properties that are eligible for listing in the National Register of Historic Places and that could be affected by construction of the proposed freeway. In certain cases, listing these properties on the National Register of Historic Places may offer them protection under Section 4(f) of the Department of Transportation Act. The traditional cultural properties identified are culturally important to other Native American tribes as well. The Yavapai-Prescott Indian Tribe deferred to the Southern Tribes to take the lead in identifying the traditional cultural properties. A response from Salt River Pima-Maricopa Indian Community dated August 14, 2012 cited the existing consultation management agreement between the Four Southern Tribes (Ak-Chin Indian Community, Gila River Indian Community,

Code	Issue	Response
46 (cont.)		Salt River Pima-Maricopa Indian Community, and Tohono O'odham Nation) and stated that the Four Southern Tribes are in consensus that Gila River Indian Community would take the lead in providing comments for the project. For more discussion of traditional cultural properties, see Draft Environmental Impact Statement pages 4-129 through 4-132, 4-148, and 5-26 through 5-28. In investigating the comment, it was noted that two of the meetings referred to in Table 2-2 discussed resources that were located off the Gila River Indian Community. As a result, these two meetings (8/4/2011 and 11/30/2011) have been removed from Table 2-2 and were added to Table 4-47 beginning on page 4-145 of the Final Environmental Impact Statement.
47	**Tribal Involvement**	Public and agency scoping for the proposed action was conducted in accordance with the requirements established by the National Environmental Policy Act as disclosed in Chapter 6 of the Draft Environmental Impact Statement. Agency scoping comments from the project initiation in 2001 are presented beginning on page 6-3 of the Draft Environmental Impact Statement. The Gila River Indian Community was part of the agency scoping process. As stated on page 2-8 of the Draft Environmental Impact Statement, the meetings in 2010 between the Gila River Indian Community's Transportation Technical Team, Arizona Department of Transportation, and the Federal Highway Administration were held in response to a request received from the Governor of the Gila River Indian Community and were not a part of the agency or public scoping process. The information provided to the Transportation Technical Team was used by the Team and the Public Information Office in the Gila River Indian Community's outreach effort prior to the February 2012 coordinated referendum. The referendum and the outreach effort were tribal actions and, other than providing requested information to the Gila River Indian Community, Arizona Department of Transportation and Federal Highway Administration did not participate in these actions.

Code	Comment Document

impacts on GRIC land to the TTT, who with the help of the Public Information office solicited recommendations and comments from GRIC tribal members on an off-reservation and an on-reservation alignment.[211] The DEIS states that meetings were held from December 2010 through March 2011 in each of the seven districts, with some districts having multiple meetings.[212] The DEIS states that meetings were also held with special interest groups and a total of 15 meetings occurred.[213] GRACE states that these meetings were heard about only if one participated in certain closed meetings and only certain people were invited to those closed meetings. Further, many in attendance questioned why ADOT was not conducting these meetings but rather GRIC representatives. It appears that ADOT inappropriately gave its duty for scoping and community outreach to tribal representatives, and failed to make sufficient and direct efforts to engage GRIC tribal members between December 2010 and March 2011.

47

The only information publicized in the GRIN that the general GRIC community had before they voted in February 2012 to voice their opinion about the South Mountain was a paid ad by Pangea in the December 2011 and January 2012 GRIN telling tribal members that an on-reservation build would save South Mountain and an off-reservation build would desecrate South Mountain and an article by GRACE in the January 2012 GRIN expressing that a no build was an option, which meant that neither the reservation would be built on nor would South Mountain be desecrated. Still, uninterested in knowing how an off and an on-reservation build would impact the GRIC negatively,[214] without conducting consultation and arguably never communicating with the general GRIC community themselves, ADOT moved forward with designing only one eastern alternative through the South Mountain. Needless to say, many GRIC tribal members felt they had not been consulted. One GRIC tribal member stated: "A.D.O.T. did not ask in proper manners what we as a community would like done or not done with our sacred place of gathering."[215] See attachment.

48

As a sovereign nation with historical, cultural, and spiritual connections with lands no longer fully assessable but which they have rights to, adequate consultation is necessary. Not only does the NHPA require consultation with the GRIC because the South Mountain is a TCP with religious and cultural significance[216] but Executive Order 12898 Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations also calls for consultation. Executive Order 12898 states "each Federal agency shall make achieving environmental justice part of its mission by identifying and addressing, as appropriate, disproportionately high and adverse human health or environmental effects of its programs, policies, and activities on minority populations"[217] Nonetheless, after listing ADOT's meetings with the GRIC, Chapter 2's *Gila River Indian Community Coordination* ends with, "in

[211] *Id.* at 8.
[212] *Id.* at 8.
[213] *Id.* at 8.
[214] GRACE's article in the January 2012 GRIN states "Both proposed freeway alignments destroy the mountain. The on reservation alignment will force the loss of more than 600 acres of GRIC lands at the base of South Mountain (source: Kimberly Dutcher, GRIC Law Office). These sites are full of cultural significance, and The Arizona Department of Transportation (ADOT) knows this. By destroying the foothills of Muhadag Do'ag, we destroy the entire mountain, as well as Muhadag Do'ag's connection to the Estrellas. And what about the Pee Posh and O'odham families that would fall victim to the on-reservation alignment, and lose their homes to the freeway?" GRIN, Jan. 2012 15, NO.01 p. 4 found at www.gilariver.org/news)

Code	Issue	Response
48	**Environmental Justice**	Section 106 of the National Historic Preservation Act requires a government-to-government relationship between the Federal Government and Indian tribes as described beginning on page 4-140 of the Final Environmental Impact Statement. Section 106 requires that federal agencies take into account the effects of their undertakings on historic properties. This process requires consultation with tribal authorities. Consultation has occurred with Gila River Indian Community government officials, the Tribal Historic Preservation Officer, the Cultural Resource Management Program, many different tribal authorities, and the State Historic Preservation Office. The consultation has resulted in concurrence from the Gila River Indian Community Tribal Historic Preservation Office and the State Historic Preservation Office on National Register of Historic Places eligibility recommendations (including traditional cultural properties), project effects, and proposed mitigation and measures to minimize harm. This consultation has been ongoing and will continue until any commitments in a record of decision are completed. However, there is no requirement to consult with individual tribal members under Section 106. The section entitled *Title VI and Environmental Justice*, beginning on page 4-29 in the Draft Environmental Impact Statement, presents acceptable methods, data, and assumptions to assess the potential for disproportionately high and adverse effects from the proposed action on environmental justice populations and disparate impacts to populations protected under Title VI. Based upon the content of the section, no such effects would result from the action alternatives. In light of comments received on the Draft Environmental Impact Statement, the above-referenced conclusions were confirmed in the preparation of the Final Environmental Impact Statement. To provide further clarity, the discussions of environmental justice and Title VI were separated and additional text explaining the relationship of environmental justice and Title VI to various environmental elements was added throughout Chapter 4, *Affected Environment, Environmental Consequences, and Mitigation*, as exemplified by the inserted text on page 4-29 of the Final Environmental Impact Statement.

Code	Comment Document
49	accordance with Executive Order 12898, on environmental justice, and with Title VI of the Civil Rights Act of 1964 (Title VI), the coordination efforts outlined in this chapter establish that reasonable efforts have been made to engage and provide the Community's population access to the EIS process for the proposed action."[218] ADOT's weak coordination efforts and flimsy access to the EIS process however are not enough: Title VI fundamentally requires consultation where exchange of ideas happens to prevent disparate impacts that Title VI prohibits. One-sided informational meetings, which most of the various GRIC meetings were between 2001 and 2012 do not give a community the potential to affect the opinions of the decision makers. The meetings to discuss the South Mountain Loop 202 were only for technical, information gathering, and for ADOT to present its intent and not for consultation. For example, while the DEIS acknowledges that the Community Council is "the primary decision-making and legislative body for the Community….consist(ing) of 17 members elected by residents of the Community's seven districts[219]", ADOT only coordinated two meetings with them, one in 2003 that only included community council representatives from districts 4, 6, and 7 and another in 2005. It is apparent ADOT was only meeting to satisfy what it allegedly believed its requirements were under Executive Order 12898 and Title VI to "coordinate" and "engage"[220] the GRIC, and moreover, to "ensure full and fair participation"[221] –again, not to truly consult or to consider anything but an on-reservation or a South Mountain Preserve alignment. Additionally, ADOT's meetings between 2001 and 2012 with the GRIC were not even full and fair. As a potential especially affected group, full and fair mean equal opportunity to participate and communicate ones position. For example, between 2010 through 2012, none of the 76 meetings focused on the proposed on-reservation alignment were conducted in districts three or five because as chapter 2 *GRIC Coordination* states, they would have been "less affected" by an on reservation alignment. This is not true because overall, the reservation is community land and any change of use will affect all tribal members. Further, a no-build is an equally legitimate option that NEPA requires analyzed. However, the meetings between 2001 and 2009 were conducted under the assumption that an alternative on the reservation was obtainable, while the meetings between 2010 and 2012 were conducted under the assumption an on-reservation alignment could be ultimately negotiated: none of the meetings therefore consulted and considered alternatives focusing on the effects and impacts on the GRIC for using GRIC land or the effects and impacts on the GRIC for desecrating sacred land. For example, chapter 2 goes on and says "informational meetings have been conducted with District 1 and 2 representatives regarding project status and identification of their concerns regarding the proposed action. These meetings occurred in 2002; both Districts 1 and 2 are outside of the Study Area. Although presentations to Districts 1 and 2 have not been made since 2002, articles regarding the project have appeared in the Gila River Indian News."[222] One GRIC tribal member stated "I wasn't notified about the meetings that they had about this freeway being built. I believe that they should of set out flyers to notify people not just only landowners but members of our community that should also be included to this matter that is coming in affect to our

Code	Issue	Response
49	**Tribal Involvement**	The Arizona Department of Transportation and Federal Highway Administration provided equal access to the public participation process to the Gila River Indian Community and its members. The Arizona Department of Transportation and Federal Highway Administration solicited input from the Gila River Indian Community and other Native American tribes and tribal members and considered fully the substantive input and comments that were received. Efforts to involve the Gila River Indian Community in the environmental impact statement process are documented in Chapter 2 of the Final Environmental Impact Statement. Gila River Indian Community members were able to comment on the environmental impact statement process and its content at any time during the preparation of the Draft Environmental Impact Statement and through the comment period once the Draft Environmental Impact Statement was issued. Public involvement with the Gila River Indian Community was conducted as requested by the tribal government. Prior to October 2005, early efforts to involve the Gila River Indian Community included attending tribal meetings and monthly meetings with Gila River Indian Community Departments (see discussion beginning on page 2-8 of the Draft and Final Environmental Impact Statements). On October 14, 2005, the Gila River Indian Community requested that all project-related communications take place at a government-to-government level (see letter on page A152 of Appendix 1-1). This request was honored by the Arizona Department of Transportation and Federal Highway Administration. All public involvement efforts were implemented by the Gila River Indian Community's public involvement officer. This is disclosed in Chapter 2 of the Final Environmental Impact Statement. Project communication with Gila River Indian Community officials followed a protocol established for this study, from years of previous consultation and coordination recognizing the sovereign nation status of the Gila River Indian Community and with respect for the Gila River Indian Community's cultural norms. Consultation and coordination occurred one-on-one with the appropriate Gila River Indian Community officials. Representatives from the Gila River Indian Community participated for years in the South Mountain Citizens Advisory Team until early 2006, when the Gila River Indian Community requested all project-related communications take place at the government-to-government level. During the public comment period, Gila River Indian Community members were provided the same opportunities to attend the public hearing and participate in a public forum as all other populations.

Code	Issue	Response
50	**Tribal Involvement**	As discussed on page 2-4 of the Draft Environmental Impact Statement, in August 2000, the Gila River Indian Community Council passed Resolution GR-64-96. This resolution concluded that the Gila River Indian Community Council strongly opposed any future alignment of the South Mountain Freeway on Gila River Indian Community land. That resolution has never been rescinded by Gila River Indian Community Council and is still considered in force and to represent the will of the Gila River Indian Community by the Arizona Department of Transportation and Federal Highway Administration. The comments received from Gila River Indian Community Governor Gregory Mendoza (see letter dated July 11, 2013, on page B38 in Appendix 7, Volume III, of the Final Environmental Impact Statement) confirm the Gila River Indian Community's position. As stated on page 2-8 of the Draft Environmental Impact Statement, the meetings in 2010 between the Gila River Indian Community's Transportation Technical Team, Arizona Department of Transportation, and the Federal Highway Administration were held in response to a request received from the Governor of the Gila River Indian Community and were not a part of the agency or public scoping process. The information provided to the Transportation Technical Team was used by the Team and the Public Information Office in the Gila River Indian Community's outreach effort prior to the February 2012 coordinated referendum. The referendum and the outreach effort were tribal actions and, other than providing requested information to the Gila River Indian Community, Arizona Department of Transportation and Federal Highway Administration did not participate in these actions. It is unclear to what timeframe the inadequate notification comment is referring. However, the Arizona Department of Transportation and Federal Highway Administration have attended meetings as requested by Gila River Indian Community groups, including the Gila Borderlands Advisory Committee and the Elderly Concerns Group. To keep Gila River Indian Community members engaged in the process and to ensure adequate access to project activities, three newsletters have been provided to the Gila River Indian Community for distribution and articles have been provided to the *Gila River Indian News* for inclusion in the weekly tribal newspaper. The Arizona Department of Transportation has participated in the Gila River Indian Community's annual fair to answer questions regarding the proposed action. Times and locations of all public meetings (see Chapter 6, *Comments and Coordination*) relating to the project have been advertised to the Gila River Indian Community, inviting members to attend. Offers to the Gila River Indian Community Manager to host a public outreach event on the Gila River Indian Community began in summer 2012. The Gila River Indian Community first officially responded to this offer at the April 30, 2013 meeting of the Transportation Technical Team. During this meeting, the Gila River Indian Community Manager requested a community forum be conducted on the Gila River Indian Community following the public hearing. This was the only request the Arizona Department of Transportation received from the Gila River Indian Community regarding whether the Arizona Department of Transportation could hold a public outreach event during the public comment period. The Arizona Department of Transportation agreed to do so, and a community forum was held on June 22, 2013 at the Komatke Boys & Girls Club on the Gila River Indian Community.

51	reservation."[223] See attachment. Another tribal member stated "I don't know why they can't hold a meeting in each District to see what the people think. Even though it is for landowners. But I think it is going to affect the whole reservation."[224] GRIC's issues and concerns of the environmental, health, and cultural cumulative impacts on them and the misuse of transportation dollars for unnecessary highway expansion in the name of parochial economic development could not be considered in the decision making process because they were ignored by ADOT's tunnel vision agenda of obtaining an on-reservation alignment so that they could spare the South Mountain and the Ahwatukee Foothills.[225] No evidence suggests that the GRIC's concerns were appropriately considered: why else after the GRIC voted for a no-build[226] did ADOT end up with only one eastern alternative that goes through the GRIC's sacred mountain. The community forum meetings during the 90 day comment period also were not full and fair.[227] As a nation with an oral tradition centered around community involvement and community transmission, (which is very different from a written tradition that is individualistic and easily transferable by non-community engagement), the one ADOT meeting on the reservation did not allow for formal "public testimony". Rather, the meeting only allowed participants to report to a court reporter who recorded GRIC members' comments individually. This was unfair as the May 21st downtown Phoenix public hearing allowed people to speak with a court reporter, complete a comment form, or give a formal 3-minute comment (public testimony).[228] By the time GRIC's community forum meeting came around June 22, 2013, the three options offered at the downtown Phoenix public hearing narrowed into only speaking with a court reporter or completing a comment form. Attendees at the GRIC community forum meeting were also forbidden to bring signs and banners to communicate and voice their opinions. These restrictions were a great insult to tribal members, especially since they felt excluded from the DEIS scoping and preparation of the DEIS. Also, the same video that was played at the beginning of the release of the DEIS and that can be found on the website was played over and over at this meeting instead of providing tribal members the opportunity to address everyone at the meeting.

[223] Winnona Catha, GRIC tribal member, Aff. ¶ 3 July 2, 2013.
[224] Bernadette Stevens, GRIC tribal member, Aff. ¶ 5 July 2, 2013.
[225] For example, after many failed attempts, Ahwatukee Foothills representative DiCiccio was hired by ADOT in 2006 as a consultant to negotiate with the GRIC to reconsider allowing the freeway on its land. (Sean Holstege, The Republic, *1998 plan for South Mountain Freeway passed*, March 25, 2013 http://www.azcentral.com/community/ahwatukee/articles/20130308south-mountain-freeway-plan-ignored.html (last visited July 11, 2013)).
[226] In late 2011, the GRIC Community Council passed a resolution to hold a Community-wide referendum on the freeway. The referendum asked members whether they supported an on-reservation alignment, an off-reservation alignment, or a "no-build" option. On February 7, 2012, most GRIC voters voted for the "no-build" option.
[227] Meetings were held in: Ahwatukee Foothills Village; Avondale; Chandler; Estrella Village; Gila River Indian Community; and Laveen Village. Public testimony was formally prohibited at all meetings. (ADOT, Public participant Guide for the Loop 202 South Mountain Freeway Study Draft Environmental Impact Statement, found at http://www.smfonlinehearing.com/files/2313/6881/9504/SMTN_Meeting_Guide.pdf; However, public testimony was allowed at the May 21st Phoenix Public Hearing.
[228] ADOT, You're invited! Loop 202 South Mountain Freeway Study Draft Environmental Impact Statement Available for Public Review and Comment, found at http://www.azdot.gov/Highways/EPG/EPG_Common/PDF/Public_Notices/Loop202-South-Mountain-Freeway-project.pdf.

Code	Issue	Response
50 (cont.)		The Arizona Department of Transportation advertisement efforts of the public hearing and public forums are documented in Chapter 6 of the Final Environmental Impact Statement beginning on page 6-23. The Gila River Indian Community Communication and Public Affairs Office informed the Arizona Department of Transportation that all communication and distribution of informational materials on Gila River Indian Community land would be handled by the Communication and Public Affairs Office. Advertisement text regarding the project, the public comment period, the public hearing and the various ways for the public to submit comments regarding the South Mountain Freeway Draft Environmental Impact Statement was given to the Gila River Indian Community's Public Information Officer at the Transportation Technical Team meeting on April 30, 2013. Two advertisements regarding the public hearing, information regarding the location and availability of the Draft Environmental Impact Statement, and a map of the alternatives was placed in the May 2013 monthly issue of the *Gila River Indian News*. The Arizona Department of Transportation Community Relations distributed electronic notices (e-newsletters) through the Government Delivery system to over 12,000 constituents who voluntarily signed up for project alerts along the Interstate 10 Papago, Maricopa, and Santan Freeways. These electronic notices included notice of availability of Draft Environmental Impact Statement (distributed on April 26, 2013); public hearing (distributed on May 10, 2013); the community forums (distributed on May 29, 2013) and one in June (close of the Draft Environmental Impact Statement public comment period). In addition, anyone who had attended a previous meeting on the proposed action and signed in received all of this information mailed individually. On May 6, 2013, 73,564 mailers were distributed to addresses within the Study Area.
51	**Tribal Involvement**	As earlier comments recognize, the Arizona Department of Transportation and Federal Highway Administration solicited input from the Gila River Indian Community and other Native American tribes and tribal members and considered fully the substantive input and comments that were received. While efforts to study project alternatives on Community land that did not directly impact South Mountain were attempted, as noted on page 2-8 of the Draft Environmental Impact Statement, a coordinated referendum occurred in February 2012, and Gila River Indian Community members voted in favor of the no-build option. Therefore, the on-Gila River Indian Community alignment was eliminated from further study. Any alternative on Gila River Indian Community land must consider tribal sovereignty. Tribal sovereignty is based in the inherent authority of Native American tribes to govern themselves. While this notion of sovereignty is manifested in many areas, generally Native American land is held in trust by the United States. Native American communities have the authority to regulate land uses and activities on their lands. States have very limited authority over activities within tribal land (see page 2-1 of the Final Environmental Impact Statement). From a practical standpoint, this means that the Arizona Department of Transportation and Federal Highway Administration do not have the authority to survey tribal land, make land use (including transportation) determinations directly affecting tribal land, or condemn tribal land for public benefit through an eminent domain process. However, mitigation measures developed through consultation and coordination with the Tribal Historic Preservation Office and other concerned parties would be considered for implementation in any final action.

Code	Issue	Response
51 (cont.)		In accordance with the National Environmental Policy Act, a range of reasonable action alternatives to carry forward for further analysis was determined through application of multidisciplinary criteria in a logical, step-wise progression. Alternatives were not disposed of or dismissed without a thorough evaluation using the multidisciplinary criteria outlined in the alternatives development and screening process presented in Chapter 3 of the Draft Environmental Impact Statement. The preferred alternative was the outcome to this process. As noted in the previous comment response, the Draft Environmental Impact Statement on page 2-4 acknowledges that the Gila River Indian Community Council passed Resolution GR-64-96 that strongly opposed any future alignment of the South Mountain Freeway on Community land. In addition, the comments received from Gila River Indian Community Governor Gregory Mendoza (see letter dated July 11, 2013, on page B38 in Appendix 7, Volume III, of the Final Environmental Impact Statement) confirm the Gila River Indian Community's position. To clarify, the comment concludes that because a distinct population conducts a vote, the outcome of said vote should be deemed as "final" when, such a vote is the reflection of a population subset of a much larger population. The environmental impact statement process accounts for such information from the voter outcome as a contributing factor to be taken into account as one of many factors to consider in terms of the National Environmental Policy Act decision making intent to promote a more informed decision in regards to the proposed action. Any alternative on Gila River Indian Community land must consider tribal sovereignty. Tribal sovereignty is based in the inherent authority of Native American tribes to govern themselves. While this notion of sovereignty is manifested in many areas, generally Native American land is held in trust by the United States. Native American communities have the authority to regulate land uses and activities on their lands. States have very limited authority over activities within tribal land (see page 2-1 of the Final Environmental Impact Statement). From a practical standpoint, this means that the Arizona Department of Transportation and Federal Highway Administration do not have the authority to survey tribal land, make land use (including transportation) determinations directly affecting tribal land, or condemn tribal land for public benefit through an eminent domain process.
52	**Tribal Involvement**	The comment is correct that the opportunity for public testimony was offered only at the public hearing on May 21, 2013. The six community forums, including the one at the Komatke Boys & Girls Club offered the opportunity to view the same materials, present comments in writing or to a court reporter and were formatted in exactly the same manner. However, signs and banners were also prohibited at the public hearing on May 21. Community forums were held after the public hearing to further invite public comment. The public hearing for the proposed action was widely advertised. Newspaper ads in six newspapers of area-wide distribution ran advertisements at least twice each. Announcements occurred on five radio stations and six television stations. Mailers were sent on May 6, 2013 to 73,564 individuals (approximately 311 on the Gila River Indian Community) who had previously expressed an interest in the project. The Arizona Department of Transportation utilized the Government Delivery system to distribute to over 12,000 recipients. E-newsletters were distributed on three different occasions. All materials were also provided to the Gila River Indian Community Public Information Officer.

(Response 52 continues on next page)

Code	Comment Document
53	"Many Community members voiced disappointment in the format of the forum, which they said was completely from ADOT's perspective…and…one-sided".[229] One GRIC tribal member stated "I was unable to attend the ONE and only meeting that I would have been allowed to speak at publicly. As stated before I don't travel to the Phoenix metro-area due to the distance, pollution and the heat. I am an elder that is in a wheelchair, which needs assistance to get around. Attending this meeting was impractical for me and the ONE meeting held in the Gila River Indian Community was held over fifty miles from my home. I feel that A.D.O.T. violated my civil right by not allowing anyone to speak at the meeting held in the Gila River Indian Community, as well as other meetings held in other communities. I was raised by oral traditions, I was taught to speak out, and I have a right to be heard in a public forum."[230] See attachment. Another GRIC tribal member said "I feel ADOT discriminated against us all at the last public forum held in Komatke, AZ. Gila River Indian Community members were not able to voice their public comments. No matter where the meetings are held. All parties whether you are against or for the freeway should be able to speak. No meeting should be one sided for any reason what so ever. That is very unfair. Again this is a fast fix to eliminate process that everyone should abide by."[231] See attachment.
54	Notice was also inadequate. The June 22 meeting was not publicized on GRIN until an ADOT advertisement appeared on GRIN the day before the actual event.[232] This did not give tribal members enough notice to plan and prepare to attend the meeting, especially because many GRIC members lack transportation. To make matters worse, transportation was not provided to the GRIC as promised for the downtown Phoenix public hearing. Because of this, minimal GRIC participation at the Phoenix meeting was possible. In attempting to obtain community transportation for the Phoenix event, GRACE representative, Lori Riddle, called to speak with ADOT on numerous occasions to ask about transportation assistance. However, no one ever picked up. She had to leave messages and left several until ADOT's answering machine became too full to allow her to leave any more messages. Then, when she then turned to MAG's Senior Engineer Bob Hazlett for assistance in resolving this issue, he only shrugged his shoulders at her and said that it was just discovered that the ADOT message machine was designed to take up to 12 or so messages at a time. He said nothing else and did nothing to help. Not until the Phoenix meeting, did ADOT then hand out instructions about transportation assistance. And, then when GRACE tried to secure transportation for GRIC tribal members for the on-reservation public forum meeting on June 22, 2013, ADOT failed to provide vans to pick up tribal members that many of the GRIC needed to attend the meeting. At the last moment, ADOT put the responsibility on the GRIC requesting that GRACE representative, Lori Riddle, provide ADOT with a list of those who needed transportation with their contact information and addresses: because of the time constraints, this was not possible to provide.
	One GRIC tribal member summed up ADOT's performance with the GRIC: "the manner in which ADOT has pursued the Gila River community member's voice and cooperation regarding the Draft Environmental Impact Study and the planning process has been poor to say

Code	Issue	Response
52 (cont.)		The Arizona Department of Transportation provided vouchers for public hearing parking and for public transit to the hearing. For the first time in the State's history, a shuttle bus to the hearing was provided from six locations in the Phoenix area, including two on the Gila River Indian Community (Komatke Boys & Girls Club and the Governance Center in Sacaton). All ads provided telephone numbers and electronic contact information regarding information on the shuttle schedules and pick-up locations.
53	**Tribal Involvement**	Although not everyone could possibly be accommodated under all circumstances, all parties were offered equal access to the public hearing. Equal opportunities were offered to all that wished to participate. The endeavor to engage all population segments exceeded National Environmental Policy Act requirements pertinent to public outreach and involvement. The outreach was full and fair; all members of the population including those in the Gila River Indian Community were provided opportunity to provide oral and written testimony in a manner appropriate to National Environmental Policy Act requirements with sufficient opportunity and time and means to participate in such engagement. The outreach also provided ample opportunity for those with special needs to inform Arizona Department of Transportation and Federal Highway Administration of special needs to allow Arizona Department of Transportation and Federal Highway Administration to be responsive to those special needs. Specifics of the outreach associated with the Draft Environmental Impact Statement comment period can be found in Chapter 6, *Comments and Coordination*, of the Final Environmental Impact Statement
54	**Tribal Involvement**	Community forums were held after the public hearing to further invite public comment. The public hearing for the proposed action was widely advertised. Newspaper ads in six newspapers of area-wide distribution ran advertisements at least twice each. Announcements occurred on five radio stations and six television stations. Mailers were sent on May 6, 2013 to 73,564 individuals (approximately 311 on the Gila River Indian Community) who had previously expressed an interest in the project. The Arizona Department of Transportation utilized the Government Delivery system to distribute to over 12,000 recipients. E-newsletters were distributed on three different occasions. All materials were also provided to the Gila River Indian Community Public Information Officer. Offers to the Gila River Indian Community Manager to host a public outreach event on the Gila River Indian Community began in summer 2012. The Gila River Indian Community first officially responded to this offer at the April 30, 2013 meeting of the Transportation Technical Team. During this meeting, the Gila River Indian Community Manager requested a community forum be conducted on the Gila River Indian Community following the public hearing. This was the only request the Arizona Department of Transportation received from the Gila River Indian Community regarding whether the Arizona Department of Transportation could hold a public outreach event during the public comment period. The Arizona Department of Transportation agreed to do so, and a community forum was held on June 22, 2013, at the Komatke Boys & Girls Club on the Gila River Indian Community.

Code	Issue	Response
54 (cont.)		The Arizona Department of Transportation advertisement efforts of the public hearing and public forums are documented in Chapter 6 of the Final Environmental Impact Statement beginning on page 6-23. The Gila River Indian Community Communication and Public Affairs Office informed the Arizona Department of Transportation that all communication and distribution of informational materials on Gila River Indian Community land would be handled by the Communication and Public Affairs Office. Advertisement text regarding the project, the public comment period, the public hearing and the various ways for the public to submit comments regarding the South Mountain Freeway Draft Environmental Impact Statement was given to the Gila River Indian Community's Public Information Officer at the Transportation Technical Team meeting on April 30, 2013. Two advertisements regarding the public hearing, information regarding the location and availability of the Draft Environmental Impact Statement, and a map of the alternatives was placed in the May 2013 monthly issue of the *Gila River Indian News*. Like the public hearing, the community forums were widely advertised. In addition to the efforts of the Gila River Indian Community Communication and Public Affairs Office, Arizona Department of Transportation ran newspaper ads in six newspapers of area-wide distribution four times each. In addition to these sources, The Gila River Indian Community's facebook page advertised the hearing and the community forum on the Gila River Indian Community. Likewise, the Gila River Against Loop 202 facebook page advertised the hearing, public transportation to the hearing, and the community forum on the Gila River Indian Community.
55	**Tribal Involvement**	As noted in Chapter 2 of the Final Environmental Impact Statement, efforts to involve the Gila River Indian Community, a sovereign nation, in the environmental impact statement process are extensive. Public involvement with the Gila River Indian Community was conducted as requested by the tribal government. Prior to October 2005, early efforts to involve the Gila River Indian Community included attending tribal meetings and monthly meetings with Gila River Indian Community Departments (see discussion beginning on page 2-8 of the Draft and Final Environmental Impact Statements). On October 14, 2005, the Gila River Indian Community requested that all project-related communications take place at a government-to-government level (see letter on page A152 of Appendix 1-1). This request was honored by the Arizona Department of Transportation and Federal Highway Administration. All public involvement efforts were implemented by the Gila River Indian Community's public involvement officer. The individuals who felt that they were not included in the comment process are doing so through this complaint. Community forums were held after the public hearing to further invite public comment.

Code	Comment Document

56

the least. There was very little communication between the GRIC and MAG and ADOT. When community members were made aware of public hearings and meetings, it was short notice and not sympathetic to our community members lack of transportation. Furthermore, when ADOT did hold a "Public Forum" in GRIC, members were not to voice their statements verbally as others were able to do at the Phoenix hearing."[233] See attachment.

ADOT also circulated and gave out inaccurate information about the GRIC, creating the false impression that the GRIC did not have as much to lose in the South Mountain Loop 202.[234] While participating in this ADOT community forum meeting on the GRIC, GRIC attendees recognized that while in the DEIS there are two TCPs[235] discussed, both of which would be completely destroyed if the proposed freeway extension was built, the ADOT posters at the meeting did not show this.[236] When the attendees asked the ADOT representatives why this was so, different representatives replied in various ways: one said that the posters were outdated, another said there were no inaccuracies, and another stated that the discrepancies were up for interpretation.[237] The posters also did not list other O'odham cultural resources such as petroglyph sites and prehistoric trails rich in artifact remains.[238] It can only be guessed at how much damage the inadequate and incompetent presentation of the GRIC's many cultural and sacred areas and artifacts have done in regards to the dialogue and understanding of this project. It also shows what is produced by inadequate consultation, full and fair participation, and actual coordination.

D. NO SUBSTANTIAL LEGITIMATE JUSTIFICATION FOR SOUTH MOUNTAIN LOOP 202 AND FEASIBLE, REASONABLE AND NON-DISCRIMINATORY ALTERNATIVES EXIST FOR ADOT

57

As enumerated in the facts of the DEIS, ADOT is well aware of the sacredness of the South Mountain and the role that the mountain plays in the GRIC tribal members' culture and heritage. Title VI requires that recipients of federal funding such as ADOT must not take actions that have a disproportionate effect /disparate impact on peoples of a specific color, race, or national origin such as the people of the GRIC who are Native Americans.

With sacred places that must be undisturbed and where rituals and ceremonies may not even be conducted without the right environment, the South Mountain Loop would disparately impact GRIC tribal members. Here, there is an Indigenous Peoples, whose culture is embedded with its relationship with the South Mountain environment –known as a sacred territory-- from which they get physical, mental, and spiritual life. The desecration of South Mountain by construction and operation of a highway loop would result in a monumental disparate impact and a prohibited discriminatory effect. Further, the health and environmental impacts would also be disproportionally burdensome on the GRIC. Native Americans are supposed to be afforded civil rights protections from the majority: this is why GRACE requests ADOT to protect and to not

56	**Cultural Resources**	The descriptions of cultural resources and potential effects to those resources as discussed in the Draft Environmental Impact Statement were correct and complete. The banners produced for the public meetings were necessarily abbreviated and simplified for quick summaries of information. The first banner related to Chapter 4, *Affected Environment, Environmental Consequences, and Mitigation*, contained two important cautions to the public: "Chapter 4 of the Draft Environmental Impact Statement includes a substantial discussion of those elements of the environment most affected by the proposed freeway." and "Viewers are urged to review the contents of Chapter 4 to obtain more information about the environmental elements presented in the banners." The banners accurately represented the number of National Register of Historic Place-eligible archaeological sites that would be adversely affected by alternative (2 to 7 sites, depending on alternative) and Traditional Cultural Properties - South Mountains (0 for Western Alternative, 1 for the E1 Alternative). The National Register of Historic Places-eligible archaeological sites that would be adversely affected presented in the banner included the trails and artifact remains referenced in the comment. The National Register of Historic Places-eligible petroglyph sites referenced in the comment would be avoided by the alternatives. Potential adverse effects to Villa Buena and Pueblo del Alamo as archaeological sites would be addressed under Section 106 of the National Historic Preservation Act. Potential impacts to Villa Buena and Pueblo del Alamo as Traditional Cultural Properties would be addressed through the implementation of the enhancement and management plan developed in consultation with the Gila River Indian Community's Cultural Resources Management Program and the Tribal Historic Preservation Officer (see page 4-142 of the Final Environmental Impact Statement). This plan outlines measures that would sufficiently reduce or eliminate the potential for adverse effect to the National Register of Historic Places-eligible Traditional Cultural Properties attributes of Villa Buena and Pueblo del Alamo.
57	**Title VI**	Since the beginning of the environmental impact statement process, the Federal Highway Administration and Arizona Department of Transportation have been carrying out cultural resources studies and engaging in ongoing, open consultation with the Gila River Indian Community Tribal Historic Preservation Office regarding the identification and evaluation of places of religious and cultural importance to the tribe that may be adversely affected by the proposed freeway. Such places are referred to as traditional cultural properties. As a result of these discussions and of studies conducted by the Gila River Indian Community's Cultural Resource Management Program, the Gila River Indian Community has identified traditional cultural properties that are eligible for listing in the National Register of Historic Places and that could be affected by construction of the proposed freeway. In certain cases, listing these properties on the National Register of Historic Places may offer them protection under Section 4(f) of the Department of Transportation Act. The traditional cultural properties identified are culturally important to other Native American tribes as well. For more discussion of traditional cultural properties, see the section, *Cultural Resources*, beginning on page 4-140 of the Final Environmental Impact Statement and pages 5-26 through 5-28.

(Response 57 continues on next page)

Code	Issue	Response
57 (cont.)		Section 106 of the National Historic Preservation Act requires a government-to-government relationship between the Federal Government and Indian tribes as described beginning on page 4-140 of the Final Environmental Impact Statement. Section 106 requires that federal agencies take into account the effects of their undertakings on historic properties. This process requires consultation with tribal authorities. Consultation has occurred with Gila River Indian Community government officials, the Tribal Historic Preservation Officer, the Cultural Resource Management Program, many different tribal authorities, and the State Historic Preservation Office. The consultation has resulted in concurrence from the Gila River Indian Community Tribal Historic Preservation Office and the State Historic Preservation Office on National Register of Historic Places eligibility recommendations (including traditional cultural properties), project effects, and proposed mitigation and measures to minimize harm. This consultation has been ongoing and will continue until any commitments in a record of decision are completed.
58	**Title VI, Environmental Justice**	The section entitled *Title VI and Environmental Justice*, beginning on page 4-29 in the Draft Environmental Impact Statement, presents acceptable methods, data, and assumptions to assess the potential for disproportionately high and adverse effects from the proposed action on environmental justice populations and disparate impacts to populations protected under Title VI. Based upon the content of the section, no such effects would result from the action alternatives. In light of comments received on the Draft Environmental Impact Statement, the above-referenced conclusions were confirmed in the preparation of the Final Environmental Impact Statement. To provide further clarity, the discussions of environmental justice and Title VI were separated and additional text explaining the relationship of environmental justice and Title VI to various environmental elements was added throughout Chapter 4, *Affected Environment*, *Environmental Consequences, and Mitigation*, as exemplified by the inserted text on page 4-29 of the Final Environmental Impact Statement. The cultural and religious places of importance, like the South Mountains, are acknowledged in the Draft Environmental Impact Statement in several locations, notably pages 4-132 and 5-26. The proposed project would accommodate and preserve (to the fullest extent possible from the available alternatives) access to the South Mountains for religious practices. The Arizona Department of Transportation and Federal Highway Administration provided equal access to the public participation process to the Gila River Indian Community and its members. The Arizona Department of Transportation and Federal Highway Administration solicited input from the Gila River Indian Community and other Native American tribes and tribal members and fully considered input and comments that were received.

(Response 58 continues on next page)

Code	Comment Document

purposely create a disparate impact on a protected class of people that would have a monumental and disastrous effect on the welfare and quality of life of the GRIC.

58 For all of the effort that was put into spelling out environmental justice requirements, Title VI itself was not defined, nor was it evaluated effectively in the DEIS. ADOT's August 2008 South Mountain Transportation Corridor Study Citizens Advisory Team Draft Technical Report Summary/Cultural Resources states that "by law, adverse impacts on cultural resources determined eligible for listing in the NRHP must be mitigated. The degree of mitigation required is directly related to the historic designation as described by Section 106. Direct impacts from construction on cultural resources determined to be of religious or traditional cultural importance by Native American groups or others could result in desecration of a sacred place. A potential indirect impact might be a community's loss of access to a culturally important place as a result of construction restrictions."[239]

59 ADOT's August 2008 South Mountain Transportation Corridor Study Citizens Advisory Team Draft Technical Report Summary/Environmental Justice [240] acknowledged that GRIC was a protected peoples[241] under Title VI; however, it made no mention that evaluating sacred places through the lens of Section 106 of the NHPA that requires "agencies to take into account the effects of their undertakings on historic properties, and afford the Advisory Council on Historic Preservation a reasonable opportunity to comment,"[242] does not eliminate the necessity of evaluating the disparate impact of losing sacred places, culture, heritage, etc. based on Title VI.[243] In this document, Title VI was not analyzed.

60 In chapter 4 of ADOT's DEIS, Title VI is only mentioned as a subset of Environmental Justice and the1994 Executive Order 12898 on environmental justice; moreover, it is not defined. Title VI is not a policy or an executive order, but is the law and must be complied with as the rule of the law. Only in a short sidebar, does chapter 4 say, "in addressing environmental justice, it is important to understand whether the proposed action would have disproportionately high and adverse impacts on the protected population"[244] but it doesn't say this in regards to Title VI or spell out its criteria. Rather, it directs the reader to go on to Land Use, Social Conditions, Displacements and Relocations, Economic Impacts, Air Quality, Noise, Cultural Resources, Visual Resources, Prime and Unique Farmlands, and Temporary Construction Impacts, which essentially are various sections of the DEIS that are over hundreds of pages long.

---

[239] ADOT, South Mountain Transportation Corridor Study Citizens Advisory Team Draft Technical Report *Summary Cultural Resources* August 28, 2008 p. 2 found at http://www.azdot.gov/southmountainfreeway/PDF/082808_SMCAT_CulturalResources_Summary_Final.pdf.

[240] ADOT, South Mountain Transportation Corridor Study Citizens Advisory Team Draft Technical Report *Summary Environmental Justice*, found at http://www.azdot.gov/southmountainfreeway/PDF/062608_SMF_CAT_EJ_Summary_Final.pdf.

[241] It appears that in this report, ADOT is not identifying GRIC accurately as a protected class. It is protected because of race not by color. The US Census currently identifies the following races: white, black or African American, American Indian and Alaska Native, Asian, Native Hawaiian and other Pacific Islander. Race, Definition (last visited 6/23/2013) http://quickfacts.census.gov/qfd/meta/long_RHI525211.htm). Further, the protection is because of a history of discrimination; therefore, the disparate impact must be evaluated through the lens of the class of people experiencing political, social, economic, cultural discrimination historically.

[242] Section 106 Regulations Summary http://www.achp.gov/106summary.html (last visited 6/23/2013).

[243] This section on Title VI errs in defining what it is by not defining it but rather, conflating it into a subsection of environmental justice. Title VI does have a place in environmental justice, but Title VI is much more than environmental justice.

[244] ADOT, South Mountain Study Team, Chapter 4 *Affected Environment, Environmental Consequences, and Mitigation* at 38.

Code	Issue	Response
58 (cont.)		Chapter 2 of the Final Environmental Impact Statement is dedicated to the explanation of the Gila River Indian Community outreach undertaken for the project. Chapter 6 of the Final Environmental Impact Statement further describes Gila River Indian Community outreach throughout the process. The Gila River Indian Community was provided equal opportunities to participate in the project as all other populations and agencies. This outreach was undertaken, in part, to ensure all populations had equal access to the process and, in part, to ensure disparate nor disproportionately high adverse impacts would result from the construction and operation of the proposed action.
59	**Cultural Resources**	Section 106 of the National Historic Preservation Act requires a government-to-government relationship between the Federal Government and Indian tribes as described beginning on page 4-140 of the Final Environmental Impact Statement. Section 106 requires that federal agencies take into account the effects of their undertakings on historic properties. This process requires consultation with tribal authorities. Consultation has occurred with Gila River Indian Community government officials, the Tribal Historic Preservation Officer, the Cultural Resource Management Program, many different tribal authorities, and the State Historic Preservation Office. The consultation has resulted in concurrence from the Gila River Indian Community Tribal Historic Preservation Office and the State Historic Preservation Office on National Register of Historic Places eligibility recommendations (including traditional cultural properties), project effects, and proposed mitigation and measures to minimize harm. This consultation has been ongoing and will continue until any commitments in a record of decision are completed. As noted in Table 4-47 that begins on page 4-145, the Gila River Indian Community was initially consulted in 2003 with subsequent contact in 2005, 2006, 2007, 2008, 2010, 2011, 2012, and 2013. This supports an early and continued consultation with the Gila River Indian Community related to resources of importance. However, there is no requirement to consult with individual tribal members under Section 106. As a result of these discussions and of studies conducted by the Gila River Indian Community's Cultural Resource Management Program, the Gila River Indian Community has identified traditional cultural properties that are eligible for listing in the National Register of Historic Places and that could be affected by construction of the proposed freeway. In certain cases, listing these properties on the National Register of Historic Places may offer them protection under Section 4(f) of the Department of Transportation Act. The traditional cultural properties identified are culturally important to other Native American tribes as well. For more discussion of traditional cultural properties, see the section, *Cultural Resources*, beginning on page 4-140 of the Final Environmental Impact Statement and pages 5-26 through 5-28.

61

ADOT is responsible for ensuring its actions and non-actions do not violate Title VI. Building a freeway through and desecrating South Mountain disproportionally affects a protected class and may only be done if there is a substantial legitimate justification. Connecting Ahwatukee Foothills to Laveen so that businesses like malls and movie theaters can come in is not a substantial legitimate justification.[245] Nor is alleviating traffic a substantial legitimate justification without first addressing the alleged problem of congestion[246] and pollution when there are more prudent and feasible alternatives[247], as well as, comparably effective alternatives with less of a disparate impact to choose from.

A substantial legitimate justification for creating a disparate impact is just not found in the DEIS. To prove a "substantial legitimate justification," the recipient of federal funds must show that the challenged action or non-action was "necessary to meeting a goal that was legitimate, important, and integral to the [recipient's] institutional mission."[248] The justification must bear a "manifest demonstrable relationship" to the challenged policy.[249] And there must not be an alternative that is comparably effective with less of a disparate impact.[250]

ADOT purposely crafted its purpose and need to strategically make a no-build alternative appear non-debatable. The DEIS gives reasons for why it appears the proposal is favored and what the projects alleged purposes and needs are. The DEIS states that population growth, housing demand, economic growth, and the deficiencies in alternative modes of transportation

[245] In a Loop 202 Meeting in Laveen on May 21, 2013, Phoenix City Councilman Michael Nowakowski stated that Laveen has "plans for a hospital, a mall, restaurants and shops, but … all the plans are dependent on the South Mountain Freeway being built…shops and businesses won't come unless there's a possibility that residents from other parts of the Valley could be attracted to the area." (Allison Hurtado, Ahwatukee Foothills News, *Laveen residents gather to organize support for South Mountain Freeway*, http://www.ahwatukee.com/news/article_20023ca0-c1ab-11e2-befb-001a4bcf887a.html (last visited July 14, 2013).

[246] Texas A&M's 30th Urban Mobility Report ranks the Phoenix-Mesa metropolitan area 40th among U.S. cities for the average amount of time motorists spend in traffic jams. 39 other areas rank higher for congestion than Phoenix-Mesa.

[247] "Section 4(f) refers to the original section within the U.S. Department of Transportation Act of 1966 which established the requirement for consideration of park and recreational lands…and historic sites in transportation projects. The law, now codified in 49 U.S.C. §303 and 23 U.S.C. §138, is implemented by the Federal Highway Administration (FHWA) through the regulation 23 CFR 774. Before approving a project that uses Section 4(f) property (e.g. a public park like SMPP), FHWA must either (1) determine that the impacts are de minimis, or (2) undertake a Section 4(f) Evaluation. If the Section 4(f) Evaluation identifies a feasible and prudent alternative that completely avoids Section 4(f) properties, it must be selected. If there is no feasible and prudent alternative that avoids all Section 4(f) properties, FHWA has some discretion in selecting the alternative that causes the least overall harm (see discussion below). FHWA must also find that all possible planning to minimize harm to the Section 4(f) property has occurred." (FHWA, *Section 4(f) at a Glance*, http://environment.fhwa.dot.gov/4f/4fAtGlance.asp (last visited July 15, 2013). SCOTUS has provided parameters to guide interpretation of the statute in *Overton Park v. Volpe*. (401 U.S. 402 (1971)). The Court defined "feasible" as an alternative grounded in "sound engineering." The Court interpreted a "prudent" alternative as one that would not present "unique" or "truly unusual" problems, or "costs or community disruption of extraordinary magnitude." (Id. at 413). The Overton Park decision stressed that protection of 4(f) lands was of "paramount importance" under the statute. (Id. at 412-413). Here, there is a 4(f) land of paramount importance, a federally funded transportation project, impacts that are not de minimis, and prudent and feasible alternatives.

Code	Issue	Response
61	**Title VI, Environmental Justice**	The obligation of the Arizona Department of Transportation and Federal Highway Administration, as the federal lead agency, in accordance with the National Environmental Policy Act is to assess if the proposed action and its alternatives would lead to substantial adverse environmental impacts, disclose those impacts and identify mitigation to reduce the impact below a level of significance (and if such mitigation is unavailable, disclose that such an impact would occur but not be mitigated). The section entitled *Title VI and Environmental Justice*, beginning on page 4-29 in the Draft Environmental Impact Statement, presents acceptable methods, data, and assumptions to assess the potential for disproportionately high and adverse effects from the proposed action on environmental justice populations and disparate impacts to populations protected under Title VI. Based on the content of the section, no such effects would result from the action alternatives. Even if one were to reach a contrary conclusion and determine that disproportionately high and adverse and/or disparate effects would occur as a result of the proposed freeway, there is substantial justification for the proposed freeway. It is needed to serve projected growth in population and accompanying transportation demand and to correct existing and projected transportation system deficiencies (see Chapter 1, *Purpose and Need*). There is no feasible and prudent alternative to the use of the South Mountains, as discussed in Chapter 5, *Section 4(f) Evaluation*. In light of comments received on the Draft Environmental Impact Statement, the above-referenced conclusions were confirmed in the preparation of the Final Environmental Impact Statement. To provide further clarity, the discussions of environmental justice and Title VI were separated and additional text explaining the relationship of environmental justice and Title VI to various environmental elements was added throughout Chapter 4, *Affected Environment, Environmental Consequences, and Mitigation*, as exemplified by the inserted text on page 4-29 of the Final Environmental Impact Statement. Chapter 2 of the Final Environmental Impact Statement is dedicated to the explanation of the Gila River Indian Community outreach undertaken for the project. Chapter 6 of the Final Environmental Impact Statement further describes Community outreach throughout the process. The Gila River Indian Community was provided equal opportunities to participate in the project as all other populations and agencies. This outreach was undertaken, in part, to ensure all populations had equal access to the process and, in part, to ensure disparate nor disproportionately high adverse impacts would result from the construction and operation of the proposed action.

make the South Mountain Loop absolutely necessary. Further, it argues a no-build solution is not a feasible alternative. The DEIS states that the proposed project's purpose and need is to get people off the southern part of Phoenix out of the existing roads onto another route; it goes on to assert that this cannot be satisfied without creating this specific Loop. The DEIS asserts that moreover, this proposal has been supported since 1985 and would complete the last part of the master plan.[251] Therefore, it is claimed that a no-build could not fulfill this purpose and need. However, if the essential purpose and need is to reduce congestion, a no-build alternative using various transportation modalities, including rail serving the southwest and southeast suburbs of Phoenix, and that included changes in zoning, used the Census Bureau's more realistic medium population prediction rather than the high prediction projection, acknowledged that the 2006 economic downturn has changed the future demographics of the area, and took a hard look on who actually would be using the South Mountain Loop 202, the purpose and need would still be fulfilled.[252] One no-build alternatives PARC has suggested is light rail along Pecos Road that would go through a small portion of the GRIC (with permission) rather than cutting through South Mountain.

[251] The DEIS states that because voters voted for a one-half cent sales tax for transportation funding in 1985, then extended the life of that tax via proposition 400, and then canvassing results by MAG showed that over a majority of voters supported proposition 400, there is overall public support for the South Mountain Loop. However, both proposition 300 and 400 are general propositions for regional transportation projects and not for the South Mountain Loop specifically. Further, the South Mountain Loop proposal has always been extremely controversial and is opposed by many. Many find the South Mountain Loop outdated, bad for communities and too expensive. (Road Rage "Jana's View" Phoenix Magazine Feb. http://www.janabommersbach.com/phx-mag-feb07.php (last visited June 26, 2013)). For example, many people of the Ahwatukee Foothills are opposed to the project. The loop would demolish recently built homes in this planned community in the foothills of South Mountain: some ask if it was that important, why it wasn't already built and why the state let this development get so large. Protecting Arizona's Resources and Children (PARC) also believes the project is unnecessary, financially irresponsible, and contrary to the public interest. (Allison Hurtado, Ahwatukee Foothills News, PARC to host public meeting about Loop 202, May 8, 2013 (last updated May 16, 2013) http://www.ahwatukee.com/community_focus/article_d7b6f25e-b748-11e2-a138-0019bb2963f4.html). South Mountain Park Board of Trustees is also against the project because the SMPP is a park preserve, land designated as conservation land: they say that this land is critical habitat and further fragmentation of natural desert will only expedite loss of species. It further degrades the essence of what a preserve is and moreover destroys highly culturally significant sites that are held sacred to many Native American Indians. The Sierra Club also opposes the South Mountain Loop for a variety of reasons, one of which is the argument that the South Mountain Loop will not reduce pollution in the long run: smart growth must be adopted and reliance of highway systems will not solve traffic or pollution problems. Don't Waste Arizona also opposes the South Mountain Freeway arguing that NEPA was violated in multiple ways: no recent scoping was done; projections of growth are outdated, most current scientific data isnot used; there is no purpose or need; major emergency planning issues were not even mentioned; and a huge superfund will need to be cleaned up. (Don't Waste Arizona and PARC, Steve Brittle, http://player.vimeo.com/video/70051539 (last visited July 12, 2013)); and the Akimel O'odham Youth Collective has been very active and vocal about the cultural and health effects that the South Mountain highway would cause. (http://aoycblog.wordpress.com/).

[252] The US census gives low, medium, and high population projections. The DEIS used the high estimates. Further, the DEIS ignores that after 1990, population growth stopped speeding at the level the DEIS predicts for 2020 and 2035; Tom R. Rex, *New Population Projections For The United States, Arizona And Arizona Counties A Report from the Office of the University*, Economist Jan. 2013 found at http://wpcarey.asu.edu/seid/ccpr/upload/Projections.pdf.

Code	Issue	Response
61 (cont.)	**Purpose and Need**	The comment further notes "Connecting Ahwatukee Foothills to Laveen so that businesses like malls and movie theaters can come in is not a substantial legitimate justification." The comment infers the action is proposed to support/promote development in the Study Area. Text beginning on page 4-170 of the Draft Environmental Impact Statement describes the proposed action's relation to development in the Study Area in that it would be built in an area planned for urban growth as established in local jurisdictions' land use planning activities for at least the last 25 years and that purpose of the project is not to promote economic development but to respond to a growing need for additional transportation capacity as a result of regional growth occurring now and as projected. As presented in Chapter 1, *Purpose and Need*, an objective and unbiased examination of the existing and planned future transportation network in the Study Area was undertaken to determine if the catalyst for the need for the environmental impact statement (being the proposed action) was still warranted. As explained in the chapter, the examination successfully attempted to provide an answer to whether or not a transportation problem(s) exist and would continue to exist in the foreseeable future. The analysis was undertaken in accordance with the National Environmental Policy Act and Federal Highway Administration guidance and policy for implementing the National Environmental Policy Act. The results confirmed the transportation problems as framed in the region's adopted long range transportation plans (both past and present) still exist and would continue to exist in the foreseeable future. The need for action was not to implement the long range plan objectives but to correct a transportation problem in the region; a beneficial outcome in doing so was consistency with the region's long range transportation planning activities. The purpose and need criteria used to frame the transportation problem are described (see Figures 1-8, 1-9, 1-10, 1-11, 1-12, and 1-13). As summarized in the section, *Conclusions*, beginning on page 1-21 of the Draft and Final Environmental Impact Statement, the analysis confirmed that without a major transportation facility in the Study Area, the region's transportation network (as recognized in over 25 years of transportation planning) will not be able to efficiently move goods and people throughout the region without major investments in the region. The analyses in the Draft Environmental Impact Statement used socioeconomic and traffic projections at the regional analysis zone and traffic analysis zone levels. At the time of publication of the Draft Environmental Impact Statement, Census 2010-based socioeconomic data at the regional analysis zone and traffic analysis zone levels had not been adopted by the Maricopa Association of Governments and were not available to the project team. Therefore, the data used in the Draft Environmental Impact Statement were the most appropriate information available.

Code	Issue	Response
61 (cont.)		The Maricopa Association of Governments approved new population, employment, housing, and traffic projections in June 2013. The new data are presented in the Final Environmental Impact Statement beginning on page 1-11. The purpose and need and analysis of alternatives were updated and reevaluated using these new socioeconomic projections and corresponding projections related to regional traffic. While new projections based on the 2010 Census showed a lower anticipated population and vehicle miles traveled in 2035 than the previous projections, the conclusions reached in the Draft Environmental Impact Statement were validated in the Final Environmental Impact Statement (see Chapter 3, *Alternatives*). The traffic analysis demonstrated that the proposed project is needed today and will continue to be needed into the future.
	Alternatives	In accordance with the National Environmental Policy Act, a range of reasonable action alternatives to carry forward for further analysis was determined through application of multidisciplinary criteria in a logical, step-wise progression. Alternatives were not disposed of or dismissed without a thorough evaluation using the multidisciplinary criteria outlined in the alternatives development and screening process presented in Chapter 3 of the Draft Environmental Impact Statement. The preferred alternative was the outcome to this process. In support of this response and given the concerns about the South Mountains, consider the following review from the U.S. Department of the Interior on the Draft Environmental Impact Statement: comment: "Following our review of the Section 4(f) Evaluation, we concur that there is no feasible or prudent alternative to the Preferred Alternative selected in the document, and that all measures have been taken to minimize harm to these resources." The complete letter can be found in Appendix 7, Volume III, on page B4 of the Final Environmental Impact Statement. Comments from other groups (e.g., South Mountain Park Board of Trustees) will be addressed in the Final Environmental Impact Statement in the same manner as the Gila River Alliance for a Clean Environment's comments are addressed. The information regarding the context and attributes of the South Mountains is disclosed in the Draft Environmental Impact Statement. The acreage of parkland to be converted to a transportation use is reported on page 5-14 in the section, *Direct Use*. It is reported that 31.3 acres or just less than 0.2 percent of the parkland would be converted (this is a reduction in the amount of use planned for in 1988). The text goes on to point out other concerns associated with the direct use reported, and text on page 5-14 in the sidebar, "*The South Mountains in Phoenix's Sonoran Preserve System*", describes the importance of Phoenix South Mountain Park/Preserve in the region. Beginning on page 5-23 in the section, *Measures to Minimize Harm*, measures are presented to be undertaken to address the use impacts, including land replacement, on properties adjacent to the park. The section, *Cultural Resources*, beginning on page 4-140, also discloses the relation of the proposed action to the cultural resource attributes of the South Mountains. The project team examined alternatives to avoid the park, but did not identify any feasible and prudent alternatives to avoid impacts. The Arizona Department of Transportation continues to work with park stakeholders to minimize impacts and address concerns. Measures to minimize harm to the park were developed (see Final Environmental Impact Statement, starting on page 5-23). The first segment of the Central Phoenix/East Valley Light Rail Transit project has been completed through central Phoenix, northern Tempe, and northwestern Mesa. While expansion routes are being studied, none would link the western and eastern termini of the proposed freeway in the Study Area. Most light rail lines radiate from a central demand generator (e.g., a central business district or major airport). Light rail

62	The DEIS analysis of the no-build asserts that more pollution would result with nothing built and that the U.S. Environmental Protection Agency's air quality standards could be met if the project went through. However, building more highway miles will only increase more driving and more pollution. And it would only motivate more urban sprawl that supports further development into the Sonoran desert of cultural significance. Moreover, the Sonoran desert is being reduced at record speed causing the loss of major ecosystem services.[253] For example, the Sonoran desert regulates temperature. "As the Phoenix metropolitan area continues to sprawl, (replacing Sonoran desert with more development) the urban heat island will expand from the urban core further into suburban regions."[254] What Arizona's unchecked urban sprawl is creating is unsustainability[255] because for one, it is not controlling it with sustainable transportation.[256] The urban heat island actually affects people of lower socioeconomic status elderly, and minorities, like Native Americans.[257] Moreover, because of their inaccurate assumptions and relative insignificance, the build verses no-build differences in percentage of trips in the study area, travel time to downtown, and differences in miles of 1-10 with 3 + hours of congestion do not identify a substantial legitimate justification for the financial cost, pollution consequences, and disparate impact to GRIC, as well as the additional consequence of added congestion on existing roadways for example, to bypass the additional 10 miles the loop would put on the Ahwatukee Foothills residents on their way to downtown Phoenix.[258] According to the DEIS, the percent change in traffic on arterial streets would be 9% and the percent change in traffic on freeways would be 8%.[259] Further, the DEIS estimates 10 saved minutes for travel time from Laveen to downtown and 6 saved minutes for Ahwatukee to downtown if the South Mountain Loop was constructed.[260] And, the DEIS estimates that with the South Mountain Loop, there would be 7 less miles of 1-10 with 3+ hours of congestion in the morning and 12 less hours of congestion in the evening.[261] The substantial legitimate justification argument fails by the fact that E-I as the preferred alternative for the east side had no other alternatives from which to compare or choose because, as the DEIS states, GRIC forbid ADOT from using GRIC reservation land for the South [253] Ecosystem services are services from natural systems like deserts that assist humans either directly or indirectly. (de Groot, R.S., M.A. Wilson, and R. M.J. Boumans. 2002. A typology for the classification, description and valuation of ecosystem functions, goods, and services. Ecological Economics 41:393-408.) Code	Issue	Response
61 (cont.)		along the proposed corridor would be inconsistent with a radial transit model and would not be able to connect to existing light rail or the planned extension. While light rail segments are planned in the *Regional Transportation Plan* near the western and eastern termini of the proposed freeway, no funds are available or anticipated to support a combined system through the Study Area. The light rail alternative alone or in combination with other nonfreeway alternatives would not meet the purpose and need criteria; specifically, they would not adequately address projected capacity and mobility needs of the region (see Figure 3-3 of the Final Environmental Impact Statement, which describes the contribution of these improvements to meeting regional transportation needs). The analyses in the Draft Environmental Impact Statement used socioeconomic and traffic projections at the regional analysis zone and traffic analysis zone levels. At the time of publication of the Draft Environmental Impact Statement, Census 2010-based socioeconomic data at the regional analysis zone and traffic analysis zone levels had not been adopted by the Maricopa Association of Governments and were not available to the project team. Therefore, the data used in the Draft Environmental Impact Statement were the most appropriate information available. The Maricopa Association of Governments approved new population, employment, housing, and traffic projections in June 2013. The new data are presented in the Final Environmental Impact Statement beginning on page 1-11. The purpose and need and analysis of alternatives were updated and reevaluated using these new socioeconomic projections and corresponding projections related to regional traffic. While new projections based on the 2010 Census showed a lower anticipated population and vehicle miles traveled in 2035 than the previous projections, the conclusions reached in the Draft Environmental Impact Statement were validated in the Final Environmental Impact Statement (see Chapter 3, *Alternatives*). The traffic analysis demonstrated that the proposed project is needed today and will continue to be needed into the future.
62	**Purpose and Need**	The Draft Environmental Impact Statement—particularly in Chapter 1, *Purpose and Need*, and Chapter 3, *Alternatives*—explains how the process of establishing a purpose and need for the proposed action followed nationally accepted guidance and policy. Examples of how the purpose and need analyses were applied include the: · section, *Context of Purpose and Need in the EIS Process*, on page 1-1 · sidebar, *"A proposed action's purpose and documentation should:"*, on page 1-1 · sidebar, "*How are MAG data used in the DEIS?*", on page 1-4 · sidebar, "*What is the MAG regional demand model?*", on page 1-5 · sidebar, "*How will the economic downturn affect growth rates?*", on page 1-11 · section, *Need Based on Regional Transportation Demand and Existing and Projected Transportation System Capacity Deficiencies*, beginning on page 1-13 · section, *Conclusions*, on page 1-21 · section, *Reconfirm the Purpose and Need for the Proposed Action*, on page 3-1 · section, *Responsiveness of the Proposed Freeway to Purpose and Need Criteria*, beginning on page 3-27 The air quality assessment for the proposed freeway analyzed impacts from carbon monoxide and particulate matter (PM_{10}) and followed U.S. Environmental Protection Agency guidelines. No violations of either the carbon monoxide or particulate matter (PM_{10}) standards were identified, even at worst-case locations along the project corridor. Thus, the carbon monoxide and particulate matter (PM_{10}) analyses demonstrated that the proposed freeway would not contribute

(Response 62 continues on next page)

Code	Comment Document

The DEIS analysis of the no-build asserts that more pollution would result with nothing built and that the U.S. Environmental Protection Agency's air quality standards could be met if the project went through. However, building more highway miles will only increase more driving and more pollution. And it would only motivate more urban sprawl that supports further development into the Sonoran desert of cultural significance. Moreover, the Sonoran desert is being reduced at record speed causing the loss of major ecosystem services.[253] For example, the Sonoran desert regulates temperature. "As the Phoenix metropolitan area continues to sprawl, (replacing Sonoran desert with more development) the urban heat island will expand from the urban core further into suburban regions."[254] What Arizona's unchecked urban sprawl is creating is unsustainability[255] because for one, it is not controlling it with sustainable transportation.[256] The urban heat island actually affects people of lower socioeconomic status elderly, and minorities, like Native Americans.[257]

63

Moreover, because of their inaccurate assumptions and relative insignificance, the build verses no-build differences in percentage of trips in the study area, travel time to downtown, and differences in miles of I-10 with 3 + hours of congestion do not identify a substantial legitimate justification for the financial cost, pollution consequences, and disparate impact to GRIC, as well as the additional consequence of added congestion on existing roadways for example, to bypass the additional 10 miles the loop would put on the Ahwatukee Foothills residents on their way to downtown Phoenix.[258] According to the DEIS, the percent change in traffic on arterial streets would be 9% and the percent change in traffic on freeways would be 8%.[259] Further, the DEIS estimates 10 saved minutes for travel time from Laveen to downtown and 6 saved minutes for Ahwatukee to downtown if the South Mountain Loop was constructed.[260] And, the DEIS estimates that with the South Mountain Loop, there would be 7 less miles of I-10 with 3+ hours of congestion in the morning and 12 less hours of congestion in the evening.[261]

64

The substantial legitimate justification argument fails by the fact that E-I as the preferred alternative for the east side had no other alternatives from which to compare or choose because, as the DEIS states, GRIC forbid ADOT from using GRIC reservation land for the South

Code	Issue	Response
62 (cont.)		to any new localized violations, increase the frequency or severity of any existing violation, or delay timely attainment of the National Ambient Air Quality Standards or any required interim emissions reductions or other milestones. For mobile source air toxics, the analysis showed that for the Study Area, constructing the freeway would have a marginal effect on annual emissions in 2025 and 2035 (less than a 1 percent difference in total annual emissions between the Preferred Alternative and No-Action Alternative). With the Preferred Alternative in 2035, modeled mobile source air toxics emissions would decrease by 57 percent to more than 90 percent, depending on the pollutant, despite a 47 percent increase in vehicle miles traveled in the Study Area compared with 2012 conditions. The air quality analyses were updated for the Final Environmental Impact Statement, including a quantitative particulate matter (PM_{10}) analysis, and are more fully described beginning on page 4-68 of the Final Environmental Impact Statement.
	Induced Growth	As described in Chapter 1, *Purpose and Need*, of the Draft and Final Environmental Impact Statements the Phoenix metropolitan area was subject to a conversion from natural desert landscape to an agricultural landscape well before any roadway existed in the valley. As described in the section, *Land Use*, beginning on page 4-3, land use patterns are predominantly the result of local and regional land use planning activities; further, the subject of induced growth and travel is addressed in text beginning on pages 4-167 and 4-179 of the Draft and Final Environmental Impact Statements, respectively.
	Heat Island	As buildings, parking lots, roads, and other infrastructure replace open land and vegetation, an urban heat island may result. The heat island effect is of a regional nature and, therefore, there is no requirement to analyze potential impacts and no possibility of determining the localized contribution at the project level to the regional heat island effect. It is likely, however, that a proposed project such as the South Mountain Freeway would be a minor contributor to the overall issue.
63	**Purpose and Need**	Chapter 1, *Purpose and Need*, of the Draft and Final Environmental Impact Statements examines the purpose and need for the proposed action in terms of defining a transportation problem. In doing so, assumptions associated with past need for the freeway were discounted as part of the environmental impact statement process. The results of the purpose and need analyses included the determination that a transportation problem (similar to the type of problem that has been represented in past Regional Transportation Plans) still exists in the area and that this problem is similar in characteristics to the transportation problem that existed in prior years. The alternatives analyses considered numerous modal alternatives, and it was concluded through the screening process that a road facility is the appropriate modal choice to address the transportation problem defined.
64	**Alternatives**	The comment notes "A substantial legitimate justification fails..." assumes a disparate impact would occur from the proposed freeway. As summarized in the first part of Response 65 above, no such disparate impact (and therefore, no violation of Title VI) would occur and as such, no such demonstration nor justification is required. Even if one were to reach a contrary conclusion and determine that disproportionately high and adverse and/or disparate effects would occur as a result of the proposed freeway, there is substantial justification for the proposed freeway. It is needed to serve projected growth in population and accompanying transportation demand and to correct existing and projected transportation system deficiencies (see Chapter 1, *Purpose and Need*). There is no feasible and prudent alternative to the use of the South Mountains, as discussed in Chapter 5, *Section 4(f) Evaluation*. Regardless, as explained in Chapter 3, *Alternatives*, the Study Area was split into a Western Section and Eastern Section. This was done so for reasons explained in that chapter. As explained in that chapter, a comprehensive set of alternatives in both sections of the Study Area were subjected to a robust, multidisciplinary screening process.

(Response 64 continues on next page)

Code	Comment Document

Code	Issue	Response
64 (cont.)		Ultimately, the other alternatives (besides the E1 Alternative) were eliminated from further study in the screening process and the Gila River Indian Community decided not to give permission to develop alternatives on its land (see Draft Environmental Impact Statement page 3-25). The E1 Alternative when combined with the W59, W71, and W101 (and its options) Alternatives in the Western Section represents three distinct action alternatives from project termini to project termini, and therefore, represents a full range of reasonable alternatives for detailed study in the Draft and Final Environmental Impact Statements. Therefore, the Arizona Department of Transportation, with concurrence from the Federal Highway Administration, identified the E1 Alternative as the eastern section of the Preferred Alternative (which includes the W59 Alternative in the Western Section of the Study Area). In reaching its determination, the Arizona Department of Transportation sought to balance its responsibilities to address regional mobility needs while being fiscally responsible and sensitive to local communities. As noted in text on page 3-54 of the Final Environmental Impact Statement, the Arizona Department of Transportation began acquiring land for the original alignment in 1988. Between 1988 and 2001, the Arizona Department of Transportation acquired approximately 293 acres. Most of this land (258 acres) is located in the Eastern Section along Pecos Road. In 2006, the Arizona Department of Transportation began protective and hardship land acquisition in the alignment right-of-way footprint for the W59 and E1 Alternatives. Between 2006 and October 2013, the Arizona Department of Transportation purchased 326 acres (303 in the Western Section and 23 in the Eastern Section). The process for hardship and advanced acquisitions is explained in text on page 4-50 of the Final Environmental Impact Statement. Advanced acquisitions in parallel to a National Environmental Policy Act environmental determination process is not unprecedented and is common practice. In this case, property acquisitions by the Arizona Department of Transportation for purposes of implementing the proposed action are done at risk as communicated to the agency by the Federal Highway Administration. If another action alternative were to be ultimately selected, the agency would likely have to place the acquired properties on the market for sale and purchase. The Arizona Department of Transportation attempts to balance the risk against its mission of timely delivery of transportation infrastructure to the driving public. Further, Federal Highway Administration regulations do not allow the ownership of right-of-way to be a factor in the decision regarding the selection of an alternative.
	Tribal Involvement	As noted in the previous comment response, the Draft Environmental Impact Statement on page 2-4 acknowledges that the Gila River Indian Community Council passed Resolution GR-64-96 that strongly opposed any future alignment of the South Mountain Freeway on Gila River Indian Community land. In addition, the comments received from Gila River Indian Community Governor Gregory Mendoza (see letter dated July 11, 2013, on page B38 in Appendix 7, Volume III, of the Final Environmental Impact Statement) confirm the Gila River Indian Community's position. Any alternative on Gila River Indian Community land must consider tribal sovereignty. Tribal sovereignty is based in the inherent authority of Native American tribes to govern themselves. While this notion of sovereignty is manifested in many areas, generally Native American land is held in trust by the United States. Native American communities have the authority to regulate land uses and activities on their lands. States have very limited authority over activities within tribal land (see page 2-1 of the Final Environmental Impact Statement). From a practical standpoint, this means that the Arizona Department of Transportation and Federal Highway Administration do not have the authority to survey tribal land, make land use (including transportation) determinations directly affecting tribal land, or condemn tribal land for public benefit through an eminent domain process.

Code	Comment Document

Mountain Loop. The DEIS does not make it clear why there were no other alternatives. Putting in the failed attempt with GRIC indicates there was a real assumption by ADOT that GRIC should have permitted the highway through its territory.[262] And because GRIC rejected the request, only one other option was available, and one that would also disparately impact the GRIC.[263] By late 1998, ADOT had spent $24 million on Pecos Road right of way. And now, ADOT says it owns about 85 percent of the land it needs along Pecos Road.[264] From the facts, having a disparate effect on the GRIC, either by putting the South Mountain in the GRIC's reservation or through its sacred mountain has never been a deterrent in ADOT's plans.

65 Regulations implementing NEPA explain that an EIS "shall briefly specify the underlying purpose and need to which the agency is responding in proposing the alternatives."[265] And the Ninth Circuit has determined that agencies should be afforded considerable discretion in defining the purpose and need of a project.[266] However, this discretion is not without limitations.[267] For example, "an agency cannot define its objectives in unreasonably narrow terms."[268] And "[a]n agency will not be permitted to narrow the objective of its action artificially and thereby circumvent the requirement that relevant alternatives be considered."[269] Because there is no other alternative, the purpose and need for the proposed project is unreasonable.

66 ADOT's Long Range Transportation Plan: 2010-2035, enumerates several goals and objectives for building transportation systems. They are: improve mobility and accessibility; preserve and maintain the system; support economic growth; link transportation and land use; consider natural, cultural, and environmental resources; enhance safety and security; strengthen partnerships; and promote fiscal stewardship. ADOT's Long Range Transportation Plan is seriously flawed by giving natural, cultural, and environmental resources only consideration; as

---

[262] After Governor Rhodes of the GRIC wrote a letter dated January 27, 2010 to ADOT's Director John Halikowski volunteering to allow a study of the effects of an On-Reservation Loop 2002 alignment in order "to mitigate any negative impacts to our culture and land" because "despite our desire for a no-build option, we recognize that there is a high likelihood that the Loop 2002 Mountain will be built", Governor Brewer of Arizona responded in a February 1, 2010 letter stating "I am hopeful for the opportunities that may exist to consider the economic development potential of this much-needed transportation corridor" and "I am pleased to know that your team is part of the conversation and that there is a path forward for ongoing talks about the conditions of the Community's cooperation." What is found in Governor Brewer's response is that Arizona is not interested in GRIC's values and needs but is only requesting that the GRIC "cooperate". (GRIC Executive Office of the Governor & Lieutenant Governor, January 27, 2010 letter to ADOT, John Halikowski; ADOT Governor, Feb. 1, 2010 letter to Governor William R. Rhodes, GRIC).

[263] ADOT spokesperson Tim Tait stated during the ADOT outreach in Komatke on June 22, 2013 that "A possible Gila River route will remain off the table unless the Community changes its stance either through a re-vote or Community Council action. If such a reversal occurs any time before the final record of decision on the freeway is reached in 2014, then an alternative Gila River alignment would be studied…As of now, there's no indication that that's changing, so the project team is moving ahead with the E1 alternative…That's the only thing that's on the table." (Joshua Jovanelly, GRIC Website, *ADOT outreach on proposed 202 ext. held in Komatke* http://www.gilariver.org/index.php/news/3829-adot-outreach-on-proposed-202-ext-held-in-komatke (last visited July 15, 2013).

Code	Issue	Response
65	**Purpose and Need**	Chapter 1, *Purpose and Need*, of the Draft and Final Environmental Impact Statements examines the purpose and need for the proposed action in terms of defining a transportation problem. The results of the purpose and need analyses included the determination that a transportation problem (similar to the type of problem that has been represented in past Regional Transportation Plans) still exists in the area and that this problem is similar in characteristics to the transportation problem that existed in prior years. The alternatives analyses considered numerous modal alternatives, and it was concluded through the screening process that a road facility would best address the transportation problem defined. As concluded on page 3-26 of the Draft and Final Environmental Impact Statements, the process of alternatives development and screening demonstrated confirmation of the purpose and need as described in Chapter 1 of the Draft and Final Environmental Impact Statements and that the purpose and need allowed for meaningful consideration of a comprehensive set of alternatives including all substantial modes of transportation.
66	**Environmental Impact Statement Process**	The mission of the Arizona Department of Transportation to provide a safe, efficient, cost effective transportation system that links Arizona to the global economy, promotes economic prosperity, and demonstrates respect for Arizona's environment and quality of life is highlighted on page 1-3 of the Final Environmental Impact Statement. While it is the construct, operate, and maintain the state's transportation infrastructure, the agency is obligated to meet the requirements of the National Environmental Policy Act when federal funds are associated with its infrastructure. In complying with the law, the agency fully accounts for natural, cultural and environmental resources as disclosed in Chapters 3 and 4 of the Draft and Final Environmental Impact Statements. The process of preparing the Environmental Impact Statement was undertaken transparently and with full disclosure and embraced engagement by all stakeholders in the process as exemplified throughout Chapter 6 of the Draft and Final Environmental Impact Statements.
	Alternatives	In terms of fiscal stewardship, the cost comparisons referenced in the comment are not necessarily appropriate as economic conditions and material pricing was different dependent upon how long ago the referenced freeway segments were constructed. Regardless, the Arizona Department of Transportation seeks to balance its responsibilities to address regional mobility needs while being fiscally responsible and sensitive to local communities. For example, cost was an important factor in the alternatives screening process described in Chapter 3 of the Draft and Final Environmental Impact Statements and in terms of the Preferred Alternative presented in the Final Environmental Impact Statement, the Arizona Department of Transportation has continuously sought to identify and incorporate cost-saving measures in preliminary design, in part, for fiscal responsibility purposes.
	Hazardous Materials	The West Van Buren Water Quality Assurance Revolving Fund site was identified and considered during development of the Draft Environmental Impact Statement (see pages 4-97 and 4-153 of the Draft Environmental Impact Statement, and the Draft Initial Site Assessment prepared for the proposed project). These sites are primarily groundwater-impact sites, and groundwater is found at a depth of over 60 feet below the footprint of the Preferred Alternative. Given the separation distance between the adversely affected medium (groundwater) and the construction zone (near-surface in these locations), the project team determined

(Response 66 continues on next page)

67

explained before, just considering significant cultural resources will limit federal funding. Further, in light of the goals and objectives, the South Mountain Loop 202 actually weakens partnerships, as the GRIC is a partner in transportation projects: marginalizing partners weakens, not strengthens partnerships. The South Mountain Loop 202 is also contrary to the promotion of fiscal stewardship. The South Mountain Highway will cost twice as much as any other highway that ADOT has built in the past: the 101 and the 202 loops cost about 40 to 46 million per mile. South Mountain would cost about 80 million per mile.[270] The DEIS also fails to even include and therefore estimate the cost of the highly contaminated areas in the path of the proposed South Mountain Loop 202 that would have to be cleaned up for the highway to be put in.[271]

The South Mountain Loop 202 is neither legitimate and integral to ADOT's mission nor is it necessary. The South Mountain Loop 202 would not be efficient or cost-effective. It would be more efficient to design a transportation mode that will strategically complement the realistic population projections, socioeconomic needs and current transportation modes to reign in urban sprawl and promote smart growth. It is not cost effective because it is going to be twice as much as other highway projects, 30 million of which would just be used to cover going through South Mountain. Having the highway through the ridges will require lots of maintenance, which will require ongoing costs.[272] Population growth, socioeconomic development and limits to current transportation modes do not bear a manifest demonstrable relationship to going through South Mountain. There are numerous ways to accommodate population growth, create smart growth and invest and improve in present transportation modes and public transportation without going through South Mountain. As PARC and others suggest, there are alternatives that are comparably effective with less of a disparate impact. Therefore, there is no substantial legitimate justification for the disparate impact on the GRIC.

If ADOT wants to fulfill the purpose and need of reducing congestion and traffic and at the same time, follow the Arizona Transportation Plan, several alternatives offered by PARC are feasible: (1) Light rail along Pecos Road but going through a small portion of the GRIC (with permission) rather than cutting through South Mountain; (2) 8-10 lane Loop 202 following Baseline Road from 51st Ave to I-10; (3) 8-10 lane Loop 202 from I-10 near Avondale going along the west side of the Estrella Mountains and then cutting between the Estrella and Maricopa Mountains, following the southern boundary of the GRIC to the I-10 north of Casa Grande; (4) 8-10 lane freeway along State Route 85 from I-10 at Buckeye to I-8 at Gila Bend as a "real" truck by-pass; (5) 8-10 lane freeway along State Route 85 from I-10 at Buckeye, cutting between the Estrella and Maricopa Mountains and across to I-10 north of Casa Grande as a "real" truck

[270] Jana Bommersbach, *Road Rage "Jana's View"* Phoenix Magazine February 2007 quoting Eric Anderson of MAG http://www.janabommersbach.com/phx-mag-feb07.php (last visited July 1, 2013).

[271] The proposed path of the freeway crosses contaminated property near Interstate 10 near 55th Avenue. Also, groundwater is contaminated with tetrachloroethene (PCE), trichloroethene (TCE), 1,1-dichloroethane (1,1-DCA), cis-1,2-dichloroethene (cis-1,2-DCE), 1,1-dichloroethene(1,1-DCE) and chromium in the area around 51st avenue and Van Buren to 59th Avenue and Van Buren: the area is on the list of the state of Arizona's Water Quality Assurance Revolving Fund (WQARF), which is the state's equivalent of a Superfund Site. (AZDEQ, *West Van Buren Water Quality Assurance Revolving Fund (WQARF) Site*, found at http://www.azdeq.gov/environ/waste/sps/download/phoenix/wvb.pdf) By purchasing this contaminated land for the freeway, the state of Arizona would have to assume the liability for the clean-up of these contaminants, along with the liability for adverse health impacts suffered by workers in the area. This would be an enormous economic impact.

[272] FHWA does not provide funding for continued maintenance of hillside erosion after construction. ADOT does not provide its maintenance highway workers funding to mitigate sediment discharges from hillside rills and failed sediment control features of the original construction best management practices.

Code	Issue	Response
66 (cont.)		that these sites would not pose a risk to construction or to the general public once the facility were completed. This assessment has been clarified in the Final Environmental Impact Statement on page 4-165. Given the separation distance between the adversely affected media (groundwater) and the construction zone (near surface in this location), the project team determined that this site would not pose a risk to construction or to the general public once the facility were completed.
67	**Mission, Alternatives**	The section, *Context of the Proposed Action Relative to the ADOT Mission*, beginning on page 1-3 of the Final Environmental Impact Statement describes the direct and appropriate application of the implementation of the proposed action to the agency mission. In accordance with the National Environmental Policy Act, a range of reasonable action alternatives to carry forward for detailed study was determined through application of multidisciplinary criteria in a logical, step-wise progression. Alternatives were not disposed of or dismissed without a thorough evaluation using the multidisciplinary criteria outlined in the alternatives development and screening process presented in Chapter 3, *Alternatives*, of the Draft and Final Environmental Impact Statements. The criteria, in general terms, considered operations, design, ability to meet purpose and need, environmental considerations, cost, and acceptability. The preferred alternative was the outcome to this process. As described therein, a comprehensive set of modal transportation (such as light rail) and non-transportation alternatives (such as a land use based alternative) were subjected to the evaluation process (these alternatives included many of the specific alternatives referenced in the comment). Reasons for elimination of those alternatives are summarized in Table 3-2 of the Final Environmental Impact Statement. Results of the process are concluded on page 3-26 of the Final Environmental Impact Statement. According to 23 Code of Federal Regulations §771.111(f)," the action evaluated in the environmental impact statement must connect logical termini and be of sufficient length to address environmental matters on a broad scope...". The proposed action should satisfy the project need and should be considered in the context of the local area socioeconomics and topography, the future travel demand, and other infrastructure improvements in the area. A partial freeway from Interstate 10 (Papago Freeway) to Laveen Village is not feasible because it would not meet the proposed freeway's identified purpose and need. When analyzing purpose and need and in consideration of alternatives, improvements to the operations of Interstate 10 through the Phoenix metropolitan area as considered in the Maricopa Association of Governments' Long Range Transportation Plan were accounted for a part of the baseline conditions.

(Response 67 continues on next page)

68

by-pass; (6) 8-10 lane freeway along one of the routes described in 2, 3, or 4, and renumber it as the I-10 so all "through" traffic would take this route as a default; (7) Renumber the I-10 through Phoenix as I-810 or the like, making it obvious that it is for Phoenix traffic only.[273] Additional alternatives are improve the Broadway Curve by applying good engineering directly to the interchanges in that area; build a road to help Laveen traffic reach I-10 West, much as Pecos Road helps Ahwatukee reach I-10 East; and improve SR 85 to a freeway and renumber the truck bypass 1-10 to better facilitate and encourage all pass-through traffic to travel around the valley instead of through it.

Further, just by applying smart technology on existing highway, infrastructure projects would look entirely different. For example, traffic planners know solutions to ameliorate congestion that could be applied to the Phoenix-metropolitan area.[274] For example, simple partial solution is a toll-free 511 traffic telephone system.[275] Another technology is based on a network of freeway cameras and sensors that would measure and monitor the amount of traffic and predict how long a journey will take: information then could be fed to mobile devices and the electronic message signs on freeways that tell motorists how long it will take to reach certain intersections.[276] Highway signs could also give alerts of traffic jams miles in advance and advise people to take detours.[277] The signs could also signal lane closures miles before cars approach a bottleneck.[278] Also, some carpool lanes might be better off converted back into regular lanes.[279] And, more signs urging slow traffic to stay to the right could also relieve congestion.[280]

VIII. REMEDIES

69

For all the reasons above, ADOT violated Title VI of the Civil Rights Act by engaging in discrimination based on race, ethnic identification, and nationality.

In order to provide effective remedies for the discrimination set forth in this Complaint, ADOT must:

(1) exclude any route for the proposed freeway that would go near or through the South Mountain or GRIC or other sites considered sacred or culturally significant to indigenous people;

(2) adopt an environmental justice policy that will ensure compliance with Title VI for all current and future projects;

(3) and prohibit future federal funding to ADOT if the South Mountain Loop 202 is built.

Submitted by: Lori Riddle

on behalf of the Gila River Alliance for a Clean Environment

Code	Issue	Response
67 (cont.)	**Water Resources**	As noted on page 4-102 of the Final Environmental Impact Statement, storm water flows and related erosion from excavated areas would be addressed by implementation of a Stormwater Pollution Prevention Plan and related best practices. Stormwater Pollution Prevention Plans are required on Arizona Department of Transportation construction projects to control and mitigate erosion and loss of soil from the project and off-site movement of eroded sediments. During construction, off-site impacts to soil from erosion related to the freeway construction project are not expected. Implementation of the Stormwater Pollution Prevention Plan and related best practices would keep eroded sediments on-site for collection and replacement as appropriate. After construction, grading and drainage and landscape design components of the freeway system would act to control and mitigate erosion.
	Truck Traffic	Creating a truck bypass is not a goal of the proposed action. The proposed freeway is part of a transportation system developed to improve mobility in the region by increasing capacity and allowing traffic—including truck traffic—to access a segment of the "loop" system (see pages 1-21, 1-22, 3-1, and 3-3 of the Final Environmental Impact Statement) in the Phoenix metropolitan area. The proposed South Mountain Freeway would be a commuter corridor, helping to move local traffic. As with all other freeways in the region, trucks would use it for the through-transport of freight, for transport to and from distribution centers, and for transport to support local commerce. Nevertheless, the primary vehicles using the proposed freeway would be automobiles. The Maricopa Association of Governments regional travel demand model projects that truck traffic would represent approximately 10 percent of the total traffic on the proposed freeway, similar to what is currently experienced on other regional freeways such as Interstate 10, State Route 101L, and U.S. Route 60. As disclosed in the Final Environmental Impact Statement, it is expected that "true" through-truck traffic (not having to stop in the metropolitan area) would continue to use the faster, designated, and posted bypass system of Interstate 8 and State Route 85 (see page 3-64 of the Final Environmental Impact Statement).
	Alternatives	According to 23 Code of Federal Regulations §771.111(f)," the action evaluated in the environmental impact statement must connect logical termini and be of sufficient length to address environmental matters on a broad scope...". The proposed action should satisfy the project need and should be considered in the context of the local area socioeconomics and topography, the future travel demand, and other infrastructure improvements in the area. A partial freeway from Interstate 10 (Papago Freeway) to Laveen Village is not feasible because it would not meet the proposed freeway's identified purpose and need. All of the alternatives reflected in the comment were accounted for in the logical, sequential, step-by-step systematic, interdisciplinary approach to developing and screening alternatives as presented in Chapter 3, *Alternatives*, of the Draft and Final Environmental Impact Statements. Each was subjected to equal consideration in the screening process and reasons for elimination can be found in that chapter.

Code	Issue	Response
68	**Alternatives**	As discussed on page 3-3 of the Draft and Final Environmental Impact Statements, the project team considered a wide range of modal alternatives to improve transportation conditions in the Study Area such as transportation system management (maximizing the efficiency of existing transportation facilities) and transportation demand management (reducing demand on existing transportation facilities); however, these and other nonfreeway alternatives were eliminated from further study; chiefly, they did not support criteria related to transportation demand and capacity deficiencies. Transportation system management and transportation demand management strategies are included in the *Regional Transportation Plan* and these strategies will continue to be implemented throughout Maricopa County. These include the use of ramp metering; overhead, automated, advanced warning signs; freeway cameras for monitoring traffic flow/ and other intelligent transportation system technology to enhance operational characteristics; ride share programs; Maricopa County Trip Reduction Program; and van pool programs. As noted in Table 3-2 on page 3-5 of the Draft and Final Environmental Impact Statements, elimination of technological alternatives (transportation system management and transportation demand management) as distinct alternatives would not preclude the use of elements of these in combination with the freeway mode. This is further described on page 3-58 of the Final Environmental Impact Statement.
69	**Title VI**	Since the beginning of the environmental impact statement process, the Federal Highway Administration and Arizona Department of Transportation have been carrying out cultural resources studies and engaging in ongoing, open consultation with the Gila River Indian Community Tribal Historic Preservation Office regarding the identification and evaluation of places of religious and cultural importance to the tribe that may be adversely affected by the proposed freeway. Such places are referred to as traditional cultural properties. As a result of these discussions and of studies conducted by the Gila River Indian Community's Cultural Resource Management Program, the Gila River Indian Community has identified traditional cultural properties that are eligible for listing in the National Register of Historic Places and that could be affected by construction of the proposed freeway. In certain cases, listing these properties on the National Register of Historic Places may offer them protection under Section 4(f) of the Department of Transportation Act. The traditional cultural properties identified are culturally important to other Native American tribes as well. For more discussion of traditional cultural properties, see the section, *Cultural Resources*, beginning on page 4-140 of the Final Environmental Impact Statement and pages 5-26 through 5-28.

Gila River Alliance for a Clean Environment (GRACE)

EMBARGO UNTIL 7 AM TUESDAY JULY 30, 2013 Contact: Lori Riddle 520-610-3405; Joseph Morago 520-610-8027

GILA RIVER INDIAN COMMUNITY TRIBAL MEMBERS TO SERVE ARIZONA DEPARTMENT OF TRANSPORTATION WITH FEDERAL TITLE VI CIVIL RIGHTS COMPLAINT FOR ADOT'S PROPOSED BLASTING OF SACRED SOUTH MOUNTAIN AND DESECRATION OF SACRED SITES IF SOUTH MOUNTAIN LOOP 202 FREEWAY IS BUILT

PRESS CONFERENCE AND SERVING ADOT WITH CIVIL RIGHTS COMPLAINT: TUESDAY, JULY 30, 2013 9 AM IN FRONT OF ARIZONA DEPARTMENT OF TRANSPORTATION 206 S. 17th AVE., PHOENIX, ARIZONA

Phoenix, AZ. – Gila River Indian Community tribal members and their community group the Gila River Alliance for a Clean Environment will have a press conference on Tuesday, July 30, 2013 at 9 am to announce that they have filed a federal civil rights complaint under Title VI of the United States Civil Rights Act against the Arizona Department of Transportation. The press conference will take place in front of ADOT, 206 S. 17th AVE., Phoenix, Arizona.

Following the press conference, tribal members with the Gila River Alliance for a Clean Environment will serve ADOT with a copy of the civil rights complaint.

The civil rights complaint alleges that ADOT violated the civil rights of Native peoples of the Gila River Indian Community by proposing and promoting the South Mountain Loop 202 Freeway that would negatively and disparately impact Gila River Indian Community tribal members by desecrating their sacred South Mountain and causing disperate health impacts. The complaint is being filed with the United States Department of Transportation, as ADOT is a recipient of funds from the US DOT/Federal Highway Administration and is subject to the non-discrimination provisions of Title VI.

Title VI states that "No person in the United States shall, on the ground of race, color, or national origin, be excluded from participation in, be denied the benefits of, or be subjected to discrimination under any program or activity receiving Federal financial assistance." Tribal members, a protected class of people, were discriminated against because:

- ADOT knowingly and purposely designed the South Mountain Loop 202 through the GRIC's sacred South Mountain, despite recognizing and acknowledging that the South Mountain Loop 202 would have a serious and major disparate impact on tribal members culturally, spiritually, and religiously;
- ADOT purposely designed a narrow purpose and need for the DEIS based on inaccurate and false estimates of population projections and users of the South Mountain Loop 202 Freeway, narrow assumptions of potential alternative transportation modalities, and ignored the environmental and sociological consequences of creating more freeway rather than moving toward smart growth, eliminating any alternative that would not have a disparate and a negative cumulative effect on the Gila River Indian Community and its people;
- ADOT failed to analyze the South Mountain Loop 202's disparate health, environmental, and economic impacts on the tribe and tribal members who already experience higher rates of diabetes and asthma that would be exacerbated if the South Mountain Loop 202 were constructed;
- ADOT provided inadequate consultation and informed consent, access, notice, and meaningful participation in the Draft Environmental Impact Statement scoping and planning to the Gila River Indian Community tribal members.

The civil rights complaint requests that the federal government cease all further funding to ADOT if the South Mountain Loop 202 project is built due to the devastating cultural, spiritual and health impacts on tribal members that would unacceptably and illegally violate civil rights of tribal members.

In addition, the Gila River Alliance for a Clean Environment will be filing international complaints with UN Special Rapporteurs on human rights and fundamental freedoms of indigenous people, cultural rights, and freedom of religion.

Code	Issue	Response
69 (cont.)		Section 106 of the National Historic Preservation Act requires a government-to-government relationship between the Federal Government and Indian tribes as described beginning on page 4-140 of the Final Environmental Impact Statement. Section 106 requires that federal agencies take into account the effects of their undertakings on historic properties. This process requires consultation with tribal authorities. Consultation has occurred with Gila River Indian Community government officials, the Tribal Historic Preservation Officer, the Cultural Resource Management Program, many different tribal authorities, and the State Historic Preservation Office. The consultation has resulted in concurrence from the Gila River Indian Community Tribal Historic Preservation Office and the State Historic Preservation Office on National Register of Historic Places eligibility recommendations (including traditional cultural properties), project effects, and proposed mitigation and measures to minimize harm. This consultation has been ongoing and will continue until any commitments in a record of decision are completed. The Draft Environmental Impact Statement, after consultation and coordination efforts, accommodates and preserves (to the fullest extent possible from the available alternatives) access to the South Mountains for religious practices. A very small portion of the mountain would be impacted by the proposed freeway (less than 0.03 percent of the total area). Although the Draft Environmental Impact Statement describes the impact on the South Mountains as adverse, Native Americans would not be kept from practicing their beliefs, access to the mountain would be maintained, and mitigation measures would be implemented based on input from members of the Gila River Indian Community.
70	**Title VI**	All comments made in the attached press release have been addressed in the complaint letter above.

EMBARGO UNTIL 7 AM TUESDAY JULY 30, 2013 Contact: Lori Riddle 520-610-3405; Joseph Morago 520-610-8027

GILA RIVER INDIAN COMMUNITY TRIBAL MEMBERS TO SERVE ARIZONA DEPARTMENT OF TRANSPORTATION WITH FEDERAL TITLE VI CIVIL RIGHTS COMPLAINT FOR ADOT'S PROPOSED BLASTING OF SACRED SOUTH MOUNTAIN AND DESECRATION OF SACRED SITES IF SOUTH MOUNTAIN LOOP 202 FREEWAY IS BUILT

PRESS CONFERENCE AND SERVING ADOT WITH CIVIL RIGHTS COMPLAINT:
TUESDAY, JULY 30, 2013 9 AM
IN FRONT OF ARIZONA DEPARTMENT OF TRANSPORTATION 206 S. 17th AVE., PHOENIX, ARIZONA

Phoenix, AZ. – Gila River Indian Community tribal members and their community group the Gila River Alliance for a Clean Environment will have a press conference on Tuesday, July 30, 2013 at 9 am to announce that they have filed a federal civil rights complaint under Title VI of the United States Civil Rights Act against the Arizona Department of Transportation. The press conference will take place in front of ADOT, 206 S. 17th AVE., Phoenix, Arizona.

Following the press conference, tribal members with the Gila River Alliance for a Clean Environment will serve ADOT with a copy of the civil rights complaint.

The civil rights complaint alleges that ADOT violated the civil rights of Native peoples of the Gila River Indian Community by proposing and promoting the South Mountain Loop 202 Freeway that would negatively and disparately impact Gila River Indian Community tribal members by desecrating their sacred South Mountain and causing disperate health impacts. The complaint is being filed with the United States Department of Transportation, as ADOT is a recipient of funds from the US DOT/Federal Highway Administration and is subject to the non-discrimination provisions of Title VI.

Title VI states that "No person in the United States shall, on the ground of race, color, or national origin, be excluded from participation in, be denied the benefits of, or be subjected to discrimination under any program or activity receiving Federal financial assistance." Tribal members, a protected class of people, were discriminated against because:

- ADOT knowingly and purposely designed the South Mountain Loop 202 through the GRIC's sacred South Mountain, despite recognizing and acknowledging that the South Mountain Loop 202 would have a serious and major disparate impact on tribal members culturally, spiritually, and religiously;

- ADOT purposely designed a narrow purpose and need for the DEIS based on inaccurate and false estimates of population projections and users of the South Mountain Loop 202 Freeway, narrow assumptions of potential alternative transportation modalities, and ignored the environmental and sociological consequences of creating more freeway rather than moving toward smart growth, eliminating any alternative that would not have a disparate and a negative cumulative effect on the Gila River Indian Community and its people;

- ADOT failed to analyze the South Mountain Loop 202's disparate health, environmental, and economic impacts on the tribe and tribal members who already experience higher rates of diabetes and asthma that would be exacerbated if the South Mountain Loop 202 were constructed;

- ADOT provided inadequate consultation and informed consent, access, notice, and meaningful participation in the Draft Environmental Impact Statement scoping and planning to the Gila River Indian Community tribal members.

The civil rights complaint requests that the federal government cease all further funding to ADOT if the South Mountain Loop 202 project is built due to the devastating cultural, spiritual and health impacts on tribal members that would unacceptably and illegally violate civil rights of tribal members.

In addition, the Gila River Alliance for a Clean Environment will be filing international complaints with UN Special Rapporteurs on human rights and fundamental freedoms of indigenous people, cultural rights, and freedom of religion.

TO: Jennifer Giff, GRIC General Counsel

FROM: Barnaby V. Lewis, CRMP Cultural Resource Specialist

DATE: March 26, 2007

SUBJECT: RESOLUTION DESIGNATING THE SOUTH MOUNTAN RANGE (Muhadag, Avikwaxois) AS A SACRED PLACE AND TRADITIONAL CULTURAL PROPERTY OF THE GILA RIVER INDAIN COMMUNITY.

Attached is a draft resolution designating the South Mountain Range as a sacred place and traditional cultural property for your review. We wish to proceed in presenting this resolution before GRIC Cultural Resource Standing Committee at the next regular meeting on Tuesday, March 27, 2007. Thank you for your attention in this review. Please call me at 562-6713 or Assistant Cultural Resource Specialist, Angela D. Garcia-Lewis at 562-6743 if you have any questions.

RESOLUTION NO. GR-41-07

72

A RESOLUTION DESIGNATING THE SOUTH MOUNTAIN RANGE (*Muhadag, Avikwaxós)* AS A SACRED PLACE AND TRADITIONAL CULTURAL PROPERTY OF THE GILA RIVER INDIAN COMMUNITY.

WHEREAS, the Gila River Indian Community Council ("the Community Council") is the governing body of the Gila River Indian Community ("the Community"); and

WHEREAS, the Community Council on January 6, 1982, did adopt Ordinance No. GR-01-82 under Title XV of the Gila River Indian Community Law and Order Code in which "[i]t is…declared as a matter of Community policy and legislative determination, that the public interests of the Pima-Maricopa people and the interests of all other persons living within the jurisdiction of the Gila River Indian Community require that the Community adopt a means whereby all sites, location, structures, and objects of sacred, historical or scientific interest or nature will be protected from desecration, destruction, theft, or other interference."; and

WHEREAS, the Community Council through Resolution GR-15-89 did approve the Policy Statement of the Four Southern Tribes (Salt River Pima-Maricopa Indian Community, Ak Chin Indian Community, Tohono O'odham Nation, and the Gila River Indian Community) which outlines the Four Tribes intent to protect, promote, and preserve cultural affinity to the HuHuKam; and

WHEREAS, the Community Council has always held the preservation of historical, archaeological, cultural, religious sites as a high priority and recognizes the need to protect the cultural heritages of the Akimel O'Odham (Pima) and the Pee Posh (Maricopa); and

WHEREAS, the identification and authentication of sacred places / traditional cultural properties is the sole responsibility of the federally recognized tribe according to its unique culture; and

WHEREAS, the Community does recognize certain locations to be sacred places / traditional cultural properties based on the unique cultural and spiritual beliefs of the Akimel O'Odham (Pima) and the Pee Posh (Maricopa); and

GILA RIVER INDIAN COMMUNITY
RESOLUTION GR-41-07
PAGE 2 OF 2

WHEREAS, all, but not limited to, of the places referenced in the oral traditions of the Akimel O'Odham (Pima) and the Pee Posh (Maricopa) are culturally and spiritually significant to the continuing life ways of the Akimel O'Odham (Pima) and the Pee Posh (Maricopa); and

WHEREAS, the ***Muhadag*** (Pima language) also known as (a.k.a.) ***Avikwaxós*** (Maricopa language), a.k.a. Greasy Mountain (English language), and geographically known as the South Mountain, South Mountain Range, or Salt River Mountains (Range) figures prominently in oral traditions of both the Akimel O'Odham (Pima) and the Pee Posh (Maricopa)

NOW THEREFORE BE IT RESOLVED, that the Community Council hereby does acknowledge and recognize that the South Mountain Range in its entirety is a sacred place / traditional cultural property and must be kept inviolate.

BE IT FURTHER RESOLVED, that the Community Council hereby strongly opposes any alteration of the South Mountain Range for any purpose would be a violation of the cultural and religious beliefs of the Gila River Indian Community and would have a negative cumulative affect on the continuing lifeways of the people of the Gila River Indian Community.

BE IT FINALLY RESOLVED, that the Governor, or in his absence, the Lieutenant Governor, is hereby authorized to sign and execute such documents as are necessary to effectuate this resolution.

CERTIFICATION

Pursuant to authority contained in Article XV, Section 1, (a) (7), (9), (18), and Section 4 of the amended Constitution and Bylaws of the Gila River Indian Community, ratified by the Tribe January 22, 1960, and approved by the Secretary of the Interior on March 17, 1960, the foregoing Resolution was adopted on the 4th of April, 2007, at a Regular Community Council Meeting held in District 3, Sacaton, Arizona at which a quorum of 10 Members were present by a vote of: 9 FOR; 0 OPPOSE; 1 ABSTAIN; 5 ABSENT; 2 VACANCIES.

GILA RIVER INDIAN COMMUNITY
RESOLUTION GR-126-00
PAGE 2

WHEREAS, the District Six Community has concerns of increasing traffic, excess speeding vehicles, the safety and welfare of its members, the area's significant cultural and religious importance to the entire Community, the deterioration of the pristine natural environment, and the increase negative noise and visual impacts;

WHEREAS, because of its concerns, the District Six Community strongly opposes the proposed parkway, truck bypass route, or any future bypass plans through portions of the South Mountain and across Community land;

WHEREAS, on June 12, 2000, the District Six Community voted to strongly oppose future transportation of hazardous waste and materials through its community; and

WHEREAS, the District Six Community strongly requests that the Community Council oppose any future development of roadways from ADOT and MCDOT through the District Six Community.

NOW THEREFORE BE IT RESOLVED, that the Community Council strongly opposes the development plans by ADOT, MCDOT, and MAG for a truck bypass route or any future bypass plans for the proposed South Mountain Parkway across Community lands.

BE IT FINALLY RESOLVED, that the Governor, or in the Governor's absence the Lieutenant Governor, is hereby authorized to take necessary action to effectuate the intent of this Resolution.

CERTIFICATION

Pursuant to authority contained in Article XV, Section 1. (a). 75

I, Winnona Catha am a community member of the Gila River Indian Reservation. My connection to the South Mountain is that it is a sacred mountain to our people. Also, it was most sacred to our ancestors.

There are many things that the mountain was used for such as ceremonies, there are stories about that mountain I was told by my elders, and there are plants that grow on this mountain that we use today for healing, eating, and blessings.

I wasn't notifying about the meetings that they had about this freeway being built. I believe that they should of set out flyers to notify people not just only landowners but members of our community that should also be included to this matter that is coming in affect to our reservation. Also, they should of provided transportation for the districts or have meetings at each of the service centers. Some of the community members don't have transportation to be these meeting were located at.

Our land and mountain is important to me then this freeway. As I look towards the District 6 area I can see a slightly cloud of pollution. If we have this freeway there will be a huge cloud of pollution that will cover our land. It will affect our peoples health like; asthma, lung diseases, infants may be born with birth defects, and heart diseases. I am concerned about our future generations' health and what they would have to live if this freeway is built. We got to look forward and think of their future before considering anything, because I remember when I was younger my grandmother would always say "This is your land and never let a white person take it from you." Well she said it to me in Pima; I understood what she was saying after she explained to me.

Thank You,

Winnona Catha

75	**Tribal Involvement**	As noted in Chapter 2 of the Final Environmental Impact Statement, efforts to involve the Gila River Indian Community in the environmental impact statement process have been extensive. Public involvement with the Gila River Indian Community was conducted as requested by the tribal government. Prior to October 2005, early efforts to involve the Gila River Indian Community included attending tribal meetings and monthly meetings with Gila River Indian Community Departments (see discussion beginning on page 2-8 of the Draft and Final Environmental Impact Statements). On October 14, 2005, the Gila River Indian Community requested that all project-related communications take place at a government-to-government level (see letter on page A152 of Appendix 1-1). This request was honored by the Arizona Department of Transportation and Federal Highway Administration. All public involvement efforts were implemented by the Gila River Indian Community's public involvement officer. As noted in Table 4-47 that begins on page 4-145, the Gila River Indian Community was initially consulted in 2003 with subsequent contact in 2005, 2006, 2007, 2008, 2010, 2011, 2012, and 2013. This supports an early and continued consultation with the Gila River Indian Community related to resources of importance. This consultation has resulted in concurrence from the State Historic Preservation Office and Gila River Indian Community Tribal Historic Preservation Office on National Historic Preservation Act eligibility recommendations, project effects, and proposed mitigation and measures to minimize harm. This consultation has been ongoing and will continue until any commitments in a record of decision are completed. The Arizona Department of Transportation advertisement efforts of the public hearing and public forums are documented in Chapter 6 of the Final Environmental Impact Statement beginning on page 6-23. The Gila River Indian Community Communication and Public Affairs Office informed the Arizona Department of Transportation that all communication and distribution of informational materials on Gila River Indian Community land would be handled by the Communication and Public Affairs Office. Advertisement text regarding the project, the public comment period, the public hearing and the various ways for the public to submit comments regarding the South Mountain Freeway Draft Environmental Impact Statement was given to the Gila River Indian Community's Public Information Officer at the Transportation Technical Team meeting on April 30, 2013. Two advertisements regarding the public hearing, information regarding the location and availability of the Draft Environmental Impact Statement, and a map of the alternatives was placed in the May 2013 monthly issue of the *Gila River Indian News*. The Arizona Department of Transportation Community Relations distributed electronic notices (e-newsletters) through the Government Delivery system to over 12,000 constituents who voluntarily signed up for project alerts along the Interstate 10 Papago, Maricopa, and Santan Freeways. These electronic notices included notice of availability of Draft Environmental Impact Statement (distributed on April 26, 2013); public hearing (distributed on May 10, 2013); the community forums (distributed on May 29, 2013) and one in June (close of the Draft Environmental Impact Statement public comment period). In addition, anyone who had attended a previous meeting on the proposed action and signed in received all of this information mailed individually. On May 6, 2013, 73,564 mailers were distributed to addresses within the Study Area.

(Response 75 continues on next page)

Code	Issue	Response
75 (cont.)		The Arizona Department of Transportation provided vouchers for public hearing parking and for public transit to the hearing. For the first time in the State's history, a shuttle bus to the hearing was provided from six locations in the Phoenix area, including two on the Gila River Indian Community (Komatke Boys & Girls Club and the Governance Center in Sacaton). All ads provided telephone numbers and electronic contact information regarding information on the shuttle schedules and pick-up locations.
	Air Quality	The Final Environmental Impact Statement addresses the history of air quality in the region (see text beginning on page 4-68 of the Final Environmental Impact Statement). The Clean Air Act § 109(b)(1) requires the U.S. Environmental Protection Agency to promulgate primary National Ambient Air Quality Standards at levels that allow an adequate margin of safety to protect the public health. Air quality in the Phoenix metropolitan area has improved over time; Phoenix was redesignated to attainment/maintenance for carbon monoxide in 2005, and the U.S. Environmental Protection Agency recently determined that Phoenix has attained the particulate matter (PM_{10}) standard. These improvements are largely associated with cleaner fuels and lower-emission vehicles along with local controls on fugitive dust. Future emissions would also be reduced by the use of cleaner-burning fuels, technological advances in automotive design (including the greater use of alternative fuel vehicles), reformulated gasoline, gas can standards, stricter enforcement of emission standards during inspections, heavy-duty diesel engine and on-highway diesel sulfur control programs, dust control programs, and others. The air quality assessment for the proposed freeway analyzed impacts from carbon monoxide and particulate matter (PM_{10}) and followed U.S. Environmental Protection Agency guidelines. No violations of either the carbon monoxide or particulate matter (PM_{10}) standards were identified, even at worst-case locations along the project corridor. Thus, the carbon monoxide and particulate matter (PM_{10}) analyses demonstrated that the proposed freeway would not contribute to any new localized violations, increase the frequency or severity of any existing violation, or delay timely attainment of the National Ambient Air Quality Standards or any required interim emissions reductions or other milestones. For mobile source air toxics, the analysis showed that for the Study Area, constructing the freeway would have a marginal effect on annual emissions in 2025 and 2035 (less than a 1 percent difference in total annual emissions between the Preferred Alternative and No-Action Alternative). With the Preferred Alternative in 2035, modeled mobile source air toxics emissions would decrease by 57 percent to more than 90 percent, depending on the pollutant, despite a 47 percent increase in vehicle miles traveled in the Study Area compared with 2012 conditions. The air quality analyses were updated for the Final Environmental Impact Statement, including a quantitative particulate matter (PM_{10}) analysis, and are more fully described beginning on page 4-68 of the Final Environmental Impact Statement. Congestion relief resulting from the proposed freeway would provide localized air quality emissions reductions on area freeways and arterial streets and at interchanges, benefiting users of area highways and those living near congested roads.

Code	Comment Document
76	My name is Renee Jackson and I am a member of the Akimel O'odham tribe also known as the Gila River Indian Community. I am writing this statement for two reasons, 1) to give a supportive statement regarding the cultural significance of Muhadag (South Mountain) and 2) to state my concerns regarding the Arizona Department of Transportation's lack of cooperation and planning with the people of GRIC. As an Akimel O'odham woman, I regard Muhadag (South Mountain) as a place of spiritual significance to the O'odham tribes. The mountain is central to the O'odham creation story and continues to be a place to hold ceremonies by and for the O'odham people. The mountain is also sacred to us because of the plant life we use for medicinal and ceremonial purposes and also because of the wildlife we hunt to sustain ourselves. The construction of this freeway would greatly harm the wellbeing of the mountain and therefore will bring harm to the O'odham. The manner in which ADOT has pursued the Gila River community member's voice and cooperation regarding the Draft Environmental Impact Study and the planning process has been poor to say the least. There was very little communication between the GRIC and MAG and ADOT. When community members were then made aware of public hearings and meetings, it was short notice and not sympathetic to our community members lack of

Code	Issue	Response
76	**Tribal Involvement**	The importance of the South Mountains Traditional Cultural Property is acknowledged on pages 4-130 and 4-141 of the Draft and Final Environmental Impact Statements, respectively. Consultation has occurred with Gila River Indian Community government officials, the Tribal Historic Preservation Officer, the Cultural Resource Management Program, many different tribal authorities, and the State Historic Preservation Office. This consultation has resulted in concurrence from the Gila River Indian Community Tribal Historic Preservation Office and the State Historic Preservation Office on National Historic Preservation Act eligibility recommendations, project effects, and proposed mitigation and measures to minimize harm. This consultation has been ongoing and will continue until any commitments in a record of decision are completed. As noted in Chapter 2 of the Final Environmental Impact Statement, efforts to involve the Gila River Indian Community in the environmental impact statement process have been extensive. Public involvement with the Gila River Indian Community was conducted as requested by the tribal government. transportation. Furthermore, when ADOT did hold a "Public Forum" in GRIC, members were not to voice their statements verbally as others were able to do at the Phoenix hearing.

Most importantly, I feel that the possible construction of this freeway through our sacred Muhadag is a direct violation to my civil and religious rights as an Indigenous person. Also, as an advocate for my children, I wish to state my opposition to the Loop 202 expansion, aka, the South Mountain Freeway as I see it as a threat to their religious freedoms being that Muhadag is considered our most valued place of worship and must be protected for our future generations.

On May 6, 2013, 73,564 mailers were distributed to addresses within the Study Area. The Arizona Department of Transportation provided vouchers for public hearing parking and for public transit to the hearing. For the first time in the State's history, a shuttle bus to the hearing was provided from six locations in the Phoenix area, including two on the Gila River Indian Community (Komatke Boys & Girls Club and the Governance Center in Sacaton). All ads provided telephone numbers and electronic contact information regarding information on the shuttle schedules and pick-up locations. Community forums were held after the public hearing to further invite public comment.
	Title VI	Since the beginning of the environmental impact statement process, the Federal Highway Administration and Arizona Department of Transportation have been carrying out cultural resources studies and engaging in ongoing, open consultation with the Gila River Indian Community Tribal Historic Preservation Office regarding the identification and evaluation of places of religious and cultural importance to the tribe that may be adversely affected by the proposed freeway. Such places are referred to as traditional cultural properties. As a result of these discussions and of studies conducted by the Gila River Indian Community's Cultural Resource Management Program, the Gila River Indian Community has identified traditional cultural properties that are eligible for listing in the National Register of Historic Places and that could be affected by construction of the proposed freeway. In certain cases, listing these properties on the National Register of Historic Places may offer them protection under Section 4(f) of the Department of Transportation Act. The traditional cultural properties identified are culturally important to other Native American tribes as well. For more discussion of traditional cultural properties, see the section, *Cultural Resources*, beginning on page 4-140 of the Final Environmental Impact Statement and pages 5-26 through 5-28. Section 106 of the National Historic Preservation Act requires a government-to-government relationship between the Federal Government and Indian tribes as described beginning on page 4-140 of the Final Environmental Impact Statement. Section 106 requires that federal agencies take into account the effects of their undertakings on historic properties. This process requires consultation with tribal authorities. Consultation has occurred with Gila River Indian Community government officials, the Tribal Historic Preservation Officer, the Cultural Resource Management Program, many different tribal authorities, and the State Historic Preservation Office. The consultation has resulted in concurrence from the Gila River Indian Community Tribal Historic Preservation Office and the State Historic Preservation Office on National Register of Historic Places eligibility recommendations (including traditional cultural properties), project effects, and proposed mitigation and measures to minimize harm. This consultation has been ongoing and will continue until any commitments in a record of decision are completed.

76 **(cont.)**		The Draft Environmental Impact Statement, after consultation and coordination efforts, accommodates and preserves (to the fullest extent possible from the available alternatives) access to the South Mountains for religious practices. A very small portion of the mountain would be impacted by the proposed freeway (less than 0.03 percent of the total area). Although the Draft Environmental Impact Statement describes the impact on the South Mountains as adverse, Native Americans would not be kept from practicing their beliefs, access to the mountain would be maintained, and mitigation measures would be implemented based on input from members of the Gila River Indian Community.

Code	Comment Document

77

My name is Peggy Mae Morago I am 66 yrs. old retired elementary school teacher an elder from the Gila River Indian Community. I am writing this statement to express my opposition and concerns about A.D.O.T.s proposed South Mountain Loop 202 Freeway.

I have a very strong connection to South Mountain. In my late teens I left my hometown of Ajo, Arizona to attend Arizona State University. As a young woman far from home it was a difficult adjustment to live in the city, but going to South Mountain help with this transition. According to our oral history South Mountain is a sacred mountain to our people. Akimel O'odham legends and stories talk about South Mountain being the home of the deity for our tribe. There are also stories about artifacts and petroglyphs from our ancestors the Hohokam located on South Mountain. As a young mother raising a child in the late sixties/early seventies, I often went to South Mountain to meditate when times became tough or if I was unable to return to Gila River for family emergencies. South Mountain has always made me feel closer to home and closer to my O'odham Himdag.

One of my major concerns about the proposed South Mountain Loop 202 freeway is the health effects on my community. As a retired school teacher I am well aware of the rise in respiratory illness in children within all communities. This proposed freeway will increase the occurrence of asthma, bronchitis, and many other respiratory ailments due to particulate matter and pollutions from this project. The elderly, newborns and young children will be hit the hardest from this freeway. I am an elder with Valley Fever; this freeway will defiantly affect my health. This is the major reason why I don't travel to the Phoenix metro area. It is difficult for me to breath from all to pollution in the air, and I don't want this pollution in my community.

Another issue I wish to address is the way A.D.O.T. conducted the meetings for the public. I was unable to attend the **ONE** and only meeting that I would have been allowed to speak at publicly. As stated before I don't travel to the Phoenix metro-area due to the distance, pollution and the heat. I am an elder that is in a wheelchair, which needs assistance to get around. Attending this meeting was impractical for me and the **ONE** meeting held in the Gila River Indian Community was held over fifty miles from my home. I feel that A.D.O.T. violated my civil right by not allowing anyone to speak at the meeting held in the Gila River Indian Community, as well as other meetings held in other communities. I was raised by oral traditions, I was taught to speak out, and I have a right to be heard in a public form.

Inclosing I want to state for the record that the proposed Loop 202 South Mountain Freeway is wrong. The destruction of our Sacred Mountain is not only a violation of our traditions and heritage, but detrimental to our O'odham Himdag. Enough has been taken away from us already, why must we sacrifice more.

Peggy Mae Morago 7-6-2013

77	**Cultural Resources**	The importance of the South Mountains Traditional Cultural Property is acknowledged on pages 4-130 and 4-141 of the Draft and Final Environmental Impact Statements, respectively. Consultation has occurred with Gila River Indian Community government officials, the Tribal Historic Preservation Officer, the Cultural Resource Management Program, many different tribal authorities, and the State Historic Preservation Office. This consultation has resulted in concurrence from the Gila River Indian Community Tribal Historic Preservation Office and the State Historic Preservation Office on National Historic Preservation Act eligibility recommendations, project effects, and proposed mitigation and measures to minimize harm. This consultation has been ongoing and will continue until any commitments in a record of decision are completed.
	Air Quality	The Final Environmental Impact Statement addresses the history of air quality in the region (see text beginning on page 4-68 of the Final Environmental Impact Statement). The Clean Air Act § 109(b)(1) requires the U.S. Environmental Protection Agency to promulgate primary National Ambient Air Quality Standards at levels that allow an adequate margin of safety to protect the public health. Air quality in the Phoenix metropolitan area has improved over time; Phoenix was redesignated to attainment/maintenance for carbon monoxide in 2005, and the U.S. Environmental Protection Agency recently determined that Phoenix has attained the particulate matter (PM_{10}) standard. These improvements are largely associated with cleaner fuels and lower-emission vehicles along with local controls on fugitive dust. Future emissions would also be reduced by the use of cleaner-burning fuels, technological advances in automotive design (including the greater use of alternative fuel vehicles), reformulated gasoline, gas can standards, stricter enforcement of emission standards during inspections, heavy-duty diesel engine and on-highway diesel sulfur control programs, dust control programs, and others. The air quality assessment for the proposed freeway analyzed impacts from carbon monoxide and particulate matter (PM_{10}) and followed U.S. Environmental Protection Agency guidelines. No violations of either the carbon monoxide or particulate matter (PM_{10}) standards were identified, even at worst-case locations along the project corridor. Thus, the carbon monoxide and particulate matter (PM_{10}) analyses demonstrated that the proposed freeway would not contribute to any new localized violations, increase the frequency or severity of any existing violation or delay timely attainment of the National Ambient Air Quality Standards or any required interim emissions reductions or other milestones. For mobile source air toxics, the analysis showed that for the Study Area, constructing the freeway would have a marginal effect on annual emissions in 2025 and 2035 (less than a 1 percent difference in total annual emissions between the Preferred Alternative and No-Action Alternative). With the Preferred Alternative in 2035, modeled mobile source air toxics emissions would decrease by 57 percent to more than 90 percent, depending on the pollutant, despite a 47 percent increase in vehicle miles traveled in the Study Area compared with 2012 conditions. The air quality analyses were updated for the Final Environmental Impact Statement, including a quantitative particulate matter (PM_{10}) analysis, and are more fully described beginning on page 4-68 of the Final Environmental Impact Statement. Congestion relief resulting from the proposed freeway would provide localized air quality emissions reductions on area freeways and arterial streets and at interchanges, benefiting users of area highways and those living near congested roads.

77 (cont.)	**Tribal Involvement**	The Arizona Department of Transportation provided vouchers for public hearing parking and for public transit to the hearing. For the first time in the State's history, a shuttle bus to the hearing was provided from six locations in the Phoenix area, including two on the Gila River Indian Community (Komatke Boys & Girls Club and the Governance Center in Sacaton). All ads provided telephone numbers and electronic contact information regarding information on the shuttle schedules and pick-up locations. Community forums were held after the public hearing to further invite public comment.

Code	Comment Document
78	My name is Joseph C. Morago I am a member the Gila River Indian Community. I am writing this statement to address my opposition of the South Mountain Loop 202 Freeway. As a charter member of G.R.A.C.E. (Gila River Alliance for a Clean Environment) I have followed this issue for many years. During this time I have notice the condescending attitude and lack of respect that A.D.O.T. (Arizona Department of Transportation) has shown to the people of the Gila River Indian Community. For well over two decades our community has repeatedly reject the idea of a freeway passing thought our community, because of cultural, religious, environmental and the current and potential health affects to our community. In spite of our concerns and objections A.D.O.T., M.A.G. (Maricopa Association of Governments), Maricopa County, and the Maricopa Regional Transportation Team still insist on building the South Mountain Loop 202 Freeway by blasting away a piece of our sacred mountain. South Mountain is a sacred place of cultural significant to the people of Gila River. Oral history and legends state that South Mountain is the home of "Elder Brother" (I'itoi) deity of the Akimil O'odham Tribe (Gila River Indian Community Tribe). South Mountain was also once inhabited by our ancestors the Hohokam. The Hohokam has been acknowledged by archeologist, anthropologist and historians to be one of the first settlers of this region. South Mountain is also a place of worship, sacred ceremonies are preformed, prayer and blessings are giving and shrines are built to honor I'itoi and our ancestors. Other activities such as the harvesting of the saguaro cactus fruit and gathering of medicinal plants occur at different times of the year. Because of the sacredness of South Mountain, any destruction would be detrimental to the spiritual wellbeing of the people of the Gila River Indian Community. Another major concern about this proposed freeway project is the health effects on the people of the Gila River Indian Community due to air quality. According to the 2005 Joint Air Toxics Assessment Program (JATAP) Gila River has a high level of Particulate Matter (PM) and Volatile Organic Compounds (VOC) in the air above the community. If the proposed South Mountain Loop 202 Freeway is completed the air quality over the Gila River Indian Community would drastically change for the worse. The U.S.E.P.A. (United States Environmental Protection Agency) "Green Book" states that Maricopa County has been nonattainment in Particulate Matter (PM)-10 since 1992. PM-10 is inhalable course particulates that consist of a complex mixture of extremely small particle and liquid droplets made up several components like acids, organic chemicals, metals, and soil or dust particles, which can cause an increase of Heart and Lung disease. Short term exposure to PM-10 can increase susceptibility to respiratory infections, aggravated lung disease, acute bronchitis and an increase of asthma attacks. Long term exposure to PM-10 have been associated with reduced lung function, chronic bronchitis, premature death, low birth weights in infants, premature delivery, and possible fetal and infant death. Infants are not the only ones at risk to these types of ailments. Older adults, the elderly, children, active adults. and people with lung and heart disease, resent studies have shown that people with diabetes are also at risk when exposed to Particulate Matter (PM)-10.

Code	Issue	Response
78	**Tribal Involvement**	As noted in Chapter 2 of the Final Environmental Impact Statement, efforts to involve the Gila River Indian Community, a sovereign nation, in the environmental impact statement process are extensive. Public involvement with the Gila River Indian Community was conducted as requested by the tribal government. Prior to October 2005, early efforts to involve the Gila River Indian Community included attending tribal meetings and monthly meetings with Gila River Indian Community Departments (see discussion beginning on page 2-8 of the Draft and Final Environmental Impact Statements). On October 14, 2005, the Gila River Indian Community requested that all project-related communications take place at a government-to-government level (see letter on page A152 of Appendix 1-1). This request was honored by the Arizona Department of Transportation and Federal Highway Administration. All public involvement efforts were implemented by the Gila River Indian Community's public involvement officer. As noted in Table 4-47 that begins on page 4-145, the Gila River Indian Community was initially consulted in 2003 with subsequent contact in 2005, 2006, 2007, 2008, 2010, 2011, 2012, and 2013. This supports an early and continued consultation with the Gila River Indian Community related to resources of importance. This consultation has resulted in concurrence from the State Historic Preservation Office and Gila River Indian Community Tribal Historic Preservation Office on National Historic Preservation Act eligibility recommendations, project effects, and proposed mitigation and measures to minimize harm. This consultation has been ongoing and will continue until any commitments in a record of decision are completed. The Draft Environmental Impact Statement on page 2-4 acknowledges that the Gila River Indian Community Council passed Resolution GR-64-96 that strongly opposed any future alignment of the South Mountain Freeway on Gila River Indian Community land. In addition, the comments received from Gila River Indian Community Governor Gregory Mendoza (see letter dated July 11, 2013, on page B38 in Appendix 7, Volume III, of the Final Environmental Impact Statement) confirm the Gila River Indian Community's position. Any alternative on Gila River Indian Community land must consider tribal sovereignty. Tribal sovereignty is based in the inherent authority of Native American tribes to govern themselves. While this notion of sovereignty is manifested in many areas, generally Native American land is held in trust by the United States. Native American communities have the authority to regulate land uses and activities on their lands. States have very limited authority over activities within tribal land (see page 2-1 of the Final Environmental Impact Statement). From a practical standpoint, this means that the Arizona Department of Transportation and Federal Highway Administration do not have the authority to survey tribal land, make land use (including transportation) determinations directly affecting tribal land, or condemn tribal land for public benefit through an eminent domain process. In addition to Chapter 2 of the Final Environmental Impact Statement which explains the Gila River Indian Community outreach undertaken for the project, Chapter 6 of the Final Environmental Impact Statement further describes Community and general outreach throughout the process. The Gila River Indian Community was provided equal opportunities to participate in the project as all other populations and agencies. This outreach was undertaken, in part, to ensure all populations had equal access to the process and, in part, to ensure disparate nor disproportionately high adverse impacts would result from the construction and operation of the proposed action.

(Response 78 continues on next page)

Code	Comment Document

The Gila River Indian Community is not the only community to raise concerns over this proposed freeway project. The residents of Ahwatukee Foothills have raised some of the same concerns about the South Mountain Loop 202 Freeway. As stated before I am a member of G.R.A.C.E. and I am also a member of P.A.R.C. (Protect Arizona's Resources & Children) to protect South Mountain. One of P.A.R.C.'s major concerns is the potential for a hazardous material incident if an accident is to occur on this proposed freeway project. According to the maps in the D.E.I.S. and A.D.O.T.'s video presentation, the South Mountain Loop 202 Freeway would be within a mile of several schools, homes, and businesses that would have to be evacuated of such an incident were to occur. With too few exits and an ineffective emergency management plan the possibility for serious injury, long term illness or loss of life is extremely high.

The next issue I wish to address is the manner in which A.D.O.T. has disseminated information concerning the South Mountain Loop 202 Freeway to the people of the Gila River Indian Community. The D.E.I.S. states that A.D.O.T. attended 178 meetings with the Gila River Indian Community. If this is true why did A.D.O.T. only attend a couple meetings with tribal council in over a decade? Who did A.D.O.T. meet with from the Gila River Indian Community? Why did A.D.O.T. fail to properly notify community members of public meeting, and why does A.D.O.T. acknowledge the cultural and religious significant of South Mountain to the Akimil O'odham people but dismiss these facts by insisting on moving forward with the construction of the South Mountain Loop 202 Freeway.

An addition to the previous mentioned issues I would like to address A.D.O.T,'s handling of the of the ninety day public comment period concerning the D.E.I.S. I feel that A.D.O.T. mishandled and misinformed the people of the Gila River Indian Community. The D.E.I.S. was released on April 25, 2013. On April 30, 2013 A.D.O.T., M.A.G., the TTT (Transportation Technical Team), Gila River Indian Community Executive Office, G.R.I.C. Law Office, G.R.A.C.E., G.R.E.Y. (Gila River Environmental Youth) with five other grassroots and private corporation organizers met to discuss how community members would be able to comment on the D.E.I.S. Among the issues discussed was transportation to the public comment meeting in Downtown Phoenix, conformation of a meeting(s) in Gila River, issues with submitting comments online, and notification to community member about important meetings, dates and other relevant information concerning the D.E.I.S. comment period.

At this meeting A.D.O.T. agreed to hold one or more public meeting(s) in Gila River to accept comments on the D.E.I.S. A.D.O.T. stated at this meeting that they would also provide free bus passes to the Downtown Phoenix public comment hearing. What A.D.O.T. failed to do was provide proper and concise information. A.D.O.T. **never** told community member that they would not be able to speak at the meeting in Gila River. A.D.O.T. also failed to provide adequate notice of this meeting. Although a notice was posted in the Gila River Indian Newspaper, this notice appeared in the paper only once on the days prior to the meeting scheduled in Gila River.

Code	Issue	Response
78 (cont.)	**Cultural Resources**	The importance of the South Mountains Traditional Cultural Property is acknowledged on pages 4-130 and 4-141 of the Draft and Final Environmental Impact Statements, respectively. Consultation has occurred with Gila River Indian Community government officials, the Tribal Historic Preservation Officer, the Cultural Resource Management Program, many different tribal authorities, and the State Historic Preservation Office. This consultation has resulted in concurrence from the Gila River Indian Community Tribal Historic Preservation Office and the State Historic Preservation Office on National Historic Preservation Act eligibility recommendations, project effects, and proposed mitigation and measures to minimize harm. This consultation has been ongoing and will continue until any commitments in a record of decision are completed.
	Health Effects	Under the Clean Air Act, the U.S. Environmental Protection Agency is responsible for establishing National Ambient Air Quality Standards to protect public health and the environment from adverse effects of air pollutants. Health effects from air pollutants are based on the concentration of the pollutants and the duration of exposure. Concentrations vary with distance from a roadway based on many factors, including background (or ambient) levels of pollution from all sources; the number, speed, and type of vehicles on the roadway; wind speed and direction; topography; and other factors. For the proposed freeway, the Federal Highway Administration conducted modeling for carbon monoxide and particulate matter (PM_{10}) using worst-case (most congested or highest traffic) modeling locations at discrete receptor locations around each analysis location (primarily residences near the interchanges). The carbon monoxide and particulate matter (PM_{10}) analyses demonstrated that the proposed freeway would not contribute to any new localized violations, increase the frequency or severity of any existing violation, or delay timely attainment of the National Ambient Air Quality Standards or any required interim emissions reductions or other milestones. Mobile source air toxics can also have adverse health impacts, but the U.S. Environmental Protection Agency has not established National Ambient Air Quality Standards for these pollutants. As a result, the Federal Highway Administration analyzes these pollutants using emissions analyses. The mobile source air toxics emissions analysis for the Study Area found little difference in total annual emissions of mobile source air toxics emissions between the Preferred and No-Action Alternatives (less than a 1 percent difference) in 2025 and 2035. With the Preferred Alternative in 2035, modeled mobile source air toxics emissions would decrease by 57 percent to more than 90 percent, depending on the pollutant, despite a 47 percent increase in vehicle miles traveled in the Study Area compared with 2012 conditions. Many studies have investigated the prevalence of adverse health effects in the near-road environment. Given concerns about the possibility of air pollution exposure in the near-road environment, the Health Effects Institute has dedicated a number of research efforts toward investigating this issue. In November 2007, the Health Effects Institute published Special Report #16: Mobile-Source Air Toxics: A Critical Review of the Literature on Exposure and Health Effects. This report concluded that the cancer health effects attributable to mobile sources are difficult to discern because the majority of quantitative assessments are derived from occupational cohorts with high concentration exposures and because some cancer potency estimates are derived from animal models. In January 2010, the Health Effects Institute released Special Report #17, investigating the health effects of traffic-related air pollution. The goal of the research was to synthesize available information on the effects of traffic on health. Researchers looked at linkages between: 1) traffic emissions (at the tailpipe)

(Response 78 continues on next page)

Code	Comment Document

Inclosing I would like to state for the record that A.D.O.T. has not acted in good faith concerning the South Mountain Loop 202 Freeway project as it pertains to the people of the Gila River Indian Community. In fact A.D.O.T. has violated the Civil Rights of the Gila River Indian Community by acknowledging the significant and sacredness of South Mountain, but dismissing these facts with plans to blast through portions of South Mountain. In effect A.D.O.T. has discriminated against the Gila River Indian Community by preventing tribal members from participating in the comment process. The failure of notification of meetings held within the Gila River Indian Community, not allowing tribal members to make verbal public comments at the only public form held within the Gila River Indian Community, and failure to provide the bus passes promised to the Gila River Tribal Leadership for community members to attend the only meeting that public verbal comments were accepted. A.D.O.T. has violated the Civil Rights of the residents of the Gila River Indian Community and should not be able to receive federal funding for the South Mountain Loop 202 Freeway project.

Code	Issue	Response
78 (cont.)		with ambient air pollution in general, 2) concentrations of ambient pollutants with human exposure to pollutants from traffic, 3) exposure to pollutants from traffic with human-health effects and toxicological data, and 4) toxicological data with epidemiological associations. Overall, researchers felt that there was "sufficient" evidence for causality for the exacerbation of asthma. Evidence was "suggestive but not sufficient" for health outcomes such as cardiovascular mortality and others. Study authors also noted that past epidemiological studies may not provide an appropriate assessment of future health associations because vehicle emissions are decreasing over time. Finally, in 2011 three studies were published by the Health Effects Institute evaluating the potential for mobile source air toxics "hot spots." In general, the authors confirmed that while highways are a source of air toxics, they were unable to find that highways were the only source of these pollutants. They determined that near-road exposures were often no different or no higher than background (or ambient) levels of exposure and, hence, no true hot spots were identified. These reports are available from the Health Effects Institute's Web site at <healtheffects.org>. The Federal Highway Administration and U.S. Environmental Protection Agency provide financial support to the Health Effects Institute's research work. Another source of information is the U.S. Environmental Protection Agency's recently released report on Children's Health and the Environment: *The level of knowledge regarding the relationship between environmental exposures and health outcomes varies widely among the topics [presented in this report], and the inclusion of an indicator in the report does not necessarily imply a known relationship between environmental exposure and children's health effects. The report provides data for selected children's health conditions that warrant further research because the causes, including possible contributing environmental factors, are complex and not well understood at this point.* *In the case of asthma, researchers do not fully understand why children develop the condition. However, substantial evidence shows exposure to certain air pollutants, including particulate matter and ozone, can trigger symptoms in children who already have asthma. Although the report found the percentage of children reported to currently have asthma increased from 8.7 percent in 2001 to 9.4 percent in 2010 and that minority populations are particularly affected by asthma, the severity of children's asthma and respiratory symptoms has declined. The rate of emergency room visits for asthma decreased from 114 visits per 10,000 children in 1996 to 103 visits per 10,000 children in 2008. Between 1996 and 2008, hospitalizations for asthma and for all other respiratory causes decreased from 90 hospitalizations per 10,000 children to 56 hospitalizations per 10,000 children.* *The report also looks at trends in other health conditions, such as Attention-Deficit/Hyperactivity Disorder (ADHD) and preterm births, for which rates have increased. There is no conclusive information on the role of environmental contaminants in ADHD or preterm births, and additional research is ongoing.* Finally, the Federal Highway Administration notes that while the incidence of some health effects (such as asthma, autism, and attention deficit/hyperactivity disorder) in the U.S. population appear to have been increasing, motor vehicle emissions have declined. This decline in mobile source air toxics emissions is documented in Figure 4-24 of the Final Environmental Impact Statement and for other pollutants at <epa.gov/ttn/chief/trends/>. This negative correlation between emissions trends and health effects trends illustrates the complexity of the issues.

Code	Issue	Response
78 (cont.)	**Hazardous Materials**	Arizona highways, as are most highways across the United States, are open to all kinds of traffic, so long as the cargo being carried is in accordance with U.S. Department of Transportation regulations for the specific type of cargo. The Arizona Department of Transportation has a few locations in the state with hazardous cargo restrictions, but these restrictions are based on emergency response issues or roadway design limitations specific to that location. For example, the Interstate 10 Deck Park Tunnel has certain hazardous cargo transport restrictions because of the limited ability for emergency responders to address a hazardous materials incident in the tunnel. The South Mountain Freeway, if implemented, is expected to operate under the same rules as other similar facilities in the state; transport of hazardous cargo would be expected to be permissible (see text box on page 4-166 of the Final Environmental Impact Statement). The Arizona Department of Public Safety (which includes the State Highway Patrol) has primary responsibility for enforcing traffic laws. The Department of Public Safety also has primacy when calling in support for traffic accidents, including hazardous materials accidents (see text box on page 4-166 of the Final Environmental Impact Statement). The Arizona Department of Transportation maintains a list of contractors who provide emergency response services, as well as local municipalities whose fire and police departments operate in cooperation with the Department of Public Safety on incidents within their jurisdiction. Requirements for shippers are maintained by the Arizona Department of Transportation's Enforcement Compliance Division. The project team is aware of the Hazardous Materials Commodity Flow Studies that the Arizona State Emergency Response Commission maintains. These studies are used by emergency response planners (such as the Arizona State Emergency Response Commission statewide and the Maricopa County Local Emergency Planning Commission for Maricopa County) as one of the elements considered when developing Emergency Response Plans. If the plan is amended, it is made available to the Arizona Department of Transportation. In the event of an incident with a hazardous materials issue on a State or federal highway, the emergency responders contact the Arizona Department of Transportation's Traffic Operations Center to report the incident. The Traffic Operations Center then contacts the Arizona Department of Transportation's Safety and Risk Management group, who responds to the accident scene and assesses needs in concert with the Incident Commander from the responding agency with jurisdiction. If requested, the Arizona Department of Transportation can assist cleanup activities by engaging specialty subcontractors with whom the Arizona Department of Environmental Quality has contracts for such support. The Arizona Department of Transportation's Safety and Risk Management group's charge is primarily public health protection, with cleanup support being secondary.
	Tribal Involvement	As noted in Chapter 2 of the Final Environmental Impact Statement, efforts to involve the Gila River Indian Community in the environmental impact statement process have been extensive. Public involvement with the Gila River Indian Community was conducted as requested by the tribal government. Prior to October 2005, early efforts to involve the Gila River Indian Community included attending tribal meetings and monthly meetings with Gila River Indian Community Departments (see discussion beginning on page 2-8 of the Draft and Final

Code	Issue	Response
78 (cont.)		Environmental Impact Statements). On October 14, 2005, the Gila River Indian Community requested that all project-related communications take place at a government-to-government level (see letter on page A152 of Appendix 1-1). This request was honored by the Arizona Department of Transportation and Federal Highway Administration. All public involvement efforts were implemented by the Gila River Indian Community's public involvement officer. The Arizona Department of Transportation advertisement efforts of the public hearing and public forums are documented in Chapter 6 of the Final Environmental Impact Statement beginning on page 6-23. The Gila River Indian Community Communication and Public Affairs Office informed the Arizona Department of Transportation that all communication and distribution of informational materials on Gila River Indian Community land would be handled by the Communication and Public Affairs Office. Advertisement text regarding the project, the public comment period, the public hearing and the various ways for the public to submit comments regarding the South Mountain Freeway Draft Environmental Impact Statement was given to the Gila River Indian Community's Public Information Officer at the Transportation Technical Team meeting on April 30, 2013. Two advertisements regarding the public hearing, information regarding the location and availability of the Draft Environmental Impact Statement, and a map of the alternatives was placed in the May 2013 monthly issue of the *Gila River Indian News*. The Arizona Department of Transportation Community Relations distributed electronic notices (e-newsletters) through the Government Delivery system to over 12,000 constituents who voluntarily signed up for project alerts along the Interstate 10 Papago, Maricopa, and Santan Freeways. These electronic notices included notice of availability of Draft Environmental Impact Statement (distributed on April 26, 2013); public hearing (distributed on May 10, 2013); the community forums (distributed on May 29, 2013) and one in June (close of the Draft Environmental Impact Statement public comment period). In addition, anyone who had attended a previous meeting on the proposed action and signed in received all of this information mailed individually. On May 6, 2013, 73,564 mailers were distributed to addresses within the Study Area. Community forums were held after the public hearing to further invite public comment. The Arizona Department of Transportation provided vouchers for public hearing parking and for public transit to the hearing. For the first time in the State's history, a shuttle bus to the hearing was provided from six locations in the Phoenix area, including two on the Gila River Indian Community (Komatke Boys & Girls Club and the Governance Center in Sacaton). All ads provided telephone numbers and electronic contact information regarding information on the shuttle schedules and pick-up locations.
	Title VI	The Arizona Department of Transportation and Federal Highway Administration provided equal access to the public participation process to the Gila River Indian Community and its members. The Arizona Department of Transportation and Federal Highway Administration solicited input from the Gila River Indian Community and other Native American tribes and tribal members and considered fully the substantive input and comments that were received.

79	My name is Laura M. Thomas. I am an enrolled member of The Gila River Indian Community. I am also a member of G.R.A.C.E. - Gila River Alliance for a Clean Environment. I am the founder G.R.E.Y. - Gila River Environmental Youth. I am also a member of P.A.R.C. - Protecting Arizona's Resources and Children. When I was younger I recall being taught about our people's heritage. Hearing the stories and being told about things that occurred many years ago in our culture. I remember being taught by my elders that we come from South Mountain. Battles were fought, families settled, it was always considered to be home to our people. In regards to this issue, I had been under the impression that the people of Gila River Indian Community had passed a vote for no build on the loop 202. This issue continues to be pushed upon our community after it has been said by the people we do not want this. The efforts put forth by A.D.O.T. (Arizona Department of Transportation) in the case of the freeway are a burden upon the people of the community. Each meeting they hold to try and convince community members to be in favor of the freeway is reaching a level of harassment. People have to take time out of their day in order to be able to attend meetings after it has been clearly said "we as a people do not want it". My people have been affected by chemical exposure. There are also many questions about health concerns that may arise because of the projected freeway. Air pollution, destruction of our sacred mountain, negative effects on the environment and the discrimination against our religious and cultural beliefs is why I'm against the proposed South Mountain Loop 202 Freeway. Laura Thomas P.O. Box #11217 Bapchule, Az. 85121 (480)532-5331 lthomas1985@yahoo.com

79	**Cultural Resources**	The importance of the South Mountains Traditional Cultural Property is acknowledged on pages 4-130 and 4-141 of the Draft and Final Environmental Impact Statements, respectively. Consultation has occurred with Gila River Indian Community government officials, the Tribal Historic Preservation Officer, the Cultural Resource Management Program, many different tribal authorities, and the State Historic Preservation Office. This consultation has resulted in concurrence from the Gila River Indian Community Tribal Historic Preservation Office and the State Historic Preservation Office on National Historic Preservation Act eligibility recommendations, project effects, and proposed mitigation and measures to minimize harm. This consultation has been ongoing and will continue until any commitments in a record of decision are completed. The Draft and Final Environmental Impact Statements on page 2-4 acknowledges that the Gila River Indian Community Council passed Resolution GR-64-96 that strongly opposed any future alignment of the South Mountain Freeway on Community land. In addition, the comments received from Gila River Indian Community Governor Gregory Mendoza (see letter dated July 11, 2013, on page B38 in Appendix 7, Volume III, of the Final Environmental Impact Statement) confirm the Gila River Indian Community's position. Any alternative on Gila River Indian Community land must consider tribal sovereignty. Tribal sovereignty is based in the inherent authority of Native American tribes to govern themselves. While this notion of sovereignty is manifested in many areas, generally Native American land is held in trust by the United States. Native American communities have the authority to regulate land uses and activities on their lands. States have very limited authority over activities within tribal land (see page 2-1 of the Final Environmental Impact Statement). From a practical standpoint, this means that the Arizona Department of Transportation and Federal Highway Administration do not have the authority to survey tribal land, make land use (including transportation) determinations directly affecting tribal land, or condemn tribal land for public benefit through an eminent domain process.
	Alternatives	In accordance with the National Environmental Policy Act, a range of reasonable action alternatives to carry forward for further analysis was determined through application of multidisciplinary criteria in a logical, step-wise progression. The preferred alternative was the outcome to this process. Alternatives were not disposed of or dismissed without a thorough evaluation using the multidisciplinary criteria outlined in the alternatives development and screening process presented in Chapter 3 of the Draft and Final Environmental Impact Statement. The preferred alternative was the outcome to this process.
	Tribal Involvement	As noted in Chapter 2 of the Final Environmental Impact Statement, efforts to involve the Gila River Indian Community, a sovereign nation, in the environmental impact statement process are extensive.
	Health Effects	Under the Clean Air Act, the U.S. Environmental Protection Agency is responsible for establishing National Ambient Air Quality Standards to protect public health and the environment from adverse effects of air pollutants. Health effects from air pollutants are based on the concentration of the pollutants and the duration of exposure. Concentrations vary with distance from a roadway based on many factors, including background (or ambient) levels of pollution from all sources; the number, speed, and type of vehicles on the roadway; wind speed and direction; topography; and other factors. For the proposed freeway, the Federal Highway Administration conducted modeling for carbon monoxide and particulate matter

(Response 79 continues on next page)

Code	Issue	Response
79 (cont.)		(PM_{10}) using worst-case (most congested or highest traffic) modeling locations at discrete receptor locations around each analysis location (primarily residences near the interchanges). The carbon monoxide and particulate matter (PM_{10}) analyses demonstrated that the proposed freeway would not contribute to any new localized violations, increase the frequency or severity of any existing violation, or delay timely attainment of the National Ambient Air Quality Standards or any required interim emissions reductions or other milestones. Mobile source air toxics can also have adverse health impacts, but the U.S. Environmental Protection Agency has not established National Ambient Air Quality Standards for these pollutants. As a result, the Federal Highway Administration analyzes these pollutants using emissions analyses. The mobile source air toxics emissions analysis for the Study Area found little difference in total annual emissions of mobile source air toxics emissions between the Preferred and No-Action Alternatives (less than a 1 percent difference) in 2025 and 2035. With the Preferred Alternative in 2035, modeled mobile source air toxics emissions would decrease by 57 percent to more than 90 percent, depending on the pollutant, despite a 47 percent increase in vehicle miles traveled in the Study Area compared with 2012 conditions. Many studies have investigated the prevalence of adverse health effects in the near-road environment. Given concerns about the possibility of air pollution exposure in the near-road environment, the Health Effects Institute has dedicated a number of research efforts toward investigating this issue. In November 2007, the Health Effects Institute published Special Report #16: Mobile-Source Air Toxics: A Critical Review of the Literature on Exposure and Health Effects. This report concluded that the cancer health effects attributable to mobile sources are difficult to discern because the majority of quantitative assessments are derived from occupational cohorts with high concentration exposures and because some cancer potency estimates are derived from animal models. In January 2010, the Health Effects Institute released Special Report #17, investigating the health effects of traffic-related air pollution. The goal of the research was to synthesize available information on the effects of traffic on health. Researchers looked at linkages between: 1) traffic emissions (at the tailpipe) with ambient air pollution in general, 2) concentrations of ambient pollutants with human exposure to pollutants from traffic, 3) exposure to pollutants from traffic with human-health effects and toxicological data, and 4) toxicological data with epidemiological associations. Overall, researchers felt that there was “sufficient” evidence for causality for the exacerbation of asthma. Evidence was “suggestive but not sufficient” for health outcomes such as cardiovascular mortality and others. Study authors also noted that past epidemiological studies may not provide an appropriate assessment of future health associations because vehicle emissions are decreasing over time. Finally, in 2011 three studies were published by the Health Effects Institute evaluating the potential for mobile source air toxics “hot spots.” In general, the authors confirmed that while highways are a source of air toxics, they were unable to find that highways were the only source of these pollutants. They determined that near-road exposures were often no different or no higher than background (or ambient) levels of exposure and, hence, no true hot spots were identified.

Code	Issue	Response
79 (cont.)		These reports are available from the Health Effects Institute's Web site at <healtheffects.org>. The Federal Highway Administration and U.S. Environmental Protection Agency provide financial support to the Health Effects Institute's research work. Another source of information is the U.S. Environmental Protection Agency's recently released report on Children's Health and the Environment: *The level of knowledge regarding the relationship between environmental exposures and health outcomes varies widely among the topics [presented in this report], and the inclusion of an indicator in the report does not necessarily imply a known relationship between environmental exposure and children's health effects. The report provides data for selected children's health conditions that warrant further research because the causes, including possible contributing environmental factors, are complex and not well understood at this point.* *In the case of asthma, researchers do not fully understand why children develop the condition. However, substantial evidence shows exposure to certain air pollutants, including particulate matter and ozone, can trigger symptoms in children who already have asthma. Although the report found the percentage of children reported to currently have asthma increased from 8.7 percent in 2001 to 9.4 percent in 2010 and that minority populations are particularly affected by asthma, the severity of children's asthma and respiratory symptoms has declined. The rate of emergency room visits for asthma decreased from 114 visits per 10,000 children in 1996 to 103 visits per 10,000 children in 2008. Between 1996 and 2008, hospitalizations for asthma and for all other respiratory causes decreased from 90 hospitalizations per 10,000 children to 56 hospitalizations per 10,000 children.* *The report also looks at trends in other health conditions, such as Attention-Deficit/Hyperactivity Disorder (ADHD) and preterm births, for which rates have increased. There is no conclusive information on the role of environmental contaminants in ADHD or preterm births, and additional research is ongoing.* Finally, the Federal Highway Administration notes that while the incidence of some health effects (such as asthma, autism, and attention deficit/hyperactivity disorder) in the U.S. population appear to have been increasing, motor vehicle emissions have declined. This decline in mobile source air toxics emissions is documented in Figure 4-24 of the Final Environmental Impact Statement and for other pollutants at <epa.gov/ttn/chief/trends/>. This negative correlation between emissions trends and health effects trends illustrates the complexity of the issues.
	Title VI	As documented in the Draft and Final Environmental Impact Statements section, *Environmental Justice and Title VI*, beginning on page 4-29, identifies acceptable methods, data, and assumptions to assess the potential for disproportionate adverse effects from the proposed action on certain populations including minority and low-income populations in sufficient detail to explain its function and the manner in which the analysis of impacts was undertaken for the proposed action to determine that no disparate impacts occurred; therefore, the Arizona Department of Transportation and Federal Highway Administration respectfully disagree that a violation to civil and religious rights has occurred.

80	Fairietta Morago Gila River Indian Community South Mountain is important to me because it's part of our heritage. There are many teachings that go with that mountain. Stories and songs that our future generations to carry on. To take the South Mountain away is a great impact to the Gila River Indian Community. It would be losing a part of us even more. I am the 3rd generation from the boarding school era. Because of that era that happened to our grandparents. Some of the stories and songs will be lost forever. Our communities as O'odham people here on Gila River Indian Community need to salvage what is left of our lands. Not ruin it by putting a freeway through it. Learn to honor and take care of our lands. Be making change this drastic is beyond the environmental issues, and the budget/cost it will take to put this freeway there. It's spiritually connection to all walks of life. A way to stay in balance for society to be whole as best as it can be. Nobody takes time to listen and learn to why certain places should be left untouched. Now days the common human being lives too fast paced. Just think of the present time. A long time ago we knew how to think of the long term impact of ways of life. Life there is no fast fix. This freeway to travel as stated at previous meetings. A 20-minute interval to get to point A to point B does not eliminate anything. A fast fix to life creates more problems you end up with a bigger mess than what you started with. I am against putting in a freeway through or by South Mountain. It's a disruption to nature's way of life. I feel ADOT discriminated against us all at the last public forum held in Komatke , Az. Gila River Indian Community members were not able to voice their public comments. No matter where the meetings are held. All parties whether you are against or for the freeway should be able to speak. No meeting should be one sided for any reason what so ever. That is very unfair. Again this is a fast fix to eliminate process that everyone should abide by. Good, bad, and Indifferent. Every comment counts. No one comment should be left unheard or unsaid. Fairietta Morago P.O. Box 893 Sacaton, AZ 85147 (520) 562-0269

80	**Cultural Resources**	The importance of the South Mountains Traditional Cultural Property is acknowledged on pages 4-130 and 4-141 of the Draft and Final Environmental Impact Statements, respectively. Consultation has occurred with Gila River Indian Community government officials, the Tribal Historic Preservation Officer, the Cultural Resource Management Program, many different tribal authorities, and the State Historic Preservation Office. This consultation has resulted in concurrence from the Gila River Indian Community Tribal Historic Preservation Office and the State Historic Preservation Office on National Historic Preservation Act eligibility recommendations, project effects, and proposed mitigation and measures to minimize harm. This consultation has been ongoing and will continue until any commitments in a record of decision are completed.
	Purpose and Need	In the Draft and Final Environmental Impact Statements, Chapter 1, *Purpose and Need*, examines the purpose and need for the proposed action in terms of defining a transportation problem. The results of the purpose and need analyses included the determination that a transportation problem (similar to the type of problem that has been represented in past Regional Transportation Plans) still exists in the area and that this problem is similar in characteristics to the transportation problem that existed in prior years.
	Tribal Involvement	The section entitled *Title VI and Environmental Justice*, beginning on page 4-29 in the Draft Environmental Impact Statement, presents acceptable methods, data, and assumptions to assess the potential for disproportionately high and adverse effects from the proposed action on environmental justice populations and disparate impacts to populations protected under Title VI. Based upon the content of the section, no such effects would result from the action alternatives. In light of comments received on the Draft Environmental Impact Statement, the above-referenced conclusions were confirmed in the preparation of the Final Environmental Impact Statement. To provide further clarity, the discussions of environmental justice and Title VI were separated and additional text explaining the relationship of environmental justice and Title VI to various environmental elements was added throughout Chapter 4, *Affected Environment*, *Environmental Consequences, and Mitigation*, as exemplified by the inserted text on page 4-29 of the Final Environmental Impact Statement. Chapter 2 of the Final Environmental Impact Statement is dedicated to the explanation of the Gila River Indian Community outreach undertaken for the project. Chapter 6 of the Final Environmental Impact Statement further describes Community outreach throughout the process. The Gila River Indian Community was provided equal opportunities to participate in the project as all other populations and agencies. This outreach was undertaken, in part, to ensure all populations had equal access to the process and, in part, to ensure disparate nor disproportionately high adverse impacts would result from the construction and operation of the proposed action.

81	July 24, 2013 Hello, my name is Lori Riddle. I am a daughter of the HoHoKam nation and a daughter of Antonio Azul, the last chief of my people. I am an enrolled member of the Gila River Indian Community. I was born here; I was raised here, lived here most of my life and will probably die here. In my lifetime, I've lived here in my territorial land and my confined reservation land, both in traditional manner and with modern conveniences. I was taught as a young girl how to gather, harvest and acquire foods and medicine for personal use. However I'm not a medicine person, a traditionalist or anything like that, I'm just a modern day O'odham woman who lives in 2 worlds and can balance both worlds. I pass this knowledge to my future generations. I am the co-founder, director and a member of GRACE (Gila River Alliance for a Clean Environment) a grassroots organization that has been, for more than a decade operating to protect my community from hazards of all types around the community. In addition, GRACE has been educating the community about subject matter surrounding those issues. I also sponsor a youth group GREY (Gila River Environmental Youth), who also does the same thing GRACE does but geared toward youth in the community. I'm also a member of various other groups and organizations, not to mention have had or currently hold seats on various committees, boards and commissions throughout the community. Finally, I am also a member of PARC (Protecting Arizona's Resources and Children). Sometime after the turn of the century events happened that set in motion my part of the equation. While being raised on the reservation I found myself living on a toxic superfund site. This began my environmental experience. I became knowledgeable of toxic substances, bio-accumulation, persistent organic pollutants, half-life and many other terms that kids such as myself shouldn't have to learn. As I translated information to my grandparents I began to find myself unknowingly being educated in the procedures used for assessment and abatement processes. I was present for the original remediation of my family's land and then again 20 years later when a bio-remediation was needed. With this knowledge and background I found locally, multiple issues in my community, one of them was the proposed South Mountain Loop 202. Taking a closer look I began to see the deficiencies in this project and notice that there was virtually no public participation. Consultation seemed minimal at best, if any? I began to look at the data for the substance releases and persistence of those substances. Ultimately, as any other project I looked at how these substances would impact Health and Human life. As a family who's been through the fire once, we've become quite aware of symptoms as a result of toxic exposure. In the documents submitted there is evidence and reference to some of the knowledge related to exposures. Back in the day of our exposure there wasn't enough information available. My concern about the Dioxin furans, the Particulate matter both 2.5 and 10 microns, Carbon monoxide and the multitude of other substances that would continually be present in our community is enormous. There is more concern because of the terrain and the natural makeup of our community. The heaviest impacted areas would be the populated villages located directly

Code	Issue	Response
81	Tribal Involvement	As noted in Chapter 2 of the Final Environmental Impact Statement, efforts to involve the Gila River Indian Community, a sovereign nation, in the environmental impact statement process are extensive. Public involvement with the Gila River Indian Community was conducted as requested by the tribal government. Prior to October 2005, early efforts to involve the Gila River Indian Community included attending tribal meetings and monthly meetings with Gila River Indian Community Departments (see discussion beginning on page 2-8 of the Draft and Final Environmental Impact Statements). On October 14, 2005, the Gila River Indian Community requested that all project-related communications take place at a government-to-government level (see letter on page A152 of Appendix 1-1). This request was honored by the Arizona Department of Transportation and Federal Highway Administration. All public involvement efforts were implemented by the Gila River Indian Community's public involvement officer. In addition to Chapter 2 of the Final Environmental Impact Statement which explains the Gila River Indian Community outreach undertaken for the project, Chapter 6 of the Final Environmental Impact Statement further describes Gila River Indian Community and general outreach throughout the process. The Gila River Indian Community was provided equal opportunities to participate in the project as all other populations and agencies. This outreach was undertaken, in part, to ensure all populations had equal access to the process and, in part, to ensure disparate nor disproportionately high adverse impacts would result from the construction and operation of the proposed action.
	Air Quality	The Final Environmental Impact Statement addresses the history of air quality in the region (see text beginning on page 4-68 of the Final Environmental Impact Statement). The Clean Air Act § 109(b)(1) requires the U.S. Environmental Protection Agency to promulgate primary National Ambient Air Quality Standards at levels that allow an adequate margin of safety to protect the public health. Air quality in the Phoenix metropolitan area has improved over time; Phoenix was redesignated to attainment/maintenance for carbon monoxide in 2005, and the U.S. Environmental Protection Agency recently determined that Phoenix has attained the particulate matter (PM_{10}) standard. These improvements are largely associated with cleaner fuels and lower-emission vehicles along with local controls on fugitive dust. Future emissions would also be reduced by the use of cleaner-burning fuels, technological advances in automotive design (including the greater use of alternative fuel vehicles), reformulated gasoline, gas can standards, stricter enforcement of emission standards during inspections, heavy-duty diesel engine and on-highway diesel sulfur control programs, dust control programs, and others. The air quality assessment for the proposed freeway analyzed impacts from carbon monoxide and particulate matter (PM_{10}) and followed U.S. Environmental Protection Agency guidelines. No violations of either the carbon monoxide or particulate matter (PM_{10}) standards were identified, even at worst-case locations along the project corridor. Thus, the carbon monoxide and particulate matter (PM_{10}) analyses demonstrated that the proposed freeway would not contribute to any new localized violations, increase the frequency or severity of any existing violation, or delay timely attainment of the National Ambient Air Quality Standards or any required interim emissions reductions or other milestones. For mobile source air toxics, the analysis showed that for the Study Area, constructing the freeway would have a marginal effect on annual emissions in 2025 and 2035 (less than a 1 percent difference in total annual emissions between the

82	July 24, 2013 between two natural barriers, the South Mountain and the Estrella Mountain ranges. These barriers would most definitely keep those toxic substances in my community. Currently, we have an amazing preserve that is full of the natural beauty that most Americans and people from all around the world picture when thinking of the well-known Sonoran desert. As a privileged individual, I've lived at the western tip of the South Mountain and seen many beautiful sunrises and given many blessings to the day and the people based on those gorgeous sunrises. In addition, while working for my community I have gained knowledge of aquifers, water sheds and washes that would be directly impacted. My people would be cut off from interactions with the mountain, as a third party recipient of this information I had heard that the engineers and designers have mentioned animal crossings that would be put in place but no mention of human crossings that would be needed to go pray and have ceremonies and such. Not to mention the distraction of noise from the vehicles. During prayer, it's important to be in a peaceful quiet area. I tasked my daughter to complete research; she found that it takes multiple generations for animals to learn their "new" crossings. During that learning time we lose numerous animals because of destruction of current natural known crossings. I have to mention about the cacti in the area, on the reservation the cacti grown more abundantly around and on mountain areas, not so much in the flat lands anymore. So naturally as we have our ceremonial harvesting activities, there is a greater need to gather the fruit in mountain areas. Lastly, we Akimel O'odham as many other peoples acknowledge the spiritual properties associated with mountains. It is in my O'odham sister's memory as with many of my O'odham sisters that I recall her making jellies and other delicious dishes for both personal and financial sustainability, yet another reason to have direct accessibility to the mountains. There is an enormous concern about Hazardous Material coming through our community. If this were to become "the" truck route, it most surely will be the hazardous material route. Since I sit on the CTERC (Chemical Tribal Emergency Response Commission), I have not seen hazard mitigation for this freeway. I also have not seen proposed policy to address what will happen in case a hazardous incident were to occur on this proposed freeway. Currently, we as a community do see our share of hazardous incidents/spills on the reservation by way of the I-10 (Interstate 10) freeway. Even though, when we look at potential incidents on either freeway, it will be apples and oranges as we have differences in the already established freeway (I-10) and the proposed freeway (L202). There were very few meetings, very little public participation. The very first invite extended was days after the DEIS was released which was April 25th, 2013. The meeting invite was on April 30th, 2013 at 3pm in GRIC at the Governance Center. Present were the TTT, Governor and Lt Governor (who is Chair of the TTT), various tribal departments, a rep from ADOT (who I can't recall), a rep from MAG, Senior Engineer Bob Hazlett as well as a few of the grassroots organizers. Represented were at least organizers from

Code	Issue	Response
81 (cont.)		Preferred Alternative and No-Action Alternative). With the Preferred Alternative in 2035, modeled mobile source air toxics emissions would decrease by 57 percent to more than 90 percent, depending on the pollutant, despite a 47 percent increase in vehicle miles traveled in the Study Area compared with 2012 conditions. The air quality analyses were updated for the Final Environmental Impact Statement, including a quantitative particulate matter (PM_{10}) analysis, and are more fully described beginning on page 4-68 of the Final Environmental Impact Statement. Congestion relief resulting from the proposed freeway would provide localized air quality emissions reductions on area freeways and arterial streets and at interchanges, benefiting users of area highways and those living near congested roads.
82	Biological Resources, Tribal Access	Connectivity is planned to allow wildlife movement beneath the freeway in multiuse crossings (see page 4-137 of the Final Environmental Impact Statement). The Federal Highway Administration and Arizona Department of Transportation have committed to providing mitigation by including multifunctional crossing structures designed for wildlife and for limited human use as well as culverts designed for connectivity for smaller species. Wildlife-friendly design information would be considered during the design of drainage and crossing structures for the freeway (see *Mitigation*, beginning on page 4-138 of the Final Environmental Impact Statement). The Arizona Department of Transportation and Federal Highway Administration would continue to work with partners, including the U.S. Fish and Wildlife Service, Arizona Game and Fish Department, and the Gila River Indian Community's Department of Environmental Quality, during the design phase regarding the design of multifunctional crossings that would allow wildlife passage across the proposed freeway alignment at natural drainages and that would allow Gila River Indian Community members to gain access to important traditional locations within the South Mountains. The Arizona Department of Transportation and Federal Highway Administration have been fully attentive to concerns expressed by the Gila River Indian Community and reiterate that position in this comment; the agencies have taken these concerns into account in describing potential impacts in the Draft Environmental Impact Statement, in ensuring that access to South Mountain would be preserved, and in developing and recommending the implementation of numerous mitigation measures.

July 24, 2013

5 groups. During this meeting we were given 3 copies of the DEIS to divide among our groups. A few days prior, a community member attempted to call to find out how to obtain a copy of the DEIS, she was told in order to get a hard copy she would have to pay 50.00 dollars. During the April 30th meeting they also advised us about the 50.00 dollar charge for hard copies. At this meeting they also told us that free bus service would be provided to the May 21st DEIS public comment hearing in Phoenix at the Phoenix Convention Center. Details about how the free bus rides to the hearing saying community members could catch the bus in two locations and even take the light rail, but no other details regarding the bus service were given. They also went through the scenario of what to expect at the hearing, how it would be set up, etc. At the beginning of the meeting the ground rules set as relayed by TTT's David White and Stephen Lewis both individuals head of the TTT. We were not allowed to speak about anything else but what the process was going to be, at this point there wasn't any mention that the Phoenix hearing would have some differences than the community forums. It was at this meeting where GRIC Lt Gov. had to officially request that a meeting (or two) be held in GRIC for community members that couldn't make the public hearing. At this meeting the handouts "Fact sheet" and "How to participate" were distributed. That's all I can recall.

A few times I attempted to call the number provided on the handouts, which also had a recording saying they couldn't receive any more messages, the box was full, or something to that effect. I had also heard similar accounts from other people who were attempting to call the number. On the Thursday before the hearing I started to get worried because there was no further mention of free transportation besides what was relayed to us during the April 30th meeting. I called the number provided and was able to have an opportunity to leave a voice message in which I said something to the effect of: Hello my name is Lori Riddle from the Gila River Indian Community and I'm trying to get some further information on bus service, passes or vouchers for my community members. How will this work? Would someone give me a call on my cell #520-610-3405, thank you?

No Response!!!!

So on the day of the Phoenix hearing May 21st, 2013 I lingered several hours. I only recognized Mr. Bob Hazlett from MAG, I approached Mr. Hazlett and asked him, "So who's in charge here"? He chuckled but didn't answer, I told him, "I ask because I have some concerns". I told him there's a problem with the number that it is always full and can't take anymore new messages, his response, "Yes, we just found out today that it only holds so many messages (I think the number he gave me was 13)". So I told him maybe they need to empty that a few times a day? The other thing I mentioned was that I had left a message on the number and relayed the message I had left the week prior. After that I said, "So how was this supposed to work? Because we could have gotten more tribal members present". He shrugged his shoulders and said, "Well it's too late now". Also on the day of the Phoenix hearing the participants received the small booklet "SMTN Meeting Guide". This was the first time we as community members

Code	Issue	Response
82 (cont.)	Hazardous Material	Creating a truck bypass is not a goal of the proposed action. The proposed freeway is part of a transportation system developed to improve mobility in the region by increasing capacity and allowing traffic—including truck traffic—to access a segment of the "loop" system (see pages 1-21, 1-22, 3-1, and 3-3 of the Final Environmental Impact Statement) in the Phoenix metropolitan area. The proposed South Mountain Freeway would be a commuter corridor, helping to move local traffic. As with all other freeways in the region, trucks would use it for the through-transport of freight, for transport to and from distribution centers, and for transport to support local commerce. Nevertheless, the primary vehicles using the proposed freeway would be automobiles. The Maricopa Association of Governments regional travel demand model projects that truck traffic would represent approximately 10 percent of the total traffic on the proposed freeway, similar to what is currently experienced on other regional freeways such as Interstate 10, State Route 101L, and U.S. Route 60. As disclosed in the Final Environmental Impact Statement, it is expected that "true" through-truck traffic (not having to stop in the metropolitan area) would continue to use the faster, designated, and posted bypass system of Interstate 8 and State Route 85 (see

July 24, 2013

had seen this. The guide did say the community forums were going to be utilizing a different format. It also listed only 1 GRIC forum and listed it as tentative.

The meeting in GRIC was short notice fliers went out to the community literally days before the event. Before this event at least three weeks prior one community organizer emailed a request urging GRIC to provide transport to community members to the meeting. There is a lack of community members without vehicles. No response. Lastly a few days before organizers and community voiced their concerns over the inability to voice, in open forum, their concerns at this meeting it was this time we saw the GRIC forum flyers for the first time. We additionally asked again if transport would be provided, they finally said yes, but we organizers had to provide a list of community members who needed transport. This was not expected, it was too short of notice to gather all that information. The day of the GRIC forum were community members dissatisfied the lack of inability to openly voice their concerns. The video was looped, as posted on ADOT's website, throughout the day.

Previously, While the TTT was going through the community with their presentation about the proposed loop 202 that I specifically TTT's David White in two district meetings that I had attended one in district six and the other in district four. There were concerns about ADOT not coming to present the information themselves. The one elder in district six asked who they were working for? He (the elder) stated that he felt like the TTT should not have been presenting the information but ADOT should have been the ones bringing this information to the community. That same consensus was expressed at the district four meeting it was raised by an elder woman (although not as confrontational as the one in district six).

In closing, I'm tired of fighting this monster of a freeway being pushed on to our community. I'm tired of reading blogs, comments to news articles and discussion forums of people with a "Bullying" attitude, telling my people what "You (Indians) need to do". Even a newspaper editorial of a popular news outlet, stated how, "the GRIC should this and should that"! It sickens me that this freeway has successfully brought out the racial wars effect. It's literally created debates, arguments and full blown fights! This needs to stop and other we need to work on discussions of cleaner transportation, safer technologies for a better cleaner, greener future for all our children.

82 (cont.)		page 3-64 of the Final Environmental Impact Statement). Arizona highways, as are most highways across the United States, are open to all kinds of traffic, so long as the cargo being carried is in accordance with U.S. Department of Transportation regulations for the specific type of cargo. The Arizona Department of Transportation has a few locations in the state with hazardous cargo restrictions, but these restrictions are based on emergency response issues or roadway design limitations specific to that location. For example, the Interstate 10 Deck Park Tunnel has certain hazardous cargo transport restrictions because of the limited ability for emergency responders to address a hazardous materials incident in the tunnel. The South Mountain Freeway, if implemented, is expected to operate under the same rules as other similar facilities in the state; transport of hazardous cargo would be expected to be permissible (see text box on page 4-164 of the Final Environmental Impact Statement). The Arizona Department of Public Safety (which includes the State Highway Patrol) has primary responsibility for enforcing traffic laws. The Department of Public Safety also has primacy when calling in support for traffic accidents, including hazardous materials accidents (see text box on page 4-164 of the Final Environmental Impact Statement). The Arizona Department of Transportation maintains a list of contractors who provide emergency response services, as well as local municipalities whose fire and police departments operate in cooperation with the Department of Public Safety on incidents within their jurisdiction. Requirements for shippers are maintained by the Arizona Department of Transportation's Enforcement Compliance Division.
	Tribal Involvement	Arizona Department of Transportation advertisement efforts of the public hearing and public forums are documented in Chapter 6 of the Final Environmental Impact Statement beginning on page 6-23. The Gila River Indian Community Communication and Public Affairs Office informed the Arizona Department of Transportation that all communication and distribution of informational materials on Gila River Indian Community land would be handled by the Communication and Public Affairs Office. Advertisement text regarding the project, the public comment period, the public hearing and the various ways for the public to submit comments regarding the South Mountain Freeway Draft Environmental Impact Statement was given to the Gila River Indian Community's Public Information Officer at the Transportation Technical Team meeting on April 30, 2013. Two advertisements regarding the public hearing, information regarding the location and availability of the Draft Environmental Impact Statement, and a map of the alternatives was placed in the May 2013 monthly issue of the *Gila River Indian News*. The Arizona Department of Transportation Community Relations distributed electronic notices (e-newsletters) through the Government Delivery system to over 12,000 constituents who voluntarily signed up for project alerts along the Interstate 10 Papago, Maricopa, and Santan Freeways. These electronic notices included notice of availability of Draft Environmental Impact Statement (distributed on April 26, 2013); public hearing (distributed on May 10, 2013); the community forums (distributed on May 29, 2013) and one in June (close of the Draft Environmental Impact Statement public comment period). In addition, anyone who had attended a previous meeting on the proposed action and signed in received all of this information mailed individually. On May 6, 2013, 73,564 mailers were distributed to addresses within the Study Area.

Hi my name is Stephanie J. Thomas and Im a Gila River Member, I Reside on District 5 Casa Blanca and I lived here all my life and I've been hearing a lot about what was going on with the South Mountian, if I had the transportation I be there at all meetings, and I've been praying Keeping everyone in Prayer. But most of all as I hear what's going on I dont like them trying to destroy the South Mountain, Because its been there for 1000's years, and I Really dont think they need to tear that down, Because its been our favorites and as I can recall I've been up there with my family just to see the whole View of Phoenix and the Gila River and its a Good View, that I knew most of the people who lived being up there and having picnics, and other like riding there horses. So I pray that this Mountain will stay Cause if we can live in this World they why ??? Cant the Mountain Stay. And as I use to live in District 6 We use to have our right access from the Mountain on 51st Boundry line and as I use to wake every morning going too School I would see the Sun Rising from there, and I know alot of people who lived

Code	Issue	Response
82 (cont.)		Community forums were held after the public hearing to further invite public comment. The public hearing for the proposed action was widely advertised. Newspaper ads in six newspapers of area-wide distribution ran advertisements at least twice each. Announcements occurred on five radio stations and six television stations. Mailers were sent on May 6, 2013 to 73,564 individuals (approximately 311 on the Gila River Indian Community) who had previously expressed an interest in the project. E-newsletters were distributed on three different occasions. All materials were also provided to the Gila River Indian Community Public Information Officer. Offers to the Gila River Indian Community Manager to host a public outreach event on the Gila River Indian Community began in summer 2012. The Gila River Indian Community first officially responded to this offer at the April 30, 2013 meeting of the Transportation Technical Team. During this meeting, the Gila River Indian Community Manager requested a community forum be conducted on the Gila River Indian Community following the public hearing. This was the only request the Arizona Department of Transportation received from the Gila River Indian Community regarding whether the Arizona Department of Transportation could hold a public outreach event during the public comment period. The Arizona Department of Transportation agreed to do so, and a community forum was held on June 22, 2013 at the Komatke Boys & Girls Club on the Gila River Indian Community. Like the public hearing, the community forums were widely advertised. In addition to the efforts of the Gila River Indian Community Communication and Public Affairs Office, the Arizona Department of Transportation ran newspaper ads in six newspapers of area-wide distribution four times each. The initial hotline capacity was 20 messages; it was expanded to 80 on May 17, 2013. Any questions that came in regarding how to participate, including any shuttle bus or transportation questions, were forwarded to one individual to address. Conversation record log sheets were kept for these efforts. For the first time in the State's history, a shuttle bus to the hearing was provided from six locations in the Phoenix area, including two on the Gila River Indian Community (Komatke Boys & Girls Club and the Governance Center in Sacaton). All ads provided telephone numbers and electronic contact information regarding information on the shuttle schedules and pick-up locations. Transportation to the community forums was not provided. As noted in Chapter 2 of the Final Environmental Impact Statement, efforts to involve the Gila River Indian Community in the environmental impact statement process are extensive. Public involvement with the Gila River Indian Community was conducted as requested by the tribal government. Prior to October 2005, early efforts to involve the Gila River Indian Community included attending tribal meetings and monthly meetings with Gila River Indian Community Departments (see discussion beginning on page 2-8 of the Draft and Final Environmental Impact Statements). On October 14, 2005, the Gila River Indian Community requested that all project-related communications take place at a government-to-government level (see letter on page A152 of Appendix 1-1). This request was honored by the Arizona Department of Transportation and Federal Highway Administration. All public involvement efforts were implemented by the Gila River Indian Community's public involvement officer.

around there know what Im talking about and so many things you don't know what it means to us having the mountain there, and it wont be the same if it should to be gone. We dont need this freeway there its just gonna cell alot of accidents there or others things I cant say. So Once Again Please dont take our South Mountain Away, Because it is Sacred to us,

Thank You

83	**Visual Impacts**	Visual impacts to and from South Mountain are presented in the Final Environmental Impact Statement on page 4-167.
	Cultural Resources	The importance of the South Mountains Traditional Cultural Property is acknowledged on pages 4-130 and 4-141 of the Draft and Final Environmental Impact Statements, respectively. Consultation has occurred with Gila River Indian Community government officials, the Tribal Historic Preservation Officer, the Cultural Resource Management Program, many different tribal authorities, and the State Historic Preservation Office. This consultation has resulted in concurrence from the Gila River Indian Community Tribal Historic Preservation Office and the State Historic Preservation Office on National Historic Preservation Act eligibility recommendations, project effects, and proposed mitigation and measures to minimize harm. This consultation has been ongoing and will continue until any commitments in a record of decision are completed. The South Mountains would not be destroyed by the proposed freeway. Use of the mountains for the purposes of the proposed freeway represents two-tenths of one percent of the total mountain range. Since 1988, and as part of this environmental impact statement process, several measures have been undertaken and will be undertaken to further reduce effects on the mountains. These measures, including narrowing the design footprint, acquiring replacement land immediately adjacent to the mountains, and the provision of highway crossings, are outlined in text beginning on page 5-23 of the Final Environmental Impact Statement.

I am David Dion Hernandez I'm a member to the Gila River Indian Community. our people have lived in the Valley for centuries, we are descendants of the the Hu Hu kom people. we have farmed this Land for thousands of years. as we wer growing up we wer taught that our Land was sacred and that we need to protect it at all cost. South Mountain park is one of our Sacred Mountains, at one time it had Belonged to our Community. I can Sit here and talk about everything that I had Learned growing up but im not. I know that what we believe as Indian people aint the Same as what you believe? you my See The Mountain as a obstacle! but We See it as a refuge for our animals, a place were we can take our Children and teach them our Culture, it may not Seem Like alot but the Mountain means So Much to our Community.

There are So Many reasons that we dont want the 202 throw the mountain! Having this Highway go throw means more Pollution for our Community. I am worried that my Children will never

84	Cultural Resources	The importance of the South Mountains Traditional Cultural Property is acknowledged on pages 4-130 and 4-141 of the Draft and Final Environmental Impact Statements, respectively. Consultation has occurred with Gila River Indian Community government officials, the Tribal Historic Preservation Officer, the Cultural Resource Management Program, many different tribal authorities, and the State Historic Preservation Office. This consultation has resulted in concurrence from the Gila River Indian Community Tribal Historic Preservation Office and the State Historic Preservation Office on National Historic Preservation Act eligibility recommendations, project effects, and proposed mitigation and measures to minimize harm. This consultation has been ongoing and will continue until any commitments in a record of decision are completed.
	Biological Resources	Multiuse crossings would be provided for wildlife and to accommodate those members of the Gila River Indian Community who wish to gain access to areas of the South Mountains for ceremonies important for their culture (see Final Environmental Impact Statement page 4-160). In addition, as stated on page 5-27 of the Final Environmental Impact Statement, a right-of-way fence would limit access to these areas by freeway users, but allow Gila River Indian Community members to gain access to the area.
	Health Effects	Under the Clean Air Act, the U.S. Environmental Protection Agency is responsible for establishing National Ambient Air Quality Standards to protect public health and the environment from adverse effects of air pollutants. Health effects from air pollutants are based on the concentration of the pollutants and the duration of exposure. Concentrations vary with distance from a roadway based on many factors, including background (or ambient) levels of pollution from all sources; the number, speed, and type of vehicles on the roadway; wind speed and direction; topography; and other factors. For the proposed freeway, the Federal Highway Administration conducted modeling for carbon monoxide and particulate matter (PM_{10}) using worst-case (most congested or highest traffic) modeling locations at discrete receptor locations around each analysis location (primarily residences near the interchanges). The carbon monoxide and particulate matter (PM_{10}) analyses demonstrated that the proposed freeway would not contribute to any new localized violations, increase the frequency or severity of any existing violation, or delay timely attainment of the National Ambient Air Quality Standards or any required interim emissions reductions or other milestones. Mobile source air toxics can also have adverse health impacts, but the U.S. Environmental Protection Agency has not established National Ambient Air Quality Standards for these pollutants. As a result, the Federal Highway Administration analyzes these pollutants using emissions analyses. The mobile source air toxics emissions analysis for the Study Area found little difference in total annual emissions of mobile source air toxics emissions between the Preferred and No-Action Alternatives (less than a 1 percent difference) in 2025 and 2035. With the Preferred Alternative in 2035, modeled mobile source air toxics emissions would decrease by 57 percent to more than 90 percent, depending on the pollutant, despite a 47 percent increase in vehicle miles traveled in the Study Area compared with 2012 conditions.

So Blue Skys, they will grow up with health problems. From all the ~~smog~~ Smog. there will be more accidents, more Spills, and more problems for our Community to worry about. We realy dont need to push anther problem for our Children to worry about.

Adot needs to know we dont want this Freeway to go throw ~~our~~ South Mountain or throw our Community. We dont need to Destroy the Mountain, & Schools, Homes and Communities! the People Have Spoken No Loop 202!

84 (cont.)		Many studies have investigated the prevalence of adverse health effects in the near-road environment. Given concerns about the possibility of air pollution exposure in the near-road environment, the Health Effects Institute has dedicated a number of research efforts toward investigating this issue. In November 2007, the Health Effects Institute published Special Report #16: Mobile-Source Air Toxics: A Critical Review of the Literature on Exposure and Health Effects. This report concluded that the cancer health effects attributable to mobile sources are difficult to discern because the majority of quantitative assessments are derived from occupational cohorts with high concentration exposures and because some cancer potency estimates are derived from animal models. In January 2010, the Health Effects Institute released Special Report #17, investigating the health effects of traffic-related air pollution. The goal of the research was to synthesize available information on the effects of traffic on health. Researchers looked at linkages between: 1) traffic emissions (at the tailpipe) with ambient air pollution in general, 2) concentrations of ambient pollutants with human exposure to pollutants from traffic, 3) exposure to pollutants from traffic with human-health effects and toxicological data, and 4) toxicological data with epidemiological associations. Overall, researchers felt that there was "sufficient" evidence for causality for the exacerbation of asthma. Evidence was "suggestive but not sufficient" for health outcomes such as cardiovascular mortality and others. Study authors also noted that past epidemiological studies may not provide an appropriate assessment of future health associations because vehicle emissions are decreasing over time. Finally, in 2011 three studies were published by the Health Effects Institute evaluating the potential for mobile source air toxics "hot spots." In general, the authors confirmed that while highways are a source of air toxics, they were unable to find that highways were the only source of these pollutants. They determined that near-road exposures were often no different or no higher than background (or ambient) levels of exposure and, hence, no true hot spots were identified. These reports are available from the Health Effects Institute's Web site at <healtheffects.org>. The Federal Highway Administration and U.S. Environmental Protection Agency provide financial support to the Health Effects Institute's research work. Another source of information is the U.S. Environmental Protection Agency's recently released report on Children's Health and the Environment: *The level of knowledge regarding the relationship between environmental exposures and health outcomes varies widely among the topics [presented in this report], and the inclusion of an indicator in the report does not necessarily imply a known relationship between environmental exposure and children's health effects. The report provides data for selected children's health conditions that warrant further research because the causes, including possible contributing environmental factors, are complex and not well understood at this point.*

84 (cont.)		*In the case of asthma, researchers do not fully understand why children develop the condition. However, substantial evidence shows exposure to certain air pollutants, including particulate matter and ozone, can trigger symptoms in children who already have asthma. Although the report found the percentage of children reported to currently have asthma increased from 8.7 percent in 2001 to 9.4 percent in 2010 and that minority populations are particularly affected by asthma, the severity of children's asthma and respiratory symptoms has declined. The rate of emergency room visits for asthma decreased from 114 visits per 10,000 children in 1996 to 103 visits per 10,000 children in 2008. Between 1996 and 2008, hospitalizations for asthma and for all other respiratory causes decreased from 90 hospitalizations per 10,000 children to 56 hospitalizations per 10,000 children.* *The report also looks at trends in other health conditions, such as Attention-Deficit/ Hyperactivity Disorder (ADHD) and preterm births, for which rates have increased. There is no conclusive information on the role of environmental contaminants in ADHD or preterm births, and additional research is ongoing.* Finally, the Federal Highway Administration notes that while the incidence of some health effects (such as asthma, autism, and attention deficit/hyperactivity disorder) in the U.S. population appear to have been increasing, motor vehicle emissions have declined. This decline in mobile source air toxics emissions is documented in Figure 4-24 of the Final Environmental Impact Statement and for other pollutants at <epa.gov/ttn/chief/trends/>. This negative correlation between emissions trends and health effects trends illustrates the complexity of the issues.
	Hazardous Materials	Arizona highways, as are most highways across the United States, are open to all kinds of traffic, so long as the cargo being carried is in accordance with U.S. Department of Transportation regulations for the specific type of cargo. The Arizona Department of Transportation has a few locations in the state with hazardous cargo restrictions, but these restrictions are based on emergency response issues or roadway design limitations specific to that location. For example, the Interstate 10 Deck Park Tunnel has certain hazardous cargo transport restrictions because of the limited ability for emergency responders to address a hazardous materials incident in the tunnel. The South Mountain Freeway, if implemented, is expected to operate under the same rules as other similar facilities in the state; truck traffic would be expected to be permissible (see the text box on page 4-166 of the Final Environmental Impact Statement).

85	Cultural Resources	The importance of the South Mountains Traditional Cultural Property is acknowledged on pages 4-130 and 4-141 of the Draft and Final Environmental Impact Statements, respectively. Consultation has occurred with Gila River Indian Community government officials, the Tribal Historic Preservation Officer, the Cultural Resource Management Program, many different tribal authorities, and the State Historic Preservation Office. This consultation has resulted in concurrence from the Gila River Indian Community Tribal Historic Preservation Office and the State Historic Preservation Office on National Historic Preservation Act eligibility recommendations, project effects, and proposed mitigation and measures to minimize harm. This consultation has been ongoing and will continue until any commitments in a record of decision are completed.
	Tribal Involvement	As noted in Chapter 2 of the Final Environmental Impact Statement, efforts to involve the Gila River Indian Community, a sovereign nation, in the environmental impact statement process are extensive. Public involvement with the Gila River Indian Community was conducted as requested by the tribal government. Prior to October 2005, early efforts to involve the Gila River Indian Community included attending tribal meetings and monthly meetings with Gila River Indian Community Departments (see discussion beginning on page 2-8 of the Draft and Final Environmental Impact Statements). On October 14, 2005, the Gila River Indian Community requested that all project-related communications take place at a government-to-government level (see letter on page A152 of Appendix 1-1). This request was honored by the Arizona Department of Transportation and Federal Highway Administration. All public involvement efforts were implemented by the Gila River Indian Community's public involvement officer. In addition to Chapter 2 of the Final Environmental Impact Statement which explains the Gila River Indian Community, a sovereign nation, outreach undertaken for the project, Chapter 6 of the Final Environmental Impact Statement further describes Gila River Indian Community and general outreach throughout the process. The Gila River Indian Community was provided equal opportunities to participate in the project as all other populations and agencies. This outreach was undertaken, in part, to ensure all populations had equal access to the process and, in part, to ensure disparate nor disproportionately high adverse impacts would result from the construction and operation of the proposed action.
86	Cultural Resources	The importance of the South Mountains Traditional Cultural Property is acknowledged on pages 4-130 and 4-141 of the Draft and Final Environmental Impact Statements, respectively. Hello, 6-29-13

My name is Nicole Johns and I am a Gila River Indian Community member. I am stating that My connection to South Mountain is that it is a very ~~sacred~~ sacred place to me and my people.

I would also like to say that A.D.O.T. did not properly notify every one in our community about the meetings they have had about South Mountian.

I my-self have not herd any thing about these meetings ~~until they~~ ~~article discussed~~ have already passed. they donot make it easy for me to get to these meetings that they have. I donot have transportation to go in to the city or to the far west end of our reservation. I would like to add that if would be more convinient if they would have went to each district and asked each of us how we felt about this.

The health concerns I have about this project are that the exhaust would kill plant life that has been there for hundreds of years and can & will be a health hazard for the people that live near

87	**Tribal Involvement**	Arizona Department of Transportation advertisement efforts of the public hearing and public forums are documented in Chapter 6 of the Final Environmental Impact Statement beginning on page 6-23. The Gila River Indian Community Communication and Public Affairs Office informed the Arizona Department of Transportation that all communication and distribution of informational materials on Gila River Indian Community land would be handled by the Communication and Public Affairs Office. Advertisement text regarding the project, the public comment period, the public hearing and the various ways for the public to submit comments regarding the South Mountain Freeway Draft Environmental Impact Statement was given to the Gila River Indian Community's Public Information Officer at the Transportation Technical Team meeting on April 30, 2013. Two advertisements regarding the public hearing, information regarding the location and availability of the Draft Environmental Impact Statement, and a map of the alternatives was placed in the May 2013 monthly issue of the *Gila River Indian News*. The Arizona Department of Transportation Community Relations distributed electronic notices (e-newsletters) through the Government Delivery system to over 12,000 constituents who voluntarily signed up for project alerts along the Interstate 10 Papago, Maricopa, and Santan Freeways. These electronic notices included notice of availability of Draft Environmental Impact Statement (distributed on April 26, 2013); public hearing (distributed on May 10, 2013); the community forums (distributed on May 29, 2013) and one in June (close of the Draft Environmental Impact Statement public comment period). In addition, anyone who had attended a previous meeting on the proposed action and signed in received all of this information mailed individually. On May 6, 2013, 73,564 mailers were distributed to addresses within the Study Area. The public hearing for the proposed action was widely advertised. Newspaper advertisements in six newspapers of area-wide distribution ran at least twice each. Announcements occurred on five radio stations and six television stations. Mailers were sent on May 6, 2013, to 73,564 individuals (approximately 311 on the Gila River Indian Community) who had previously expressed an interest in the project. E-newsletters were distributed on three different occasions. All materials were also provided to the Gila River Indian Community Public Information Officer. Offers to the Gila River Indian Community Manager to host a public outreach events on the Gila River Indian Community began in summer 2012. The Gila River Indian Community first officially responded to this offer at the April 30, 2013, meeting of the Transportation Technical Team. During this meeting, the Gila River Indian Community Manager requested that a community forum be conducted on the Gila River Indian Community following the public hearing. This was the only request the Arizona Department of Transportation received from the Gila River Indian Community regarding whether the Arizona Department of Transportation could hold a public outreach event during the public comment period. The Arizona Department of Transportation agreed to do so, and a community forum was held on June 22, 2013, at the Komatke Boys & Girls Club on the Gila River Indian Community.

87 (cont.)	Health Effects	Under the Clean Air Act, the U.S. Environmental Protection Agency is responsible for establishing National Ambient Air Quality Standards to protect public health and the environment from adverse effects of air pollutants. Health effects from air pollutants are based on the concentration of the pollutants and the duration of exposure. Concentrations vary with distance from a roadway based on many factors, including background (or ambient) levels of pollution from all sources; the number, speed, and type of vehicles on the roadway; wind speed and direction; topography; and other factors. For the proposed freeway, the Federal Highway Administration conducted modeling for carbon monoxide and particulate matter (PM_{10}) using worst-case (most congested or highest traffic) modeling locations at discrete receptor locations around each analysis location (primarily residences near the interchanges). The carbon monoxide and particulate matter (PM_{10}) analyses demonstrated that the proposed freeway would not contribute to any new localized violations, increase the frequency or severity of any existing violation, or delay timely attainment of the National Ambient Air Quality Standards or any required interim emissions reductions or other milestones. Mobile source air toxics can also have adverse health impacts, but the U.S. Environmental Protection Agency has not established National Ambient Air Quality Standards for these pollutants. As a result, the Federal Highway Administration analyzes these pollutants using emissions analyses. The mobile source air toxics emissions analysis for the Study Area found little difference in total annual emissions of mobile source air toxics emissions between the Preferred and No-Action Alternatives (less than a 1 percent difference) in 2025 and 2035. With the Preferred Alternative in 2035, modeled mobile source air toxics emissions would decrease by 57 percent to more than 90 percent, depending on the pollutant, despite a 47 percent increase in vehicle miles traveled in the Study Area compared with 2012 conditions. Many studies have investigated the prevalence of adverse health effects in the near-road environment. Given concerns about the possibility of air pollution exposure in the near-road environment, the Health Effects Institute has dedicated a number of research efforts toward investigating this issue. In November 2007, the Health Effects Institute published Special Report #16: Mobile-Source Air Toxics: A Critical Review of the Literature on Exposure and Health Effects. This report concluded that the cancer health effects attributable to mobile sources are difficult to discern because the majority of quantitative assessments are derived from occupational cohorts with high concentration exposures and because some cancer potency estimates are derived from animal models. In January 2010, the Health Effects Institute released Special Report #17, investigating the health effects of traffic-related air pollution. The goal of the research was to synthesize available information on the effects of traffic on health. Researchers looked at linkages between: 1) traffic emissions (at the tailpipe) with ambient air pollution in general, 2) concentrations of ambient pollutants with human exposure to pollutants from traffic, 3) exposure to pollutants from traffic with human-health effects and toxicological data, and 4) toxicological data with epidemiological associations.

87 (cont.)		Overall, researchers felt that there was "sufficient" evidence for causality for the exacerbation of asthma. Evidence was "suggestive but not sufficient" for health outcomes such as cardiovascular mortality and others. Study authors also noted that past epidemiological studies may not provide an appropriate assessment of future health associations because vehicle emissions are decreasing over time. Finally, in 2011 three studies were published by the Health Effects Institute evaluating the potential for mobile source air toxics "hot spots." In general, the authors confirmed that while highways are a source of air toxics, they were unable to find that highways were the only source of these pollutants. They determined that near-road exposures were often no different or no higher than background (or ambient) levels of exposure and, hence, no true hot spots were identified. These reports are available from the Health Effects Institute's Web site at <healtheffects.org>. The Federal Highway Administration and U.S. Environmental Protection Agency provide financial support to the Health Effects Institute's research work. Another source of information is the U.S. Environmental Protection Agency's recently released report on Children's Health and the Environment: *The level of knowledge regarding the relationship between environmental exposures and health outcomes varies widely among the topics [presented in this report], and the inclusion of an indicator in the report does not necessarily imply a known relationship between environmental exposure and children's health effects. The report provides data for selected children's health conditions that warrant further research because the causes, including possible contributing environmental factors, are complex and not well understood at this point.* *In the case of asthma, researchers do not fully understand why children develop the condition. However, substantial evidence shows exposure to certain air pollutants, including particulate matter and ozone, can trigger symptoms in children who already have asthma. Although the report found the percentage of children reported to currently have asthma increased from 8.7 percent in 2001 to 9.4 percent in 2010 and that minority populations are particularly affected by asthma, the severity of children's asthma and respiratory symptoms has declined. The rate of emergency room visits for asthma decreased from 114 visits per 10,000 children in 1996 to 103 visits per 10,000 children in 2008. Between 1996 and 2008, hospitalizations for asthma and for all other respiratory causes decreased from 90 hospitalizations per 10,000 children to 56 hospitalizations per 10,000 children.* *The report also looks at trends in other health conditions, such as Attention-Deficit/Hyperactivity Disorder (ADHD) and preterm births, for which rates have increased. There is no conclusive information on the role of environmental contaminants in ADHD or preterm births, and additional research is ongoing.* Finally, the Federal Highway Administration notes that while the incidence of some health effects (such as asthma, autism, and attention deficit/hyperactivity disorder) in the U.S. population appear to have been increasing, motor vehicle emissions have declined. This decline in mobile source air toxics emissions is documented in Figure 4-24 of the Final Environmental Impact Statement and for other pollutants at <epa.gov/ttn/chief/trends/>. This negative correlation between emissions trends and health effects trends illustrates the complexity of the issues.

[redacted] Frances Stevens, I am 13 years old, I am a Gila River Indian Community member and a member of G.R.E.Y. (Gila River Environmental Youth)

I'm against the freeway to be built, because [redacted] the polution will make us sick also destroy our plant lifes, In the future even make our animals die or get sick.

[redacted] first of all, I really [redacted] don't like the idea of this freeway/loop 202. because it can ruin our lifes in the future, make us very sick. what I'm saying is that we have enough of polution on the reservations, we don't need more polution to ruin our future families.

[redacted] Second of all, the polution will destroy our plants/crops that we make a living on, also our tree's! we need our trees.

[redacted] [redacted] The last thing I would like to talk about is why weren't there [redacted] tranportation given to the community.

87 (cont.)	**Cultural Resources**	The importance of the South Mountains Traditional Cultural Property is acknowledged on pages 4-130 and 4-141 of the Draft and Final Environmental Impact Statements, respectively. Consultation has occurred with Gila River Indian Community government officials, the Tribal Historic Preservation Officer, the Cultural Resource Management Program, many different tribal authorities, and the State Historic Preservation Office. This consultation has resulted in concurrence from the Gila River Indian Community Tribal Historic Preservation Office and the State Historic Preservation Office on National Historic Preservation Act eligibility recommendations, project effects, and proposed mitigation and measures to minimize harm. This consultation has been ongoing and will continue until any commitments in a record of decision are completed.
88	**Biology, Plants, and Wildlife**	Within the context of overall vegetation, wildlife, and wildlife habitat, all action alternatives and options would decrease the amount of cover, nesting areas, and food resources for wildlife species caused by habitat loss, fragmentation, and traffic disturbance. See the section, *General Impacts on Vegetation, Wildlife, and Wildlife Habitat*, beginning on page 4-136 of the Final Environmental Impact Statement, for additional details on potential effects on vegetation, wildlife, and wildlife habitat. The Arizona Department of Transportation and Federal Highway Administration completed a Biological Evaluation containing analysis of the project effects on listed and candidate species under the Endangered Species Act. The Biological Evaluation was completed in 2014 following identification of the Preferred Alternative in the Draft Environmental Impact Statement. The Biological Evaluation was sent to the U.S. Fish and Wildlife Service, Arizona Game and Fish Department, and Gila River Indian Community Department of Environmental Quality for technical assistance with assessing the level of project effects on listed and candidate species prior to completion of the Final Environmental Impact Statement. The Arizona Department of Transportation and Federal Highway Administration have committed to continue coordination with the Arizona Game and Fish Department, Gila River Indian Community Department of Environmental Quality, and U.S. Fish and Wildlife Service regarding wildlife concerns as a result of the freeway's potential implementation. The results of the Biological Evaluation may be found beginning on page 4-125 of the Final Environmental Impact Statement.
	Air Quality, Health Effects	As noted on page 4-69 of the Final Environmental Impact Statement, secondary air quality standards are promulgated to minimize environmental and property damage. Primary and secondary standards for particulate matter (PM_{10}) are identical; no threshold is established by the U.S. Environmental Protection Agency for carbon monoxide (CO). Under the Clean Air Act, the U.S. Environmental Protection Agency is responsible for establishing National Ambient Air Quality Standards to protect public health and the environment from adverse effects of air pollutants. Health effects from air pollutants are based on the concentration of the pollutants and the duration of exposure. Concentrations vary with distance from a roadway based on many factors, including background (or ambient) levels of pollution from all sources; the number, speed, and type of vehicles on the roadway; wind speed and direction; topography; and other factors. For the proposed freeway, the Federal Highway Administration conducted modeling for carbon monoxide and particulate matter (PM_{10}) using worst-case (most congested or highest traffic) modeling locations at discrete receptor locations around each analysis location (primarily residences near the interchanges). The carbon monoxide and particulate matter (PM_{10})analyses

This negative correlation between emissions trends and health effects trends illustrates the complexity of the issues.
	Tribal involvement	The Arizona Department of Transportation provided vouchers for public hearing parking and for public transit to the hearing. For the first time in the State's history, a shuttle bus to the hearing was provided from six locations in the Phoenix area, including two on the Gila River Indian Community (Komatke Boys & Girls Club and the Governance Center in Sacaton). All ads provided telephone numbers and electronic contact information regarding information on the shuttle schedules and pick-up locations.

To whom it may concern

91 My name is Veranadette Stevens. I am an enrolled member of the Salt River Reservation. I am a Pima/Apache residing in District 3.

All and most of my life I have lived on the reservation. I originally grew up in District 3. I left the reservation a few years to another reservation out of State. As I returned back to the reservation I finished grade school and went to boarding school. By that time I learned my parents and family had moved to the West end of the reservation. There I had lived to grow into my adult hood.

So today as I hear about this project being built. It saddens me to know that they are so persistant to build this Freeway. I guess because thats all ~~that~~ that Tonto is there for. All of this saddens me to hear all the stuff that everyone is going through. As for myself. I care much for my people. And with this project in latter. I know there will be alot of health issues. As I lived on the West End. I use to do alot of running along the gas line. I also use to climb the mountain.

89	**Purpose and Need**	In the Draft and Final Environmental Impact Statements, Chapter 1, *Purpose and Need*, examines the purpose and need for the proposed action in terms of defining a transportation problem. The results of the purpose and need analyses included the determination that a transportation problem (similar to the type of problem that has been represented in past Regional Transportation Plans) still exists in the area and that this problem is similar in characteristics to the transportation problem that existed in prior years. The alternatives analyses considered numerous modal alternatives, and a robust screening process led to the conclusion that a road facility would best address the transportation problem defined.
	Health Effects	As noted on page 4-69 of the Final Environmental Impact Statement, secondary air quality standards are promulgated to minimize environmental and property damage. Primary and secondary standards for particulate matter (PM_{10}) are identical; no threshold is established by the U.S. Environmental Protection Agency for carbon monoxide (CO). Under the Clean Air Act, the U.S. Environmental Protection Agency is responsible for establishing National Ambient Air Quality Standards to protect public health and the environment from adverse effects of air pollutants. Health effects from air pollutants are based on the concentration of the pollutants and the duration of exposure. Almost everyday. I would sit on the top and pray. It gave me a good feeling within myself each day I did this. I would also see how close the house had started to come out. This was only the beginning. Now today I see more much of the city has come. Then it makes me wonder how many of these white people that are having their house come out our way, could and are prejudice of Indians. To hear of this mountain being destroyed has put a great hurt in my spiritual life. Because God has made this creation and people are wanting to mess it up for something that is not really necessary. The Freeway today has been serving a good enough purpose. Also if this Freeway is being built it would take away my grandchildrens right to have a home out there. As well as my daughter. She has a part in this section about the Freeway being built. Through all this she has not been notified of every meeting that was held. She only heard it from her aunts after the meeting had taken place. I for her to help. She needs to be notified of all mtgs. I don't know who these people who are even wanting

to build this Freeway. I dont know why they cant hold a meeting in each District to see ~~what~~ the people think. Even though it is for landowners. But I think it is going to affect the whole reservation. Especially with the living conditions. For the ones who are in their homes. Will they continue to stay or will they have to move. I know in life that change is good. But in this matter I dont think so. I know of some elders who still go to get the medicine, ~~and~~ cactus food and sage for their health and spiritual needs. As we grow older. How can our tradition stay alive if we dont stand up for our community. I can see that there are more homes being built out there today. And if these people have to move then why are we wasting money when it could start going to a medical or other emergency need. Because by this Freeway being built. We are all going to need alot of medical needs. Especially of the speed limit and if the car goes over the railing. Has anyone thought of all the accidents and mishaps there could be. I dont know how many people climb that mountain. But you need to climb it and take a good look

Code	Issue	Response
89 (cont.)		Finally, the Federal Highway Administration notes that while the incidence of some health effects (such as asthma, autism, and attention deficit/hyperactivity disorder) in the U.S. population appear to have been increasing, motor vehicle emissions have declined. This decline in mobile source air toxics emissions is documented in Figure 4-24 of the Final Environmental Impact Statement and for other pollutants at <epa.gov/ttn/chief/trends/>. This negative correlation between emissions trends and health effects trends illustrates the complexity of the issues.
	Cultural Resources	The importance of the South Mountains Traditional Cultural Property is acknowledged on pages 4-130 and 4-141 of the Draft and Final Environmental Impact Statements, respectively. Consultation has occurred with Gila River Indian Community government officials, the Tribal Historic Preservation Officer, the Cultural Resource Management Program, many different tribal authorities, and the State Historic Preservation Office. This consultation has resulted in concurrence from the Gila River Indian Community Tribal Historic Preservation Office and the State Historic Preservation Office on National Historic Preservation Act eligibility recommendations, project effects, and proposed mitigation and measures to minimize harm. This consultation has been ongoing and will continue until any commitments in a record of decision are completed.
	Tribal Involvement	Arizona Department of Transportation advertisement efforts of the public hearing and public forums are documented in Chapter 6 of the Final Environmental Impact Statement beginning on page 6-23. The Gila River Indian Community Communication and Public Affairs Office informed the Arizona Department of Transportation that all communication and distribution of informational materials on Gila River Indian Community land would be handled by the Communication and Public Affairs Office. Advertisement text regarding the project, the public comment period, the public hearing and the various ways for the public to submit comments regarding the South Mountain Freeway Draft Environmental Impact Statement was given to the Gila River Indian Community's Public Information Officer at the Transportation Technical Team meeting on April 30, 2013. Two advertisements regarding the public hearing, information regarding the location and availability of the Draft Environmental Impact Statement, and a map of the alternatives was placed in the May 2013 monthly issue of the *Gila River Indian News*. The Arizona Department of Transportation Community Relations distributed electronic notices (e-newsletters) through the Government Delivery system to over 12,000 constituents who voluntarily signed up for project alerts along the Interstate 10 Papago, Maricopa, and Santan Freeways. These electronic notices included notice of availability of Draft Environmental Impact Statement (distributed on April 26, 2013); public hearing (distributed on May 10, 2013); the community forums (distributed on May 29, 2013) and one in June (close of the Draft Environmental Impact Statement public comment period). In addition, anyone who had attended a previous meeting on the proposed action and signed in received all of this information mailed individually. On May 6, 2013, 73,564 mailers were distributed to addresses within the Study Area.

at the pollution. Believe me it is not a very good feeling. To see all of the grey. Geez we don't even want to stand in a dust storm. That even carries all kinds of chemicals as well. I thought it was just dirt. Until my daughter caught the Valley Fever. And asked around. Then I realized that we all have it. Because we live in the Desert. It's just how are bodies work and our immune system. So to wonder if the pollution that will come along with the Freeway. and To say to someone that I helped put my family in danger. Is kinda foolish. Because I might as well have killed them myself. I wish there is another way to build a road not a Freeway. Because there is always another solution. Because in life we have a Wrong and a right. So please take into consideration of everyone involved from infants to adults. As well as all the health reasons of the people have of today. The mountain does have a reason for it being where it is at today. So to bother it would bring more than we all Bargained for. Because it is the work of our Lord. And it brings Survival. I also wonder if they build this Freeway. Are

Code	Issue	Response
89 (cont.)		The public hearing for the proposed action was widely advertised. Newspaper advertisements in six newspapers of area-wide distribution ran at least twice each. Announcements occurred on five radio stations and six television stations. Mailers were sent on May 6, 2013, to 73,564 individuals (approximately 311 on the Gila River Indian Community) who had previously expressed an interest in the project. E-newsletters were distributed on three different occasions. All materials were also provided to the Gila River Indian Community Public Information Officer. Offers to the Gila River Indian Community Manager to host a public outreach events on the Gila River Indian Community began in summer 2012. The Gila River Indian Community first officially responded to this offer at the April 30, 2013, meeting of the Transportation Technical Team. During this meeting, the Gila River Indian Community Manager requested that a community forum be conducted on the Gila River Indian Community following the public hearing. This was the only request the Arizona Department of Transportation received from the Gila River Indian Community regarding whether the Arizona Department of Transportation could hold a public outreach event during the public comment period. The Arizona Department of Transportation agreed to do so, and a community forum was held on June 22, 2013, at the Komatke Boys & Girls Club on the Gila River Indian Community. As noted in Chapter 2 of the Final Environmental Impact Statement, efforts to involve the Gila River Indian Community, a sovereign nation, in the environmental impact statement process are extensive. Public involvement with the Gila River Indian Community was conducted as requested by the tribal government. Prior to October 2005, early efforts to involve the Gila River Indian Community included attending tribal meetings and monthly meetings with Gila River Indian Community Departments (see discussion beginning on page 2-8 of the Draft and Final Environmental Impact Statements). On October 14, 2005, the Gila River Indian Community requested that all project-related communications take place at a government-to-government level (see letter on page A152 of Appendix 1-1). This request was honored by the Arizona Department of Transportation and Federal Highway Administration. All public involvement efforts were implemented by the Gila River Indian Community's public involvement officer.
	Water Resources	Table 4-41 on page 4-106 of the Final Environmental Impact Statement discloses the number of wells that may be acquired by each action alternative and, as noted on page 4-108 of the Final Environmental Impact Statement, some of these wells are abandoned wells. Impacts to wells on the Gila River Indian Community are not anticipated.
	Acquisitions and Relocations	No homes on Gila River Indian Community land would be acquired for the proposed freeway.

Code	Comment Document

my people who live out there going to have to start paying for their water from the city. I know there are several water wells out there. But will they have to be covered because of the freeway. The water out in that area is not to well. But in order to have better water. The wells would have to be dug deeper. So to take things away or destroy is not a good way of life. The mountain has given me much in my life. It has kept me strong, sane, peaceful, and healthy. As well as other purposes. So to see it being destroyed is sad. Because I'm sure if we want our kids to stay active and exercise. We need to all need to take a stand. So one needs to be really honest about all aspects of this Freeway. Especially to the community of the reservation

1 Arizona Department of Transportation officials who are part of 202 planning were to have taken cultural awareness trainings put on by the Gila River Indian Community, as stated by Community Manager David White. When were those trainings conducted, what GRIC department conducted them, and what were the policy shifts, if any, that resulted from the cultural awareness trainings? What scoping comments from these trainings went into the DEIS?

2 Was the Section 106 process for South Mountain ever begun between the Tribal Historic Preservation Office and the Arizona Department of Transportation? If no, when can GRIC expect that process to start, in order to comply with the Religious Freedom and Restoration Act, as well as the National Historic Preservation Act? What outreach and scoping has ADOT done to the sister tribes of O'odham who also hold the South Mountain range as sacred, namely the Salt River Pima-Maricopa Indian Community, the Ak-Chin Indian Community, and the Tohono O'odham Nation? What outreach and scoping has ADOT done to the other tribes who have cultural affiliation to South Mountain, such as the Colorado River Indian Tribes and the Hopi Nation?

3 If the freeway were to be built, what type of assurances are there that air quality assessments for Gila River and Maricopa County will be kept separate? Gila River has been awarded a Clean Air Excellence award by the Environmental Protection Agency, and our community does not want any of our air quality measurements to fall under the Phoenix region, which has had sanctions from the EPA for withdrawing their clean air programs.

4 On January 19, 2011, the Environmental Protection Agency Regional Administrator signed the Gila River Indian Community's (GRIC) Tribal Implementation Program (TIP) into effect. The effect of this action was to make the TIP federally enforceable. The TIP regulates air quality within the boundaries of Gila River, and its purpose is to enforce air quality standards within the GRIC boundaries. The TIP contains ordinances that require GRICDEQ staff, tribal attorneys, and if needed, the GRIC tribal police, to assume civil and criminal enforcement actions against persons who violate clean air standards outlined in the TIP. If the E1 alignment is built, and air quality monitors in Gila River exceed PM10 and ozone standards, what will be the procedure for Gila River to prosecute federal agencies or persons whose actions violate clean air standards within the TIP?

5 On January 25, 2011 the State of Arizona withdrew plans for a State Implementation Plan (SIP) to meet particulate matter-10 standards in the Maricopa County PM-10 nonattainment area, thus failing to comply with provisions of the Clean Air Act. By withdrawing the SIP, the State of Arizona triggered a January 31, 2011 decision by the Environmental Protection Agency to begin a sanctions clock on Maricopa County, because the county's air quality plan does not adequately protect human health. What air quality permits will the Arizona Department of Transportation have to secure in order to begin construction on the E1 alignment in Maricopa County, especially in light of being under the sanctions clock by the

Code	Issue	Response
1	**Cultural Resources**	Cultural sensitivity training sessions were held on May 24, 2010, June 14, 2010, December 28, 2010, and January 20, 2011. The training sessions were led by the Gila River Indian Community's Tribal Historic Preservation Officer and by staff from the Gila River Indian Community's Cultural Resource Management Program. The purpose of the training was to raise awareness and sensitivity to cultural and natural resources that would be encountered by personnel as they conducted field investigations on Community land for the proposed Gila River Indian Community Alignment. The training was recommended by the Gila River Indian Community's Cultural Resources Standing Committee at the time they issued the right of entry to the South Mountain project team. The training did not result in policy shifts or scoping comments for the study. As noted on page 2-8 of the Draft and Final Environmental Impact Statement, the coordinated referendum occurred in February 2012, and Community members voted in favor of the no-build option. Therefore, the Gila River Indian Community Alignment was eliminated from further study.
2	**Cultural Resources**	Section 106 of the National Historic Preservation Act requires a government-to-government relationship between the Federal Government and Indian tribes as described beginning on page 4-140 of the Final Environmental Impact Statement. Section 106 requires that federal agencies take into account the effects of their undertakings on historic properties. This process requires consultation with tribal authorities. Consultation has occurred with Gila River Indian Community government officials, the Tribal Historic Preservation Officer, the Cultural Resource Management Program, many different tribal authorities, and the State Historic Preservation Office. The consultation has resulted in concurrence from the Gila River Indian Community Tribal Historic Preservation Office and the State Historic Preservation Office on National Register of Historic Places eligibility recommendations (including traditional cultural properties), project effects, and proposed mitigation and measures to minimize harm. In 2003, the Federal Highway Administration and Arizona Department of Transportation initiated National Historic Preservation Act Section 106 consultations with all Native American tribes that claimed cultural affiliation to the Study Area. Consultations were initiated with the Ak-Chin Indian Community, Gila River Indian Community, the Hopi Tribe, the Salt River Pima-Maricopa Indian Community, the Tohono O'odham Nation, the Yavapai-Apache Tribe, and the Yavapai-Prescott Indian Tribe. As noted in Table 4-47 that begins on page 4-145 of the Final Environmental Impact Statement, the Gila River Indian Community was consulted in 2003 with subsequent contact in 2005, 2006, 2007, 2008, 2010, 2011, 2012, and 2013. This supports an early and continued consultation with the Gila River Indian Community related to resources of importance. In 2005, the Federal Highway Administration and Arizona Department of Transportation consulted with all Native American tribes in Arizona to ensure all interested Native Americans were included in the process and had the opportunity to communicate their concerns. These tribes were the Ak-Chin Indian Community, the Chemehuevi Tribe, the Cocopah Tribe, the Colorado River Indian Tribe, the Fort McDowell Yavapai Nation, the Fort Mojave Tribe, the Fort Yuma-Quechan Tribe, the Gila River Indian Community, the Havasupai Tribe, the Hopi Tribe, the Hualapai Tribe, the Kaibab-Paiute Tribe, the Navajo Nation, the Pascua Yaqui Tribe, the Pueblo of Zuni, the Salt River Pima-Maricopa Indian Community, the

Code	Comment Document
	EPA?
6	Because of South Mountain's religious and cultural significance to the Gila River Indian Community, the Salt River Pima-Maricopa Indian Community, and the Colorado River Indian Tribes, building the E1 alignment will have an adverse impact on the exercise of Native American religious beliefs. If MAG, ADOT, and the State of Arizona continue with plans to build the proposed E1 alignment, these agencies and the state will be violating parts of the Religious Freedom and Restoration Act (RFRA), specifically as defined in 42 U.S.C. Amendment 2000cc-5. The proposed E1 alignment would introduce visual, atmospheric, and audible elements that would diminish South Mountain's cultural and religious significance. Many O'odham feel that South Mountain is in eminent danger from construction plans that will impact their sacred site for all time. There has been a lack of good faith consultation with O'odham traditional religious leaders, and almost a complete lack of diligence in the Section 106 process with GRIC. When will ADOT begin to consult closely with O'odham religious leaders, and to also inform them that the proposed 202 extension is also part of the Maricopa Association of Governments' plan to build the Sun Corridor between Phoenix and Tucson?
7	What type of government-to-government talks will ADOT disclose that they have done with Gila River tribal leadership to uphold the United Nations Declaration of the Rights of Indigenous People (UNDRIP), namely Article 7 of Convention No. 169 which states that Indigenous and tribal peoples have the right to "decide their own priorities for the process of development as it affects their lives, beliefs, institutions and spiritual well-being and the lands they occupy or otherwise use, and to exercise control over their economic, social and cultural development."? Maricopa County is within the territorial boundaries of the U.S. and is subject to the laws, both international and domestic of the United States of America, and since the U.S. is a supporter of the UNDRIP, Maricopa County officials also are obligated to the UNDRIP's articles and recommendations. Finally they U.S. Ratified the ILO Convention 169 (which is legally binding) and signed onto the ILO, which means they are legally obligated to is principles and conventions.
8	The cornerstone of Convention No. 169, on which all its provisions are based, is consultation and participation of Indigenous and tribal peoples. The Convention requires that Indigenous and tribal peoples are consulted on issues that affect them. It requires that these peoples are able to engage in free, prior and informed participation in policy and development processes that affect them. This means not just the Gila River Indian Community, but also Salt River Pima-Maricopa Indian Community, Ak-Chin Indian Community, Tohono O'odham Nation, Colorado River Indian Tribes and Hopi Nation, which are all tribes that have cultural affiliations to South Mountain. To ensure that the rights of these Indigenous and tribal peoples are protected and taken into account when any measures are being undertaken that are likely to have an impact on these peoples, scoping must be done by ADOT in those communities.

Code	Issue	Response
2 (cont.)		San Carlos Apache Tribe, the San Juan Southern Paiute, the Tohono O'odham Nation, the Tonto Apache Tribe, the White Mountain Apache Tribe, the Yavapai-Apache Tribe, and the Yavapai-Prescott Indian Tribe. Most of these tribes did not express an interest in the proposed project. The Ak-Chin Indian Community, the Salt River Pima-Maricopa Indian Community, and the Tohono O'odham deferred to the Gila River Indian Community to take the lead with Section 106 consultations on this proposed action project. Consultation with Native America tribes has been extensive and demonstrates a reasonable and good faith effort to include all interested Native American tribes in the process to take their concerns seriously in the planning effort. This consultation has been ongoing and will continue until any commitments in a record of decision are completed.
3	**Air Quality**	The Clean Air Excellence Award was awarded to the Gila River Indian Community Department of Environmental Quality Air Quality Program Team based on the development of a multi-program Air Quality Management Plan to regulate air quality, the first of its kind for an Indian Community. The award was not in any way an indication of the quality of the air within Gila River Indian Community land. The Gila River Indian Community is not included in the Maricopa County Carbon Monoxide Maintenance Area or the Maricopa 8-hour Ozone Nonattainment Area. The northern part of the Gila River Indian Community is within the Maricopa County Particulate Matter Nonattainment Area (see Figure 4-20 on page 4-71 of the Final Environmental Impact Statement). The Gila River Indian Community is part of the Maricopa Association of Governments and as such is included in air quality conformity demonstrations for the Maricopa Association of Governments region. The air quality assessment for the proposed freeway analyzed impacts from carbon monoxide and particulate matter (PM_{10}) and followed U.S. Environmental Protection Agency guidelines. No violations of either the carbon monoxide or particulate matter (PM_{10}) standards were identified, even at worst-case locations along the project corridor. Thus, the carbon monoxide and particulate analyses demonstrated that the proposed freeway would not contribute to any new localized violations, increase the frequency or severity of any existing violation or delay timely attainment of the National Ambient Air Quality Standards or any required interim emissions reductions or other milestones. For mobile source air toxics, the analysis showed that for the Study Area, constructing the freeway would have a marginal effect on annual emissions in 2025 and 2035 (less than a 1 percent difference in total annual emissions between the Preferred Alternative and No-Action Alternative). With the Preferred Alternative in 2035, modeled mobile source air toxics emissions would decrease by 57 percent to more than 90 percent, depending on the pollutant, despite a 47 percent increase in vehicle miles traveled in the Study Area compared with 2012 conditions. The air quality analyses were updated for the Final Environmental Impact Statement, including a quantitative particulate matter (PM_{10}) analysis, and are more fully described beginning on page 4-68 of the Final Environmental Impact Statement. Congestion relief resulting from the proposed freeway would provide localized air quality emissions reductions on area freeways and arterial streets and at interchanges, benefiting users of area highways and those living near congested roads.

Code	Comment Document
9	The proposed freeway is meant to be an I-10 commercial truck bypass to decrease traffic congestion on I-10 in Maricopa County. In the DEIS, the impacts of air pollution do not include vehicle emissions from commercial trucks originating from Mexico, which are fueled with diesel that does not meet the environmental standards adopted by Arizona. The air pollution models in the DEIS need to study the number of Mexican commercial trucks with destinations that pass through metro Phoenix, or whose destinations are in this geographic region. Those tons of air pollution need to be identified (what type of particulate matter it would be and the associated health impacts), quantified, and factored in to the analysis of air quality.
10	If living near a major highway adversely affects air quality, does it shorten the human lifespan, and if so, how much shorter is the human lifespan? ADOT or HDR has a legal and civil responsibility to bring in outside research and air toxicology experts to explain how poor air quality affects the body, as well as pregnancy outcomes and fertility rates. The 2005 JATAP study must be included in the FEIS, as well.
11	Aerial photography must be added to the DEIS to show how many homes in Gila River would be destroyed by the path of the proposed project, as well as the acreage of Indigenous TCPs that would be destroyed.
12	South Mountain is a sacred area not just to the Gila River Indian Community, but to the Ak-Chin Indian Community, Salt River Pima-Maricopa Indian Community, the Tohono O'odham Nation, the Hopi, and to the Colorado River Indian Tribes. What type of scoping, community outreach, and hearings did ADOT perform in those communities?
13	What consultants from those communities were brought in to stress the protection of traditional cultural properties?
14	What types of protections are in place for NRHP-eligible resources in the South Mountain Park Preserves (SMPP)? Under Criterion A (association with an important event) and Criterion B (association with an important person) of Section 106 of the NRHP, the entire 16,600 acres of the SMPP is NRHP-eligible as a traditional cultural property. This means the No Build alternative is the only action ADOT can take to protect the South Mountains.
15	The DEIS describes a fence to be built around an O'odham cultural resource , as a mitigation measure. Culture cannot be fenced, and the freeway's direct and indirect impacts to this site must be brought back to the Gila River Indian Community, Ak-Chin Indian Community, Salt River Pima-Maricopa Indian Community, Tohono O'odham Nation, Hopi tribe, and the Colorado River Indian Tribes (CRIT) before this resource is further impaired. Article 8 of the 2007 United Nations Declaration of the Rights of Indigenous Peoples (UNDRIP) prohibits the "forced assimilation or destruction of Indigenous culture." Further analysis of direct and indirect impacts to Site AZ T:12:112 is a basic human and civil right for the affected tribal stakeholders.

Code	Issue	Response
4	**Air Quality**	The Gila River Indian Community's primary purpose for developing the Tribal Implementation Plan and the Air Quality Management Plan is to provide a regulatory structure for industrial sources that were not permitted by the Gila River Indian Community nor U.S. Environmental Protection Agency. The Gila River Indian Community's regulatory authority is limited to enforcement of these permitted facilities.
5	**Air Quality**	In May 2012, the Arizona Department of Environmental Quality submitted a revised Maricopa Association of Governments 2012 Five Percent Plan for the region. On July 20, 2012, the U.S. Environmental Protection Agency made an official finding that the Maricopa Association of Governments 2012 Five Percent Plan was administratively complete. This decision ended the sanctions clocks associated with Arizona's decision to withdraw the Maricopa Association of Governments 2007 Five Percent Plan. On February 6, 2014, the U.S. Environmental Protection Agency published a notice in the *Federal Register* proposing to approve the Maricopa Association of Governments *2012 Five Percent Plan for Attainment of the PM-10 Standard* for the Maricopa County Nonattainment Area. In the same notice, the U.S. Environmental Protection Agency stated that it would concur with exceptional event (as a result of haboobs and dust storms) documentation prepared by the Arizona Department of Environmental Quality, which would give the region the 3 years of clean data needed for attainment of the particulate matter (PM_{10}) 24-hour standard. Finally on May 30, 2014, the U.S. Environmental Protection Agency approved the 2012 Five Percent Plan and found the area in attainment of the 24-hour particulate matter (PM_{10}) standard based on monitoring data for the years 2010 to 2012 (see page 4-72 of the Final Environmental Impact Statement for more information). The air quality assessment for the proposed freeway analyzed impacts from carbon monoxide and particulate matter (PM_{10}) and followed U.S. Environmental Protection Agency guidelines. No violations of either the carbon monoxide or particulate matter (PM_{10}) standards were identified, even at worst-case locations along the project corridor. Thus, the carbon monoxide and particulate analyses demonstrated that the proposed freeway would not contribute to any new localized violations, increase the frequency or severity of any existing violation or delay timely attainment of the National Ambient Air Quality Standards or any required interim emissions reductions or other milestones. The Arizona Department of Transportation will need to obtain dust control permits from Maricopa County Air Quality Department. These requirements are typical for this type of project.

(Responses continue on next page)

Code	Comment Document
16	If the E1 alignment were built, there are eight O'odham TCPs that would be indirectly affected, including petroglyphs, artifact scatter, and prehistoric trails. The E1 alignment completely destroys another TCP element, as it is in the path of the proposed freeway. The City of Phoenix is currently undertaking an NRHP-eligibility determination study of the archaeological sites within SMPP. Civil rights and human rights within the UNDRIP mandate that an evaluation of the traditional cultural properties be performed with direct consultation of traditional O'odham leaders BEFORE any route of the proposed project can be selected. Article 7 of the UNDRIP states that Indigenous and tribal peoples have the right to "decide their own priorities for the process of development as it affects their lives, beliefs, institutions and spiritual well-being and the lands they occupy or otherwise use, and to exercise control over their economic, social and cultural development".
7	The City of Phoenix, under the provisions of the Phoenix Mountain Preserve Act, is not able to sell South Mountain Park Preserves land to ADOT. ADOT would have to condemn 31.3 acres of SMPP land before it could be used for the proposed freeway extension. Under the 1964 Civil Rights Act, Native Americans are a protected class, and intrusions on Native American religious practices are illegal. How does ADOT plan to condemn 31 acres of an O'odham cultural resource without consulting with traditional leaders of O'odham tribes, as well as Hopi and CRIT? Article 25, Section 3 of the UNDRIP says that "states shall give legal recognition and protection to these lands, territories and resources. Such recognition shall be conducted with due respect to the customs, traditions and land tenure systems of the Indigenous peoples concerned."
17	No action can be taken on the proposed freeway extension until the Tribal Historic Preservation Office responds to an August 17, 2011 document regarding NRHP eligibility of the South Mountains. Request that ADOT withdraw consideration of the South Mountain extension of the Loop 202 Freeway until all tribal stakeholders are directly consulted by the Tribal Historic Preservation Office about NRHP eligibility.
18	Because of the egregious lack of information in the DEIS, a revised DEIS must first be written by ADOT/HDR Engineering that adequately informs the public so that members of the public can make an informed decision about the proposed project.

Code	Issue	Response
6	**Cultural Resources**	Since the beginning of the environmental impact statement process, the Federal Highway Administration and Arizona Department of Transportation have been carrying out cultural resources studies and engaging in ongoing, open consultation with the Gila River Indian Community Tribal Historic Preservation Office regarding the identification and evaluation of places of religious and cultural importance to the tribe that may be adversely affected by the proposed freeway. Such places are referred to as traditional cultural properties. As a result of these discussions and of studies conducted by the Gila River Indian Community's Cultural Resource Management Program, the Gila River Indian Community has identified traditional cultural properties that are eligible for listing in the National Register of Historic Places and that could be affected by construction of the proposed freeway. In certain cases, listing these properties on the National Register of Historic Places may offer them protection under Section 4(f) of the Department of Transportation Act. The traditional cultural properties identified are culturally important to other Native American tribes as well. For more discussion of traditional cultural properties, see the section, *Cultural Resources*, beginning on page 4-140 of the Final Environmental Impact Statement and pages 5-26 through 5-28. Section 106 of the National Historic Preservation Act requires a government-to-government relationship between the Federal Government and Indian tribes as described beginning on page 4-140 of the Final Environmental Impact Statement. Section 106 requires that federal agencies take into account the effects of their undertakings on historic properties. This process requires consultation with tribal authorities. Consultation has occurred with Gila River Indian Community government officials, the Tribal Historic Preservation Officer, the Cultural Resource Management Program, many different tribal authorities, and the State Historic Preservation Office. The consultation has resulted in concurrence from the Gila River Indian Community Tribal Historic Preservation Office and the State Historic Preservation Office on National Register of Historic Places eligibility recommendations (including traditional cultural properties), project effects, and proposed mitigation and measures to minimize harm. This consultation has been ongoing and will continue until any commitments in a record of decision are completed. The Draft Environmental Impact Statement, after consultation and coordination efforts, accommodates and preserves (to the fullest extent possible from the available alternatives) access to the South Mountains for religious practices. A very small portion of the mountain would be impacted by the proposed freeway (less than 0.03 percent of the total area). Although the Draft Environmental Impact Statement describes the impact on the South Mountains as adverse, Native Americans would not be kept from practicing their beliefs, access to the mountain would be maintained, and mitigation measures would be implemented based on input from members of the Gila River Indian Community.

(Response 6 continues on next page)

Code	Comment Document

Code	Issue	Response
6 (cont.)		As detailed in Chapter 1, *Purpose and Need*, in the Draft and Final Environmental Impact Statements, the proposed action is needed to address local capacity deficiencies, not to address the Sun Corridor between Tucson and Phoenix, and has been developed in response to local growth in population, housing, employment, and travel levels. As further discussed, on page 1-5 of the Draft and Final Environmental Impact Statements, the proposed action is based on logical termini, sufficient length, independent utility, projected travel needs, and construction priorities. The proposed action is not needed in response to national freight movement, nor is it intended to provide service primarily for freight movement.

Code	Comment Document

Code	Issue	Response
7	**Cultural Resources**	The United States has confirmed that the United Nations Declaration on the Rights of Indigenous Peoples is "not legally binding or a statement of current international law" and is limited to "moral and political force." *Announcement of U.S. Support for the United Nations Declaration on the Rights of Indigenous Peoples*, U.S. State Department (Dec. 17, 2010) (available at: state.gov/documents/organization/154782.pdf). The government's Announcement further clarified that the United States "understands [that the Declaration] calls for a process of meaningful consultation with tribal leaders, but not necessarily the agreement of those leaders, before the actions addressed in those consultations are taken." In this case, as described in the Draft and Final Environmental Impact Statements, through consultation, the Tribal Historic Preservation Office of the Gila River Indian Community concurred with the mitigation measures recommended for implementation in connection with the E1 Alternative. To the extent there is disagreement by individual tribal members, their comments have been considered and taken into account. However, the Declaration does not create an enforceable legal standard amending the National Environmental Policy Act process. As described in the Draft and Final Environmental Impact Statements, the consultation process with Native American tribes, and in particular with the Gila River Indian Community, was lengthy, repeated, and extensive. Traditional cultural properties were evaluated with input from affected tribes and are described in the Draft and Final Environmental Impact Statements. Although the consent of tribal leaders is not required, as the United States made clear in its Announcement quoted above, the Tribal Historic Preservation Officer agrees with the mitigation measures to be imposed in connection with the E1 Alternative affecting a small portion of South Mountain. The quoted language in the comment attributed to Article 7 of the Declaration does not appear there. The language appears to derive from the International Labor Organization's 1989 Indigenous and Tribal Peoples Convention (Convention No. 169). Convention 169 has never been ratified by the United States, which has not agreed to align legislation, policies, and programs with the Convention as a legal requirement.
8	**Cultural Resources**	Section 106 requires that federal agencies take into account the effects of their undertakings on historic properties. This process requires consultation with tribal authorities. Consultation has occurred with Gila River Indian Community government officials, the Tribal Historic Preservation Officer, the Cultural Resource Management Program, many different tribal authorities, and the State Historic Preservation Office. The consultation has resulted in concurrence from the Gila River Indian Community Tribal Historic Preservation Office and the State Historic Preservation Office on National Register of Historic Places eligibility recommendations (including traditional cultural properties), project effects, and proposed mitigation and measures to minimize harm. This consultation has been ongoing and will continue until any commitments in a record of decision are completed. In 2003, the Federal Highway Administration and Arizona Department of Transportation initiated National Historic Preservation Act Section 106 consultations with all Native American tribes that claimed cultural affiliation to the Study Area. Consultations were initiated with the Ak-Chin Indian Community, Gila River Indian Community, the Hopi Tribe, the Salt River Pima-Maricopa Indian Community, the Tohono O'odham Nation, the Yavapai-Apache Tribe, and the Yavapai-Prescott Indian Tribe.

(Response 8 continues on next page)

Code	Comment Document

Code	Issue	Response
8 (cont.)		As noted in Table 4-47 that begins on page 4-145 of the Final Environmental Impact Statement, the Gila River Indian Community was consulted in 2003 with subsequent contact in 2005, 2006, 2007, 2008, 2010, 2011, 2012, and 2013. This supports an early and continued consultation with the Gila River Indian Community related to resources of importance. In 2005, the Federal Highway Administration and Arizona Department of Transportation consulted with all Native American tribes in Arizona to ensure all interested Native American were included in the process and had the opportunity to communicate their concerns. These tribes were the Ak-Chin Indian Community, the Chemehuevi Tribe, the Cocopah Tribe, the Colorado River Indian Tribe, the Fort McDowell Yavapai Nation, the Fort Mojave Tribe, the Fort Yuma-Quechan Tribe, the Gila River Indian Community, the Havasupai Tribe, the Hopi Tribe, the Hualapai Tribe, the Kaibab-Paiute Tribe, the Navajo Nation, the Pascua Yaqui Tribe, the Pueblo of Zuni, the Salt River Pima-Maricopa Indian Community, the San Carlos Apache Tribe, the San Juan Southern Paiute, the Tohono O'odham Nation, the Tonto Apache Tribe, the White Mountain Apache Tribe, the Yavapai-Apache Tribe, and the Yavapai-Prescott Indian Tribe. Most of these tribes did not express an interest in the proposed project. The Ak-Chin Indian Community, the Salt River Pima-Maricopa Indian Community, and the Tohono O'odham deferred to the Gila River Indian Community to take the lead with Section 106 consultations on this proposed action project. Consultation with Native America tribes has been extensive and demonstrates a reasonable and good faith effort to include all interested Native American tribes in the process to take their concerns seriously in the planning effort.
9	**Trucks**	Creating a truck bypass is not a goal of the proposed action. The proposed freeway is part of a transportation system developed to improve mobility in the region by increasing capacity and allowing traffic—including truck traffic—to access a segment of the "loop" system (see pages 1-21, 1-22, 3-1, and 3-3 of the Final Environmental Impact Statement) in the Phoenix metropolitan area. The proposed South Mountain Freeway would be a commuter corridor, helping to move local traffic. As with all other freeways in the region, trucks would use it for the through-transport of freight, for transport to and from distribution centers, and for transport to support local commerce. Nevertheless, the primary vehicles using the proposed freeway would be automobiles. The Maricopa Association of Governments regional travel demand model projects that truck traffic would represent approximately 10 percent of the total traffic on the proposed freeway, similar to what is currently experienced on other regional freeways such as Interstate 10, State Route 101L, and U.S. Route 60. As disclosed in the Final Environmental Impact Statement, it is expected that "true" through-truck traffic (not having to stop in the metropolitan area) would continue to use the faster, designated, and posted bypass system of Interstate 8 and State Route 85 (see page 3-64 of the Final Environmental Impact Statement).

(Response 9 continues on next page)

Code	Issue	Response
9 (cont.)		Trucks crossing from Mexico to Arizona are restricted to the commercial zones within 25 miles of the border. The Federal Motor Carrier Safety Administration is administering a United States-Mexico cross-border, long-haul trucking pilot program. The program tests and demonstrates the ability of Mexico-based motor carriers to operate safely in the United States beyond the municipalities and commercial zones along the United States-Mexico border (see <fmcsa.dot.gov/intl-programs/trucking/trucking-program.aspx>). Petróleos Mexicanos (better known as Pemex), the Mexican state-owned petroleum company that serves all of Mexico, provides 15 parts per million in its sulfur diesel fuel in the border region, which is consistent with the U.S. Environmental Protection Agency requirements for American diesel fuel (see <http://transportpolicy.net/index.php?title=Mexico:_Fuels:_Diesel_and_Gasoline>). Arizona highways, as are most highways across the United States, are open to all kinds of traffic, so long as the cargo being carried is in accordance with U.S. Department of Transportation regulations for the specific type of cargo. The South Mountain Freeway would operate under the same rules as other similar facilities in the state; truck traffic would be permissible (see text box on Final Environmental Impact Statement page 4-157). The CANAMEX and Phoenix truck bypass (Interstate 8/State Route 85) routes are not mandatory for truck traffic; they are recommended. The Arizona Department of Transportation does not enforce these routes. It is not anticipated that these routes would be enforced as mandatory in the future. The air quality analyses included projected truck traffic. The carbon monoxide and particulate matter (PM_{10}) analyses demonstrated that the proposed freeway would not contribute to any new localized violations, increase the frequency or severity of any existing violation, or delay timely attainment of the National Ambient Air Quality Standards or any required interim emissions reductions or other milestones. For mobile source air toxics, the analysis showed that for the Study Area, constructing the freeway would have a marginal effect on annual emissions in 2025 and 2035 (less than a 1 percent difference in total annual emissions between the Preferred Alternative and No-Action Alternative). With the Preferred Alternative in 2035, modeled mobile source air toxics emissions would decrease by 57 percent to more than 90 percent, depending on the pollutant, despite a 47 percent increase in vehicle miles traveled in the Study Area compared with 2012 conditions. Because Mexican trucks are currently restricted to the border region, they are not operating in the project Study Area and they were not included in the air quality analyses.

Code	Issue	Response
10	**Air Quality**	Under the Clean Air Act, the U.S. Environmental Protection Agency is responsible for establishing National Ambient Air Quality Standards to protect public health and the environment from adverse effects of air pollutants. Health effects from air pollutants are based on the concentration of the pollutants and the duration of exposure. Concentrations vary with distance from a roadway based on many factors, including background (or ambient) levels of pollution from all sources; the number, speed, and type of vehicles on the roadway; wind speed and direction; topography; and other factors. For the proposed freeway, the Federal Highway Administration conducted modeling for carbon monoxide and particulate matter (PM_{10}) using worst-case (most congested or highest traffic) modeling locations at discrete receptor locations around each analysis location (primarily residences near the interchanges). The carbon monoxide and particulate matter (PM_{10}) analyses demonstrated that the proposed freeway would not contribute to any new localized violations, increase the frequency or severity of any existing violation, or delay timely attainment of the National Ambient Air Quality Standards or any required interim emissions reductions or other milestones. Mobile source air toxics can also have adverse health impacts, but the U.S. Environmental Protection Agency has not established National Ambient Air Quality Standards for these pollutants. As a result, the Federal Highway Administration analyzes these pollutants using emissions analyses. The mobile source air toxics emissions analysis for the Study Area found little difference in total annual emissions of mobile source air toxics emissions between the Preferred and No-Action Alternatives (less than a 1 percent difference) in 2025 and 2035. With the Preferred Alternative in 2035, modeled mobile source air toxics emissions would decrease by 57 percent to more than 90 percent, depending on the pollutant, despite a 47 percent increase in vehicle miles traveled in the Study Area compared with 2012 conditions. Many studies have investigated the prevalence of adverse health effects in the near-road environment. Given concerns about the possibility of air pollution exposure in the near-road environment, the Health Effects Institute has dedicated a number of research efforts toward investigating this issue. In November 2007, the Health Effects Institute published Special Report #16: Mobile-Source Air Toxics: A Critical Review of the Literature on Exposure and Health Effects. This report concluded that the cancer health effects attributable to mobile sources are difficult to discern because the majority of quantitative assessments are derived from occupational cohorts with high concentration exposures and because some cancer potency estimates are derived from animal models. In January 2010, the Health Effects Institute released Special Report #17, investigating the health effects of traffic-related air pollution. The goal of the research was to synthesize available information on the effects of traffic on health. Researchers looked at linkages between: 1) traffic emissions (at the tailpipe) with ambient air pollution in general, 2) concentrations of ambient pollutants with human exposure to pollutants from traffic, 3) exposure to pollutants from traffic with human-health effects and toxicological data, and 4) toxicological data with epidemiological associations. Overall, researchers felt that there was “sufficient” evidence for causality for the exacerbation of asthma. Evidence was “suggestive but not sufficient” for health outcomes such as cardiovascular mortality and others. Study authors also noted that past epidemiological studies may not provide an appropriate assessment

(Response 10 continues on next page)

Code	Comment Document

Code	Issue	Response
10 (cont.)		of future health associations because vehicle emissions are decreasing over time. Finally, in 2011 three studies were published by the Health Effects Institute evaluating the potential for mobile source air toxics "hot spots." In general, the authors confirmed that while highways are a source of air toxics, they were unable to find that highways were the only source of these pollutants. They determined that near-road exposures were often no different or no higher than background (or ambient) levels of exposure and, hence, no true hot spots were identified. These reports are available from the Health Effects Institute's Web site at <healtheffects.org>. The Federal Highway Administration and U.S. Environmental Protection Agency provide financial support to the Health Effects Institute's research work. Another source of information is the U.S. Environmental Protection Agency's recently released report on Children's Health and the Environment: *The level of knowledge regarding the relationship between environmental exposures and health outcomes varies widely among the topics [presented in this report], and the inclusion of an indicator in the report does not necessarily imply a known relationship between environmental exposure and children's health effects. The report provides data for selected children's health conditions that warrant further research because the causes, including possible contributing environmental factors, are complex and not well understood at this point.* *In the case of asthma, researchers do not fully understand why children develop the condition. However, substantial evidence shows exposure to certain air pollutants, including particulate matter and ozone, can trigger symptoms in children who already have asthma. Although the report found the percentage of children reported to currently have asthma increased from 8.7 percent in 2001 to 9.4 percent in 2010 and that minority populations are particularly affected by asthma, the severity of children's asthma and respiratory symptoms has declined. The rate of emergency room visits for asthma decreased from 114 visits per 10,000 children in 1996 to 103 visits per 10,000 children in 2008. Between 1996 and 2008, hospitalizations for asthma and for all other respiratory causes decreased from 90 hospitalizations per 10,000 children to 56 hospitalizations per 10,000 children.* *The report also looks at trends in other health conditions, such as Attention-Deficit/Hyperactivity Disorder (ADHD) and preterm births, for which rates have increased. There is no conclusive information on the role of environmental contaminants in ADHD or preterm births, and additional research is ongoing.* Finally, the Federal Highway Administration notes that while the incidence of some health effects (such as asthma, autism, and attention deficit/hyperactivity disorder) in the U.S. population appear to have been increasing, motor vehicle emissions have declined. This decline in mobile source air toxics emissions is documented in Figure 4-24 of the Final Environmental Impact Statement and for other pollutants at <epa.gov/ttn/chief/trends/>. This negative correlation between emissions trends and health effects trends illustrates the complexity of the issues. Summary information about the findings of the Joint Air Toxics Assessment Project study is provided as background information in the Draft and Final Environmental Impact Statements, but the study itself is not relevant to the type of analysis done pursuant to the Federal Highway Administration's mobile source air toxics guidance, which is an emissions analysis. Monitored ambient concentrations of mobile source air toxics (the focus of the Joint Air Toxics Assessment Project) do not inform this type of analysis. While monitoring data can be useful for defining current conditions in the affected environment (to the extent that the monitoring

(Response 10 continues on next page)

Code	Comment Document

Code	Issue	Response
10 (cont.)		data are current),they don't tell us anything about future conditions, or the impacts of the project itself, which is why an emissions analysis was performed. The mobile source air toxic analysis presented beginning on page 4-77 of the Final Environmental Impact Statement is an estimated inventory of mobile source air toxic emissions for the entire Study Area for 2025 and 2035. This approach was used because the inventory estimate accounts for changes in traffic and emissions on all roadways affected by a proposed project, and would, therefore, be a more reliable predictor of changes in exposure to mobile source air toxics.
11	**Right-of-way**	Maps of the W59 and E1 (Preferred) Alternatives were provided at the public hearing and community forums and are available for viewing and downloading through the project Web site (see azdot.gov/southmountainfreeway). None of the action alternatives would be located on Gila River Indian Community land so there would be 0 homes destroyed by the path of the proposed project. The impacts on traditional cultural properties are described in the *Cultural Resources* section beginning on pages 4-131 and 4-142 of the Draft and Final Environmental Impact Statements, respectively, and in Chapter 5, *Section 4(f) Evaluation*, beginning on page 5-26 of the Draft and Final Environmental Impact Statements. The locations of sites of cultural importance are not shown in public documents to protect the sites from potential pilfering.
12	**Cultural Resources**	Since the beginning of the environmental impact statement process, the Federal Highway Administration and Arizona Department of Transportation have been carrying out cultural resources studies and engaging in ongoing, open consultation with the Gila River Indian Community Tribal Historic Preservation Office regarding the identification and evaluation of places of religious and cultural importance to the tribe that may be adversely affected by the proposed freeway. Such places are referred to as traditional cultural properties. As a result of these discussions and of studies conducted by the Gila River Indian Community's Cultural Resource Management Program, the Gila River Indian Community has identified traditional cultural properties that are eligible for listing in the National Register of Historic Places and that could be affected by construction of the proposed freeway. In certain cases, listing these properties on the National Register of Historic Places may offer them protection under Section 4(f) of the Department of Transportation Act. The traditional cultural properties identified are culturally important to other Native American tribes as well. For more discussion of traditional cultural properties, see the section, *Cultural Resources*, beginning on page 4-140 of the Final Environmental Impact Statement and pages 5-26 through 5-28. Section 106 of the National Historic Preservation Act requires a government-to-government relationship between the Federal Government and Indian tribes as described beginning on page 4-140 of the Final Environmental Impact Statement. Section 106 requires that federal agencies take into account the effects of their undertakings on historic properties. This process requires consultation with tribal authorities. Consultation has occurred with Gila River Indian Community government officials, the Tribal Historic Preservation Officer, the Cultural Resource Management Program, many different tribal authorities, and the State Historic Preservation Office. The consultation has resulted in concurrence from the Gila River Indian Community Tribal Historic Preservation Office and the State Historic Preservation Office on National Register of Historic Places eligibility recommendations (including traditional cultural properties), project effects, and proposed mitigation and measures to minimize harm. This consultation has been ongoing and will continue until any commitments in a record of decision are completed.

(Response 12 continues on next page)

Code	Comment Document

Code	Issue	Response
12 (cont.)		Agency scoping comments from the project initiation in 2001 are presented beginning on page 6-3 of the Draft and Final Environmental Impact Statements. The Gila River Indian Community was part of the agency scoping process. Public involvement with the Gila River Indian Community was conducted as requested by the tribal government. Prior to October 2005, early efforts to involve the Gila River Indian Community included attending tribal meetings and monthly meetings with Gila River Indian Community Departments (see discussion beginning on page 2-8 of the Draft and Final Environmental Impact Statements). On October 14, 2005, the Gila River Indian Community requested that all project-related communications take place at a government-to-government level (see letter on page A152 of Appendix 1-1). This request was honored by the Arizona Department of Transportation and Federal Highway Administration. All public involvement efforts were implemented by the Gila River Indian Community's public involvement officer. In addition to Chapter 2 of the Final Environmental Impact Statement which explains the Gila River Indian Community outreach undertaken for the project, Chapter 6 of the Final Environmental Impact Statement further describes Gila River Indian Community and general outreach throughout the process. The Gila River Indian Community was provided equal opportunities to participate in the project as all other populations and agencies. This outreach was undertaken, in part, to ensure all populations had equal access to the process and, in part, to ensure disparate nor disproportionately high adverse impacts would result from the construction and operation of the proposed action.
13	**Cultural Resources**	The Gila River Indian Community has been involved in many aspects of this proposed project. The Gila River Indian Community's Cultural Resource Management Program was contracted to provide cultural resources surveys, to determine the eligibility of cultural resources sites (including traditional cultural properties) for listing in the National Register of Historic Places, and to assist in the development of measures to minimize harm to traditional cultural properties. The Gila River Indian Community's Tribal Historic Preservation Office has also been involved in determining the eligibility of cultural resources sites (including traditional cultural properties) for listing in the National Register of Historic Places, and in assisting in the development of measures to minimize harm to traditional cultural properties. After determining that no prudent and feasible alternatives existed to avoid the South Mountains Traditional Cultural Property, efforts were undertaken to minimize harm. These measures are documented, beginning on page 5-27 of the Draft and Final Environmental Impact Statements. Some of these measures included avoidance of specific sites and providing multiuse crossings and fencing that would limit access by freeway users, but allow Gila River Indian Community members to continue to gain access to the site. In addition, the Federal Highway Administration and Arizona Department of Transportation committed to provide funds for the Gila River Indian Community to conduct a full evaluation of the South Mountains Traditional Cultural Property (see page 4-159 of the Final Environmental Impact Statement). Documentation of these efforts are in a letter from the Lieutenant Governor of the Gila River Indian Community to the Administrator, Arizona Division, Federal Highway Administration, dated June 23, 2010 (see page A372 of Appendix 2-1 of the Final Environmental Impact Statement). In this letter, the Gila River Indian Community submitted a proposal for the "Evaluation of Traditional Cultural Property and

(Response 13 continues on next page)

Code	Comment Document

Code	Issue	Response
13 (cont.)		Adverse Effects of Transportation Corridor Development posed by the proposed construction of the current Pecos Alignment of the South Mountain Freeway." In committing to the evaluation of the South Mountains Traditional Cultural Property, the Federal Highway Administration and Arizona Department of Transportation also committed to the Gila River Indian Community's participation in ongoing engineering design refinements and acknowledged the significance of all plants and animals in the traditional culture of the Akimel O'odham and Pee Posh of the Gila River Indian Community. The Arizona Department of Transportation and Federal Highway Administration solicited input from the Gila River Indian Community and other Native American tribes and tribal members and considered fully the substantive input and comments that were received. While efforts to study project alternatives on Gila River Indian Community land that did not directly impact South Mountain were attempted, as noted on page 2-8 of the Draft and Final Environmental Impact Statements, a coordinated referendum occurred in February 2012, and Gila River Indian Community members voted in favor of the no-build option. Therefore, the on-Gila River Indian Community alignment was eliminated from further study. Any alternative on Gila River Indian Community land must consider tribal sovereignty. Tribal sovereignty is based in the inherent authority of Native American tribes to govern themselves. While this notion of sovereignty is manifested in many areas, generally Native American land is held in trust by the United States. Native American communities have the authority to regulate land uses and activities on their lands. States have very limited authority over activities within tribal land (see page 2-1 of the Final Environmental Impact Statement). From a practical standpoint, this means that the Arizona Department of Transportation and Federal Highway Administration do not have the authority to survey tribal land, make land use (including transportation) determinations directly affecting tribal land, or condemn tribal land for public benefit through an eminent domain process. However, mitigation measures developed through consultation and coordination with the Tribal Historic Preservation Office and other concerned parties would be considered for implementation in any final action.
14	**Cultural Resources**	The eligibility recommendations to the National Register of Historic Places for cultural resources within the Study Area begin on page 4-141 of the Final Environmental Impact Statement. According to page 5-26 of the Final Environmental Impact Statement, the South Mountains Traditional Cultural Property boundary is currently undefined; however, as noted on page 5-27, the Arizona Department of Transportation and Federal Highway Administration would provide funds for the Gila River Indian Community to conduct an evaluation of the South Mountains Traditional Cultural Properties to determine those boundaries as a measure to minimize harm to the South Mountains Traditional Cultural Properties. Section 106 of the National Historic Preservation Act requires a government-to-government relationship between the Federal Government and Indian tribes as described beginning on page 4-140 of the Final Environmental Impact Statement. Section 106 requires that federal agencies take into account the effects of their undertakings on historic properties. This process requires consultation with tribal authorities. Thus disclosure of effects and consultation are the outcomes of the Act. Protection of these resources is provided by Section 4(f) of the Department of Transportation Act of 1966 (as amended). The Final Environmental Impact Statement, beginning on page 5-1, describes the protections provided by Section 4(f). Section 4(f) states that the use of resources afforded protection under Section 4(f)

(Response 14 continues on next page)

Code	Comment Document

Code	Issue	Response
14 (cont.)		requires a determination that there is no prudent and feasible alternative to using that land; and that the project includes all possible planning to minimize harm to the resource resulting from the use. The outcome of this process was the determination that there was no prudent and feasible alternative to the E1 Alternative. This conclusion was supported by the U.S. Department of the Interior in their comment on the Draft Environmental Impact Statement: comment: "Following our review of the Section 4(f) Evaluation, we concur that there is no feasible or prudent alternative to the Preferred Alternative selected in the document, and that all measures have been taken to minimize harm to these resources. " The complete letter can be found in Appendix 7, Volume III, on page B4 of the Final Environmental Impact Statement. Measures to minimize harm to the South Mountains Traditional Cultural Property (and traditional cultural properties that contribute to the South Mountains Traditional Cultural Property) were developed in consultation with the Gila River Indian Community (and other tribes with interest). During the design phase, the Arizona Department of Transportation would consult directly with the Gila River Indian Community to identify and implement other design measures, when feasible, to further reduce land requirements needed for the proposed action. (See Final Environmental Impact Statement page 5-27 for the discussion on measures to minimize harm.)
15	**Cultural Resources**	The complete statement on page 5-26 of the Draft Environmental Impact Statement, states, "A right-of-way fence would limit access to the site by freeway users, but Community members would continue to gain access to the site as they currently do." As described in the Draft and Final Environmental Impact Statements, the Tribal Historic Preservation Office of the Gila River Indian Community concurred with the mitigation measures recommended for implementation in connection with the E1 Alternative. To the extent there is disagreement by individual tribal members, their comments have been considered and taken into account. However, the United Nations Declaration on the Rights of Indigenous Peoples Declaration does not create an enforceable legal standard amending the National Environmental Policy Act process.
16	**Cultural Resources**	The comment that eight traditional cultural properties would be indirectly affected is incorrect. Adverse effects to the South Mountains Traditional Cultural Property and one site that is contributing to the South Mountains Traditional Cultural Property (AZ T:12:197) would occur with the construction of the E1 Alternative. No extant petroglyph sites would be adversely affected. The trail sites were determined eligible for listing in the National Register of Historic Places listing under Criterion D as archaeological sites; therefore, as noted on page 5-2 of the Final Environmental Impact Statement, generally, cultural resources eligible for listing in the National Register of Historic Places under Criterion D are not eligible for protection under Section 4(f). Through consultation and coordination, the Gila River Indian Community Tribal Historic Preservation Office, the Arizona State Historic Preservation Office, and many other tribal authorities concurred with these recommendations (see Table 4-47 on page 4-145 of the Final Environmental Impact Statement for more details on tribal concurrences). To the extent there is disagreement by individual tribal members, their comments have been considered and taken into account. However, the United Nations Declaration on the Rights of Indigenous Peoples Declaration does not create an enforceable legal standard amending the National Environmental Policy Act process.

(Responses continue on next page)

Code	Comment Document

Code	Issue	Response
17	**Cultural Resources**	As documented in Table 4-47 on page 4-145 of the Final Environmental Impact Statement, the Gila River Indian Community concurred with the National Register of Historic Places eligibility of traditional cultural places and the adequacy of the draft traditional cultural places mitigation plans on July 3, 2012. Section 106 of the National Historic Preservation Act requires a government-to-government relationship between the Federal Government and Indian tribes as described beginning on page 4-140 of the Final Environmental Impact Statement. Section 106 requires that federal agencies take into account the effects of their undertakings on historic properties. This process requires consultation with tribal authorities. Consultation has occurred with Gila River Indian Community government officials, the Tribal Historic Preservation Officer, the Cultural Resource Management Program, many different tribal authorities, and the State Historic Preservation Office. The consultation has resulted in concurrence from the Gila River Indian Community Tribal Historic Preservation Office and the State Historic Preservation Office on National Register of Historic Places eligibility recommendations (including traditional cultural properties), project effects, and proposed mitigation and measures to minimize harm. This consultation has been ongoing and will continue until any commitments in a record of decision are completed. As noted in Table 4-47 that begins on page 4-145 of the Final Environmental Impact Statement, the Gila River Indian Community was initially consulted in 2003 with subsequent contact in 2005, 2006, 2007, 2008, 2010, 2011, 2012, and 2013. This supports an early and continued consultation with the Gila River Indian Community related to resources of importance.
18	**Cultural Resources**	The Arizona Department of Transportation and Federal Highway Administration, in cooperation with the U.S. Army Corps of Engineers, the U.S. Bureau of Indian Affairs, and the Western Area Power Administration, prepared the Draft Environmental Impact Statement and Section 4(f) Evaluation in accordance with the National Environmental Policy Act of 1969 [42 United States Code § 4332(2)(c)], Section 4(f) of the U.S. Department of Transportation Act of 1966 (49 United States Code § 303, as amended), and Section 404 of the Clean Water Act of 1977 (33 United States Code § 1251). The Draft Environmental Impact Statement and Section 4(f) Evaluation 1) satisfies Federal Highway Administration and Arizona Department of Transportation's environmental analysis requirements; 2) provides a comparison of the social, economic, and environmental impacts that may result from implementation of the proposed action—construction and operation of a major transportation facility; and 3) identifies measures to avoid, reduce, or otherwise mitigate adverse impacts.

Code	Comment Document

over, Ana Morago, if you're here we'll take you at that time.

(Recessed from 12:00 p.m. until 12:28 p.m.)

THE FACILITATOR: Thank you.

Ana Morago.

If you'd like to speak and have not yet registered, please go out to the front desk registration.

Thank you. Amy Bratt.

MS. BRATT: Good afternoon. My name is Amy Bratt, and I'm with the Greater Phoenix Chamber of Commerce. The Chamber support of this freeway goes back over 25 years to the first time the voters approved the transportation funds to build it. For us, this is a no-brainer. The project is an opportunity to bolster this low economic recovery efforts that have occurred to date in our region. The 30,000 jobs created during the five- to six-year construction period, and the $2 billion investment in land, professional services, materials, and equipment will be a significant boost to our economy. Putting people to work and moving goods and services are the key elements of commerce.

To the end -- or to that end, on behalf

Code	Comment Document

of our 2,600 members, the greater Phoenix Chamber of Commerce agrees it is time to build the South Mountain Freeway. We support investments in transportation projects that will improve mobility and contribute to economic development, environmental quality and jobs. We need the jobs, and we want the investment.

It's time to relieve the congestion in the southern portion of our metropolitan region, and allow for free movement of people and commerce. As we supported it 25 years ago, we support it again today. Thank you so much for the opportunity to provide comment.

THE FACILITATOR: Thank you. Kate Gallego.

MS. GALLEGO: Hello, I'm Kate Gallego, South Mountain resident. Former chair of the Environmental Quality Commission in Phoenix, and I'm here in support of the freeway. I think it will relieve congestion and stop some of the cut-through traffic. It will bring important economic development to Laveen and job creation, creating over 30,000 jobs.

It's an important part of our transportation network. It needs to be part of a

Code	Issue	Response

Code	Comment Document

respectfully to each other.

THE FACILITATOR: Thank you.

Joseph Perez. Joseph Perez.

MR. PEREZ: I'm Joseph Perez. Thank you for allowing me the opportunity to make a comment to you about your Draft Environmental Impact Statement. I am a Gila River Indian Community member. I'm also a partner with Pangia [phonetic] and I lead a little bit over 1,200 landowners who exist in the Pecos Road Land Area that have put forward the initiative with the Gila River Indian Community for a revote to try to bring the alignment down on the reservation, which hopefully will be resolved tomorrow in a special council meeting.

I'm here today to comment on the draft EIS in the sense that the work that has been done pertaining to the Gila River Indian Community, and the cultural aspects was done through the community's cultural department. And they've worked closely and for a long time, I believe over 12 years, doing that aspect of the EIS. Unfortunately, where it stands right now, there is no other alternative for the freeway, because the only other alternative would be on the Gila River Indian Community. I believe that will have to be resolved with the people of the

1

Code	Issue	Response
1	**Alternatives**	In accordance with 40 Code of Federal Regulations § 1502.14, the Arizona Department of Transportation and Federal Highway Administration explored and evaluated all reasonable alternatives. Page 2-10 of the Final Environmental Impact Statement discusses the path forward should alternatives on Gila River Indian Community land become available for study. Any alternative on Gila River Indian Community land must consider tribal sovereignty. Tribal sovereignty is based in the inherent authority of Native American tribes to govern themselves. While this notion of sovereignty is manifested in many areas, generally Native American land is held in trust by the United States. Native American communities have the authority to regulate land uses and activities on their lands. States have very limited authority over activities within tribal land (see page 2-1 of the Final Environmental Impact Statement). From a practical standpoint, this means that the Arizona Department of Transportation and Federal Highway Administration do not have the authority to survey tribal land, make land use (including transportation) determinations directly affecting tribal land, or condemn tribal land for public benefit through an eminent domain process.

Code	Comment Document

community or in tribal council.

My main focus today is that the impact that the freeway would have is across the board. I believe your statement covers that. I believe your study covers that. What I would like to comment about is that we believe there will be other opportunities -- another opportunity for another alignment. We hope that that is taken into consideration when that opportunity comes.

In terms of my culture, that is across the board. You're talking about Native Americans, Pimas, O'odhams, Pee Posh, Maricopas that live within the community. They all call themselves community members. We've all been raised differently. We all see the world through the way that our grandparents should have raised us. I'm considered an O'odham. I consider what we have doesn't end at our border. The no-build that many people will talk about, hemda [phonetic], and say that that is what they're trying to protect. What I want you to understand in terms of the cultural aspects of your Draft Environmental Impact Statement is that hemda [phonetic] doesn't stop at the border; it doesn't stop at the border of the Gila River Indian Community; it doesn't stop with us community members, it transcends everything that

Code	Issue	Response

Code	Comment Document

our world encompasses; it transcends everything that we do.

And so with that in mind, I, as a community member, apologize for the disrespect that you get, for the disrespect that ADOT gets in everything. We should not be that way. We should practice a better way to be with you.

And that's what I want to thank you about for today. Thank you.

THE FACILITATOR: Thank you. Terry Morris.

MR. MORRIS: Hello, I'm Terry Morris. I'm a fourth-generation Arizonan, and listening to Mr. Perez just now changed my train of thought a little bit. I had -- my main concern about this project is the -- I believe the lack of attention to the Indian communities in the Maricopa County, as evidenced by the lack of posters in the other room. There's a lot of information over there in the other room, but not very much that I can see that pertain to the impact on the Native American communities.

I'm also very concerned about the threatened and endangered wildlife that can be affected. I am an avid hiker, and there are not very many preserve hikes left, where you're not in the

Document Created: 7/24/2013 4:13:25 PM by Web Comment Form

Since 2004 Pangea a development company has been 2004 organizing over 1,200 individual land owners on the Gila River Indian Community (GRIC), this land is owned by these individual Native Americans and not under the regulatory control of the GRIC government.

Pangea is in the final stages of leasing approximately 5,500 acres of this land just south of Pecos road. This land is scheduled to be developed as a fully master planned community, which will include residential, commercial, retail, manufacturing, sports facilities, amusement park and entertainment venues.

The Loop 202 is a catalyst for this development and the current alignment on Pecos road is acceptable for Pangea and the over 1,200 individual land owners but an alignment that is on the GRIC and on the allotted land would benefit all parties and would save South Mountain from any destruction as well as substantially reduce the overall cost of building the Loop 202 (not have to cut through South Mountan).

Our review of the Draft Environmental Impact Statement (DEIS) has determined that the research conducted and current recommendation is satisfactory from a development perspective for Pangea and the landowners. Pangea and the landowners encourage and support ADOT and the Maricopa Association of Governments (MAG) to build the South Mountain Loop 202 freeway as quickly as possible for the many reasons identified with the DEIS.

1

In addition to supporting the building of the South Mountain Loop 202, the landowners and Pangea request that ADOT and MAG investigate and further study a schedule for construction which would start at the junction of the San Tan Freeway and Interstate-10 or the east end of the E-1 Alternative alignment as opposed to the W59 Alternative or west side of Phoenix at Interstate-10.

This schedule of construction would directly benefit the landowners, Pangea, the citizens of Ahwatukee, Maricopa County and the State of Arizona in the following ways:

1. Immediate and much needed economic development to the GRIC and directly to the landowners.
2. Directly reduce the over 60% unemployment rate of GRIC members.
3 Directly reduce the over 65% of GRIC members that live under the poverty level of the State of Arizona by providing jobs and revenue from their land leases with Pangea.
4. Provide residential opportunity for over 8,000 GRIC members that currently live within the greater Phoenix Metro area and can not obtain housing on the GRIC.
5. Provide direct business development opportunity for GRIC members within the Pangea development.
6. Provide immediate short-term (6 months) and long-term (20 years) construction business

Code	Issue	Response
1	**Construction**	As noted in the Draft and Final Environmental Impact Statements, construction sequencing and duration could change based on several factors, including funding availability, traffic volumes, coordination with other major freeway projects, earthwork balancing, utility relocation schedules, and regional priorities. The project team will take the request under advisement.

Code	Comment Document

and job opportunity for non-Native companies within the greater Phoenix Metro area.
7. Provide a new business and job opportunity base that would directly support the Ahwatukee area and provide much needed positive benefits of the Loop 202 directly to Ahwatukee.
8. Provide an new, immediate and long term tax based for the State of Arizona and Maricopa County that is estimated to provide $21,000,000 of retail transaction and privilege tax over the next 10 years due to the Pangea development.
9. As there are no master planned communities greater than 500 acres scheduled for the Laveen area or along W59 Alternative alignment, the Pangea development has already started and construction of the Loop 202 on the east side would immediately and directly benefit the GRIC, Maricopa County and the State.
10. The positive public relations benefits of starting construction on the east end far outweigh any positive benefits of starting on the west end.

Pangea and the landowners once again ask that a revision of the DEIS be conducted to study the direct impacts of construction starting on the east of the E-1 Alternative and the benefits for all parties involved.

Pangea will continue to support the landowners in their on-going public voter Initiative on the GRIC, as the current status of the Initiative is not ended. The current actions of the GRIC Tribal Elections Office is not supported by evidence gathered by the police department, as the investigation provided evidence of only 21 signatures that could be invalidated, not the 174 the Tribal Elections Office removed from the Initiative.

2

Pangea and the landowners also request that the DEIS be revised to include the study data for an alignment on the GRIC for the following reasons:

1. GRIC Resolution GR-80-98, adopted on June 17, 1998 by Tribal Council resolved that the Gila River Borderlands area (Regional Planning Study for the Gila River Borderlands Planning area/ Gila River Borderlands Study) be considered the land use plan for the Gila Borderlands area.
2. This Resolution stands to this day and has never been rescinded by any action from the GRIC Tribal Council and is not rescinded or affected by the referendum vote of February 2012 for "No Build".
3. The Resolution approved the GRIC Loop 202 alignment identified within the study document as the land use plan for transportation for the freeway system on the GRIC.
4. The Resolution identifies over 60 meetings were held within the seven Districts, with Elderly, Community Council Standing Committees, Corporations, Departments and other Community Entities and the Community's Planning and Zoning Commission publicized and conducted public hearings on the Gila Borderlands Study.
5. The Resolution identifies that the Economic Development and Natural Resources Standing Committees reviewed the Gila Borderland Study and approved if for action by Tribal Council.
6. The Resolution identifies that the Community Council also reviewed the Gila Borderlands

Code	Issue	Response
2	**Alternatives**	In accordance with 40 Code of Federal Regulations § 1502.14, the Arizona Department of Transportation and Federal Highway Administration explored and evaluated all reasonable alternatives. Page 2-10 of the Final Environmental Impact Statement discusses the path forward should alternatives on Gila River Indian Community land become available for study. Any alternative on Gila River Indian Community land must consider tribal sovereignty. Tribal sovereignty is based in the inherent authority of Native American tribes to govern themselves. While this notion of sovereignty is manifested in many areas, generally Native American land is held in trust by the United States. Native American communities have the authority to regulate land uses and activities on their lands. States have very limited authority over activities within tribal land (see page 2-1 of the Final Environmental Impact Statement). From a practical standpoint, this means that the Arizona Department of Transportation and Federal Highway Administration do not have the authority to survey tribal land, make land use (including transportation) determinations directly affecting tribal land, or condemn tribal land for public benefit through an eminent domain process.

Code	Comment Document

Study and approved it as the land use plan for the Community.
7. The referendum conducted in February 2012 and approved by voters did not eliminate the the land use plan and Loop 202 on Reservation alignment.

It is only prudent and within the best interest of the GRIC, Community members, Pecos road landowners, the residences of Ahwatukee, Maricopa County and the State of Arizona to include this data as the information should be available for the public to view and tax dollars of the public was used to gather this data. More importantly, this data would greatly assist members of the GRIC in understanding more about the freeway and the impact it would have on the Community.

Pangea hopes that the above request be implemented in the final draft of the EIS as this project is vital for all parties involved.

Thank you.

Joseph M. Perez, Partner
Pagnea

want to go hike in a park where there's a huge eight-lane freeway cut through the southwest region.

So Save Our Mountains Foundation would like to encourage you, and whoever in the state needs to make this happen, to negotiate better with the Gila River Indian community and the Indian community at large, and we hope that they will also come to the table to talk, and that we can make a freeway happen where it doesn't chop into the preserve and part of what forms a crown and glory for the City of Phoenix. We don't have oceans, we don't have beaches, but we do have a beautiful preserve system.

Thank you very, very much.

THE FACILITATOR: Thank you, Ms. Rothwell.

Michael Goodman.

MR. GOODMAN: Thank you. I'm Michael Goodman. I'm also with the Phoenix Mountains Preservation Council, and I am a member of the ADOT Citizens Advisory Team. Pretty much I agree with what has already been said, so I'll be pretty brief. I did finish reading the EIS, and with regards to the E-1 section, I was highly disappointed. I know during the so-called 12 years we've been studying this, we had a number of reports, I guess the E-1 was

Code	Issue	Response

probably about, what, four or five years of that time period. And I found that with almost every report, somebody who understood what was going on had a question for the consultants to explain something or other that they seemed to have left out or just didn't want to talk about.

And it was -- it got to be very frustrating, we never were quite able to get all the answers we wanted. And the saying from the consultants kept being, well, wait until the draft. Well, the draft's out and I've read it and still many of the questions that people ask simply weren't answered or we were -- or I notice that there's things that had been mentioned that there's outdated information. There was just a lack of information or it just seemed that anything that didn't support what ADOT and MAG wanted, which is to blow up South Mountain, somehow got left out of the draft.

1

And for that reason, I am opposed to the freeway if it has to go through South Mountain Preserve.

2

Thank you.

THE FACILITATOR: Thank you, Mr. Goodman. John Mockus. Did I pronounce that right, sir?

Code	Issue	Response
1	**Environmental Impact Statement Process**	The Arizona Department of Transportation and Federal Highway Administration, in cooperation with the U.S. Army Corps of Engineers, the U.S. Bureau of Indian Affairs, and the Western Area Power Administration, prepared the Draft Environmental Impact Statement and Section 4(f) Evaluation in accordance with the National Environmental Policy Act of 1969 [42 United States Code § 4332(2)(c)], Section 4(f) of the U.S. Department of Transportation Act of 1966 (49 United States Code § 303, as amended), and Section 404 of the Clean Water Act of 1977 (33 United States Code § 1251). The Draft Environmental Impact Statement and Section 4(f) Evaluation 1) satisfies Federal Highway Administration and Arizona Department of Transportation's environmental analysis requirements; 2) provides a comparison of the social, economic, and environmental impacts that may result from implementation of the proposed action—construction and operation of a major transportation facility; and 3) identifies measures to avoid, reduce, or otherwise mitigate adverse impacts. The comment references regular inquiry pertinent to information to be disclosed in the Draft Environmental Impact Statement and directly tied to the alternatives development and screening process of the Draft Environmental Impact Statement. In those instances, information from analyses either had yet to be fully formed and/or disclosure prior to the issuance of the Draft Environmental Impact Statement would have been pre-decisional.
2	**Section 4(f) and Section 6(f)**	The proposed freeway would pass through the park's southwestern edge. Section 4(f) of the Department of Transportation Act extends protection to significant publicly owned public parks, recreation areas, and wildlife and waterfowl refuges, as well as significant historic sites, whether they are publicly or privately owned. This protection stipulates that those facilities can be used for transportation projects only if there is no prudent and feasible alternative to using the land and the project includes all possible planning to minimize harm to the land [see Final Environmental Impact Statement, Chapter 5, *Section 4(f) Evaluation*].The project team examined alternatives to avoid the Phoenix South Mountain Park/Preserve, but did not identify any feasible and prudent alternatives to avoid the use of the park. Use of a portion of the mountains for the purposes of the proposed freeway represents two-tenths of one percent of the total mountain range (31.3 acres of the park's approximately 16,600 acres; see Final Environmental Impact Statement pages S-39 and 5-31). Since 1988, and as part of this environmental impact statement process, several measures have been undertaken and will be undertaken to further reduce effects on the mountains. These measures, including narrowing the design footprint, acquiring replacement land immediately adjacent to the mountains, and the provision of highway crossings, are outlined in text beginning on page 5-23 of the Final Environmental Impact Statement. Phoenix South Mountain Park/Preserve would remain the largest municipally owned park in the United States. The activities that make the park a highly valued resource (recreational activities, interaction with the Sonoran Desert) would remain. Nine-tenths of a mile of the proposed freeway would pass through the park's southwestern edge (see Final Environmental Impact Statement page 5-13).

Code	Comment Document

My name is Maxine Lakin, past Parks and Recreation Chairman as well as past Chairman of the Phoenix Mountains Preservation Council.

The Phoenix Mountains Preservation Council is an organization put into place by Arizona visionaries, and for the last 40 years has continued to monitor and anticipate the impact that rapid population growth would have on our precious Mountain Preserve system.

PMPC is steadfastly opposed to any alignment of the Loop 202 South Mountain Freeway that allows for trespass onto the Mountain Preserve or for any excavation into the South Mountain what so ever. The Mountain preserves are unique and are for **people and wildlife**, not for vehicle trespass. PMPC does not agree with many of the DEIS assumptions, finding them objectionable and deficient in the following areas.

(1) Unacceptable Pre-Decisional Actions: ADOT has made some pre-decisional actions with the purchase of property before the Draft Environmental Impact Statement (DEIS) was released. PMPC questions the legality of this action and the entire DEIS when it appears ADOT has already made considerable financial investment to establish the alignment for the South Mountain Freeway rather than follow the prescribed process.

(2) Dismal Wildlife Connectivity: The DEIS does not meet the minimal requirements for coordination and analysis of wildlife resources. The consultation with the Arizona Game and Fish Department confirmed in 2009 that the current connection to the Estrella mountains allows for passage of mule deer, javelina, bobcat and mountain lion. The mountain ridge area slated for demolition meets the definition of the

Code	Issue	Response
1	**Alternatives**	The comment suggests the environmental impact statement process was biased by a history of property acquisitions within the Study Area. More specifically, properties falling within the limits of the Preferred Alternative, as identified in the Final Environmental Impact Statement, were targeted for acquisition. As noted in text on page 3-54 of the Final Environmental Impact Statement, the Arizona Department of Transportation began acquiring land for the original alignment in 1988. Between 1988 and 2001, the Arizona Department of Transportation acquired approximately 293 acres. Most of this land (258 acres) is located in the Eastern Section along Pecos Road. In 2006, the Arizona Department of Transportation began protective and hardship land acquisition in the alignment right-of-way footprint for the W59 and E1 Alternatives. Between 2006 and October 2013, the Arizona Department of Transportation purchased 326 acres (303 in the Western Section and 23 in the Eastern Section). The process for hardship and advanced acquisitions is explained in text on page 4-50 of the Final Environmental Impact Statement. The comment infers that by taking such action, the objective equal consideration of the alternatives studied in detail in the Draft and Final Environmental Impact Statements is tainted. Advanced acquisitions in parallel to a National Environmental Policy Act environmental determination process is not unprecedented and is common practice. In this case, property acquisitions by the Arizona Department of Transportation for purposes of implementing the proposed action are done at risk as communicated to the agency by the Federal Highway Administration. If another action alternative were to be ultimately selected, the agency would likely have to place the acquired properties on the market for sale and purchase. The Arizona Department of Transportation attempts to balance the risk against its mission of timely delivery of transportation infrastructure to the driving public. Further, Federal Highway Administration regulations do not allow the ownership of right-of-way to be a factor in the decision regarding the selection of an alternative.
2	**Biology, Plants, and Wildlife**	The section, *General Impacts on Vegetation, Wildlife, and Wildlife Habitat*, beginning on page 4-136 of the Final Environmental Impact Statement, discloses by what means the proposed action and its alternatives would affect vegetation, wildlife, and wildlife habitat. A Biological Evaluation was submitted to the U.S. Fish and Wildlife Service, Arizona Game and Fish Department, and Gila River Indian Community Department of Environmental Quality that addressed threatened, endangered, and candidate species, including the Sonoran desert tortoise. The information used to prepare the analysis in the Draft Environmental Impact Statement (page 4-122) was based on 2011 information retrieved from the Arizona Game and Fish Department (Gopherus agassizii, draft unpublished abstract compiled and edited by the Heritage Data Management System, Phoenix). Current information on threats and connectivity strategies was included in the Biological Evaluation. The U.S. Fish and Wildlife Service concurred with the species determinations in the Biological Evaluation (see Appendix 1-1 of the Final Environmental Impact Statement). Connectivity is planned to allow wildlife movement beneath the freeway in multiuse crossings (see page 4-137 of the Final Environmental Impact Statement). The Federal Highway Administration and Arizona Department of Transportation have committed to providing mitigation by including multifunctional crossing structures designed for wildlife and for limited human use as well as culverts designed for

(Response 2 continues on next page)

Code	Comment Document
	Sonoran desert tortoise habitat. There is no evidence of further efforts to ascertain wildlife connectivity or habitat needs.
3	Unreasonable Taking of Mountain Preservation Lands: The DEIS states in Figure 5-7 of Public Parkland that the avoidance of taking over 30 acres of the Preserve is not "prudent and feasible". The taking of this mountainside will destroy important archeological, spiritual, cultural and recreational sites with no realistic or reasonable mitigation possible in the study. The study also failed to recognize and address new two trails on the southwest end of the Preserve.
4	
5	Outdated Data Projections Used: The DEIS is based on outdated data projections that are now six to eight years old. **IN ALL** their studies, the DEIS provides NO alternative analysis to the demolition of the southwest ridges of South Mountain.
6	
7	Over 3 million visitors come to South Mountain Park/Preserve annually, according to the City of Phoenix statistics. Destroying any part of the mountain to align a high-capacity freeway will only have a negative impact on tourism and the many unique resources the park offers.
	We urge ADOT to stop providing studies that do not accurately or thoroughly address the impact this freeway has on South Mountain. It's time to stop the 20 million dollar and more in wasted taxpayer's money to study the environmental impact and design for an alignment that no longer makes sense.

Code	Issue	Response
2 (cont.)		connectivity for smaller species. Wildlife-friendly design information would be considered during the design of drainage and crossing structures for the freeway (see *Mitigation*, beginning on page 4-138 of the Final Environmental Impact Statement).
3	**Section 4(f) and Section 6(f)**	Chapter 5 of the Draft and Final Environmental Impact Statements presents the Section 4(f) Evaluation for the South Mountains in terms of the resource's protection as a Section 4(f) resource in terms of a regional park, historic property and traditional cultural property. The evaluation included examination of feasible and prudent avoidance alternatives which concluded no such alternatives were available to the direct use of the resource. A review from the U.S. Department of the Interior on the Draft Environmental Impact Statement concluded "Following our review of the Section 4(f) Evaluation, we concur that there is no feasible or prudent alternative to the Preferred Alternative selected in the document, and that all measures have been taken to minimize harm to these resources." The complete letter can be found in Appendix 7, Volume III, on page B4 of the Final Environmental Impact Statement.
4	**Section 4(f) and Section 6(f)**	South Mountain's newest trails are the Bursera and Pyramid Trails (see Final Environmental Impact Statement page 5-8). The E1 Alternative is approximately 1 mile south of the Pyramid Trail and even farther from the Bursera Trail; thus, it would not affect either trail. The trails have walk-in access from Chandler Boulevard and 19th Avenue, with on-street parking. This walk-in access would be north of and adjacent to the planned extension of Chandler Boulevard and, thus, would not be directly affected. The walk-in access point and the part of the Pyramid Trial at the access point are located adjacent to a residential neighborhood and the City of Phoenix's planned Chandler Boulevard Extension. These trails are typically used for high-intensity recreational activities such as running, hiking, and biking, not noise- or viewshed-sensitive activities. All proposed action alternatives would span existing and proposed trails to avoid impacts. However, during construction (if an action alternative were selected), trails that would be spanned or would be near potential freeway construction would be closed for limited times for safety reasons. Closures would necessitate that trail users detour around construction sites to rejoin the trails farther along their length. According to Phoenix South Mountain Park/Preserve rangers, the Gila Trail—although well-defined—is not a designated trail within the park. That said, the Gila Trail would not be affected by the proposed freeway or by the Chandler Boulevard Extension. The Final Environmental Impact Statement Appendix page A665 contains information directly from the Phoenix General Plan and early coordination with the City of Phoenix Parks Department. The trails in the preserve are exceptions to this statement and were always meant as such. The trails within 1/4 mile of the proposed alternatives were treated separately, as in the case of the Maricopa County Regional Trails System. Should an alternative be selected, the Arizona Department of Transportation and Federal Highway Administration would work closely with the City of Phoenix during final design to ensure the connectivity of trails is maintained, whether they are eligible as Section 4(f) resources or not.

Code	Issue	Response
5	**Purpose and Need**	The analyses in the Draft Environmental Impact Statement used socioeconomic and traffic projections at the regional analysis zone and traffic analysis zone levels. At the time of publication of the Draft Environmental Impact Statement, Census 2010-based socioeconomic data at the regional analysis zone and traffic analysis zone levels had not been adopted by the Maricopa Association of Governments and were not available to the project team. Therefore, the data used in the Draft Environmental Impact Statement were the most appropriate information available. The Maricopa Association of Governments approved new population, employment, housing, and traffic projections in June 2013. The new data are presented in the Final Environmental Impact Statement beginning on page 1-11. The purpose and need and analysis of alternatives were updated and reevaluated using these new socioeconomic projections and corresponding projections related to regional traffic. While new projections based on the 2010 Census showed a lower anticipated population and vehicle miles traveled in 2035 than the previous projections, the conclusions reached in the Draft Environmental Impact Statement were validated in the Final Environmental Impact Statement (see Chapter 3, *Alternatives*). The traffic analysis demonstrated that the proposed project is needed today and will continue to be needed into the future.
6	**Alternatives**	Several action alternatives were subject to the alternatives development and screening process; not just the E1 Alternative and alternatives located on the Gila River Indian Community (Figure 3-6 on page 3-10 of the Draft Environmental Impact Statement illustrates a representation of such alternatives). Ultimately the other alternatives were eliminated from further study in the screening process and the Gila River Indian Community decided not to give permission to study alternatives on their land (see Final Environmental Impact Statement page 3-25). Therefore, the Arizona Department of Transportation, with concurrence from Federal Highway Administration, identified the E1 Alternative as the eastern section of the Preferred Alternative (which includes the W59 Alternative in the Western Section of the Study Area). In reaching its determination, the Arizona Department of Transportation sought to balance its responsibilities to address regional mobility needs while being fiscally responsible and sensitive to local communities.
7	**Section 4(f) and Section 6(f)**	City of Phoenix planning efforts since the mid-1980s illustrate an awareness of the potential for the proposed freeway to affect Phoenix South Mountain Park/Preserve. In 1989, the South Mountain Park Master Plan was adopted by the Phoenix City Council. The master plan shows the freeway alignment as adopted by the State Transportation Board in 1988. In 1990, the South Mountain Preserve Act was ratified by the Arizona Legislature. The Act did not apply to roadways through a designated mountain preserve if the roadway was in the State Highway System prior to August 15, 1990. The proposed freeway was in the State Highway System prior to 1990. Records prior to the Act suggest a primary reason for the exception was to allow the proposed freeway to go through Phoenix South Mountain Park/Preserve (see Final Environmental Impact Statement page 5-14). The project team examined alternatives to avoid the park, but did not identify any feasible and prudent alternatives to avoid impacts. The portion of the park that would be used for the proposed freeway would be 31.3 acres, or approximately 0.2 percent of the park's approximately 16,600 acres (see Final Environmental Impact Statement pages S-39 and 5-31). The Arizona Department of Transportation continues to work with park stakeholders to minimize impacts and address concerns. Measures to minimize harm to the park were developed (see Final Environmental Impact Statement, starting on page 5-23).

Document Created: 7/25/2013 2:14:06 PM by Web Comment Form

PMPC is steadfastly opposed to any alignment of the Loop 202 South Mountain Freeway that allows for trespass onto the Mountain Preserve or for any excavation into the South Mountain what so ever. These mountain preserves ensures a lifestyle that 80% of Arizona voters consistently support. The mountain preserves are unique and are for people and wildlife, not for vehicle trespass. PMPC does not agree with many of the DEIS assumptions finding them objectionable and deficient in the following analysis areas.

(1) Unexceptable Pre-Decisional Actions: ADOT has made some pre-decisional actions with the purchase of property before the Draft Environmental Impact Statement (DEIS) was released. Phoenix Mountains Preservation Council (PMPC) questions the legality of this action and the entire DEIS when it appears ADOT has already made considerable financial investment to establish the alignment for the South Mountain Freeway rather than follow the prescribed process.

(2) Dismal Wildlife Connectivity: The DEIS does not meet the minimal requirements for coordination and analysis of wildlife resources. The Arizona Game and Fish Department was consulted in 2009 during scoping. The current connection to the Estrella Mountains allows for passage of mule deer, javelina, bobcat, and mountain lion. There is no evidence of further efforts to ascertain wildlife connectivity needs or possible mitigation. The Sonoran desert tortoise provides additional evidence of inadequate cumulative analysis given its status as a U.S. Fish & Wildlife Service's candidate species. The mountain ridge area slated for demolition meets the definition for the tortoise's habitat.

(3) Unreasonable Taking of Mountain Preservation Lands: The DEIS states in Figure 5-7 Public Parkland the avoidance of taking over 30 acres of the Preserve is "not prudent and feasible". The taking of this mountainside will destroy important archeological, spiritual, cultural and recreational sites with no realistic or reasonable mitigation possible in the study. The study

(4) failed to recognize and address new two trails, Gila and Bursera Trails, created in the southwest end of the Preserve in 2010.

(5) Outdated Data Projections Used: The DEIS is based on outdated data projections that are now six to eight years old. The analysis does not acknowledge the impact the major economic downturn had and it brings into question the validity of projected growth levels put forth in the DEIS. In all the alternative studies, the DEIS does not provide one alternative

(6) analysis to the demolition of the southwest ridges of South Mountain. Furthermore, nowhere in this study is there an assessment of hazardous material truck traffic nor any mention of

(7) managing this truck traffic and the consequences of a serious hazard waste incident.

Over 3 million visitors come to South Mountain Park/Preserve annually, according to City of Phoenix statistics. Destroying any part of the mountain to align a high-capacity freeway will only have a negative impact on tourism and the many unique resources the park offers.

We urge ADOT to stop providing studies that do not accurately or thoroughly address the impact this freeway has on South Mountain. It's time to stop the $20 million and more in wasted tax payer's money to study the environmental impact and design for an alignment that no longer makes sense.

Code	Issue	Response
1	**Alternatives**	The comment suggests the environmental impact statement process was biased by a history of property acquisitions within the Study Area. More specifically, properties falling within the limits of the Preferred Alternative, as identified in the Final Environmental Impact Statement, were targeted for acquisition. As noted in text on page 3-54 of the Final Environmental Impact Statement, the Arizona Department of Transportation began acquiring land for the original alignment in 1988. Between 1988 and 2001, the Arizona Department of Transportation acquired approximately 293 acres. Most of this land (258 acres) is located in the Eastern Section along Pecos Road. In 2006, the Arizona Department of Transportation began protective and hardship land acquisition in the alignment right-of-way footprint for the W59 and E1 Alternatives. Between 2006 and October 2013, the Arizona Department of Transportation purchased 326 acres (303 in the Western Section and 23 in the Eastern Section). The process for hardship and advanced acquisitions is explained in text on page 4-50 of the Final Environmental Impact Statement. The comment infers that by taking such action, the objective equal consideration of the alternatives studied in detail in the Draft and Final Environmental Impact Statements is tainted. Advanced acquisitions in parallel to a National Environmental Policy Act environmental determination process is not unprecedented and is common practice. In this case, property acquisitions by the Arizona Department of Transportation for purposes of implementing the proposed action are done at risk as communicated to the agency by the Federal Highway Administration. If another action alternative were to be ultimately selected, the agency would likely have to place the acquired properties on the market for sale and purchase. The Arizona Department of Transportation attempts to balance the risk against its mission of timely delivery of transportation infrastructure to the driving public. Further, Federal Highway Administration regulations do not allow the ownership of right-of-way to be a factor in the decision regarding the selection of an alternative.
2	**Biology, Plants, and Wildlife**	The section, *General Impacts on Vegetation, Wildlife, and Wildlife Habitat*, beginning on page 4-136 of the Final Environmental Impact Statement, discloses by what means the proposed action and its alternatives would affect vegetation, wildlife, and wildlife habitat. A Biological Evaluation was submitted to the U.S. Fish and Wildlife Service, Arizona Game and Fish Department, and Gila River Indian Community Department of Environmental Quality that addressed threatened, endangered, and candidate species, including the Sonoran desert tortoise. The information used to prepare the analysis in the Draft Environmental Impact Statement (page 4-122) was based on 2011 information retrieved from the Arizona Game and Fish Department (Gopherus agassizii, draft unpublished abstract compiled and edited by the Heritage Data Management System, Phoenix). Current information on threats and connectivity strategies was included in the Biological Evaluation. The U.S. Fish and Wildlife Service concurred with the species determinations in the Biological Evaluation (see Appendix 1-1 of the Final Environmental Impact Statement). Connectivity is planned to allow wildlife movement beneath the freeway in multiuse crossings (see page 4-137 of the Final Environmental Impact Statement). The Federal Highway Administration and Arizona Department of Transportation have committed to providing mitigation by including multifunctional crossing structures designed for wildlife and for limited human use as well as culverts

(Response 2 continues on next page)

Code	Comment Document

Code	Issue	Response
2 (cont.)		designed for connectivity for smaller species. Wildlife-friendly design information would be considered during the design of drainage and crossing structures for the freeway (see *Mitigation*, beginning on page 4-138 of the Final Environmental Impact Statement).
3	**Section 4(f) and Section 6(f)**	The religious and cultural importance of the South Mountains is acknowledged in the Draft Environmental Impact Statement in several locations, notably pages 4-132 and 5-26 as well as in the Summary of the Draft Environmental Impact Statement. The description in the Draft and Final Environmental Impact Statements is based on input received from the Gila River Indian Community and its members and other Indian Nations and their members. The Final Environmental Impact Statement includes discussion on efforts to avoid use of Phoenix South Mountain Park/Preserve, starting on page 5-16. Measures to minimize harm to the park as a result of the proposed freeway start on page 5-23. The portion of the park that would be used for the proposed freeway would be 31.3 acres, or approximately 0.2 percent of the park's approximately 16,600 acres (see Final Environmental Impact Statement pages S-39 and 5-31). The activities that make the park such a highly valued resource (recreational activities, interaction with the Sonoran Desert) would remain.
4	**Section 4(f) and Section 6(f)**	South Mountain's newest trails are the Bursera and Pyramid Trails (see Final Environmental Impact Statement page 5-8). The E1 Alternative is approximately 1 mile south of the Pyramid Trail and even farther from the Bursera Trail; thus, it would not affect either trail. The trails have walk-in access from Chandler Boulevard and 19th Avenue, with on-street parking. This walk-in access would be north of and adjacent to the planned extension of Chandler Boulevard and, thus, would not be directly affected. The walk-in access point and the part of the Pyramid Trial at the access point are located adjacent to a residential neighborhood and the City of Phoenix's planned Chandler Boulevard Extension. These trails are typically used for high-intensity recreational activities such as running, hiking, and biking, not noise- or viewshed-sensitive activities. All proposed action alternatives would span existing and proposed trails to avoid impacts. However, during construction (if an action alternative were selected), trails that would be spanned or would be near potential freeway construction would be closed for limited times for safety reasons. Closures would necessitate that trail users detour around construction sites to rejoin the trails farther along their length. According to Phoenix South Mountain Park/Preserve rangers, the Gila Trail—although well-defined—is not a designated trail within the park. That said, the Gila Trail would not be affected by the proposed freeway or by the Chandler Boulevard Extension. The Final Environmental Impact Statement Appendix page A665 contains information directly from the Phoenix General Plan and early coordination with the City of Phoenix Parks Department. The trails in the preserve are exceptions to this statement and were always meant as such. The trails within 1/4 mile of the proposed alternatives were treated separately, as in the case of the Maricopa County Regional Trails System. Should an alternative be selected, the Arizona Department of Transportation and Federal Highway Administration would work closely with the City of Phoenix during final design to ensure the connectivity of trails is maintained, whether they are eligible as Section 4(f) resources or not.

Code	Issue	Response
5	**Purpose and Need**	The analyses in the Draft Environmental Impact Statement used socioeconomic and traffic projections at the regional analysis zone and traffic analysis zone levels. At the time of publication of the Draft Environmental Impact Statement, Census 2010-based socioeconomic data at the regional analysis zone and traffic analysis zone levels had not been adopted by the Maricopa Association of Governments and were not available to the project team. Therefore, the data used in the Draft Environmental Impact Statement were the most appropriate information available. The Maricopa Association of Governments approved new population, employment, housing, and traffic projections in June 2013. The new data are presented in the Final Environmental Impact Statement beginning on page 1-11. The purpose and need and analysis of alternatives were updated and reevaluated using these new socioeconomic projections and corresponding projections related to regional traffic. While new projections based on the 2010 Census showed a lower anticipated population and vehicle miles traveled in 2035 than the previous projections, the conclusions reached in the Draft Environmental Impact Statement were validated in the Final Environmental Impact Statement (see Chapter 3, *Alternatives*). The traffic analysis demonstrated that the proposed project is needed today and will continue to be needed into the future.
6	**Alternatives**	Several action alternatives were subject to the alternatives development and screening process; not just the E1 Alternative and alternatives located on the Gila River Indian Community (Figure 3-6 on page 3-10 of the Final Environmental Impact Statement illustrates a representation of such alternatives). Ultimately the other alternatives were eliminated from further study in the screening process and the Gila River Indian Community decided not to give permission to study alternatives on its land (see Final Environmental Impact Statement page 3-25). Therefore, the Arizona Department of Transportation, with concurrence from Federal Highway Administration, identified the E1 Alternative as the eastern section of the Preferred Alternative (which includes the W59 Alternative in the Western Section of the Study Area). In reaching its determination, the Arizona Department of Transportation sought to balance its responsibilities to address regional mobility needs while being fiscally responsible and sensitive to local communities.

Code	Issue	Response
7	**Hazardous Materials**	Arizona highways, as are most highways across the United States, are open to all kinds of traffic, so long as the cargo being carried is in accordance with U.S. Department of Transportation regulations for the specific type of cargo. The Arizona Department of Transportation has a few locations in the state with hazardous cargo restrictions, but these restrictions are based on emergency response issues or roadway design limitations specific to that location. For example, the Interstate 10 Deck Park Tunnel has certain hazardous cargo transport restrictions because of the limited ability for emergency responders to address a hazardous materials incident in the tunnel. The South Mountain Freeway, if implemented, is expected to operate under the same rules as other similar facilities in the state; transport of hazardous cargo would be expected to be permissible (see text box on page 4-157 of the Final Environmental Impact Statement). The Arizona Department of Public Safety (which includes the State Highway Patrol) has primary responsibility for enforcing traffic laws. The Department of Public Safety also has primacy when calling in support for traffic accidents, including hazardous materials accidents (see text box on page 4-157 of the Final Environmental Impact Statement). The Arizona Department of Transportation maintains a list of contractors who provide emergency response services, as well as local municipalities whose fire and police departments operate in cooperation with the Department of Public Safety on incidents within their jurisdiction. Requirements for shippers are maintained by the Arizona Department of Transportation's Enforcement Compliance Division. In the event of an incident with a hazardous materials issue on a State or federal highway, the emergency responders contact the Arizona Department of Transportation's Traffic Operations Center to report the incident. The Traffic Operations Center then contacts the Arizona Department of Transportation's Safety and Risk Management group, who responds to the accident scene and assesses needs in concert with the Incident Commander from the responding agency with jurisdiction. If requested, the Arizona Department of Transportation can assist cleanup activities by engaging specialty subcontractors with whom the Arizona Department of Environmental Quality has contracts for such support. The Arizona Department of Transportation's Safety and Risk Management group's charge is primarily public health protection, with cleanup support being secondary.

Subject: Opposition to South Mountain Freeway Construction

Phoenix Mountains Preservation Council
Opposition to South Mountain Freeway Construction

PMPC is an organization put into place by Arizona visionaries, and for the last 40 years PMPC has continued to monitor and anticipate the impact that rapid population growth would have on our precious Mountain Preserve system.

PMPC is steadfastly opposed to any alignment of the Loop 202 South Mountain Freeway that allows for trespass onto the Mountain Preserve or for any excavation into the South Mountain what so ever. These mountain preserves ensures a lifestyle that 80% of Arizona voters consistently support. The mountain preserves are unique and are for people and wildlife, not for vehicle trespass. PMPC does not agree with many of the DEIS assumptions finding them objectionable and deficient in the following analysis areas.

(1) Unexceptable Pre-Decisional Actions: ADOT has made some pre-decisional actions with the purchase of property before the Draft Environmental Impact Statement (DEIS) was released. Phoenix Mountains Preservation Council (PMPC) questions the legality of this action and the entire DEIS when it appears ADOT has already made considerable financial investment to establish the alignment for the South Mountain Freeway rather than follow the prescribed process.

(2) Dismal Wildlife Connectivity: The DEIS does not meet the minimal requirements for coordination and analysis of wildlife resources. The Arizona Game and Fish Department was consulted in 2009 during scoping. The current connection to the Estrella Mountains allows for passage of mule deer, javelina, bobcat, and mountain lion. There is no evidence of further efforts to ascertain wildlife connectivity needs or possible mitigation. The Sonoran desert tortoise provides additional evidence of inadequate cumulative analysis given its status as a U.S. Fish & Wildlife Service's candidate species. The mountain ridge area slated for demolition meets the definition for the tortoise's habitat.

(3) Unreasonable Taking of Mountain Preservation Lands: The DEIS states in Figure 5-7 Public Parkland the avoidance of taking over 30 acres of the Preserve is "not prudent and feasible". The taking of this mountainside will destroy important archeological, spiritual, cultural and recreational sites with no realistic or reasonable mitigation possible in the study. The study failed to recognize and address new two trails, Gila and Bursera Trails, created in the southwest end of the Preserve in 2010.

(4)

(5) Outdated Data Projections Used: The DEIS is based on outdated data projections that are now six to eight years old. The analysis does not acknowledge the impact the major

2

Based on a review of the data, it appears that the DEIS is no more than a thinly veiled, very expensive attempt to manipulate the public into believing that construction of the preferred alternative(s) for the Loop 202 South Mountain Freeway is a good thing. This DEIS, and the actions that created it, represent, *inter alia*, a gross abuse of the public trust, a violation of the processes required by the National Environmental Policy Act ("NEPA") and Section 4(f) of the Transportation Act, and an approximately $3 billion waste of tax payers' money. Modern history is replete with examples of fraud, waste, and/or abuse on a large scale. Unlike many of these schemes, however, the South Mountain Freeway project does not just involve the misuse and/or misappropriation of large sums of money. The South Mountain Freeway will have a significant negative impact on the health of thousands of people, including children, who live and/or go to school near the proposed right-of-way. It will require the relocation of hundreds of homes, and dry up lakes and golf courses in the Ahwatukee area. The project will pollute the air, bombard residents with noise, negatively impact recreational opportunities, devalue homes, re-route large numbers of commercial trucks through an historic bedroom community, and destroy a large segment of the South Mountain Park – a valuable natural resource that is sacred to the Gila River Indian Community and other tribes in the area.

3

Notwithstanding the negative impacts and cost, construction and utilization of the proposed South Mountain Freeway will result in capacity deficiencies at levels comparable to the No Action Alternative on freeways and arterials throughout the Metropolitan Area. That is, even if we assume, *arguendo*, that all of the data presented in the DEIS is accurate, according to ADOT's own estimation, the Loop 202 South Mountain Freeway, if built, will not improve traffic flow in areas of congestion on freeways and surface streets in the metropolitan Phoenix area. Regrettably, this is not just hyperbole. Indeed, the consultants/experts who helped to provide the included reports address each of these issues (and more) with specificity. As discussed herein, these issues were either ignored in the DEIS or were presented in the DEIS in a false and/or misleading light.

4

The DEIS utilizes bad data, inappropriate modeling techniques, and presents misguided and misleading conclusions throughout in a Procrustean effort to support selection of the "preferred alternative." Even the population projections used to demonstrate need for the project are based on bad data. The DEIS takes an exceptionally high growth period – using 2005 census data – and assumes such growth will continue unabated for the next 30 years. Census data from 2010, which was readily available to ADOT, however, objectively confirms that ADOT's projections were fatally flawed and grossly exaggerated from the outset. The DEIS expressly puts off analyses of whole categories of impacts until the "design phase" of construction, even though such analysis is an essential aspect of the decision-making process that preparation of a DEIS is supposed to promote. Moreover, ADOT identifies only one action alternative for the

Code	Issue	Response
2	**Environmental Impact Statement Process**	The Arizona Department of Transportation, the project sponsor, working in close consultation with the Federal Highway Administration, the lead federal agency for the proposed action, and in cooperation with the U.S. Army Corps of Engineers, the U.S. Bureau of Indian Affairs, and the Western Area Power Administration, prepared the Draft and Final Environmental Impact Statements and Section 4(f) Evaluations for the South Mountain Freeway in accordance with: the National Environmental Policy Act of 1969 [42 United States Code § 4332(2)(c)], Section 4(f) of the U.S. Department of Transportation Act of 1966 (49 United States Code § 303, as amended), and Section 404 of the Clean Water Act of 1977 (33 United States Code § 1251). The Draft and Final Environmental Impact Statements and Section 4(f) Evaluations: 1) satisfy the Federal Highway Administration's and Arizona Department of Transportation's environmental analysis requirements; 2) provide a comparison of the social, economic, and environmental impacts that may result from implementation of the proposed action—construction and operation of a major transportation facility; and 3) identify measures to avoid, reduce, or otherwise mitigate adverse impacts. The Draft and Final Environmental Impact Statements includes sufficient preliminary design information to compare alternatives. Responses to specific comments appear below.
3		Responses to specific comments appear below.
4		Responses to specific comments appear below.

Code	Comment Document

eastern alignment in the DEIS. NEPA requires a detailed analysis of all viable alternatives. Section 4(f) of the Transportation Act mandates, in pertinent part, that the Secretary of Transportation reject any project that requires the use of park land (South Mountain) unless: (1) there is no feasible and prudent alternative to the use of such land; and (2) such program includes all possible planning to minimize harm to such park.[1] In the instant case, the only action alternative considered by ADOT requires blasting through South Mountain. As discussed in the attached reports, there are many other feasible and prudent alternatives that do not impact park land that ADOT refused/failed to consider/select – including but not limited to the no action alternative. As a practical matter, ADOT simply rejected a number of otherwise viable alternatives because they were outside the "study area" – a restrictive geographic boundary with no apparent factual or scientific basis or justification.

5

The only conclusion to be drawn is that the NEPA process for the South Mountain Loop 202 Freeway is not intended or designed to promote informed decision making and public participation.[2] Indeed, it appears that the selection of both the eastern and western alignments was a foregone conclusion, with ADOT attempting to only facially comply with its statutory obligations. This conclusion is further supported by the fact that ADOT began acquiring property along the Pecos Road alignment in 1988. To date, ADOT has spent at least $43 million on purchasing properties along the Pecos Road alignment. ADOT has been purchasing properties along the 59th Avenue alignment since 1987. To date, ADOT has spent, at least, $45.5 million on properties along the 59th Avenue alignment – and nothing along the other western alignment alternatives.

6

The following people/organizations, *inter alia*, have provided reports on behalf of the commenters that are attached hereto:

1. George Thurston, Sc.D: Dr. Thurston is a full Professor at the New York University Medical School. Dr. Thurston identifies, in part: Kyrene de la Estrella; Kyrene de los Lagos; Kyrene del Milenio; Kyrene Akimel A-al; Desert Vista High School; Keystone Montessori; Summit School of Ahwatukee; Horizon Community Learning Center; St. John Bosco Interparish Catholic School; Betty Fairfax High School; Cheatham Elementary School; Country Gardens Charter School; Sunridge Elementary

[1] The DEIS also fails to consider, *inter alia*, the "constructive use" of Pecos Park/recreation area and the public school playgrounds located within 0.5 miles of the proposed right-of-way – the "hot spot" zone for greatest health/air impacts.

[2] Documents identified in the DEIS were, more often than not, not available at the identified locations and/or online. ADOT was often unresponsive or slow to respond in providing requested documents necessary to provide informed comments on the DEIS.

Code	Issue	Response
5		Responses to specific comments appear below.
6		Responses to specific comments appear below.

Code	Comment Document

School; and Western Valley Middle School as all being within the area of greatest negative health impacts from the proposed Freeway.[3]

Dr. Thurston concludes that, ". . . the increased exposure to residents living or going to school near to the proposed South Mountain Freeway will be at substantially increased risk of adverse health effects if the Freeway is built as proposed, and I further note that these serious health impacts are ignored or not sufficiently addressed in the DEIS. In particular, if the Freeway is built as planned, children with asthma will be at much greater risk of experiencing asthma exacerbations (e.g., asthma attacks, wheezing, cough, etc.). Healthy children will be at significantly higher risk of getting new-onset asthma, and all children living near the proposed Freeway will likely have their lung growth and development inhibited from what it would have been without the Freeway. In adults, the primary health threat from the proposed Freeway air pollution will be increased risks of chronic cardiovascular illness (e.g., PAD) acute myocardial infarctions (MIs), and premature mortality."

7

2. Kevin Kane: Mr. Kane is a Ph.D. candidate and instructor at Arizona State University's School of Geographical Sciences and Urban Planning. Mr. Kane addresses the agency's utilization of faulty population projections to support the very purpose and need for the Freeway. The DEIS relies on aggressive growth rates based on 2005 census data, even though 2010 census data was readily available. ADOT also projects that vehicle miles traveled (VMT) per person would grow. Not only were ADOT's VMT projections based on exaggerated population figures, but contrary to ADOT's findings, both national and state studies have shown that VMTs are actually declining on a *per capita* basis. Mr. Kane concludes, in part, that "MAG's modeling, which is relied upon in the DEIS to establish the purpose and need for the Freeway expansion fails to accurately identify short-range growth and uses outdated data to estimate long-range growth. It reports its projections in a manner that indicates that they are certain to happen, which is not supported by the data and modeling techniques used. Using accurate data to objectively evaluate purpose and need based on socioeconomic factors supports the no build option."

8

3. Herman Basmaciyan, P.E.: Mr. Basmaciyan is a Registered Civil and Traffic Engineer in the State of California and a Registered Engineer (in retired status) in the states of Washington, Arizona and Florida. He has over 50 years of experience in traffic and transportation engineering, traffic modeling and forecasting, and the preparation of traffic impact studies. Mr. Basmaciyan identifies myriad deficiencies in the DEIS, including the faulty population projections used to justify the project. He identifies

[3] Although not listed in Dr. Thurston's report, it appears that Kyrene de la Sierra, Kings Ridge Preparatory Academy, and Western Valley Elementary School are also within this "hot zone" for negative health effects from the proposed freeway.

Code	Issue	Response
7		Responses to specific comments appear below.
8		Responses to specific comments appear below.

Code	Comment Document

various alternatives that should have been considered in the DEIS but were not. Indeed, only one route is considered for the eastern alignment. Mr. Basmaciyan further finds, in part, that "[e]ven assuming arguendo that the demographics used to demonstrate the need for the project are accurate (they are not), none of the Action Alternatives considered will alleviate the anticipated capacity deficiencies identified in the Purpose and Need. Despite the expenditure of about $2 billion to $3 billion to build the South Mountain Freeway and despite the displacement of many residences and business establishments, there will be capacity deficiencies at levels comparable to the No Action Alternative on freeways and arterials throughout the Metropolitan Area and on the South Mountain Freeway itself"

Further, according to Mr. Basmaciyan, "[b]ased on these traffic and circulation considerations, none of the Action Alternatives should have been selected as the preferred Alternative. Indeed, when correct socio-economic data is used, the No Action Alternative largely achieves the desired outcomes without exorbitant costs and/or negative impacts."

9

4. SWCA Environmental Consultants: The SWCA team reviewed the DEIS for its discussion on water, air, noise and socio-economic impacts and provided a comment "matrix". The conclusions included in the matrix are too voluminous to outline here. SWCA did, however, confirm, in part, that: (1) there is no technical or scientific rationale or justification for why the "Study Area" is defined the way it is; (2) otherwise viable alternatives were eliminated simply because they did not fit into the arbitrarily defined "Study Area"; (3) ADOT used the wrong modeling program and faulty data in presenting its analysis of impacts of air pollution; and (4) there is essentially no discussion of the impact construction would have on the wells that currently serve the Lakewood and Foothills communities – this project will likely dry up the lakes and golf courses in Ahwatukee.

10

5. Richard Haddow: Mr. Haddow is a former District Environmental Coordinator with the Arizona Department of Transportation (ADOT). According to Mr. Haddow, in part, "[t]he use of data, the methodology employed, and the conclusions presented in the DEIS are absolutely without technical merit and do not comply with the fundamental concepts and purpose of an environmental impact statement. The DEIS does not protect or properly inform the citizens of the level of risk to public health by building the freeway." Further, according to Mr. Haddow, the DEIS completely fails to consider the terrain that will be impacted by the project. According to Mr. Haddow, in part, "[n]otwithstanding that this NEPA process has taken over 12 years, ADOT has not conducted any studies on atmospheric and/or ambient quality/conditions in the Ahwatukee area. As a result, there is no valid baseline data to input into air quality models that predict how bad the pollution in the area will be. Sites listed for reference to determine air quality for the citizens are nowhere near the impacted area and should not be used to determine air quality north of the Pecos Road alignment. Similarly, there are no temperature soundings for accurate air shed profiling. There are no air toxics

Code	Issue	Response
9		Responses to specific comments appear below.
10		Responses to specific comments appear below.

Code	Comment Document

measurements taken to understand the current components of the ambient air quality, and there are no wind speed and direction instruments installed as necessary to apply good science for modeling. . ."

11

6. Stephen Brittle: Mr. Brittle is the President and Co-Founder of Don't Waste Arizona, Inc. (DWAZ), a statewide non-profit environmental organization that was formed in 1990. Mr. Brittle was a member of Maricopa County Local Emergency Planning Committee for ten years. He is also a private sector consultant who has worked on various environmental and hazardous materials issues. Mr. Brittle provides comments on, in part, the CANAMEX route (one reason why the proposed Freeway will simply act as a truck bypass for high polluting commercial trucks originating in Mexico), Environmental Justice issues, Air Toxics, and hazardous materials transportation. He, again, finds the DEIS lacking on all fronts. According to Mr. Brittle, in part, "the DEIS fails to mention and analyze the risks from a catastrophic release of hazardous chemicals due to a transportation incident . . . In the matter of evacuation of Ahwatukee, the GRIC community near the freeway, and Laveen, a detailed traffic flow analysis and evacuation plan . . . must be prepared. . . If the analysis shows that the community . . . cannot be evacuated within 5-10 minutes, then the No Build option is the only logical and humane result. . . Since Ahwatukee is not six miles wide from the Pecos Road to South Mountain, it is easy to conclude that, in the event of a catastrophic release of chlorine from a 17-ton tanker of chlorine gas, all of Ahwatukee would have to either evacuate or shelter in place. . . Further, an ALOHA modeling indicates that buildings within two miles of the point where the chlorine release occurred would have high enough levels of chlorine gas infiltrate into them to become lethal, which means that shelter in place strategies would not work. . ." Mr. Brittle also questions why HDR, the consultants who prepared the DEIS for ADOT, did not include any analysis of the risks associated with hazardous materials transport – HDR was the same contractor who prepared the November 26, 2008, SPR 624 Hazardous Materials Transportation in Arizona Literature Review with Findings Report for ADOT.

Thank you for your consideration. As outlined herein and supported through the attached reports/comments, there is no valid justification for the construction of the South Mountain Loop 202 Freeway.

NEPA requires a fully informed decisional process through, in part, the preparation of a DEIS. The DEIS, however, treats the crucial decision to proceed with a $3 billion tax payers' funded project, not as an impending choice to be pondered, but as a foregone conclusion to be rationalized. The DEIS provides flawed analyses, generalities, and heavy-handed self-justifications. This is a direct violation of applicable law and a gross abuse of the public trust. No reasoned decision could be made on the basis of the DEIS that, for example, improvements to existing highways and arterials would not better serve regional transportation needs; that public transportation alternatives are not viable;

Background & Qualifications

I am a full Professor at the New York University (NYU) School of Medicine in the Department of Environmental Medicine. I have also served as the Deputy Director of the NYU Particulate Matter Health Research Center, and am presently the Director of the Program in Exposure Assessment and Health Effects in my department at the School of Medicine.

I received my undergraduate degree in Environmental Engineering from Brown University in 1974, and my Doctorate of Science (Sc.D.) in Environmental Health Sciences from the Harvard University School of Public Health in 1983. I served on the New York State Department of Environmental Conservation's Air Management Advisory Committee from 1991 to 1996, and was Chairman of the Health and Environment Panel of the Canadian Joint Industry/Government Study of Sulfur in Gasoline and Diesel Fuels in 1997.

I have published extensively regarding the human health effects of inhaled air pollutants, particularly in relation to asthma attacks, hospital admissions, and human mortality. I have been called upon by both the U.S. House of Representatives and the U.S. Senate multiple times in recent years to provide testimony before them regarding the human health effects of air pollution.

I have served as an advisor to the U.S. EPA regarding the human health effects of air pollution as a member of the Clean Air Scientific Advisory Committee (CASAC) panel on Sulfur Oxides and Nitrogen Oxides, and as a contributing author of various EPA Integrated Science Assessments (ISAs), which are relied upon by the EPA to set air pollution air quality standards in the US. A copy of my professional curriculum vitae is attached to this letter, and it accurately represents my relevant education, training, and experience.

12

Introduction

Traffic is an increasingly dominant contributor to air pollution in Phoenix, and elsewhere in the United States. Cars, buses, trucks and other motorized vehicles are amongst the largest sources of air pollution that have been clearly linked to adverse health effects (e.g., see HEI, 2010). These adverse effects of traffic related air pollution have been documented in cities around the world, across the nation, and in Phoenix, AZ. Most people are exposed to air pollution from road traffic on a daily basis, whether as a result of residing at homes located near highways, or driving, walking, or standing along busy streets. Vehicle engines are known to produce a number of air pollutants that pose risks to public health. When engines burn fuel (gasoline or diesel), chemicals such as fine particulate matter, ultrafine particles (UFP), nitrogen oxides, carbon monoxide, volatile organic

Code	Issue	Response
12	**Air Quality**	The contribution of mobile sources (traffic) to air quality in the Study Area is addressed beginning on page 4-68 of the Final Environmental Impact Statement.

Code	Comment Document

compounds (VOCs), and elemental carbon (EC) black carbon soot are all emitted. As summarized by the U.S. EPA (2009), especially steep gradients in black carbon soot mass have been observed along roadways with high diesel traffic (e.g., Zhu et al., 2002). These primary emissions, such as UFP number concentrations and EC, are highest near roadways (Levy et al., 2003; Reponen et al., 2003; Zhu et al., 2005). For example, a personal monitoring study that I conducted in Bronx County, New York determined that personal EC concentrations, and especially the fraction of $PM_{2.5}$ mass that is as EC (which is an urban tracer for diesel particulate matter, DPM), decreases linearly as a function of the distance of primary residence to busy roadways as shown below in Figure 1 (Spira-Cohen et al., 2010).

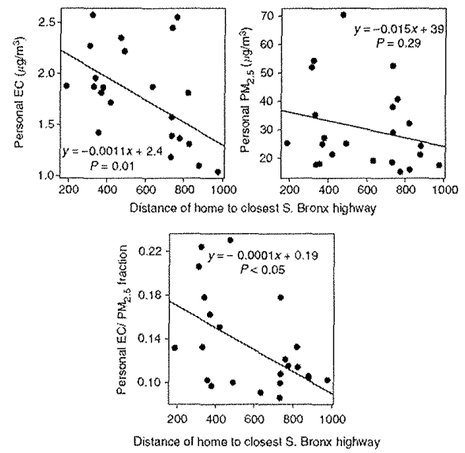

Figure 1. Living closer to a major roadway is significantly associated with larger mean personal elemental carbon (EC) soot concentration (distances in feet) (Spira-Cohen et al., 2010).

In addition to near roadway effects, some of the fuel used by engines evaporates without having been burned, and this also creates secondary pollution downwind, such as ozone, which has also been associated with increased risk of adverse health effects, including increased risk of death. Overall, traffic related emissions are a key contributor to the formation of soot and smog and the many adverse health effects they can cause.

13	
THE HEALTH EFFECTS OF AIR POLLUTION FROM ROAD TRAFFIC

The epidemiological literature on the health effects of traffic related air pollution is growing rapidly. The findings of recent scientific studies indicate that traffic is a significant contributor to the adverse effects of air pollution on public health, but this evidence is not sufficiently acknowledged or considered by the DEIS. Studies of air pollution near roadways, including my own in New York City, have provided insights into the spatially and temporally dynamic nature of traffic related pollution. The epidemiological studies on traffic and health have largely focused on the consequences of exposures incurred by living near large roadways, such as freeways in southern California. Air pollution from road traffic has been linked to a variety of negative health effects. To date, the findings indicate associations of traffic indicators with increased risk for multiple adverse health effects that may include asthma and allergic diseases, cardiac effects, respiratory symptoms, reduced lung function, inhibited lung function growth and development, premature mortality, adverse reproductive outcomes, and lung cancer, as elaborated below.

• *Asthma and allergic disease*

Numerous studies have documented the role of traffic related pollution in respiratory health. Scientific studies in North America and Europe show that children living in areas with high road traffic volumes have more respiratory-related illness symptoms than other children. More specifically, a significant number of studies conclude that exposure to traffic pollution can aggravate asthma in children (HEI, 2010). Brauer et al. (2002, 2007) found associations by elevated concentrations of NO_2 and diesel soot at children's homes with increased risk of wheezing in children in the Dutch PIAMA cohort. Symptom associations were also reported in two separate analyses of the GINI and LISA cohort study in Munich (Gehring et al. 2002; Morgenstern et al. 2007), in which dry cough at night had an association with traffic-related pollution in boys at ages 1 and 2 years. In a subsequent study (Morgenstern et al., 2008), children ages 4 and 6 years exhibited associations by distances from a busy street (50 m, 250 m, 1000 m, or > 1000 m) in Munich with symptoms of asthma, hay fever, and eczema. At the nearest (50-m) distance category, the roadway proximity association reached statistical significance for asthma symptoms (OR = 1.24; 95% CI, 1.01–1.52), indicating a 24% increase in asthma symptoms in those children vs. children living more than 1 km away from the roadway.

Code	Issue	Response
13	**Health Risk Assessment**	**The Role of Health Risk Assessment in a National Environmental Policy Act Context** The Federal Highway Administration's National Environmental Policy Act documents are developed under two guiding regulations: the Council on Environmental Quality's National Environmental Policy Act regulations applicable to all federal agencies (40 Code of Federal Regulations Parts 1500–1508) and the Federal Highway Administration's implementing regulations governing Federal Highway Administration National Environmental Policy Act documents (23 Code of Federal Regulations Part 771). In its mobile source air toxics guidance, the Federal Highway Administration discusses 40 Code of Federal Regulations Part 1502.22 and acknowledges that while much work has been done to assess the overall health risk of mobile source air toxics, analytical tools and techniques for assessing project-specific health outcomes as a result of lifetime exposures to mobile source air toxics remain limited. These limitations impede the ability to evaluate the potential health risks attributable to exposure to mobile source air toxics as part of the decision-making process in the National Environmental Policy Act context. However, as with any analysis that the Federal Highway Administration conducts for National Environmental Policy Act purposes, the Federal Highway Administration's approach for mobile source air toxic analysis in National Environmental Policy Act documents is informed not just by 40 Code of Federal Regulations Part 1502.22, but by all applicable Council on Environmental Quality requirements. The appropriateness of air toxics health risk assessment as an analysis method for National Environmental Policy Act documents is discussed below, in the context of Council on Environmental Quality requirements for these documents. In addition to the 40 Code of Federal Regulations Part 1502.22 provisions regarding uncertainty and limitations discussed in the Federal Highway Administration's MSAT Interim Guidance Appendix C, three other provisions of the Council on Environmental Quality regulations are particularly relevant to the topic of health risk assessment: *40 Code of Federal Regulations § 1500.1(b): NEPA procedures must insure that environmental information is available to public officials and citizens before decisions are made and before actions are taken. The information must be of high quality. Accurate scientific analysis, expert agency comments, and public scrutiny are essential to implementing NEPA. Most important, NEPA documents must concentrate on the issues that are truly significant to the action in question, rather than amassing needless detail.* *40 Code of Federal Regulations § 1502.1: An environmental impact statement is more than a disclosure document. It shall be used by Federal officials in conjunction with other relevant material to plan actions and make decisions.* *40 Code of Federal Regulations § 1502.2: (a) Environmental impact statements shall be analytic rather than encyclopedic. (b) Impacts shall be discussed in proportion to their significance.(c) Environmental impact statements shall be kept concise and shall be no longer than absolutely necessary to comply with NEPA and with these regulations.*

Code	Comment Document

Venn et al. (2001) investigated the relation between proximity of the family home to the nearest main road, estimated objectively using geographical information system software, and the risk of wheeze in the past year in a case-control sample of 6,147 primary schoolchildren (age 4 to 11 yr.) and a random cross-sectional sample of 3,709 secondary schoolchildren (age 11 to 16 yr.) in Nottingham, United Kingdom. Among children living within 150 m of a main road, the risk of wheeze increased with increasing proximity by an odds ratio (OR) of 1.08 (95% confidence interval [CI] 1.00 to 1.16) per 30-m increment in primary schoolchildren, and 1.16 (1.02 to 1.32) in secondary schoolchildren. Most of the increased risk was localized to within 90 m of the roadside. Among primary schoolchildren, effects were stronger in girls than boys (p(interaction) = 0.02). Living within approximately 90 m of a main road is associated with a roadway proximity-related increase in the risk of wheezing illness in children.

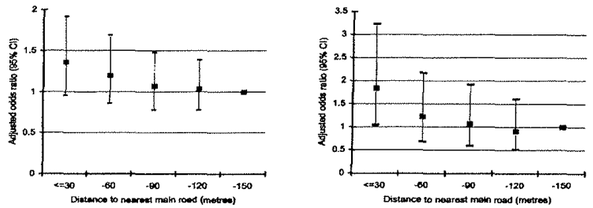

Figure 2. Living Near a Main Road Increases the Risk of Wheezing Illness in Primary (left) and Secondary (right) School Children (Venn et al., 2001)

In my own work in the South Bronx, and shown below in Figure 3, I have found that respiratory symptoms (such as cough and wheeze) can double in number per day in children with asthma (vs. a day with low traffic air pollution), as measured by the levels of elemental carbon (EC) soot measured by samplers carried by the children each day.

Code	Issue	Response
13 (cont.)		Section 1500.1(b) states that information for decision making must be of high quality and based on accurate scientific analysis. Air toxics health risk assessments can involve large uncertainties. The mobile source air toxic health risk assessment uncertainty builds on itself—each step of the analysis involves uncertainties, including modeling traffic and then modeling emissions, and using this estimated output to model dispersion/concentrations, which provide information for estimating or assuming exposures to those concentrations, and finally predicting health outcomes. Major uncertainties are associated with traffic and emissions projections over a 70-year period, and dispersion models are typically held to a "factor of 2" performance standard. Health impacts of mobile source air toxics in the U.S. Environmental Protection Agency Integrated Risk Information System are based on a 70-year lifetime exposure, which introduces significant uncertainty (e.g., on average, people in the United States change residence approximately once every 8 years and change jobs once every 3). Finally, as noted above, the U.S. Environmental Protection Agency's Integrated Risk Information System provides toxicity (risk) values for various pollutants and routes of exposure; in a health risk assessment, the Federal Highway Administration would compare calculated concentrations of mobile source air toxic pollutants to the Integrated Risk Information System values to estimate health risk. In the Integrated Risk Information System, the U.S. Environmental Protection Agency states the toxicity values are believed to be accurate to within an order of magnitude (a factor of 10). The total cumulative uncertainty involved in highway project health risk assessment is much larger than the change in emissions attributable to projects (typically a few percentage points). In this context, the information would not necessarily have a strong nexus to the requirements for high-quality information and accurate scientific analysis.

(Response 13 continues on next page)

Code	Comment Document

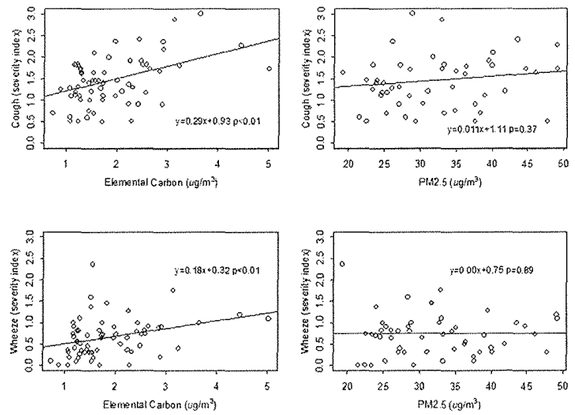

Figure 3. Days with higher traffic air pollution (i.e., higher elemental carbon (EC) soot) is associated with increased asthma symptoms (adapted from Spira-Cohen et al., 2010).

Overall, the 2010 Health Effects Institute (HEI) Publication 17 found (on page xv.) that: "the Panel concluded that the evidence is sufficient to support a causal relationship between exposure to traffic-related air pollution and exacerbation of asthma." This conclusion from the HEI Publication 17 is also acknowledged in the South Mountain Freeway DEIS (on pg. 4-75), but not sufficiently considered or applied to the proposed project impact assessment.

I agree with the above HEI Publication 17 conclusion, and I point out that this conclusion is of direct relevance to the proposed South Mountain Freeway, as there are a host of schools, that have children with asthma in them every school day, that would be adversely affected by a worsening of their asthma problems because they are located within a very short distance of the proposed freeway, including the following (distance from center of freeway):

- Kyrene de la Estrella, 2620 E. Liberty Lane (0.2 mi.)
- Kyrene de los Lagos, 17001 S. 34th Way (0.1 mi.)
- Kyrene del Milenio, 4630 E. Frye Road (0.5 mi.)
- Kyrene Akimel A-al, 2720 E. Liberty Lane (0.2 mi.)
- Desert Vista High School, 16440 S. 32nd St. (0.4 mi.)

Code	Issue	Response
13 (cont.)		Section 1500.1(b) also directs agencies to focus their National Environmental Policy Act analysis and documentation on issues that are truly significant to the action in question. In the context of mobile source air toxics, the Federal Highway Administration must consider whether changes in mobile source air toxic emissions attributable to a project have the potential for significant health risk. Using cancer risk as an example, the U.S. Environmental Protection Agency estimates that the overall risk of cancer in the United States is approximately 330,000 in a million, and that air toxics (from all sources) are responsible for a risk of approximately 50 in a million. In its most recent mobile source air toxics rule-making, the U.S. Environmental Protection Agency estimated mobile source air toxic cancer risk, after implementation of emissions controls, at approximately 5 in a million (or 0.0015 percent of overall cancer risk from any cause). For the Preferred Alternative, the mobile source air toxic emissions analysis for the Study Area found little difference in total annual emissions of mobile source air toxic emissions between the Preferred and No Action Alternatives (less than a 1 percent difference) in 2025 and 2035. With the Preferred Alternative in 2035, modeled mobile source air toxic emissions would decrease by more than 80 percent, depending on the pollutant, despite a 47 percent increase in vehicle miles traveled in the Study Area compared with 2012 conditions (see the discussion beginning on page 4-77 of the Final Environmental Impact Statement). In summary, available information from the U.S. Environmental Protection Agency indicates that mobile source air toxics are a small component of overall cancer risk, and the analysis for the Final Environmental Impact Statement indicates both that the Preferred Alternative would result in a small change in the emissions contributing to this risk and that emissions will decline by a large amount regardless of alternative. As described above and in the air quality technical report, results from the health risk assessment would be influenced more by the uncertainty introduced into the process through assumptions and speculations rather than by genuine insight into the actual health impacts directly attributable to mobile source air toxic exposure associated with a project. Therefore, outcomes of such a health risk assessment do not provide useful information for decision makers, as required by Section 1502.1. The Federal Highway Administration emissions analysis meets the requirement to produce information that is useful for both disclosure and decision making because it allows the public and decision makers to see which alternative has less mobile source air toxic emissions, with much less uncertainty than a health risk assessment.

Code	Issue	Response
13 (cont.)		Given the uncertainty of a mobile source air toxic health risk assessment, the Federal Highway Administration instead addresses the potential impacts of mobile source air toxics through an emissions assessment in its National Environmental Policy Act documents. For smaller projects with a lower likelihood of a meaningful impact, this discussion is qualitative. For larger projects, emissions analysis is conducted. The Federal Highway Administration approach is consistent with the Council on Environmental Quality's direction in Section 1502.2(b) to discuss impacts in proportion to their significance. The results of an emissions analysis can be summarized concisely in a National Environmental Policy Act document and provide useful information for decision makers (e.g., an alternative that has lower emissions is likely to be "better" from a mobile source air toxics health risk standpoint than one that has higher emissions). While the U.S. Environmental Protection Agency and the Federal Highway Administration both agree on the usefulness of addressing mobile source air toxics in National Environmental Policy Act documents for highway projects, the agencies disagree about the value of health risk assessment as a method for doing so.

(Response 13 continues on next page)

Code	Comment Document

Code	Issue	Response
13 (cont.)		Another consideration with respect to health impacts is that the Preferred Alternative would also reduce in-vehicle mobile source air toxics exposure as opposed to the No Action Alternative. The U.S. Environmental Protection Agency has found that in-vehicle benzene concentrations were between 2.5 and 40 times higher than nearby ambient concentrations, based on a review of studies discussed in the Regulatory Impact Analysis for the U.S. Environmental Protection Agency's 2007 mobile source air toxics rule-making (Final Regulatory Impact Analysis, Environmental Protection Agency 420-R-07-002, 3-17 [February 2007]). Construction of the Preferred Alternative would result in a reduction in benzene exposure to drivers and passengers for two reasons: decreased travel times (motorists would spend less time in traffic to reach their destinations) and lower emissions rates (attributable to speed improvements). Reducing on-road exposure would provide a health benefit for motorists using the roadway network. Congestion relief resulting from the proposed freeway would provide localized air quality emissions reductions on area freeways and arterial streets and at interchanges, benefiting users of area highways and those living near congested roads. The Federal Highway Administration determined that a supplemental environmental impact statement is not required at this time because there were no changes to the proposed action that will result in significant environmental impacts not evaluated in the Draft Environmental Impact Statement nor is there new information relevant to environmental concerns and bearings on the proposed action or its impacts that will result in significant environmental impacts not evaluated in the Draft Environmental Impact Statement.

Clearly, the proposed highway will cause new and additional noise and air pollution impacts to many school-age children during the school week, exacerbating their respiratory symptoms, especially for children with asthma, as discussed above, and putting children who do not have asthma at greater risk of getting the disease. Moreover, as shown in Figure 4 below, there are many homes located near these schools, in which many of the students will reside. Thus, these children's exposure will be even greater, as they will be exposed to much higher traffic air pollution and noise throughout the entire day. Not only will this increase their risk of asthma symptoms, there is now evidence indicating that it can also increase the risk of healthy children contracting asthma.

While the HEI Publication 17 Review of the health effects of traffic air pollution concluded that the evidence showing associations between exposure to traffic air pollution and the onset of new asthma in healthy children was only suggestive at that time (i.e. not enough to conclude causality), that report was published in January 2010, before more definitive evidence of this relationship was published. Notably, McConnell et al (2010) later published a study of the relationship of new-onset asthma with traffic-related pollution near homes and schools of children participating in the highly regarded California Children's Health Study. Physician diagnosis of new-onset asthma (n = 120) was identified during 3 years of follow-up of a cohort of 2,497 kindergarten and first-grade children who were asthma- and wheezing-free at study entry into the Southern California Children's Health Study. The researchers assessed traffic-related pollution exposure based on a line source dispersion model of traffic volume, distance from home and school, and local meteorology. They found that asthma risk increased with modeled traffic-related pollution exposure from roadways near homes [HR 1.51; 95% confidence interval (CI), 1.25–1.82] and near schools (HR 1.45; 95% CI, 1.06–1.98). Thus, these findings more definitively indicate that the risk of new asthma was increased by

7

Code	Issue	Response
14	**Noise, Air Quality**	With regard to noise impacts, schools were included in the categories of activities considered in the noise pollution analysis for the project in keeping with 23 Code of Federal Regulations Part 772 (see page 4-80 of the Draft Environmental Impact Statement). As stated in the Draft and Final Environmental Impact Statements, sensitive receivers, including schools, would be affected by implementation of the project. These impacts, however, will be mitigated as discussed beginning on page 4-91 of the Final Environmental Impact Statement. The noise analysis was updated for the Final Environmental Impact Statement (beginning on page 4-88). It is important to note that no substantial differences between the analyses in the Draft and Final Environmental Impact Statements resulted from the update. With regard to the use of chemicals in the context of the project, such use would not likely result in the exposure of children to hazardous materials as children are not expected to be employed in project construction. As detailed in the section of Chapter 4 related to *Temporary Construction Impacts*, windbreaks, when applicable, will be used to prevent accidental dust pollution. It is anticipated that these precautions will mitigate any potential exposure to dust suppressants (see page 4-173 of the Final Environmental Impact Statement). See Federal Highway Administration's position on the preparation of a health risk assessment as presented in the last response.
15	**Health Effects**	A common theme in public comments on the proposed project has been the potential impacts of the project on children's health, primarily through vehicle emissions and noise. Many commenters raised concerns about the proximity of the project to schools or other aspects of the project that may affect children. In addition, the U.S. Environmental Protection Agency requested that the Final Environmental Impact Statement address Executive Order 13045, *Protection of Children from Environmental Health Risks and Safety Risks*. Throughout the Final Environmental Impact Statement, potential impacts on and subsequent mitigation for human health are disclosed and identified, as inherent in the environmental impact statement process. The Final Environmental Impact Statement incorporates an assessment of the potential impacts of the proposed project on all populations, including children. The Final Environmental Impact Statement addresses potential impacts of the project on children in the Chapter 4 environmental consequences analyses. The U.S. Environmental Protection Agency's Toxicity and Exposure Assessments for Children's Health report (see page 4-73 of the Final Environmental Impact Statement) indicated that indoor air concentrations of benzene are usually higher than outdoor levels and that indoor air in smokers' homes is a significant contributor to children's exposures. It mentioned children when identifying the effects of acute exposure to naphthalene. The Final Environmental Impact Statement acknowledges and fully discloses public scoping comments that raised the topic of health effects on neighborhoods and adjacent schools (see page 4-31 of the Final Environmental Impact Statement).

(Response 15 continues on next page)

Code	Comment Document

approximately 50% among children exposed to roadway pollution, vs. children who went to school and/or lived further away from the roadways. It is now clear that living and/or going to school near a major roadway is a significant risk to healthy children of developing asthma.

15

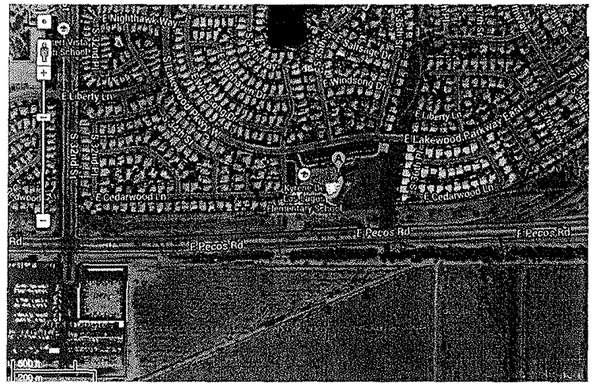

Figure 4. More children, like those attending Kyrene de los Lagos Elementary (shown here), will reside and go to school with much higher traffic noise and air pollution exposures if the proposed South Mountain Freeway is built.

In Phoenix, a recent study by Grineski et al (2010) found an association between traffic-related air pollution (as indicated by nitrogen dioxide, NO_2) and increased children's daily asthma hospital admissions in that city. As shown in Figure 1 from this study, NO_2 air pollution is strongly associated with traffic pollution in the Phoenix area, as concentrations consistently peak following the morning and evening rush hours (e.g., 8AM and 8PM). The authors found, similar to other studies, that there was an increased risk of asthma hospitalization on days of high traffic-related NO_2 air pollution, but also that the risk estimates for asthma hospital admissions were 2.25(95% CI: 1.47–3.46) times greater for black children as compared to white children. In addition, the study found that, among all Hispanic children, those without health insurance have 1.9 (95% CI: 1.3-3.0) times greater risk than those with private insurance of being admitted to the hospital for asthma from NO_2 exposure, and the same finding held for Hispanic children without insurance vs. Hispanic children with Medicaid. Thus, traffic related air pollution adversely affects children in the Phoenix area, and most severely those children lacking health insurance.

8

Code	Issue	Response
15 (cont.)		The Final Environmental Impact Statement evaluates Clean Air Act criteria air pollutant concentrations in Maricopa County and the Phoenix area (see pages 4-75 to 4-77 of the Final Environmental Impact Statement). With regard to air quality impacts, the Final Environmental Impact Statement addresses children's health impacts within the broader discussion regarding health impacts under the National Ambient Air Quality Standards. Clean Air Act Section 109(b)(1) requires the U.S. Environmental Protection Agency to promulgate primary National Ambient Air Quality Standards at levels that allow an adequate margin of safety and are requisite to protect the public health. As noted by the U.S. Environmental Protection Agency in its 2013 rulemaking for particulate matter, Clean Air Act Section 109's legislative history demonstrates that the primary standards are "to be set at the maximum permissible ambient air level... which will protect the health of any [sensitive] group of the population" (78 *Federal Register* 3086 and 3090) (quoting S. Rep. No. 91-1196, 91st Cong., 2 Sess. 10 [1970]) (alterations in original). Accordingly, the Final Environmental Impact Statement National Ambient Air Quality Standards-based evaluation of criteria air pollutants includes a health-based review of sensitive populations, including children, given the National Ambient Air Quality Standards inherent consideration of those factors. Furthermore, the National Ambient Air Quality Standards-based assessment ensures adequate consideration of health-based issues as "[t]he requirement that primary standards provide an adequate margin of safety was intended to address uncertainties associated with inconclusive scientific and technical information ... and to protect against hazards that research has not yet identified" (78 *Federal Register* 3090). Sensitive receivers for air and noise are already included in the air quality and noise analyses in accordance with State and federal guidance. Both sections, *Air Quality* and *Noise*, beginning on Final Environmental Impact Statement pages 4-68 and 4-88, respectively, have addressed requirements under the National Environmental Policy Act. As stated on page 4-89 of the Final Environmental Impact Statement, over 220 sensitive receivers were evaluated at exterior locations from a traffic noise perspective. All of the receivers represent noise-sensitive land uses in proximity to the proposed project, including homes, schools, and parks, and these receivers would have higher noise levels than similar facilities more distant from the proposed action. Each modeled school was reexamined to determine whether noise impacts would result from the proposed freeway and whether appropriate mitigation of these impacts was provided. Of the nine schools modeled in the analysis for the Final Environmental Impact Statement, all were predicted to exceed the Federal Highway Administration noise abatement criteria (see Table 4-40, beginning on page 4-93). Mitigation, in the form of noise walls, was proposed for all schools. After applying this mitigation, all schools except one were mitigated according to the Arizona Department of Transportation noise policy. According to Arizona Department of Transportation policy, noise mitigation should achieve a reduction of 5 to 7 A-weighted decibels and result in a noise level of less than 64 A-weighted decibels for residential and similar areas. These criteria were not reached for one school (receiver 67, Santa Maria Elementary School) because the policy limits wall heights to 20 feet. A wall taller than 20 feet would be required to bring levels at this receiver down to 64 A-weighted decibels. However, a 5-A-weighted decibels reduction would be provided by the 20-foot wall proposed in this area. It is important to note that this receiver would be affected only by the W71 Alternative, which is not the Preferred Alternative.

(Response 15 continues on next page)

Code	Comment Document

15

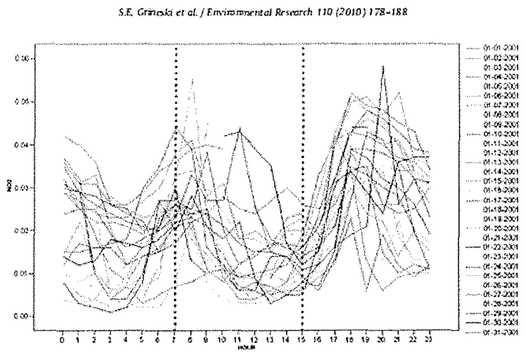

Figure 5. NO_2 in the Phoenix Area are highest following rush hour periods, documenting the large role of traffic-related pollution in air pollution impacts in the Phoenix Metro area

• *Reduced lung function*

Research by Svendsen et al. (2012) has found both long-term and short-term reductions in lung function (i.e., ability to inhale and exhale air) as a result of traffic-related air pollution exposure. For example, investigators examined 5,654 children enrolled in the El Paso, Texas, public school district by questionnaire in 2001. School-level and residence-level exposures to traffic-related air pollutants were estimated using a land use regression model. For 1,529 children with spirometry, residential levels of traffic-related ambient air pollution were associated with a 2.4% decrement in forced vital capacity (95% confidence interval (CI): -4.0, -0.7) after adjustment for demographic, anthropomorphic, and socioeconomic factors and spirometer/technician effects.

In my own work in the South Bronx, NY, I have found reduced lung function among elementary school children occurs on days of elevated traffic-related EC concentrations (Spira-Cohen et al, 2011). As shown in the plots below, the impact of diesel traffic related EC was larger and more significant that particles in general ($PM_{2.5}$).

Code	Issue	Response
15 (cont.)		The Arizona Department of Transportation noise policy also states that noise abatement shall be considered if "substantial increases" (defined as a 15 A-weighted decibels or greater increase) are predicted. Of the nine schools modeled, substantial increases were predicted at six schools. As discussed above, however, noise walls would reduce noise levels at all schools according to the Arizona Department of Transportation noise policy, with the exception of Santa Maria Elementary School, which would be affected only by the W71 Alternative, which is not the Preferred Alternative. According to the Federal Highway Administration's 1995 Highway Traffic Noise Analysis and Abatement Policy and Guidance, in most cases, if the exterior area can be protected, the interior will also be protected. Receptor placement met the criteria for selecting modeling locations as specified in 40 Code of Federal Regulations § 93.123(a). The carbon monoxide analysis was updated in the Final Environmental Impact Statement. Although a qualitative analysis of particulate matter (PM_{10}) was presented in the Draft Environmental Impact Statement, a quantitative project-level particulate matter (PM_{10}) hot-spot analysis is included in the Final Environmental Impact Statement. The results of the air quality updates are summarized in the prologue to the Final Environmental Impact Statement (page xiii) and are more fully described beginning on page 4-68 of the Final Environmental Impact Statement. The carbon monoxide and particulate matter (PM_{10}) analyses demonstrated that the proposed freeway would not contribute to any new localized violations, increase the frequency or severity of any existing violation, or delay timely attainment of the National Ambient Air Quality Standards or any required interim emissions reductions or other milestones. Through analysis, the Federal Highway Administration has determined that the proposed project would not produce disproportionate impacts on children.

15

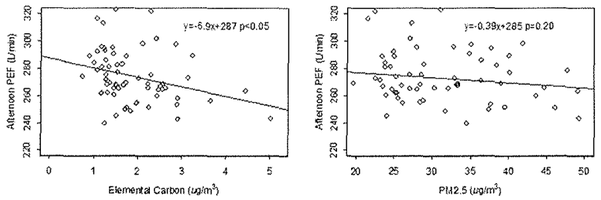

Figure 6. Lung Function in Children Decreases with Increasing Exposure to Traffic Related EC.

• *Reduced Lung Development and Growth*

Traffic-related air pollution has also been indicated to inhibit the growth of young lungs among children over the long-term of exposure. Schultz et al (2012) followed more than 1,900 children in the Swedish birth cohort BAMSE with repeated questionnaires, dynamic spirometry, and IgE measurements until 8 years of age. Outdoor concentrations of particulate matter with an aerodynamic diameter less than 10 μm (PM_{10}) from road traffic were estimated for residential, day care, and school addresses from birth and onward using dispersion modeling. The relationship between time-weighted average exposure during different time windows and FEV at 8 years was analyzed by linear regression, adjusting for potential confounding factors, including short-term exposure to air pollution. The authors found that a 5th to 95th percentile difference in traffic-related average PM_{10} exposure during the first year of life was associated with a reduced FEV1 of 259.3 ml (95% confidence interval, 2113 to 25.6) at 8 years of age. Clearly, exposure to traffic-related air pollution reduces the ability for children to properly grow and develop their full lung capacity.

13

• *Cardiac effects*

Exposure to air pollution from road traffic has also been linked to a number of other health issues including heart attack, coronary artery disease and increased risk of death from cardiac conditions in adults. For example, Peters et al. (2000) compared patient implanted defibrillator discharge interventions among 100 patients with such devices in eastern Massachusetts, according to variations in concentrations of particulate matter, black carbon, and gaseous air pollutants that were measured daily for the years 1995 through 1997. Patients with ten or more interventions experienced increased arrhythmias in association with nitrogen dioxide, carbon monoxide, black carbon, and fine particle mass. A stronger association was found for NO_2 and black carbon than for $PM_{2.5}$. Consistent positive associations were observed with black carbon, CO, and NO_2 (noted markers for

Code	Issue	Response

Code	Comment Document
13	local traffic-related pollution), with the strongest associations observed for NO_2. A 26-ppb increase in nitrogen dioxide was associated with nearly a doubling of defibrillator interventions (odds ratio = 1.8; 95% confidence interval = 1.1–2.9). These results indicate that exposure to elevated levels of these traffic-related air pollutants are associated with potentially life-threatening arrhythmias. In January 2010, the HEI Publication 17 Report (HEI, 2010) concluded that the evidence supporting the effects of traffic-related air pollution on cardiac morbidity and mortality were suggestive, but that was also concluded before newer, more definitive evidence was published. In my own work (Lall et al, 2010) in New York City, daily $PM_{2.5}$ speciation measurements collected in Mid-town Manhattan were analyzed via Positive Matrix Factorization source apportionment to determine the original source of different components of air pollution. Daily and distributed-lag Generalized Linear Models of Medicare respiratory and cardiovascular hospital admissions during 2001-2002 considered $PM_{2.5}$ mass and $PM_{2.5}$ from five sources: transported sulfate, residual oil, traffic, steel/construction and soil. Traffic-related $PM_{2.5}$ was significantly associated with an increase in the risk of cardiovascular hospital admissions. Investigations have also found biological markers of cardiac effects by traffic-related air pollution. Hoffmann et al. (2007) conducted a cross-sectional analysis of data collected at baseline for 4,494 residents of Germany followed from 2000 to 2003. The age of participants ranged from 45-74 yrs. of age. The authors estimated 1-yr avg. exposure to $PM_{2.5}$ in 2002 (the midpoint of the baseline exam). They found a 43% (95% CI: -15 to 115) increase in coronary-artery calcification (CAC) per 10 $\mu g/m^3$ increase in $PM_{2.5}$. The strength of association was similar across demographic and clinical characteristics subgroups. The authors reported a more consistent association of CAC with traffic exposure (i.e., distance from a major roadway) than with $PM_{2.5}$ mass in general, indicating a stronger role by traffic particles. In a subsequent analysis of these data, Hoffmann et al. (2009) examined the association between Ankle-Brachial Index (ABI, an index of Peripheral Arterial Disease, PAD) and $PM_{2.5}$ in this population. In both studies, residing near a major roadway was the strongest predictor of atherosclerotic disease progression. • *Premature mortality* Premature mortality, especially for cardiac causes, has been widely found to be associated with traffic-related air pollution. In my own research in New York City, We analyzed daily deaths and emergency hospitalizations for CVDs among persons ≥ 40 years of age for associations with $PM_{2.5}$, its chemical components, nitrogen dioxide (NO_2), carbon monoxide (CO), and sulfur dioxide for the

Code	Issue	Response

Code	Comment Document
13	years 2000-2006 using a Poisson time-series model adjusting for temporal and seasonal trends, temperature effects, and day of the week (Ito et al, 2011). We estimated excess risks per interquartile-range increases at lags 0 through 3 days for warm (April through September) and cold (October through March) seasons. We found that increased CVD mortality and increased CVD hospitalizations were both associated with increased exposure to traffic–related elemental carbon and NO_2 throughout the year in New York City, NY. Similarly, Beckermann et al. (2012) assessed the association between the occurrence of Ischemic Heart Disease (IHD) and air pollutants in Toronto, Ontario, Canada. Confounding was controlled with individual and neighborhood-level covariates. After adjusting for multiple covariates, nitrogen dioxide(NO_2) (a pollutant derived from traffic, as per Figure 5 above) was significantly associated with increased IHD risk, relative risk (RR) = 1.33 (95% confidence interval [CI]: 1.2, 1.47). Subjects living near major roads and highways had a trend toward an elevated risk of IHD, RR = 1.08 (95% CI: 0.99, 1.18). In Phoenix, research by Mar et al (2000) evaluated the association between mortality outcomes in elderly individuals and particulate matter (PM) of varying aerodynamic diameters (in micrometers) [PM10, PM2.5, and PMCF (PM_{10} minus $PM_{2.5}$)], and selected particulate and gaseous phase pollutants in Phoenix, Arizona, using 3 years of daily data (1995–1997). Although source apportionment and epidemiologic methods have been previously combined to investigate the effects of air pollution on mortality, this was the first study to use detailed PM composition data in a time–series analysis of mortality. These authors found that total and cardiovascular disease mortality was significantly associated with air pollution factors associated with motor vehicle emissions. Total mortality was significantly associated with CO and NO_2 ($p < 0.05$). Increase cardiovascular mortality was significantly associated with CO, NO_2, SO_2, $PM_{2.5}$, PM_{10}, PMCF ($p < 0.05$), and EC soot (related to diesel truck emissions). Thus, the evidence indicating that the risk of cardiac illness and mortality from exposure to traffic-related air pollution has expanded since the HEI Publication 17 report in 2010, and I conclude that adults are at increased risk of cardiac illness and/or mortality from increased exposure to traffic-related air pollution exposure. *Other Potential Health Effects* There are a host of other adverse health effects that could result from human exposures to the air pollution emitted by the proposed Freeway that, while less well proven, are also not sufficiently

Code	Issue	Response

Code	Comment Document

acknowledged by the DEIS. These other potential adverse effects of air pollution exposure from traffic-related air pollution exposure may include increased risk of lung cancer (especially from increased exposure to diesel particulate matter) and adverse birth outcomes (e.g., low birth weight, small for gestational age, and perinatal mortality). In my own research in the largest cohort studied to date, we have found an increased risk of lung cancer to be associated with increased exposure to $PM_{2.5}$ air pollution (Pope et al, 2002). For these outcomes, as noted by the HEI Publication 17, there is presently only "limited evidence of associations, but the data were either inadequate or insufficient to draw firmer conclusions." While not as well proven as the above effects of exposure to traffic-related air pollution, the risk of lung cancer from traffic air pollution is considered too lightly in the DEIS, and possible adverse birth outcomes are not even discussed in Chapter 4's "Air Quality" section of the draft DEIS.

Conclusions

13 14 15

Based upon my review of the published scientific and medical literature, including my own relevant research, I conclude that the increased exposure to residents living or going to school near to the proposed South Mountain Freeway will be at substantially increased risk of adverse health effects if the freeway is built as proposed, and I further note that these various health impacts are ignored or not sufficiently addressed in the draft DEIS. In particular, if the freeway is built as planned, children with asthma will be at much greater risk of experiencing asthma exacerbations (e.g., asthma attacks, wheezing, cough, etc.). Healthy children will be at significantly higher risk of getting new-onset asthma, and all children living near the proposed Freeway will likely have their lung growth and development inhibited from what it would have been without the Freeway. In adults, the primary health threat from the proposed Freeway air pollution will be increased risks of chronic cardiovascular illness (e.g., PAD), acute myocardial infarctions (MIs), and premature mortality.

Education

Degree	Field	Institution
Diploma	Academic	Barrington High School, RI
Sc.B. (Honors)	Environmental Engineering	Brown University
A.B.	Environmental Studies	Brown University
S.M.	Environmental Health Sciences	Harvard Univ. Schl. of Public Health
Sc.D.	Environmental Health Sciences	Harvard Univ. Schl. of Public Health

Postdoctoral Training

Specialty	Mentor	Place of Training
Environ. Epidemiology	Dr. H. Ozkaynak	Harvard Univ., Kennedy Schl. of Gov., Camb., MA

Internships and Residencies N/A

Clinical and Research Fellowships N/A

Licensure and Certification N/A

Academic Appointments

1987-1993	Assistant Professor, Dept. of Environmental Medicine, New York University School of Medicine, New York City, NY.
1993-2006	Associate Professor (Tenured), Dept. of Environmental Medicine, New York University School of Medicine, New York City, NY.
2007-present	Professor (Tenured), Dept. of Environmental Medicine, New York University School of Medicine, New York City, NY.
2007-present	Affiliated Faculty, Environmental Studies Program, College of Arts and Sciences, New York University, New York City, NY.
2012-present	Affiliated Faculty, Marron Institute on Cities and the Urban Environment, New York University, New York City, NY
2012-present	Faculty Mentoring Champion, Dept. of Environmental Medicine, New York University School of Medicine, New York City, NY.

Hospital Appointments: N/A

Other Professional Positions and Visiting Appointments:
Oak Ridge Institute for Science and Education Fellow (2008-2010)

Major Administrative Responsibilities

Year	*Title, Place of Responsibility*
1995-2004	Director, Community Outreach and Environmental Education Program, NYU-NIEHS Center of Excellence, Nelson Inst. of Environ. Med., NYU School of Medicine, Tuxedo, NY
2002-2012	Deputy Director, NYU Particulate Matter Research Center, Nelson Inst. of Environmental Medicine, NYU School of Medicine, Tuxedo, NY
2007-2008	Director, Environmental Epidemiology Core, NYU-NIEHS Center of Excellence, Department of Environmental Medicine, Tuxedo, NY
2010-present	Co-Leader, Metals Research Focus Group, NYU-NIEHS Center of Excellence, Department of Environmental Medicine, Tuxedo, NY.
2012-present	Director, Program in Exposure Assessment and Human Health Effects, Department of Environmental Medicine, NYU School of Medicine.
2012-present	Chair, Appointments and Promotions Committee, Department of Environmental Medicine, NYU School of Medicine.

Teaching Experience

Year	*Name of course*	*Type of Teaching/Contact Hrs.*	
1984-1994	Air Poll. Transport Modeling	(G48.2048)	Course Director
2006-present	Weather, Air Pollution, and Health	(G48.1010)	Course Director
1986-present	Aerosol Science	(G48.2033)	Course Director
1984-2010	Environmental Contamination	(G48.2305)	Lecturer
1984-present	Environ. Hygiene Measurements	(G48.2035)	Lecturer/Lab
1990-1998	Environmental Toxicology	(G48.1006)	Lecturer
1993-1995	Environmental Epidemiology I	(G48.2039)	Lecturer
2001-2003	NYU Summer Institute, Wagner School		Lecturer
2006-present	Environmental Epidemiology I	(G48.2039)	Lecturer
2006-present	Science, Health & Envir. Journalism	(G54.1017.0)	Lecturer
2009-2011	Global Environmental Health	(U10.2153.1)	Course Director
2009-2012	Global Issues in Environ. Health	(G48.1011)	Course Director
2009-present	Earth Systems Science (undergrad)	(V36.0200)	Lecturer
2011-present	Principles of Environmental Health	(G48.1004)	Course Director

Awards and Honors

November 1999	Orange Environment Citizens Action Group, OE Award for Excellence in Translating Science to the Public
December 2000	NYU School of Medicine Dean's Research Incentive Award
October 2012	Recipient of the "Haagen Smit Prize" for Best Paper, Atmospheric Environment. http://geo.arc.nasa.gov/sgg/singh/winners12.html
March 2013	Recipient of the "Top Science Paper of the Year – Science" Award from ES&T http://pubs.acs.org/doi/full/10.1021/es400924t

Major Committee Assignments

New York University Committees

2007-present: University Sustainability Task Force
2010-2012: University Faculty Senate Alternate
2012-present: University Faculty Senator

NYU School of Medicine Departmental Committees

1992-1998:	Sterling Forest Library Committee, Member, NYU SOM Dept of Environ. Medicine
1991-1994	Health & Safety Committee, Member, NYU SOM Dept. of Environ.. Medicine
1992-2004	Community Outreach and Education Comm., Chairman, NYSOM Dept. of Environ. Med.

Code	Issue	Response

Code	Comment Document

1999-2004 Dept. Chairman's Internal Advisory Comm., Member, NYUSOM Dept. of Environ. Med.
2005-present Dept. Academic Steering Committee, Member, NYUSOM Dept. of Environ. Medicine
2007-2012 Dept. Appointments & Promotions Comm., Member, NYUSOM, Dept. of Environ. Medicine
2012-present Dept. Appointments & Promotions Comm., Chair, NYUSOM, Dept. of Environ. Medicine

Advisory Committees

Regional

1983-1984 Massachusetts Acid Rain Advisory Board, Member, Mass. Dept. of Env. Protection
1984-1986 Committee on Environ. And Occup. Health. , NY State American Lung Association
1991-1996 Air Management Advisory Comm., Member of Health Effects Subcom., NY State DEC
1995-1999 Engineering Advisory Board, Member, Tuxedo, NY
1997-1998 Advisory Committee to the Mayor on the Port of Newburgh, Member, Newburgh, NY
1996-1999 CUES Asthma Working Group, Member, New York Academy of Medicine
2008-2010 New York City Community Air Study (NYCCAS) Advisory Panel

National

1995-1999 Comm. on Health Effects of Waste Incineration, Member, National Academy of Sciences
1995-1999 National Air Conservation Commission, Member, American Lung Association
2000-2004 National Action Panel on Environment, Member, American Lung Association
2005-present National Clean Air Committee, Member, American Lung Association
2007-2010 U.S. EPA Clean Air Science Advisory Committee (CASAC) for SOx and NOx
Mar. 2012 EPA Panelist for "Kickoff Workshop to Inform EPA's Review of the Primary NO_2 NAAQS"

International

1996-1997 Sulfur in Gasoline Health and Environment Panel, Chairperson, Health Canada
Sept. 2007 Illness Cost of Air Pollution Expert Committee, Canadian Medical Association
2008-2012 Global Burden of Disease (GBD), Committee on the Human Health Effects of Outdoor Air Pollution, World Health Organization (WHO)

Grant Review Committees (National)

March 1989 EPA Air Chemistry and Physics Extramural Grants Review Panel (*ad hoc member*)
Oct. 1989 NIEHS P30 Center Special Review Panel (*ad hoc member*)
July 1992 NIH R01 Epidemiology & Disease Control Study Section (*ad hoc member*)
Nov. 1992 NIEHS P20 Center Development Grant Special Study Section, (*ad hoc member*)
June 1996 EPA Special Review Panel of the Health Effects Institute (HEI) (*ad hoc member*)
March 1997 EPA Office of Res. and Development External Grant Review Panel (*ad hoc member*)
April 1997 NIEHS Community-Based Participatory Res. R01 Special Study Sect. (*ad hoc member*)
July 1997 EPA National Environ. Research Lab Intramural Research Review Panel (*ad hoc member*)
June 1998 EPA Office of Res. and Development External Grant Review Panel (*ad hoc member*)
July 1998 EPA Climate Policy and Programs Division Grant Application Review (*ad hoc member*)
Oct. 1998 Mickey Leland Center for Air Toxics Grant Review Panel (*ad hoc member*)
April 2000 NIEHS P30 Center Special Review Panel (*ad hoc member*)
July 2001 NIEHS Community-Based Participatory Res. R01 Special Study Sect. (*ad hoc member*)
Dec. 2001 NIEHS Program Project P01 Site Visit Review Panel (*ad hoc member*)
April 2003 NIH R21 Fogarty Health, Env. and Economic Development Study Sect. (*ad hoc member*)
Nov. 2003 U.S. EPA STAR Grant Panel (Epidemiologic Research on Health Effects of Long-Term Exposure to Ambient Particulate Matter and Other Air Pollutants) (*member*)
October 2004 NIEHS Program Project P01 Review Panel (*ad hoc member*)
June 2005 NIH Special Emphasis Panel (ZRG1 HOP Q 90 S) (*ad hoc member*)
Nov. 2005 NIH Infectious Disease, Reproductive Health, Asthma/Allergy, and Pulmonary (IRAP) Conditions Study Section Review Panel (*ad hoc member*)

Scientific Report Reviewer

August, 1986	Reviewer for the National Academy of Sciences, Board on Environmental Studies and Toxicology report "The Airliner Cabin Environment: Air Quality and Safety"
October, 2002	Reviewer for the National Academy of Sciences, Board on Environmental Studies and Toxicology report "Estimating the Public Health Benefits of Proposed Air Pollution Regulations"

Mentoring of Graduate Students, Residents, Post-Doctoral Fellows in Research

Under direct supervision:

Student Name	*Type of Position*	*Time Period*	*Present Position*
Mark Ostapczuk	Masters	1984-1986	Industrial Hyg., Barr Labs, Pomona, NJ
Kazuhiko Ito	Masters/Doctoral	1984-1990	Scientist, NYC Dept. of Health, NYC, NY
Peter Jaques	Masters/Doctoral	1988-1998	Assoc. Prof., Clarkson Univ., Potsdam, NY
R. Charon Gwynn	Masters/Doctoral	1992-1999	Epidemiologist, Columbia Univ., NY
Ramona Lall	Masters/Doctoral	2000-2007	Research Sci. IV, NYC Dept. of Health, NY
Ariel Spira-Cohen	Masters/Doctoral	2003-2009	Research Sci. III, NYC Dept. of Health, NY
Kevin Cromar	Masters/Doctoral	2008-2012	Assistant Professor, NYU School Of Medicine
Lital Yinon	Doctoral	2011-present	Doctoral Candidate, NYU School of Medicine

In advisory function (thesis committee):

Student Name	*Advisory Role*	*Time Period*	*Student's Supervisor*
Shao-Keng Liang	Doctoral Committee member	1990-1994	Dr. J. Waldman, UMDNJ, Rutgers
Jerry Formisano	Doctoral Committee member	1997-2000	Dr. M. Lippmann, NYU SOM
Yair Hazi	Doctoral Committee member	1993-2001	Dr. B. Cohen, NYU SOM
Samantha Deleon	Doctoral Committee member	1997-2003	Dr. K Ito, NYU SOM
Chun Yi Wu	Doctoral Committee member	2000-2004	Dr. L.C. Chen, NYU SOM
Carlos Restrepo	Doctoral Committee member	2002-2004	Dr. R. Zimmerman, Wagner, NYU
Shaou-I Hsu	Doctoral Committee member	2000-2009	Dr. M. Lippmann, NYU-SOM
Steven Schauer	Doctoral Committee member	2007-2009	Dr. B. Cohen, NYU-SOM
Christine Ekenga	Doctoral Committee Chair	2009-2011	Dr. G. Friedman-Jimenez, NYU-SOM
Rebecca Gluskin	Doctoral Committee Chair	2009-2012	Dr. Kazuhiko Ito, NYU SOM
Jiang Zhou	Doctoral Committee Chair	2008-2012	Dr. Kazuhiko Ito, NYU SOM

Teaching Awards Received

N/A

Major Research Interests

1) Air Pollution Epidemiology: The study of real-world air pollution exposures and human health effects in the general population and in study cohorts of suspected susceptible individuals (e.g., children, older adults, and those with asthma).

2) Aerosol Science: The study of ambient particulate matter aerosol exposures, including designing and implementing air monitoring equipment to collect human exposures to air pollution.

3) Environmental Exposure Assessment: The study of methods to assess human exposures and health effects from air pollution, especially the development of source apportionment models to separate human effects on the basis of pollution source, as well as the design of epidemiological

Code	Comment Document

models and methods that better incorporate potential confounders/effect modifiers in the air pollution-health link, such as weather and genetic influences on health.

Other Invited Presentations

Regional Presentations

April 21, 1993 "Summertime Smog and Hospital Admissions for Respiratory Illness", Environmental and Occupational Health Sciences Institute Seminar Series Lecture, UMDNJ-Robert Wood Johnson Medical School, Piscataway, NJ.

Dec .14, 1995 "Health Effects of Acidic Aerosols", NY State Dept. of Health, Wadsworth Center Seminar, Albany, NY

Jan. 18, 1996 "Outdoor Air Pollution and Asthma in Children " American Lung Association Press Briefing, New York, NY.

June 1, 1996 "Asthma and Urban Air Pollution", WHEACT, Harlem Hospital, New York, NY.

July17, 1996 "Asthma and Outdoor Air Pollution", Making the Connection: Urban Air Toxics & Public Health. Northeast States for Coordinated Air Use Management (NESCAUM), Roxbury, MA

Feb. 11, 1997 "Outdoor Air Pollution and Asthma", Bellevue Hospital Asthma Clinic *Grand Rounds*. New York City, NY.

Feb. 26, 1998 "Scientific Research for Ozone and Fine Particulate Standards ", Pace University School of Law, White Plains, NY

Nov. 30, 1998 "Outdoor Air Pollution and Asthma", Center for Urban and Environmental Studies (CUES), NY Academy of Medicine,, New York, NY

Feb. 22, 1999 "Asthma and Air Pollution", Cornell University, Ithaca, NY

April 28, 2001 "Asthma and Air Pollution in New York City", NYC Council Environmental Candidate School, NY League of Conservation Voters, New York, NY.

Nov. 1, 2001 "Air Quality and Environmental Impacts Due to the World Trade Center Disaster", Testimony before the Comm. on Environ. Protection, NYC Council, New York, NY.

Nov. 13, 2001 "WTC Pollution Impacts in Lower Manhattan", Stuyvesant High School Parents Association General Meeting, Stuyvesant High School, New York, NY

Feb. 28, 2002 "Lung Cancer Effects of Long-Term Exposure to Ambient Fine Particulate Matter", Mailman School of Public Health, Columbia University, New York, NY.

Code	Comment Document

April 5, 2002 "Air Pollution Impacts of the WTC Disaster", 23rd Annual Scientific Conference of the NY/NJ Education and Research Center: "Worker Health and Safety: Lessons Learned in the Aftermath of Sept. 11, 2001," Mt. Sinai School of Medicine, NYC, NY

April 21, 2002 "Adverse Health Effects of Power Plant Air Pollution on Children" Earth Day 2002, 14th Street Y, New York City, NY.

May 23, 2002 "Human Health Effects of Power Plant Pollution", Rockland County Conservation Association, Suffern, NY

May 31, 2002 "Environmental Health Impacts of the World Trade Center Disaster", University of Rochester Medical School, Rochester, NY.

Sept. 19, 2002 "Community Air Pollution Related to the World Trade Center Disaster". NYC Council Forum: The Environmental Health Consequences of 9/11: Where Do We Stand One Year Later? Borough of Manhattan Community College, New York City, NY.

Oct. 3, 2002 "Community Exposures to Particulate Matter Air Pollution from the World Trade Center Disaster", Mount Sinai School of Medicine *Grand Rounds*, New York City, NY.

April 11, 2003 "Environmental Impacts of the World Trade Center Disaster", NIEHS Public Interest Liaison Group, New York City, NY.

April 21, 2003 "Asthma and Air Pollution", Airborne Threats to Human Health, NIEHS Town Hall Meeting, Syracuse, NY.

May 7, 2003 "Asthma and Air Pollution in NY City" Environmental Candidate School for New York City Council Candidates, Wagner School, NYU, New York City, NY.

July 21, 2003 "Health Effects of Particulate Matter Air Pollution", Ozone Transport Commission, Philadelphia, PA.

Nov. 18, 2004 "Ambient Air Pollution Particulate Matter (PM): Sources and Health Impacts". U.S. Environmental Protection Agency, Region 2, New York City, NY.

Feb. 17, 2005 "Community Air Pollution Aspects Of The Demolition Of 9-11 Contaminated Buildings". Testimony before the Committee On Lower Manhattan Redevelopment, New York City Council, New York City, NY.

Oct. 19, 2005 Air Pollution Health Effects: Consideration of Mixtures. Fall Meeting of the Mid-Atlantic Chapter of the Society of Toxicology (MASOT), East Brunswick, NJ.

Dec.7, 2006 Asthma and Air Pollution Effects in the South Bronx. New York City Child Health Forum, The Children's health Fund, Harlem, NYC, NY.

Jan. 18, 2007 Air Pollution Effects in New York City. NYU Environmental Sciences Seminar Lecture, Washington Square, NYC, NY.

Jan. 23, 2007 The South Bronx Backpack Study: Asthma and Air Pollution in NYC. Presented at the forum "High Asthma Rates in the Bronx: What Science Now Knows and Needs to Learn." New York Academy of Sciences, 7 World Trade Center, NYC, NY.

Oct. 2, 2009 "Diesel Air Pollution and Asthma in New York City". Brown Superfund Research Program. http://www.brown.edu/Research/SRP/thurston%20oct%202.pdf , Brown University, Providence, RI.

June 19, 2012 "The Backpack Study of Asthma and Diesel Air Pollution in the South Bronx". Region 1 U.S. EPA, Citizen Science Workshop, New York City, NY.

National Presentations

Oct. 20, 1987. NIEHS Symposium on the Health Effects of Acid Aerosols: "Re-examination of London, England, Mortality in Relation to Exposure to Acidic Aerosols During 1963-1972 Winters" RTP, NC.

Aug. 13, 1991 "Kuwait Mortality Risks from SO_2 and Particles: Insights from the London Fogs"' The Kuwait Oil Fires Conf., American Academy of Arts and Sciences, Cambridge, MA.

REPORTS

Two

Response to ADOT Draft Environmental Impact Statement (DEIS) 1. Purpose and Need A. Need Based on Socioeconomic Factors by Kevin Kane dated July 24, 2013.

Code	Issue	Response

Code	Comment Document

RESPONSE TO ADOT DRAFT ENVIRONMENTAL IMPACT STATEMENT (DEIS)
1. PURPOSE AND NEED
A. NEED BASED ON SOCIOECONOMIC FACTORS

Comments prepared by Kevin Kane[1] on behalf of PARC, et al.
July 24, 2013

Introduction

The Arizona Department of Transportation (ADOT) justifies the purpose and need for the construction of the South Mountain Freeway in Chapter 1 of the DEIS. Most of the conclusions rely on socioeconomic projections for the year 2035 conducted by the Maricopa Association of Governments (MAG) and the Arizona Department of Economic Security (DES).

19

The DEIS justification of the purpose and need for the Loop 202/South Mountain Freeway ("Freeway") is fatally flawed. This report demonstrates how the use of outdated input data, the extension of short-term trends to long-term growth, and the failure to account for uncertainty in future projections all contribute to the DEIS' flawed conclusions. If appropriate data, inputs, and interpretation of model results are used, it becomes evident that there is no purpose or need for the freeway based on socioeconomic factors.

Background: Establishing Need Based on Socioeconomic Factors

20

The DEIS relies on projections of future population, land use, employment, and housing produced by MAG, with additional Input from the DES. MAG projections are detailed in three reports: an original 2007 report[2], the documentation to support the projections in this report[3], and a 2009 update of the same model extending the projections an additional five years to 2035[4].

The MAG land use model allocates households and employment to locations in Maricopa County as of 2035 using a proprietary model called DRAM/EMPAL. Starting with current population, employment, land use, and an estimated growth rate, the model assigns people and jobs to available locations based on the location's attractiveness and the expected travel costs. The output is in the form of maps of projected land use at five-year intervals until 2035. The

[1] Kevin Kane is a PhD student and instructor at Arizona State University's School of Geographical Sciences and Urban Planning. His specialties include geographic analysis of city growth and Phoenix residential development patterns during the recession. A Curriculum Vita listing his qualifications can be found as Exhibit 1.

Code	Issue	Response
19	**Purpose and Need**	The Arizona Department of Transportation and Federal Highway Administration used appropriate data, inputs, and model results in assessing whether a purpose and need exist for the proposed action. Data, inputs, and model results were used throughout the environmental impact statement process. The Draft Environmental Impact Statement—particularly in Chapter 1, *Purpose and Need*, and Chapter 3, *Alternatives*—explains how the process of establishing a purpose and need for the proposed action followed nationally accepted guidance and policy. Examples of how the purpose and need analyses were applied include: · the section, *Context of the Purpose and Need in the EIS Process*, on page 1-1 · the sidebar, *"A proposed action's purpose and need documentation should:"*, on page 1-1 · the sidebar, "*How are MAG data used in the DEIS?*", on page 1-4 · the sidebar, "*What is the MAG regional demand model?*", on page 1-5 · the sidebar, "*How will the economic downturn affect growth rates?*", on page 1-11 · the section, *Need Based on Regional Transportation demand and Existing and Projected Transportation System Capacity Deficiencies*, beginning on page 1-13 · the section, *Conclusions*, on page 1-21 · the section, *Reconfirm the Purpose and Need for the Proposed Action*, on page 3-1 · the section, *Responsiveness of the Proposed Freeway to Purpose and Need Criteria*, beginning on page 3-27 The models, methods, and assumptions used throughout the Draft Environmental Impact Statement account for reasonably foreseeable future conditions and dismiss speculative considerations. As an example, the Maricopa Association of Governments, as the federally designated regional transportation planning agency, is nationally recognized as a leader in air quality modeling and traffic modeling and forecasting. The models used account for the assumptions made in the comment. The Maricopa Association of Governments model and its application are "state of the practice" exceeding National Environmental Policy Act thresholds relative to sound science. The National Environmental Policy Act recognizes that: · data and projections can change throughout the process · it is important for the process to account for those changes as they become available · if a reasonable person could conclude that the updated information would lead to substantially different results, the decision-making attributes of the National Environmental Policy Act could be affected
20	**Purpose and Need**	The analyses in the Draft Environmental Impact Statement used socioeconomic and traffic projections at the regional analysis zone and traffic analysis zone levels. At the time of publication of the Draft Environmental Impact Statement, Census 2010-based socioeconomic data at the regional analysis zone and traffic analysis zone levels had not been adopted by the Maricopa Association of Governments and were not available to the project team. Therefore, the data used in the Draft Environmental Impact Statement were the most appropriate information available.

(Response 20 continues on next page)

Code	Comment Document
20	TransCAD traffic modeling software then uses these maps to estimate travel patterns and traffic volume based on the predicted location of households and businesses in 2035. Socioeconomic modeling is common practice among planning organizations, and it is often statutorily mandated. In fact, the MAG model adds several elements that are not present in earlier DRAM/EMPAL models such as integrating zoning restrictions and municipalities' land use plans to estimate how to allocate households and employment. However, several major flaws can exist in modeling techniques that often result in inaccurate or misleading projections of future travel need: - Models are extremely sensitive to input data - Models rely on extending short-term economic trends over long time periods - Models lack confidence intervals – they report only a single projected value, implying a much greater amount of certainty than is actually available In the case of the MAG model and the proposed Freeway extension, these flaws are so significant that they call the purpose and need for the project as established in the DEIS into question. <u>Use of Outdated Input Data</u> The first page of Chapter 1 of the DEIS states; "At the beginning of the EIS process, the need for a major transportation facility was reexamined to determine whether such a facility is still needed." However, the DEIS fails to re-evaluate the purpose and need as of its effective date of April 2013, instead relying on projections that were released to the public when the Freeway was proposed in 2004-2005. By ignoring the effects of the real estate collapse and global recession, which had profound effects on Phoenix's growth, ADOT fails to effectively analyze purpose and need. The original report[2] relies principally on base year 2005 data to project land use at five year increments until 2030. The updated report[4] extended these projections to 2035, but used the same data sources. The conclusions in the DEIS are based principally on: i. 2005 Special Census for population ii. 2000 Census housing unit count, updated to 2005 using estimated residential completions iii. 2005 employment iv. 2005 existing land use coverage The documentation of MAG's projections also states that, "the model takes into account short-term economic conditions, but not long-range employment trends"[5]. In other words, MAG admits that a shortcoming of the model it uses is the extension of short-range trends to long-range growth. Notwithstanding, MAG not only uses short-range trends to predict long-range growth, it fails to accurately identify short-range trends. 2010 Census data is currently available and should have been included in the DEIS. In Table 1, actual 2010 figures are used to check the accuracy of the projections found in the DEIS: [5] See Ref. 3, pg. 20 - 2 -

Code	Issue	Response
20 (cont.)		The Maricopa Association of Governments approved new population, employment, housing, and traffic projections in June 2013. The new data are presented in the Final Environmental Impact Statement beginning on page 1-11. The purpose and need and analysis of alternatives were updated and reevaluated using these new socioeconomic projections and corresponding projections related to regional traffic. While new projections based on the 2010 Census showed a lower anticipated population and vehicle miles traveled in 2035 than the previous projections, the conclusions reached in the Draft Environmental Impact Statement were validated in the Final Environmental Impact Statement (see Chapter 3, *Alternatives*). The traffic analysis demonstrated that the proposed project is needed today and will continue to be needed into the future. The Maricopa Association of Governments' control total for Maricopa County is consistent with the "ADOA—Medium Series" reported in Table 3 of the comment.

Code	Comment Document

19

Table 1

TOTAL POPULATION	2005 Actual Population	2010 Projected Population	2005-2010 Projected Annual Growth Rate	2010 Actual Population	2005-2010 Actual Annual Growth Rate
Maricopa County	3,681,025	4,216,499	2.75%	3,817,117	0.73%
Study Area	1,309,001	1,606,100	4.18%	1,422,105	1.67%
Central West	512,836	615,229	3.71%	562,805	1.88%
South Central	82,434	84,976	0.61%	72,331	-2.58%
Southeast	588,349	681,077	2.97%	617,139	0.96%
Southwest Valley	125,382	224,818	12.39%	169,830	6.26%

As indicated in Table 1, MAG estimates of 2005-2010 annual population growth in the County and the Study Area as reflected in the DEIS are ***more than double*** the actual population growth experienced. Table 2 uses 2010 Census data to compare projected with actual growth in the number of housing units:

Table 2

TOTAL HOUSING UNITS	2005 Actual Units	2010 Projected Units	2005-2010 Projected Annual Growth Rate	2010 Actual Units	2005-2010 Actual Annual Growth Rate
Maricopa County	1,479,767	1,685,134	2.63%	1,639,279	2.07%
Study Area	471,484	589,087	4.55%	478,340	0.29%
Central West	173,619	213,113	4.18%	174,920	0.15%
South Central	33,389	34,134	0.44%	28,909	-2.84%
Southeast	223,968	264,045	3.35%	224,256	0.03%
Southwest Valley	40,508	77,795	13.94%	50,255	4.41%

While the MAG estimates of housing growth in Maricopa County are less overstated than population growth, the Study Area experienced virtually no housing growth over this period. Indeed, independent analysis of Phoenix from 2006-2012 indicates that three Phoenix neighborhoods within the Study Area – Ahwatukee Foothills, Estrella, and Laveen – are in the top five for decrease in residential completions over this period[6]. MAG estimates dramatically overstate growth in the study area and fail to accurately predict short-term growth.

Extension of Short-Term Economic Trends to Long-Range Growth

MAG admits that a shortcoming of the model it uses is the extension of short-range trends to long-range growth. Notwithstanding, MAG not only uses short-range trends to predict long-range growth, it fails to accurately identify short-range trends (as shown in Tables 1 and 2 above). The DEIS includes a lengthy discussion of the historical indicators of growth in Phoenix and a sidebar on page 1-11 that states, "the critical factors underlying these indicators remain unchanged" and further provides that short-term economic conditions are not relevant to long-term planning horizons. This conclusion conveniently omits structural economic changes resulting from the recent real estate collapse and global recession and is internally inconsistent.

20

Although not acknowledged in the DEIS, the Arizona Department of Administration (ADOA) produced population estimates in 2012[7]. ADOA bases its projections on fertility, mortality, and net migration. ADOA projects populations by county for each year until 2050. Unlike the MAG model used in the DEIS, ADOA relies on the most recent available population count (2010 U.S. Census). Furthermore, by considering the fact that future fertility, mortality, and net migration in Maricopa County may vary, ADOA provides a range of possible future population counts by considering multiple possible input values. Thus, their population projections are reported as a Medium Series (the baseline estimate), alongside a Low Series and a High Series in order to reflect this variation.

Table 3 provides a comparison of various methods of projecting population in 2035. The DEIS figures (1) are compared with the various ADOA projections (3-5). In addition, we update the MAG/DEIS projections using actual 2010 census data, but using MAG's growth rate (2).

Table 3: Maricopa County Population Projections for 2035

	2035 Maricopa County Population Projections	
	SOURCE	**ESTIMATE**
(1)	MAG	6,545,000
(2)	MAG + 2010 US Census	5,925,065
(3)	ADOA - Low Series	5,222,906
(4)	ADOA - Medium Series	5,776,252
(5)	ADOA - High Series	6,232,206

**2010 US Census Actual Population: 3,817,117*

Table 3 indicates that there is a substantial range in possible outcomes when attempting to use short-range trends to predict long-range population growth. The original MAG projections (1) are far in excess of the updated figure using the same growth rate (2), indicating that using outdated input data inflates estimates. Furthermore, the original MAG projections are above all three ADOA estimates, indicating that the DEIS uses a more aggressive growth rate than even the highest growth population scenario predicted by the ADOA.

ADOA figures of county-wide population growth represent an improvement given their use of newer data and providing a range of values, though they do not provide data for population in the Freeway Study Area or include projections of housing units or Vehicle Miles Travelled (VMT). Using Geographic Information System (GIS) software, we are able to demonstrate the impact of using outdated input data on population projections for the Freeway Study Area and its component regions. We again update MAG/DEIS projections using 2010 U.S. Census data in combination with their predicted growth rates. This is done for population (Table 4) and housing units (Table 5).

Table 4: MAG Population Projections, Updated with 2010 U.S. Census Data

TOTAL POPULATION	2010 Projected	2010 Actual	2035 Projected	2010-2035 Projected Annual Growth Rate	2035 Projected - Using 2010 Actual
Maricopa County	4,216,499	3,817,117	6,545,000	1.77%	5,925,065
Study Area	*1,606,100*	*1,422,105*	*2,577,760*	1.91%	2,282,452
Central West	615,229	562,805	809,191	1.10%	740,239
South Central	84,976	72,331	88,589	0.17%	75,406
Southeast	681,077	617,139	871,138	0.99%	789,357
Southwest Valley	224,818	169,830	808,842	5.25%	611,008

Table 5: MAG Housing Unit Projections, Updated with 2010 U.S. Census Data

TOTAL HOUSING UNITS	2010 Projected	2010 Actual	2035 Projected	2010-2035 Projected Annual Growth Rate	2035 Projected - Using 2010 Actual
Maricopa County	1,685,134	1,639,279	2,676,294	1.87%	2,603,468
Study Area	589,087	478,340	983,560	2.07%	798,653
Central West	213,113	174,920	292,760	1.28%	240,293
South Central	34,134	28,909	35,669	0.18%	30,209
Southeast	264,045	224,256	344,570	1.07%	292,647
Southwest Valley	77,795	50,255	310,561	5.69%	200,620

Tables 4 and 5 indicate that long range growth estimates in parts of the Study Area are especially sensitive to input data. For example, even if the dramatic 5.69% annual growth rate in Southwest Valley housing units were to continue, the fact that the actual number of housing units in 2010 was far less than the MAG report projected it would be for that year has a very significant impact on 2035 projections (200,620 versus 310,561).

These updated projections of population growth highlight the problems in extending short-range growth rates to long-term trends. The problem is magnified when short-range growth rates are faulty, as is the case with the projections used in the DEIS. If the information relied upon in the DEIS is unable to accurately predict short-range growth, the same methodology should not be relied upon to justify the purpose and need for major transportation infrastructure based on socioeconomic factors. This is especially true given the tendency to significantly overstate growth in the DEIS.

21

Uncertainty of Estimates of Population and Vehicle Miles Travelled (VMT)

The final major shortcoming in combined land use – transportation projection is the failure to integrate uncertainty into projections. Municipal projections of population, housing, employment, and vehicle miles travelled rarely include a confidence interval based on generally accepted statistical practices, which is necessary in order for a policymaker to understand the likelihood of particular future scenarios. While some studies allude to the notion there is a variety of potential future outcomes, such as the low, medium and high estimates in the ADOA population projections, the projections contained in the DEIS are presented as certain outcomes.

Code	Issue	Response
21	**Purpose and Need**	The study used state-of-the-practice, scientific community methods and similarly accepted methods, including the use of a standard input-output economic model and of assumptions based on traffic data and projections. The analysis is not required to project ranges, and the results are reasonably foreseeable based on what data are provided from the U.S. Environmental Protection Agency-approved Maricopa Association of Governments model as well as local plans. Further, methods, assumptions, and data were developed early in the environmental impact statement process and peer-reviewed by the Federal Highway Administration, the Arizona Department of Transportation, and other federal, state, and local agencies. Peer reviewers concluded that the methods, assumptions, and data are appropriate. Potential factors that could influence changes in the analysis and study findings are listed on page 4-1 of the Final Environmental Impact Statement.

Code	Comment Document
21	Basic statistical techniques can provide the policymaker with not only a range of possible values, but also a percentage that expresses the statistical likelihood of each outcome. Furthermore, a common critique of ADOT is that follow-up plans have not been provided for previous highway projects in order to evaluate the accuracy of past projections. A 2006 review of 183 highway projects in major world cities shows a dramatic tendency of agencies to overstate future demand. Half of all projects overstated traffic demand by more than 20%, and one-fourth of all projects overstated traffic demand by more than 40%[8].
22	The uncertainty of traffic projections for toll roads has also been used by credit ratings agencies which finance projects based on expected toll revenue. A Standard & Poor's review of 104 tollway projects finds substantial "optimism bias" – on average, projects over-projected travel demand in the first five years by more than 20%. The same study analyzed the traffic forecasting used in a confidential sample of these projects, finding that projections of traffic volumes 30 years into the future by different consultants varied by 204% based on modeling techniques and assumptions used[9].
21	One study empirically modeled the uncertainty stemming from the use of an earlier version of the DRAM/EMPAL land use-transportation model, the same basic model used by MAG. While the outcome of this study is unique to Austin, Texas, researchers ran the model hundreds of times to create simulated confidence intervals and found that, for projections 20 years into the future, errors set around a 70% confidence interval were: - 38% for peak-period VMT - 50% for residential density - 37% for employment density The projected VMT in Austin, Texas generated by DRAM/EMPAL was 6 million/day, though researchers could only be 70% certain that actual VMT would be between 3.7 million and 8.4 million[10]. While the Austin, Texas results are unique to that city, Table 5 compares the manner in which these results were reported to the DEIS 2035 estimates for Maricopa County. Because it is not possible to calculate a confidence interval using available data, the missing values below indicate what such a report would look like. Statistically, it would be possible to say that there is a certain percent (15%, in this example) chance of 2035 VMT being above the upper bound or below the lower bound. Meanwhile, wide range in projections of the Austin, Texas study illustrates that there is a fairly strong probability that future VMT is far greater or far lower than anticipated, including the very real possibility of a decrease in VMT.

Code	Issue	Response
22	**Alternatives**	The Draft Environmental Impact Statement does not consider toll roads as an alternative warranting detailed study in the Draft Environmental Impact Statement and as such, a comparison of performance between toll roads and the proposed action is inappropriate. The study used state-of-the-practice, scientific community methods and similarly accepted methods, including the use of a standard input-output economic model and of assumptions based on traffic data and projections. The analysis is not required to project ranges, and the results are reasonably foreseeable based on what data are provided from the U.S. Environmental Protection Agency-approved Maricopa Association of Governments model as well as local plans. Further, methods, assumptions, and data were developed early in the environmental impact statement process and peer-reviewed by the Federal Highway Administration, the Arizona Department of Transportation, and other federal, state, and local agencies. Peer reviewers concluded that the methods, assumptions, and data are appropriate. Potential factors that could influence changes in the analysis and study findings are listed on page 4-1 of the Final Environmental Impact Statement.

Source: * Krishnamurthy and Kockelman 2003, **DEIS

21

By providing only a single value, the DEIS projections are misleading in suggesting that the only possible outcome is a substantial increase in VMT. By failing to provide a confidence interval, the DEIS projections provide only minimal guidance to policymakers about the likelihood of possible future outcomes.

Additionally, DEIS statements indicating that the "factors underlying these indicators" remain unchanged, particularly in the case of VMT, are inaccurate. Recent studies have indicated long-term trends away from driving as a primary means of commuting, citing telecommuting, online shopping, increased fuel prices, and most importantly a generational shift away from vehicle ownership. These changes are not likely to be reflected in MAG modeling, especially trends that have emerged in the last several years since the model was last updated. This would include any number of changes due to the global recession which would almost certainly tend to decrease VMT. An independent report uses US DOT data to show that, despite continual projected increases by planning agencies, VMT per capita has actually decreased by 1.0% per year since 2004[11].

These strong national and regional trends would indicate that, assuming arguendo, an increase in population, VMT is more likely to decrease than increase. Decreased VMT per capita combined with the DEIS' overstated population growth projections means that there is a very high likelihood that future VMT will be well below the projected figures found in the DEIS.

Conclusion

23

In effect, the modeling relied on by the DEIS to justify purpose and need based on socioeconomic factors extends aggressive, pre-recession growth rates decades into the future while ignoring recent data that reflects deep-seated regional and national structural changes that have become apparent in the last several years. MAG's modeling, which is relied upon in the DEIS to establish the purpose and need for the Freeway expansion fails to accurately identify short-range growth and uses outdated data to estimate long-range growth. It reports its projections in a manner that indicates that they are certain to happen, which is not supported by the data and modeling techniques used. Using accurate data to objectively evaluate purpose and need based on socioeconomic factors supports the no build option.

Code	Issue	Response
23	**Purpose and Need**	The analyses in the Draft Environmental Impact Statement used socioeconomic and traffic projections at the regional analysis zone and traffic analysis zone levels. At the time of publication of the Draft Environmental Impact Statement, Census 2010-based socioeconomic data at the regional analysis zone and traffic analysis zone levels had not been adopted by the Maricopa Association of Governments and were not available to the project team. Therefore, the data used in the Draft Environmental Impact Statement were the most appropriate information available. The Maricopa Association of Governments approved new population, employment, housing, and traffic projections in June 2013. The new data are presented in the Final Environmental Impact Statement beginning on page 1-11. The purpose and need and analysis of alternatives were updated and reevaluated using these new socioeconomic projections and corresponding projections related to regional traffic. While new projections based on the 2010 Census showed a lower anticipated population and vehicle miles traveled in 2035 than the previous projections, the conclusions reached in the Draft Environmental Impact Statement were validated in the Final Environmental Impact Statement (see Chapter 3, *Alternatives*). The traffic analysis demonstrated that the proposed project is needed today and will continue to be needed into the future.

Abstract: Where people choose to live and the type of city their decisions create has formed the basis of decades of scholarly endeavor. While the typical notion of a tradeoff between access and space remains important, sprawl, gentrification, polycentricity, land use institutions (zoning), and the composition of the immediately surrounding area (local effects) can all impact residential choice. We propose a logistic regression model to investigate determinants of single-family residential development at the parcel-level in Phoenix, Arizona during the 2002-2006 real estate boom and the 2006-2012 global recession. Results show a preference for cheaper land and agricultural conversion farther from urban subcenters during the boom, while zoning, though relatively inconsistent with actual land use, is an indicator of future development. Development trajectories change dramatically during the bust, disproportionately impacting agricultural conversions and previously fast-growing areas while highlighting the depth of impact that the financial environment has on land use change. [Key words: residential location, land use policy, urban sprawl, recession]

EXHIBIT 3

How (In)accurate Are Demand Forecasts in Public Works Projects?

The Case of Transportation

Bent Flyvbjerg, Mette K. Skamris Holm, and Søren L. Buhl

This article presents results from the first statistically significant study of traffic forecasts in transportation infrastructure projects. The sample used is the largest of its kind, covering 210 projects in 14 nations worth U.S.$59 billion. The study shows with very high statistical significance that forecasters generally do a poor job of estimating the demand for transportation infrastructure projects. For 9 out of 10 rail projects, passenger forecasts are overestimated; the average overestimation is 106%. For half of all road projects, the difference between actual and forecasted traffic is more than ±20%. The result is substantial financial risks, which are typically ignored or downplayed by planners and decision makers to the detriment of social and economic welfare. Our data also show that forecasts have not become more accurate over the 30-year period studied, despite claims to the contrary by forecasters. The causes of inaccuracy in forecasts are different for rail and road projects, with political causes playing a larger role for rail than for road. The cure is transparency, accountability, and new forecasting methods. The challenge is to change the governance structures for forecasting and project development. Our article shows how planners may help achieve this.

Bent Flyvbjerg is a professor of planning at Aalborg University, Denmark. He is founder and director of the university's research program on large-scale infrastructure planning. His latest books are *Megaprojects and Risk* (Cambridge University Press, 2003, with Nils Bruzelius and Werner Rothengatter), *Making Social Science Matter* (Cambridge University Press, 2001), and *Rationality and Power* (University of Chicago Press, 1998). **Mette K. Skamris Holm** is a former assistant professor of planning at Aalborg University. She now works as a planner with Aalborg Municipality. **Søren L. Buhl** is an associate professor of mathematics at Aalborg University. He is associate statistician with the university's research program on large-scale infrastructure planning.

Journal of the American Planning Association,
Vol. 71, No. 2, Spring 2005.
© American Planning Association, Chicago, IL.

Despite the enormous sums of money being spent on transportation infrastructure, surprisingly little systematic knowledge exists about the costs, benefits, and risks involved. The literature lacks statistically valid answers to the central and self-evident question of whether transportation infrastructure projects perform as forecasted. When a project underperforms, this is often explained away as an isolated instance of unfortunate circumstance; it is typically not seen as the particular expression of a general pattern of underperformance in transportation infrastructure projects. Because knowledge is wanting in this area of research, until now it has been impossible to validly refute or confirm whether underperformance is the exception or the rule.

In three previous articles (Flyvbjerg, Holm, et al., 2002, 2003, 2004), we answered the question of project performance as regards costs and cost-related risks. We found that projects do not perform as forecasted in terms of costs: almost 9 out of 10 projects fall victim to significant cost overrun. We also investigated the causes and cures of such inaccurate cost projections (see Flyvbjerg, Bruzelius, et al., 2003). In this article we focus on the benefit side of investments and answer the question of whether projects perform as forecasted in terms of demand and revenue risks. We compare forecasted demand with actual demand for a large number of projects. Knowledge about cost risk, benefit risk, and compound risk is crucial to making informed decisions about projects. This is not to say that costs and benefits are or should be the only basis for deciding whether to build. Clearly, forms of rationality other than economic rationality are at work in most infrastructure projects and are balanced in the broader frame of public decision making. But the costs and benefits of infrastructure projects often run in the hundreds of millions of dollars, with risks correspondingly high. Without knowledge of such risks, decisions are likely to be flawed.

As pointed out by Pickrell (1990) and Richmond (1998), estimates of the financial viability of projects are heavily dependent on the accuracy of traffic demand forecasts. Such forecasts are also the basis for socioeconomic and environmental appraisal of transportation infrastructure projects. According to the experiences gained with the accuracy of demand forecasting in the transportation sector, covering traffic volumes, spatial traffic distribution, and distribution between transportation modes, there is evidence that demand forecasting—like cost forecasting, and despite all scientific progress in modeling—is a major source of

Error and optimism bias in toll road traffic forecasts

Robert Bain

Published online: 28 February 2009
© Springer Science+Business Media, LLC. 2009

Abstract Traffic forecasts are employed in the toll road sector, inter alia, by private sector investors to gauge the bankability of candidate investment projects. Although much is written in the literature about the theory and practice of traffic forecasting, surprisingly little attention has been paid to the predictive accuracy of traffic forecasting models. This paper addresses that shortcoming by reporting the results from the largest study of toll road forecasting performance ever conducted. The author had access to commercial-in-confidence documentation released to project financiers and, over a 4-year period, compiled a database of predicted and actual traffic usage for over 100 international, privately financed toll road projects. The findings suggest that toll road traffic forecasts are characterised by large errors and considerable optimism bias. As a result, financial engineers need to ensure that transaction structuring remains flexible and retains liquidity such that material departures from traffic expectations can be accommodated.

Keywords Toll road · Traffic forecast · Optimism bias · Forecasting error

Introduction

The global trend for investor-financed toll road concessions brings traffic forecasts—and their predictive accuracy—into sharp relief. All too often, aggressive financial structuring leaves little room for traffic usage to depart from expectations before projects experience distress and debt repayment obligations become threatened. Thus the accuracy of traffic forecasts is of considerable interest to practitioners in the toll road sector yet, until recently, very little was published in the literature about the predictive performance of traffic and revenue forecasting models. That literature is reviewed here.

The review starts by examining an early, small-scale study of toll road traffic forecasting accuracy from the USA. Building on and extending this analysis, the majority of the paper is devoted to recent toll road traffic forecasting research conducted by the

ABSTRACT

This work examines the propagation of uncertainty in outputs of a standard integrated model of transportation and land use. Austin-calibrated DRAM-EMPAL predictions of residence and work locations are used as inputs to a UTPP-type four-step travel demand model (TDM), and the resulting travel times are fed forward into the future period's land use models. Covariance in inputs (including model parameters and demographic variables) was accommodated through multivariate Monte Carlo sampling of 200 scenarios. Variances in land use and travel predictions were then analyzed, over time, and as a function of input values. Results indicate that output variations were most sensitive to the exponent of the link performance function, the split of trips between peak and off-peak and several trip generation & attraction rates. 20 years in the future, final uncertainty levels (as measured by coefficients of variation) due solely to input and parameter estimation errors are on the order of 38% for total regional peak-period VMT, 45% for peak-period flows, and 50% and 37% for residential and employment densities, respectively. This means that central point estimates of key model outputs are very likely (more than 30%) to fall 38% to 50% below or above the mean value. In the Austin example, 15% of the 200 region's simulated peak-period VMT estimates fell below 3.7 million miles (per day) and 15%

exceeded 8.4 million miles. Such substantial variation is due solely to standard model parameter and input uncertainties. Other uncertainty about the future and human behavior also exists and will add further variation.

Keywords
Uncertainty propagation, integrated transportation-land use model, travel demand model

Executive Summary

The Driving Boom—a six decade-long period of steady increases in per-capita driving in the United States—is over.

Americans drive fewer total miles today than we did eight years ago, and fewer per person than we did at the end of Bill Clinton's first term. The unique combination of conditions that fueled the Driving Boom—from cheap gas prices to the rapid expansion of the workforce during the Baby Boom generation—no longer exists. Meanwhile, a new generation—the Millennials—is demanding a new American Dream less dependent on driving.

Transportation policy in the United States, however, remains stuck in the past. Official forecasts of future vehicle travel continue to assume steady increases in driving, despite the experience of the past decade. Those forecasts are used to justify spending vast sums on new and expanded highways, even as existing roads and bridges are neglected. Elements of a more balanced transportation system—from transit systems to bike lanes—lack crucial investment as powerful interests battle to maintain their piece of a shrinking transportation funding pie.

The time has come for America to hit the "reset" button on transportation policy—replacing the policy infrastructure of the Driving Boom years with a more efficient, flexible and nimble system that is better able to meet the transportation needs of the 21st century.

The Driving Boom is over.

- Americans drove more miles nearly every year between the end of World War II and 2004. (See Figure ES-1, next page.) By the end of this period of rapid increases in per-capita driving—which we call the "Driving Boom"—the average American was driving 85 percent more miles each year than in 1970.

- Americans drive no more miles in total today than we did in 2004 and no more per person than we did in 1996.

- On the other hand, Americans took nearly 10 percent more trips via public transportation in 2011 than we did in 2005. The nation also saw increases in commuting by bike and on foot.

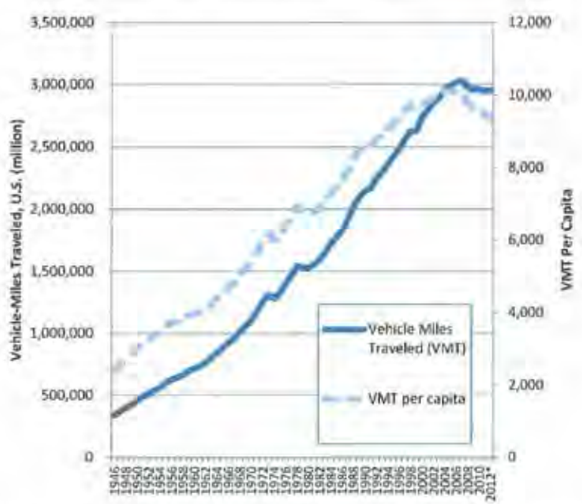
Code	Comment Document

Figure ES-1. Total and Per-Capita Vehicle-Miles Traveled, U.S.



* 2012 data from U.S. Department of Transportation's (U.S. DOT) *Traffic Volume Trends* series of reports; data from previous years from U.S. DOT's *Highway Statistics* series of reports.

- A return to the steady growth in per-capita driving that characterized the Driving Boom years is unlikely given the aging of the Baby Boom generation, the projected continuation of high gas prices, anticipated reductions in the percentage of Americans in the labor force, and the peaking of demand for vehicles and driver's licenses and the amount of time Americans are willing to spend in travel.

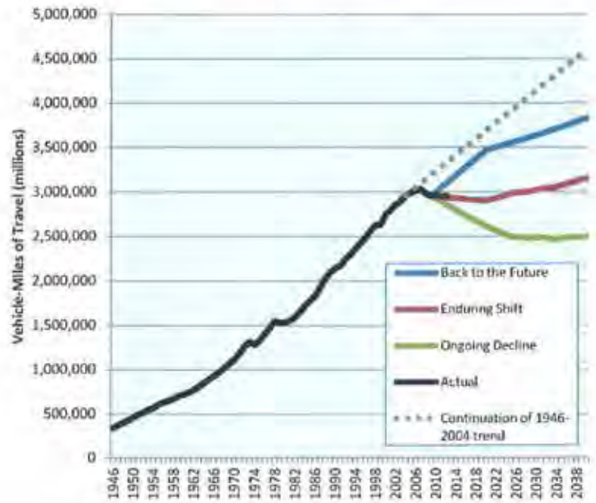
The Millennial generation has led the recent change in transportation trends—driving significantly less than previous generations of young Americans. Millennials are already the largest generation in the United States and their choices will play a crucial role in determining future transportation infrastructure needs.

- The Millennials (people born between 1983 and 2000) are now the largest generation in the United States. By 2030, Millennials will be far and away the largest group in the peak driving age 35-to-54 year old demographic, and will continue as such through 2040.

Code	Issue	Response

Code	Comment Document

Figure ES-2. Aggregate Vehicle-Miles Traveled in the United States under Several Scenarios of Future Travel Growth, 1946-2040



- Young people aged 16 to 34 drove 23 percent fewer miles on average in 2009 than they did in 2001—a greater decline in driving than any other age group. The severe economic recession was likely responsible for some of the decline, but not all.
- Millennials are more likely to want to live in urban and walkable neighborhoods and are more open to non-driving forms of transportation than older Americans. They are also the first generation to fully embrace mobile Internet-connected technologies, which are rapidly spawning new transportation options and shifting the way young Americans relate to one another, creating new avenues for living connected, vibrant lives that are less reliant on driving.
- If the Millennial-led decline in per-capita driving continues for another dozen years, even at half the annual rate of the 2001-2009 period (illustrated by the *Ongoing Decline* scenario in Figure ES-2 above), total vehicle travel in the United States could remain well below its 2007 peak through at least 2040—despite a 21 percent increase in population. If

Code	Issue	Response

Code	Comment Document

Millennials retain their current propensity to drive less as they age and future generations follow (*Enduring Shift*), driving could increase by only 7 percent by 2040. If, unexpectedly, Millennials were to revert to the driving patterns of previous generations (*Back to the Future*), total driving could grow by as much as 24 percent by 2040.

- All three of these scenarios yield far less driving than if the Driving Boom had continued past 2004. Driving declines more dramatic than any of these scenarios would result if future per-capita driving were to fall at a rate near that of recent years or if annual per-capita reductions continue through 2040.
- Regardless of which scenario proves true, the amount of driving in the United States in 2040 is likely to be lower than is assumed in recent government forecasts. This raises the question of whether changing trends in driving are being adequately factored into public policy. (See Figure ES-3.)

The recent reduction in driving has already delivered important benefits for

Figure ES-3. Recent Official Forecasts of Vehicle Travel Compared to Range of Scenarios, 1946-2040

Code	Issue	Response

Code	Comment Document

the nation, while raising new challenges. Future driving trends will have major implications for transportation policy and other aspects of American life.

- **Traffic congestion has fallen.** According to data from the Texas Transportation Institute, Americans spent 421 million fewer hours stuck in traffic in 2011 than they did in 2005. Further reductions in driving could lead to additional easing of congestion without massive investments in new highway capacity, as long as roads are maintained in a state of good repair.

- **America is less dependent on oil.** In 2011, gasoline consumption for transportation hit a 10-year low. Further reductions in driving consistent with the *Ongoing Decline* scenario—coupled with expected vehicle fuel economy improvements—could result in the nation using half as much gasoline or other fuels in our cars and trucks by 2040 as we use today.

- **Our roads are getting less use … but the gas tax is bringing in less income.** Reduced vehicle travel (particularly in large trucks) reduces the wear and tear on our nation's roads, reducing maintenance needs. Reduced driving, however, also reduces the amount of revenue brought in by the already-strained gasoline tax.

The recent reduction in driving and embrace of less auto-dependent ways of living by Millennials and others creates a golden opportunity for America to adopt transportation policies that use resources more efficiently, preserve our existing infrastructure, and provide support for Americans seeking alternatives to car travel.

A new vision for transportation policy should:

- **Plan for uncertainty.** With future driving patterns uncertain, federal, state and local transportation officials should evaluate the costs and benefits of all transportation projects based on several scenarios of future demand for driving. Decision-makers should also prioritize those projects that are most likely to deliver benefits under a range of future circumstances.

- **Support the Millennials and other Americans in their desire to drive less.** Federal, state and local policies should help create the conditions under which Americans can fulfill their desire to drive less. Increasing investments in public transportation, bicycling and pedestrian infrastructure and intercity rail—especially when coupled with regulatory changes to enable the development of walkable neighborhoods—can help provide more Americans with a broader range of transportation options.

- **Revisit plans for new or expanded highways.** Many highway projects currently awaiting funding were initially conceived of decades ago and proposed based on traffic projections made before the recent decline in driving. Local, state and federal governments should revisit the need for these "legacy projects" and ensure that proposals for new or expanded highways are still a priority in light of recent travel trends.

- **Refocus the federal role.** The federal government should adopt a more strategic role in transportation policy, focusing resources on key priorities (such as repair and maintenance of existing infrastructure and the expansion of transportation options) and evaluating projects competitively on the basis of their benefits to society.

Code	Issue	Response

Code	Comment Document

- **Use transportation revenue where it makes the most sense.** Transportation spending decisions should be based on overall priorities and a rigorous evaluation of project costs and benefits—not on the source of the revenue.
- **Do our homework.** Federal and state governments should invest in research to evaluate the accuracy and usefulness of transportation models and better understand changing transportation trends in the post-Driving Boom era.

1. BACKGROUND

Arizona State and County Population Projections (2012 edition) are prepared in accordance with Sections 1, 4 and 5 of Executive Order 2011-04 signed by Governor Janice Brewer:

> Section 1: The Arizona Department of Administration (ADOA) shall be the agency designated to produce the official population estimates and projections for the State of Arizona.
>
> Section 4: ADOA shall produce the official population projections for each year for a minimum of the next 25-year period. The projections shall be dated as of July 1 and shall include projections for the State, its counties, its incorporated jurisdictions, and the unincorporated balance of each county.
>
> Section 5: ADOA shall release the State and county projections as soon as possible following the release of detailed decennial census data by the U.S. Department of Commerce, Bureau of the Census, but no later than December 31 in years ending in 2. These projections shall be updated twice at three year intervals, prior to the release of the next decennial census data and no later than December 31 in the years ending in 5 and 8.

Executive Order 2011-04 also directs the use of these projections:

> Section 10: Population estimates and projections produced by ADOA in accordance with this Executive Order shall be used by all State agencies for all purposes, including those required by federal law, which necessitates the development of population estimates or population projections.

2. METHODOLOGY

The Arizona Population Projections Model is a Cohort-Component model. This model is used to project population for 10 race/ethnic groups in 16 geographical areas (Arizona state and its 15 counties) over a projection period of 40 years. The 10 race/ethnic groups are the combinations of five race groups by Hispanic origin. The five race groups are: White, Black, Native American, Asian (including Native Hawaiian and Pacific Islander), and Other (including two or more races). Each of these races is delineated into Hispanic origin and non-Hispanic origin to make a total of 10 race/ethnic groups.

A component methodology accounts for each aspect of demographic change (fertility, mortality, and migration). These components, each projected separately, are combined to produce population projections by age, sex, race, and ethnic group.

Comments by Don't Waste Arizona, Inc. President,
Stephen Brittle

Code	Issue	Response

Code	Comment Document

Don't Waste Arizona, Inc. (DWAZ) is a non-profit environmental organization dedicated to the protection and preservation of the environment in Arizona. DWAZ is especially concerned about environmental justice, civil rights protections, risks from hazardous materials and toxics, and air pollution. DWAZ is headquartered at 6205 South 12th Street, Phoenix, AZ 85042, and may be reached at (602) 268-6110. DWAZ has members in the affected areas. DWAZ is allied with PARC, et al for the purposes of preparing comments in opposition to the freeway, and the use of these comments by these allies is allowed and unrestricted. DWAZ joins with PARC et al in these comments, and any and all co-parties are allowed to use these in litigation. Stephen Brittle, President of Don't Waste Arizona, is also a member of PARC.

The following comments on the DEIS for the South Mountain Freeway were prepared for DWAZ, PARC, et al. . . .

31

General Comments:

The 4f analysis is done wrong, and uses old and outdated information and data.

32

There is no analysis of having alternative to the freeway in the form of a road connecting Laveen to the I-10 west for the purposes of giving Laveen area residents a better access to the I-10. This would actually serve Laveen area residents' needs better because it would eliminate most of the traffic from trucks.

Too many of the details are left to the "design phase" when they should be examined at this stage of the process.

The intersection with I-10 west near 59rh Avenue fails in many ways. What about the severe traffic congestion that already occurs there during rush hour, as well as pollution impacts? Where is the current data showing traffic patterns?

Why haven't there been any new concurrences since 2008?

Have there been any new agreements since 2005-2007?

The following are comments related to impacts to air pollution and air quality:

Truck Traffic from Mexico and High-Sulfur Diesel; Truck Bypass Negated

The modeling of air pollution impacts in the DEIS do not include the additional air pollution from truck traffic, and also from truck traffic originating in Mexico that would be using high sulfur diesel fuel that has been banned in the US. The DEIS briefly mentions the issue, but it claims it has no way to know what impact the change in the bypass route would be. That is patently absurd and unacceptable. The number of trucks coming over the border from Mexico is on record, and even if these trucks have hazardous materials in their cargoes is on record. HDR and ADOT simply have to get the

Code	Issue	Response
31	**Section 4(f) and Section 6(f)**	The Arizona Department of Transportation and Federal Highway Administration followed all requirements of Section 4(f) of the Department of Transportation Act that are found in 49 United States Code § 303. The methodology employed follows 23 Code of Federal Regulations § 774 and standard industry practice. Under the National Environmental Policy Act, it is common for new data to avail itself and to therefore update the environmental impact statement as new data does become available. Reviewers have noted that newer trails in the South Mountains (Bursera and Pyramid Trails) were not discussed in the Draft Environmental Impact Statement. This information has been considered, investigated, and the effects of the proposed freeway on these facilities has been addressed (see Final Environmental Impact Statement, page 5-9). This new information has not changed the findings of the Section 4(f) analysis in the Draft Environmental Impact Statement. A thorough feasible and prudent avoidance analysis of the South Mountains was conducted as presented in Chapter 5 of the Final Environmental Impact Statement and concluded avoidance to the direct use of the resource was not feasible and prudent. In support of this response, consider the following review from the U.S. Department of the Interior on the Draft Environmental Impact Statement comment: "Following our review of the Section 4(f) Evaluation, we concur that there is no feasible or prudent alternative to the Preferred Alternative selected in the document, and that all measures have been taken to minimize harm to these resources." The complete letter can be found in Appendix 7, Volume III, on page B4 of the Final Environmental Impact Statement. The Section 4(f) analysis for the proposed action was properly performed.
32	**Purpose and Need**	The establishment of the purpose and need for the proposed action must follow 40 Code of Federal Regulations 1502.13. The comment reflects a concern about need related to west valley travel. Chapter 1, *Purpose and Need*, describes a regional transportation problem warranting a transportation solution. The alternatives considered and evaluated in Chapter 3, *Alternatives*, consider a comprehensive set of alternatives and take into account the need as presented in Chapter 1. During the modal screening process (see text beginning on page 3-3 of the Final Environmental Impact Statement), expansion of the arterial street system was considered. The reasons this alternative was eliminated are presented in Table 3-2 on page 3-5 of the Final Environmental Impact Statement. According to 23 Code of Federal Regulations § 771.111(f), "the action evaluated in the environmental impact statement must connect logical termini and be of sufficient length to address environmental matters on a broad scope ..." The proposed action should satisfy the project need and should be considered in the context of the local area's socioeconomics and topography, the future travel demand, and other infrastructure improvements in the area. A partial freeway from Interstate 10 (Papago Freeway) to Laveen Village is not feasible because it would not meet the proposed freeway's identified purpose and need.

1

Code	Issue	Response
33	**Design**	Federal Highway Administration Order 6640.1A *FHWA Policy on Permissible Project Related Activities During the National Environmental Protection Agency Process* clarifies the Federal Highway Administration's policy regarding the permissible project-related activities that may be advanced prior to the conclusion of the National Environmental Policy Act process. Preliminary design may occur to define the general project location and design concepts. It includes, but is not limited to, preliminary engineering and other activities and analyses, such as environmental assessments, topographic surveys, metes and bounds surveys, geotechnical investigations, hydrologic analysis, hydraulic analysis, utility engineering, traffic studies, financial plans, revenue estimates, hazardous materials assessments, general estimates of the types and quantities of materials, and other work needed to establish parameters for the final design. Prior to completion of the National Environmental Policy Act review process, any such preliminary engineering and other activities and analyses must not materially affect the objective consideration of alternatives in the National Environmental Policy Act review process. The current level of engineering is used to determine the limits of environmental and construction impacts that would be attributable to the proposed freeway. Location and the profile of the freeway would be evaluated to minimize potential changes to the freeway as the design level would progress. The current level of engineering is an accepted industry standard for determining impacts. (See Final Environmental Impact Statement sidebar on page 3-40 for more discussion.)
34	**Traffic**	An assessment of existing traffic operational characteristics and future traffic operational characteristics without the proposed freeway is presented in the Final Environmental Impact Statement, beginning on page 1-13. This includes current and future traffic volumes and durations of level of service E or F conditions (congestion) along Interstate 10 between State Route 101L and Interstate 17. An assessment of future traffic conditions with and without the proposed freeway is presented in the Final Environmental Impact Statement, beginning on page 3-27. Observations from Figures 3-15 and 3-16 indicate that conditions would be similar or slightly better with the proposed freeway in place. The traffic conditions presented in these sections are consistent with the environmental impact analysis for elements such as air quality and noise, and the results of those analyses can be found in their respective sections of Chapter 4 of the Final Environmental Impact Statement. The air and noise analyses were updated for the Final Environmental Impact Statement (see sections beginning on pages 4-68 and 4-88, respectively). It is important to note that no substantial differences between the analyses for the Draft and Final Environmental Impact Statements resulted from the update.
35	**Cultural Resources**	National Historic Preservation Act Section 106 consultation is summarized in Table 4-46 beginning on page 4-136 of the Draft Environmental Impact Statement. There have been a number of concurrences since 2008.
36		The comment is not specific enough in its reference to "agreements" to allow an accurate response.

Code	Issue	Response
37	**Air Quality**	Arizona highways, as are most highways across the United States, are open to all kinds of traffic, so long as the cargo being carried is in accordance with U.S. Department of Transportation regulations for the specific type of cargo. The South Mountain Freeway, if implemented, is expected to operate under the same rules as other similar facilities in the state; truck traffic would be expected to be permissible (see text box on page 4-157 of the Final Environmental Impact Statement). Trucks crossing from Mexico to Arizona are restricted to the commercial zones within 25 miles of the border. The Federal Motor Carrier Safety Administration is administering a United States-Mexico cross-border, long-haul trucking pilot program. The program tests and demonstrates the ability of Mexico-based motor carriers to operate safely in the United States beyond the municipalities and commercial zones along the United States-Mexico border (see <fmcsa.dot.gov/intl-programs/trucking/trucking-program.aspx>). Petróleos Mexicanos (better known as Pemex), the Mexican state-owned petroleum company, has guaranteed 15 parts per million in its sulfur diesel fuel in the border region (see <http://transportpolicy.net/index.php?title=Mexico:_Fuels:_Diesel_and_Gasoline>). As explained on page 4-77 of the Final Environmental Impact Statement, the emissions analysis conducted for the project shows that future mobile source air toxics emissions will be lower than current levels. This analysis included projected truck traffic.

Code	Comment Document

data and analyze it. This should be examined as a cumulative impact, an indirect impact, and a direct impact.

There is a reason why the idea of a truck bypass around the urban core of Maricopa County came up in the first place, all those years ago. It is because there have been chronic issues about air quality in the Phoenix metro area, so bad and for so long that public policy makers suggested as one of the strategies to reduce particulate matter from truck exhaust in urban Maricopa County was to designate a bypass for truck traffic around the urban area.

This bypass is also now the designated route of the Canamex Highway. It is Interstate 8 (south of Casa Grande) to State Highway 85, to Interstate 10, west of the Phoenix metro area. This was formally adopted by MAG (Maricopa Association of Governments on April 25, 2001. In the resolution of decision, the wording about air quality and for particulate matter under ten microns in diameter (PM-10) reveals the intent of the decision, , "BE IT RESOLVED that the Maricopa Association of Governments recommends the future designation of the CANAMEX Corridor within the Maricopa region to include I-8 between I-10 and SR 85, SR 85 between I-8 and I-10, and the US 93 / US 60 Wickenburg Bypass, with the connection between the SR 85 / I-10 junction and the Wickenburg Bypass to be designated following additional study but constrained to a location **outside of the air quality nonattainment area for particulate matter under ten microns in diameter (PM-10) as specified in the "Revised MAG 1999 Serious Area Particulate Plan for PM-10 for the Maricopa County Nonattainment Area" (February 2000)**
[See http://www.azmag.gov/Documents/pdf/cms.resource/FinalCANAMEXResolution_670.pdf]

38 The decisions about the truck bypass route came as part of a series of actions by MAG and the Arizona legislature to bring Maricopa County into compliance with the PM standards of the National Ambient Air Quality Standards (NAAQS) under the Clean Air Act and to stave off sanctions for noncompliance.

39 **Attainment Status Designation: Serious Nonattainment**

Maricopa County was reclassified as a serious PM_{10} nonattainment area on June 10, 1996. On July 9, 1999, the Maricopa Association of Governments (MAG) submitted to EPA the MAG 1999 Serious Area Particulate Plan for PM_{10} (Executive Summary), addressing both the 24-hour and annual standards.

A revised state implementation plan (SIP) was submitted in February 2000. (A state implementation plan is a plan that shows how the state will implement the Clean Air Act and meet the requirements of the National Ambient Air Quality Standards (NAAQS), i.e. comply with the standards for levels of air pollution allowed in the air) The Plan, based on new most stringent measures, included an extension request for attainment no later than December 31, 2006. On January 10, 2002, EPA announced approval of Arizona's

Code	Issue	Response
38	**Trucks**	It is agreed that the truck bypass for the Phoenix metropolitan area would not include the proposed freeway. As with all other freeways in the Maricopa Association of Governments region, trucks would use the proposed freeway for the through-transport of freight, for transport to and from distribution centers, and for transport to support local commerce (see page 3-64 of the Final Environmental Impact Statement). The trucking industry depends on the efficient and fast movement of freight and on travel-time savings. Therefore, it is expected that "true" through-truck traffic (not having to stop in the metropolitan area) would continue to use the faster, designated, and posted bypass system of Interstate 8 and State Route 85. The comment offers no source or evidence. In April 2001, the Maricopa Association of Governments Regional Council formally adopted the route depicted in the map on page 3-64 as the CANAMEX Corridor within Maricopa County. As noted on page 3-64 of the Final Environmental Impact Statement, in the Maricopa County area the CANAMEX Corridor is to follow Interstate 10 from Tucson to Interstate 8 near Casa Grande, Interstate 8 west to State Route 85 near Gila Bend, State Route 85 north to Interstate 10 northwest of Buckeye, Interstate 10 west to Wickenburg Road, Wickenburg Road to Vulture Mine Road west of Wickenburg, and then connect with the planned U.S. Route 93/U.S. Route 60 Wickenburg Bypass.
39	**Air Quality**	In May 2012, the Arizona Department of Environmental Quality submitted a revised Maricopa Association of Governments 2012 Five Percent Plan for the region. On July 20, 2012, the U.S. Environmental Protection Agency made an official finding that the Maricopa Association of Governments 2012 Five Percent Plan was administratively complete. This decision ended the sanctions clocks associated with Arizona's decision to withdraw the Maricopa Association of Governments 2007 Five Percent Plan. On February 6, 2014, the U.S. Environmental Protection Agency published a notice in the *Federal Register* proposing to approve the Maricopa Association of Governments *2012 Five Percent Plan for Attainment of the PM-10 Standard* for the Maricopa County Nonattainment Area. In the same notice, the U.S. Environmental Protection Agency stated that it would concur with exceptional event (as a result of haboobs and dust storms) documentation prepared by the Arizona Department of Environmental Quality, which would give the region the 3 years of clean data needed for attainment of the particulate matter (PM_{10}) 24-hour standard. Finally on May 30, 2014, the U.S. Environmental Protection Agency approved the 2012 Five Percent Plan and found the area in attainment of the 24-hour particulate matter (PM_{10}) standard based on monitoring data for the years 2010 to 2012 (see page 4-72 of the Final Environmental Impact Statement for more information).

Code	Comment Document
39	plan to attain the standards for PM_{10} in the metropolitan Phoenix area by 2006. EPA's approval granted a 5-year extension of the attainment date for both the 24-hour and annual PM_{10} standards to December. 31, 2006. Both decisions were published in the Federal Register on July 25, 2002 (67 FR 48718). On July 2, 2002, EPA found that more work was needed to achieve attainment of the 24-hour standard in the area of the Salt River monitoring site (43rd Avenue/Broadway). This resulted in the Revised PM10 State Implementation Plan for the Salt River Area in September 2005. [http://www.azdeq.gov/environ/air/plan/download/sr-sip.pdf] Despite the most stringent measures and best available control measures adopted and implemented earlier, the nonattainment area failed to attain the NAAQS by the extended deadline of December 31, 2006. This failure triggered a special requirement under Section 189(d) of the Clean Air Act that SIP revisions provide for annual reductions of PM_{10} or PM_{10} precursors of not less than 5 percent of the most recent emissions inventory, until the NAAQS is attained, be submitted to EPA by December 31, 2007. This SIP revision was prepared by the Maricopa Association of Governments and submitted to EPA by the deadline. The primary sources of particulate pollution in the area are construction activities, **paved road dust**, unpaved roads and parking lots, agricultural activities, windblown dust from disturbed vacant lots, construction sites, and agricultural fields, fires and open burning, dust from off-road recreational vehicles, leaf blowers, and **exhaust from cars**. (Emphasis added.) [http://www.maricopa.gov/aq/divisions/planning_analysis/state_implementation_plan.aspx]
40	If the South Mountain Freeway is built, the bypass route, which has few amenities, would be a longer route and it is not a full freeway for the entire distance, while the South Mountain Freeway and Truck Bypass would be a modern highway. There is no law that would force trucks to use the longer original bypass route, so it is entirely likely most or even all these trucks would now come through Phoenix, negating the whole bypass strategy that had been agreed upon 12 years ago, and negating that public policy decision. By completing the South Mountain Freeway, this would all be negated, but the reversal of this public policy decision and the effects it might have on air pollution are never mentioned in the DEIS. Further, trucks originating in Mexico will be fueled with diesel that doesn't meet the CARB diesel standards adopted by Arizona over a decade ago. In Mexico, there is no regulation about the sulfur in diesel fuel. In Arizona, the law was changed to allow only diesel fuel to be sold that has had 98% of the sulfur removed. This was another part of the strategy to bring Maricopa County into compliance with the particulate matter standards required by the Clean Air Act (CAA).There was extensive modeling of the effect of adopting the CARB diesel standards and a discussion of this at the Arizona legislature, where it passed, so the data is in government hands. The CARB diesel standards for Arizona were adopted by EPA by rule in August 2008, which makes them part of the SIP.

Code	Issue	Response
40	**Trucks**	The use of the proposed action by truck traffic is disclosed in the Draft Environmental Impact Statement (see page 3-64). Creating a truck bypass is not a goal of the proposed action and not established as part of the purpose and need as disclosed in full in Chapter 1, *Purpose and Need*, of the Draft Environmental Impact Statement. The proposed freeway is part of a transportation system developed to improve mobility in the region by increasing capacity and allowing traffic—including truck traffic—to access a segment of the "loop" system (see pages 1-21, 1-22, 3-1, and 3-3 of the Final Environmental Impact Statement) in the Phoenix metropolitan area. The proposed South Mountain Freeway would be a commuter corridor, helping to move local traffic. As with all other freeways in the region, trucks would use it for the through-transport of freight, for transport to and from distribution centers, and for transport to support local commerce. Nevertheless, the primary vehicle using the proposed freeway would be automobiles. The Maricopa Association of Governments regional travel demand model projects that trucks will represent approximately 10 percent of the total traffic on the proposed action, similar to what is currently experienced on other regional freeways such as Interstate 10, State Route 101L, and U.S. Route 60. Further, it is not expected that the entire 21 percent of through-truck traffic (by tonnage) using Interstate 10 would divert from Interstate 10 to use the proposed freeway (see Final Environmental Impact Statement page 3-64). Trucking destinations in the Phoenix metropolitan area would still prompt trucks to enter congested areas. Drivers choosing to travel on the proposed freeway versus Interstate 10 would not receive substantial travel-time benefits. Therefore, it is expected that "true" through-truck traffic (not having to stop in the metropolitan area) would continue to use the faster, designated, and posted bypass system of Interstate 8 and State Route 85. Trucks crossing from Mexico to Arizona are restricted to the commercial zones within 25 miles of the border. The Federal Motor Carrier Safety Administration is administering a United States-Mexico cross-border, long-haul trucking pilot program. The program tests and demonstrates the ability of Mexico-based motor carriers to operate safely in the United States beyond the municipalities and commercial zones along the United States-Mexico border (see <fmcsa.dot.gov/intl-programs/trucking/trucking-program.aspx>). Petróleos Mexicanos (better known as Pemex), the Mexican state-owned petroleum company, has guaranteed 15 parts per million in its sulfur diesel fuel in the border region (see <http://transportpolicy.net/index.php?title=Mexico:_Fuels:_Diesel_and_Gasoline>). As explained on page 4-77 of the Final Environmental Impact Statement, the emissions analysis conducted for the project shows that future mobile source air toxics emissions will be lower than current levels. This analysis included projected truck traffic.

"August 4, 2008: Final rule regarding BACM and MSM demonstrations.

Final rule to again approve the best available control measures (BACM) and most stringent measures (MSM) demonstrations in the Phoenix Area's PM-10 plan in response to a 9th Circuit Court of Appeals remand to re-evaluate the feasibility of implementing California Air Resources Board (CARB) diesel fuel as a BACM. *The correct docket number (as stated at the top of the document) is EPA-R09-OAR-2006-0571."*

http://www.epa.gov/region9/air/phoenixpm/

Also, we know exactly the number of trucks arriving from Mexico and their destinations in the US, so this is data that is available for the DEIS.

Once this additional pollution is honestly quantified and factored in, there would be a huge net increase in air pollution from the South Mountain Freeway and Truck Bypass, and associated increases in asthma, heart disease, premature death, and other adverse health impacts. This would lead to the No Build option being chosen as the only option.

The DEIS does mention, in Chapter 4, part 1, page 68:
"Heavy-duty Diesel Emissions Standards
In December 2000, EPA issued its final rule in a two-part strategy to reduce diesel emissions from heavy-duty trucks and buses. The standards pertain to diesel engines found in such vehicles (weighing over 8,500 pounds), beginning in model year 2004. Additional standards and procedures were implemented in 2007.

EPA required diesel fuel refiners to produce diesel fuels (for highway vehicle use) that have a sulfur content of no more than 15ppm, effective October 2006, a 97percent reduction from the previous 500ppm level."

So ADOT and HDR have to aware of the issue regarding high sulfur diesel, but the impacts of truck traffic from Mexico using high sulfur diesel fuel and the additional pollution is not addressed.

41

Air Toxics Already a Crisis but Not Mentioned

In the DEIS, Chapter 4 part 1 page 64, it is stated,
"Local Emissions of Priority MSATs (mobile sources of air toxics)
It is possible to estimate the relative contributions (by weight of emissions) of the different local sources of priority M SATs using EPA-compiled information. In June 2009, EPA released the results of its National-Scale Air Toxics Assessment for 2002."

In the DEIS, Chapter 4 part 1 page 68-69, it is stated,
"Mobile Source Air Toxics

Code	Comment Document
41	Controlling air toxic emissions became a national priority with the passage of the Clean Air Act Amendments of 1990, whereby Congress mandated that EPA regulate 188 air toxics, also known as HAPs. EPA has assessed this expansive list in its latest rule on the Control of Hazardous Air Pollutants from Mobile Sources(Federal Register 72(37): 8430, February 26, 2007), and identified a group of 93 compounds emitted from mobile sources that are listed in its Integrated Risk Information System <www.epa.gov/iris/>. In addition, EPA identified seven compounds with significant contributions from mobile sources that are among the national- and regional-scale cancer risk drivers from its 1999 National Air Toxics Assessment <www.epa.gov/ttn/atw/nata1999/>. These are acrolein; benzene; 1,3-butadiene; DPM plus diesel exhaust organic gases; formaldehyde; naphthalene; and POM. While F H WA considers these the priority MSATs, the list is subject to change and may be adjusted in consideration of future EPA rules." "Information Availability Constraints in Analyzing Project-Specific MSATs Impacts This section includes a basic analysis of the likely M SATs emissions impacts of the proposed action and the No -Action Alternative. Available technical tools do not, however, enable the prediction of project-specific health impacts of the emissions changes associated with the action alternatives. Because of these limitations, the following discussion is included in accordance with Council on Environmental Quality (CEQ) regulations [40 C.F.R .§ 1502.22(b)] regarding incomplete or unavailable information. 40 C.F.R. § 1502.22(b) addresses situations where analysis of an impact in a NEPA document is restricted by missing or incomplete information, and requires the NEPA document to 1) state that there is missing or incomplete information, 2) discuss the relevance of this information, 3) summarize what is known about the impact in question, and 4) in the face of what is known and not known, present the federal agency's evaluation of the likely impact. In F H WA's view, information is incomplete or unavailable to credibly predict the project-specific health impacts attributable to changes in MSAT emissions associated with a proposed set of freeway alternatives. The outcome of such an assessment, adverse or not, would be influenced more by the uncertainty introduced into the process through assumption and speculation rather than any genuine insight into the actual health impacts directly attributable to MSAT exposure associated with a proposed action." **But there is already very complete and specific data related to all of this that was excluded and is not properly reviewed or analyzed, and it is much more recent.**
42	In 2005, there was an extensive air monitoring of certain toxic chemicals (air toxics) conducted by EPA and ADEQ in a joint effort named the Joint Air Toxics Assessment Program (JATAP). This was conducted at specific sites in Maricopa County that modeling showed would likely be hot spots for air toxics, including a site on the Gila River Indian Community (GRIC), that would be adjacent to the South Mountain Freeway and Truck Bypass. [These JATAP study results are posted at:

Code	Issue	Response
42	**Air Quality**	The Joint Air Toxics Assessment Project compares monitored values to the Environmental Protection Agency's one-in-a-million risk threshold, but this numerical benchmark is not a "standard" in the sense that it represents a pass/fail threshold (like the National Ambient Air Quality Standards). This issue is discussed in Appendix F of the Air Quality Technical Report, where examples are provided where the U.S. Environmental Protection Agency itself has promulgated emissions control regulations that result in residual risk of more than one in a million (i.e., the Environmental Protection Agency considered it "acceptable" to adopt regulations that did not reduce risk to a level below one in a million). Summary information about the findings of the Joint Air Toxics Assessment Project study is provided as background information in the Draft and Final Environmental Impact Statements, but the study itself is not relevant to the type of analysis done pursuant to the Federal Highway Administration's mobile source air toxics guidance, which is an emissions analysis. Monitored ambient concentrations of mobile source air toxics (the focus of the Joint Air Toxics Assessment Project) do not inform this type of analysis. While monitoring data can be useful for defining current conditions in the affected environment (to the extent that the monitoring data are current), they don't tell us anything about future conditions, or the impacts of the project itself, which is why an emissions analysis was performed. The mobile source air toxic analysis presented beginning on page 4-77 of the Final Environmental Impact Statement is an estimated inventory of mobile source air toxic emissions for the entire Study Area for 2025 and 2035. This approach was used because the inventory estimate accounts for changes in traffic and emissions on all roadways affected by a proposed project, and would, therefore, be a more reliable predictor of changes in exposure to mobile source air toxics.

Code	Comment Document
42	http://yosemite.epa.gov/r9/sfund/r9sfdocw.nsf/3dc283e6c5d6056f88257426007417a2/bd0cae65f8ca89368825790d0056f0e4/$FILE/Final%20Rpt_Phoenix%20Air%20Toxics_JATAP%202005.pdf.] The monitoring sites included a site near St. Johns on the Gila River Indian Community (GRIC), and some of the other monitoring sites were in west Phoenix and South Phoenix. The JATAP monitoring results were reported in 2006, during a time the data for the DEIS was being gathered. The JATAP monitoring results found levels of certain toxic chemicals associated with vehicular emissions were above the standard of a one in a million chance of cancer in a lifetime of exposure in the west Phoenix, south Phoenix, and GRIC sites. The JATAP monitoring at the St. Johns monitoring site on the GRIC found certain air toxics attributed to "mobile sources," or vehicular traffic burning hydrocarbons. These findings of the air toxics were many times the "accepted" cancer risk standard set by USEPA. The St. Johns monitoring site's annual mean concentrations of mobile source air toxics (MSATs): • benzene at 4.7 times the accepted cancer risk standard; • 1,3 butadiene at 3.9 times the accepted cancer risk standard The JATAP study also found other air toxics associated with transportation exhaust. Acetaldehyde, formaldehyde, ethylbenzene, m,p-Xylene, o-Xylene, and toluene were detected at high levels at the St. Johns monitoring site.
43	Residents of the GRIC living around and adjacent to the monitoring site are currently being subjected to all of these carcinogens, not just one. And if a freeway were to be built near this monitoring site on the GRIC, there would be more air toxics in addition to the ones detected at levels that far exceed the USEPA risk standard. At the West Phoenix monitoring site, which is the same 43rd Avenue and Broadway site that has had many exceedances of the particulate matter standards, even higher levels of air toxics were found. This site is about a mile or so downwind from the proposed route of the South Mountain Freeway, and air toxics levels would be impacted by the freeway. The West Phoenix monitoring site's annual mean concentrations of mobile source air toxics (MSATs): • benzene at 18.7 times the accepted cancer risk standard; • 1,3 butadiene at 21.5 times the accepted cancer risk standard
42	The JATAP study also found other air toxics associated with transportation exhaust. Formaldehyde, ethylbenzene, m,p-Xylene, o-Xylene, and toluene were detected at high levels at the West Phoenix monitoring site.

Code	Issue	Response
43	**Air Quality**	The emission modeling developed for the proposed action showed that for the mobile source air toxics study area, constructing the freeway would have a marginal effect on total mobile source air toxics emissions in 2025 and 2035 (less than a 1 percent difference in total annual emissions between the Preferred Alternative and No-Action Alternative) (see discussion beginning on page 4-72 of the Final Environmental Impact Statement). With the Preferred Alternative in 2035, modeled mobile source air toxics emissions would decrease by 57 percent to more than 90 percent, depending on the pollutant, despite a 47 percent increase in vehicle miles traveled in the Study Area compared with 2012 conditions. The Preferred Alternative would also reduce in-vehicle mobile source air toxics exposure as opposed to the No-Action Alternative. The U.S. Environmental Protection Agency has found that in-vehicle benzene concentrations were between 2.5 and 40 times higher than nearby ambient concentrations, based on a review of studies discussed in the Regulatory Impact Analysis for the U.S. Environmental Protection Agency's 2007 mobile source air toxics rule-making (Final Regulatory Impact Analysis, Environmental Protection Agency 420-R-07-002, 3-17 [February 2007]). Construction of the South Mountain Freeway would result in a reduction in benzene exposure to drivers and passengers for two reasons: decreased travel times (motorists would spend less time in traffic to reach their destinations) and lower emissions rates (attributable to speed improvements). Reducing on-road exposure would provide a health benefit for motorists using the freeway under consideration. Congestion relief resulting from the proposed freeway would provide localized air quality emissions reductions on area freeways and arterial streets and at interchanges, benefiting users of area highways and those living near congested roads.

Code	Comment Document
43	One of the JATAP's findings presented to the EPA National Air Monitoring Conference in November 2006 was, "**Annual average concentrations of formaldehyde, acetaldehyde, benzene and 1,3 butadiene were on the high end of the range reported in EPA funded assessments of other US cities**." This finding relates to any future proposed freeway in the JATAP study area, which includes in entirety the route of the proposed South Mountain Freeway and Truck Bypass. In the December 2006 ANALYSIS OF AIR TOXICS COLLECTED AS PART OF THE JOINT AIR TOXICS ASSESSMENT PROJECT FINAL REPORT, Page 3-6, it states this with more precision: **"How Do Air Toxics Concentrations Compare with Typical National Levels? Phoenix area urban concentrations of1,3-butadiene, acetaldehyde, formaldehyde, chloroform, benzene, and tetrachloroethene were typically on the high end of the national urban scale (i.e., above the 75th percentile). Other air toxics concentrations were typically within the interquartile range of national concentrations (25th to 75th percentile)."**
44	**So the air toxics are already worse than many other areas of the United States, and the proposed freeway would add even more.** Obviously, adding more vehicular traffic emissions by building a freeway where there had not been one would add to this toxic burden. And because this is an ethnic minority community, Native Americans, there are civil rights and environmental justice issues involved, also. ADOT and the Maricopa Association of Governments (MAG) were not stakeholders or involved in the JATAP, so these agencies had no control over the science or the direction of the JATAP, and certainly had no authority to stop the project from finding data that would not support building the South Mountain Freeway and Truck Bypass. But the JATAP results are barely mentioned in the DEIS, then discounted and misrepresented. Instead there is a strange and unsubstantiated missive about the uncertainty of the risk from these air toxics standards, and associated modeling methodologies, which is simply not true. ADOT is quite suspect in these regards. The cancer risk standards have been promulgated and published by EPA after extensive research and study, and they are well-known and peer-reviewed.
45	In EPA's own words: "The National-Scale Air Toxics Assessment (NATA) is EPA's ongoing comprehensive evaluation of air toxics in the U.S. EPA developed the NATA as a state-of-the-science screening tool for State/Local/Tribal Agencies to prioritize pollutants, emission sources and locations of interest for further study in order to gain a better understanding of risks. NATA assessments do not incorporate refined information about emission sources, but rather, use general information about sources to develop estimates of risks which are more likely to overestimate impacts than underestimate them. NATA provides estimates of the risk of cancer and other serious health effects from breathing (inhaling) air toxics in order to inform both national and more localized efforts to identify and prioritize air toxics, emission source types and locations which are of greatest potential concern in terms of contributing to population risk. This in turn helps air pollution experts focus limited analytical resources on areas and or populations

Code	Issue	Response
44	**Air Quality**	The Draft and Final Environmental Impact Statements present information and analysis about the proposed action and the enhanced conditions when compared against the No-Action Alternative and would not cause substantial adverse effects. The results of the analysis are summarized in the prologue to the Final Environmental Impact Statement (page xiii) and are more fully described beginning on page 4-68 of the Final Environmental Impact Statement. The carbon monoxide and particulate matter (PM_{10}) analyses demonstrated that the proposed freeway would not contribute to any new localized violations, increase the frequency or severity of any existing violation, or delay timely attainment of the National Ambient Air Quality Standards or any required interim emissions reductions or other milestones. The Draft Environmental Impact Statement provided the results of modeling for each of the seven priority mobile source air toxics, in both the Eastern and Western Subareas, and compared relative mobile source air toxics emissions that would result from three different potential alternatives (W59, W71, W101) as compared with the No-Action Alternative. It also included modeling of mobile source air toxics emissions in the overall mobile source air toxics study area assuming the W59 Alternative (see pages 4-70 to 4-74 of the Draft Environmental Impact Statement) along with implementation of recent U.S. Environmental Protection Agency mobile source air toxics rules. During the period when the project has been under review, the U.S. Environmental Protection Agency has issued two rules on controlling mobile source air toxics emissions from motor vehicles (66 *Federal Register* 17229 [March 29, 2001] and 72 *Federal Register* 8427 [February 26, 2007]). In those rules, the U.S. Environmental Protection Agency examined the impacts of existing and newly promulgated mobile source control programs, including its reformulated gasoline program, its national low emission vehicle standards, its Tier 2 motor vehicle emissions standards and gasoline sulfur control requirements, and heavy duty engine and vehicle standards and on-highway diesel fuel sulfur control requirements. As a result, the U.S. Environmental Protection Agency adopted controls on gasoline and passenger vehicles that significantly reduce emissions of benzene and other mobile source air toxics such as 1,3-butadiene; formaldehyde; acetaldehyde; acrolein; and naphthalene; as well as significant reductions in emissions of particulate matter from passenger vehicles. On March 3, 2014, the U.S. Environmental Protection Agency also promulgated new "Tier 3" vehicle and fuel regulations, which will produce additional reductions of mobile source air toxics pollutants. Since these reductions have not yet been incorporated into the U.S. Environmental Protection Agency's emissions model, they are not accounted for in the South Mountain Freeway analysis. The emission modeling developed for the proposed action showed that for the mobile source air toxics study area, there would be little difference in total annual emissions of mobile source air toxics emissions between the Preferred and No-Action Alternatives (less than a 1 percent difference) in 2025 and 2035. With the Preferred Alternative in 2035, modeled mobile source air toxics emissions would decrease by 57 percent to more than 90 percent, depending on the pollutant, despite a 47 percent increase in vehicle miles traveled in the Study Area compared with 2012 conditions (see discussion beginning on page 4-77 of the Final Environmental Impact Statement).

(Response 44 continues on next page)

Code	Comment Document
45	where the potential for health risks are highest. Assessments include estimates of cancer and non-cancer health effects based on chronic exposure from outdoor sources, including assessments of non-cancer health effects for Diesel Particulate Matter (PM). Assessments provide a snapshot of the outdoor air quality and the risks to human health that would result if air toxic emissions levels remained unchanged." [http://www.epa.gov/nata/] As for the JATAP itself, the modeling conducted before the monitoring indicated certain issues that might be clarified: "Objectives for Monitoring NATA results indicate that, overall, VOCs and carbonyls are the biggest risk drivers – Particulate metals significant in some areas •Additional monitoring needed to compare with model results – Annual average concentrations of key HAPs – Spatial gradients – **Potential hot spots (near freeway environments)** (Emphasis added.) – Diurnal variability – Source identification through fingerprinting – Which HAPs contribute most to the risk?" In the DEIS, Chapter 4 part 1, page 75, it states, "Mobile Source Air Toxic Hot Spots Given concerns about the possibility of MSAT exposure in the near-road environment, The HEI dedicated a number of research efforts at trying to find an MSAT "hotspot." In 2011, three studies were published that tested this hypothesis. In general, the authors confirm that while highways are a source of air toxics, they were unable to find that highways were the only source of these pollutants. They determined that near road exposures were often no different or no higher than background or ambient levels of exposure and, hence, no true hot spots were identified. Additional information may be found at <pubs.healtheffects.org/getfile.php?u=659> page 137, <pubs.healtheffects.org/getfile.php?u=656> page 143, and <pubs.healtheffects.org/getfile.php?u=617> page 87, where monitored on-road emissions were higher than emission levels monitored at near-road residences, but **the issue of hot spots was not ultimately discussed**." (Emphasis added.). Yes, the JATAP, its purpose, its results, its recommendations, all would be a reason to not build the freeway, to determine No Build as the only acceptable alternative. So the JATAP is barely mentioned and misrepresented, and the EPA's Air Toxics program is downplayed and obfuscated, and an inconclusive study that admittedly doesn't discuss the issue of hot spots gets the focus. In NEPA, if a project causes a negative, a problem, ways to eliminate or mitigate the damage have to examined and assessed. In this case, not building a freeway near a site that has already been identified as being at a higher risk due to the same sorts of toxic air pollution found by freeways would be the only logical conclusion. **So no wonder ADOT and HDR excluded the JATAP results and included a propaganda missive against the EPA's Air Toxics Program.** 8

Code	Issue	Response
44 (cont.)		For mobile source air toxics, the project would have a negligible effect on emissions in the mobile source air toxics study area. The Preferred Alternative would also reduce in-vehicle mobile source air toxics exposure as opposed to the No-Action Alternative. The U.S. Environmental Protection Agency has found that in-vehicle benzene concentrations were between 2.5 and 40 times higher than nearby ambient concentrations, based on a review of studies discussed in the Regulatory Impact Analysis for the U.S. Environmental Protection Agency's 2007 mobile source air toxics rule-making (Final Regulatory Impact Analysis, Environmental Protection Agency 420-R-07-002, 3-17 [February 2007]). Construction of the South Mountain Freeway would result in a reduction in benzene exposure to drivers and passengers for two reasons: decreased travel times (motorists would spend less time in traffic to reach their destinations) and lower emissions rates (attributable to speed improvements). Reducing on-road exposure would provide a health benefit for motorists using the freeway under consideration. Congestion relief resulting from the proposed freeway would provide localized air quality emissions reductions on area freeways and arterial streets and at interchanges, benefiting users of area highways and those living near congested roads.
45	**Health Risk Assessment**	**The Role of Health Risk Assessment in a National Environmental Policy Act Context** The Federal Highway Administration's National Environmental Policy Act documents are developed under two guiding regulations: the Council on Environmental Quality's National Environmental Policy Act regulations applicable to all federal agencies (40 Code of Federal Regulations Parts 1500–1508) and the Federal Highway Administration's implementing regulations governing Federal Highway Administration National Environmental Policy Act documents (23 Code of Federal Regulations Part 771). In its mobile source air toxics guidance, the Federal Highway Administration discusses 40 Code of Federal Regulations Part 1502.22 and acknowledges that while much work has been done to assess the overall health risk of mobile source air toxics, analytical tools and techniques for assessing project-specific health outcomes as a result of lifetime exposures to mobile source air toxics remain limited. These limitations impede the ability to evaluate the potential health risks attributable to exposure to mobile source air toxics as part of the decision-making process in the National Environmental Policy Act context. However, as with any analysis that the Federal Highway Administration conducts for National Environmental Policy Act purposes, the Federal Highway Administration's approach for mobile source air toxic analysis in National Environmental Policy Act documents is informed not just by 40 Code of Federal Regulations Part 1502.22, but by all applicable Council on Environmental Quality requirements. The appropriateness of air toxics health risk assessment as an analysis method for National Environmental Policy Act documents is discussed below, in the context of Council on Environmental Quality requirements for these documents. In addition to the 40 Code of Federal Regulations Part 1502.22 provisions regarding uncertainty and limitations discussed in the Federal Highway Administration's MSAT Interim Guidance Appendix C, three other provisions of the Council on Environmental Quality regulations are particularly relevant to the topic of health risk assessment:

(Response 45 continues on next page)

Code	Comment Document

Code	Issue	Response
45 **(cont.)**		*40 Code of Federal Regulations § 1500.1(b): NEPA procedures must insure that environmental information is available to public officials and citizens before decisions are made and before actions are taken. The information must be of high quality. Accurate scientific analysis, expert agency comments, and public scrutiny are essential to implementing NEPA. Most important, NEPA documents must concentrate on the issues that are truly significant to the action in question, rather than amassing needless detail.* *40 Code of Federal Regulations § 1502.1: An environmental impact statement is more than a disclosure document. It shall be used by Federal officials in conjunction with other relevant material to plan actions and make decisions.* *40 Code of Federal Regulations § 1502.2: (a) Environmental impact statements shall be analytic rather than encyclopedic. (b) Impacts shall be discussed in proportion to their significance.(c) Environmental impact statements shall be kept concise and shall be no longer than absolutely necessary to comply with NEPA and with these regulations.* Section 1500.1(b) states that information for decision making must be of high quality and based on accurate scientific analysis. Air toxics health risk assessments can involve large uncertainties. The mobile source air toxic health risk assessment uncertainty builds on itself—each step of the analysis involves uncertainties, including modeling traffic and then modeling emissions, and using this estimated output to model dispersion/concentrations, which provide information for estimating or assuming exposures to those concentrations, and finally predicting health outcomes. Major uncertainties are associated with traffic and emissions projections over a 70-year period, and dispersion models are typically held to a "factor of 2" performance standard. Health impacts of mobile source air toxics in the U.S. Environmental Protection Agency Integrated Risk Information System are based on a 70-year lifetime exposure, which introduces significant uncertainty (e.g., on average, people in the United States change residence approximately once every 8 years and change jobs once every 3). Finally, as noted above, the U.S. Environmental Protection Agency's Integrated Risk Information System provides toxicity (risk) values for various pollutants and routes of exposure; in a health risk assessment, the Federal Highway Administration would compare calculated concentrations of mobile source air toxic pollutants to the Integrated Risk Information System values to estimate health risk. In the Integrated Risk Information System, the U.S. Environmental Protection Agency states the toxicity values are believed to be accurate to within an order of magnitude (a factor of 10). The total cumulative uncertainty involved in highway project health risk assessment is much larger than the change in emissions attributable to projects (typically a few percentage points). In this context, the information would not necessarily have a strong nexus to the requirements for high-quality information and accurate scientific analysis. Section 1500.1(b) also directs agencies to focus their National Environmental Policy Act analysis and documentation on issues that are truly significant to the action in question. In the context of mobile source air toxics, the Federal Highway Administration must consider whether changes in mobile source air toxic emissions attributable to a project have the potential for significant health risk. Using cancer risk as an example, the U.S. Environmental Protection Agency estimates that the overall risk of cancer in the United States is approximately 330,000 in a million, and that air toxics (from all sources) are responsible for a risk of approximately 50 in a million. In its most recent mobile source air toxics rule-making, the U.S. Environmental Protection Agency estimated mobile source air toxic cancer risk,

(Response 45 continues on next page)

Code	Comment Document

Code	Issue	Response
45 (cont.)		after implementation of emissions controls, at approximately 5 in a million (or 0.0015 percent of overall cancer risk from any cause). For the Preferred Alternative, the mobile source air toxic emissions analysis for the Study Area found little difference in total annual emissions of mobile source air toxic emissions between the Preferred and No Action Alternatives (less than a 1 percent difference) in 2025 and 2035. With the Preferred Alternative in 2035, modeled mobile source air toxic emissions would decrease by more than 80 percent, depending on the pollutant, despite a 47 percent increase in vehicle miles traveled in the Study Area compared with 2012 conditions (see the discussion beginning on page 4-77 of the Final Environmental Impact Statement). In summary, available information from the U.S. Environmental Protection Agency indicates that mobile source air toxics are a small component of overall cancer risk, and the analysis for the Final Environmental Impact Statement indicates both that the Preferred Alternative would result in a small change in the emissions contributing to this risk and that emissions will decline by a large amount regardless of alternative. As discussed above and in the air quality technical report, results from the health risk assessment would be influenced more by the uncertainty introduced into the process through assumptions and speculations rather than by genuine insight into the actual health impacts directly attributable to mobile source air toxic exposure associated with a project. Therefore, outcomes of such a health risk assessment do not provide useful information for decision makers, as required by Section 1502.1. The Federal Highway Administration emissions analysis meets the requirement to produce information that is useful for both disclosure and decision making because it allows the public and decision makers to see which alternative has less mobile source air toxic emissions, with much less uncertainty than a health risk assessment. Given the uncertainty of a mobile source air toxic health risk assessment, the Federal Highway Administration instead addresses the potential impacts of mobile source air toxics through an emissions assessment in its National Environmental Policy Act documents. For smaller projects with a lower likelihood of a meaningful impact, this discussion is qualitative. For larger projects, emissions analysis is conducted. The Federal Highway Administration approach is consistent with the Council on Environmental Quality's direction in Section 1502.2(b) to discuss impacts in proportion to their significance. The results of an emissions analysis can be summarized concisely in a National Environmental Policy Act document and provide useful information for decision makers (e.g., an alternative that has lower emissions is likely to be "better" from a mobile source air toxics health risk standpoint than one that has higher emissions).

(Response 45 continues on next page)

Code	Comment Document

Code	Issue	Response
45 (cont.)		While the U.S. Environmental Protection Agency and the Federal Highway Administration both agree on the usefulness of addressing mobile source air toxics in National Environmental Policy Act documents for highway projects, the agencies disagree about the value of health risk assessment as a method for doing so. Another consideration with respect to health impacts is that the Preferred Alternative would also reduce in-vehicle mobile source air toxics exposure as opposed to the No Action Alternative. The U.S. Environmental Protection Agency has found that in-vehicle benzene concentrations were between 2.5 and 40 times higher than nearby ambient concentrations, based on a review of studies discussed in the Regulatory Impact Analysis for the U.S. Environmental Protection Agency's 2007 mobile source air toxics rule-making (Final Regulatory Impact Analysis, Environmental Protection Agency 420-R-07-002, 3-17 [February 2007]). Construction of the Preferred Alternative would result in a reduction in benzene exposure to drivers and passengers for two reasons: decreased travel times (motorists would spend less time in traffic to reach their destinations) and lower emissions rates (attributable to speed improvements). Reducing on-road exposure would provide a health benefit for motorists using the roadway network. Congestion relief resulting from the proposed freeway would provide localized air quality emissions reductions on area freeways and arterial streets and at interchanges, benefiting users of area highways and those living near congested roads. The Federal Highway Administration determined that a supplemental environmental impact statement is not required at this time because there were no changes to the proposed action that will result in significant environmental impacts not evaluated in the Draft Environmental Impact Statement nor is there new information relevant to environmental concerns and bearings on the proposed action or its impacts that will result in significant environmental impacts not evaluated in the Draft Environmental Impact Statement.

Maricopa County, Arizona, Joint Air Toxics Assessment Project (JATAP)

As a result of this project, will further data be collected, monitoring be conducted, or additional problem identification studies undertaken? Will refinements be made to modeling or exposure and/or toxicity assumptions?

(46)

If the project is complete, what recommendations were made to reduce risk and/or emissions or otherwise mitigate the impacts of the problems identified as a result of this project? *Examples of recommendations include: encouraging control of HAP from mobile sources, educating a community about the impacts of indoor air pollution, encouraging appropriate action to reduce diesel truck exhaust, and encouraging community involvement with State and EPA resources to reduce HAP emissions.*

If the project is complete, were reduction activity emissions or risk reductions calculated?

Are reduction factors being developed?

What are the expected reductions achieved by the individual activities?

Will the results of this project contribute to regulatory development, enforcement actions, or voluntary actions?

Code	Issue	Response
46	**Air Quality**	The Joint Air Toxics Assessment Project was funded by the U.S. Environmental Protection Agency; it would be the U.S. Environmental Protection Agency's decision whether to collect further data or studies related to the Joint Air Toxics Assessment Project. See: Phoenix, Arizona Air Toxics Assessment-Final Comprehensive Report (September 30, 2011)

Code	Comment Document
46	**Additional Comments:** **Are future projects/efforts planned or refined as a result of this project?** Together, these projects are building toward a much needed air toxics risk assessment for the Phoenix urban area. At this early stage, the project is oriented toward technical assessment work; as the work progresses, EPA should use the opportunity of providing grant funding to ensure that our priorities, including community involvement and early reduction programs, are addressed. **Are there any major uncertainties or cautions regarding the project process or findings?** **Are there any lessons learned that would benefit other projects?**
45	Focusing on: " *Examples of recommendations include: encouraging control of HAP from mobile sources, educating a community about the impacts of indoor air pollution, encouraging appropriate action to reduce diesel truck exhaust, and encouraging community involvement with State and EPA resources to reduce HAP emissions."* Controlling HAP from mobile sources and encouraging appropriate action to reduce diesel truck exhaust relate directly to the proposed South Mountain Freeway and Truck Bypass, as the only way to successfully accomplish that would be to not build the freeway. **It appears that ADOT, through its contractor, HDR, deliberately misrepresented the JATAP monitoring results and its recommendations from the DEIS precisely because it strongly supports the No Build conclusion for the Record of Decision of the NEPA process for the proposed freeway. There can be no other logical conclusion.** (This also explains the aforementioned lack of data and analysis of the impacts of the emissions from the high diesel fuel truck traffic from Mexico that would be driving along the South Mountain Freeway and Truck Bypass.)
47	***There are also Environmental Justice concerns raised by this. Chapter 4, page 9, the DEIS feigns concerns about environmental justice and notes that one of the "fundamental environmental justice principles [that] apply to the transportation project development process" is "to avoid, minimize, or mitigate disproportionately high and adverse human health and environmental effects, including social and economic effects, on minority populations and low-income populations." [http://azdot.gov/SouthMountainFreeway/PDF/south-mountain-loop-202-docs/EIS/chapter4/chapter4part1.pdf]***

Code	Issue	Response
47	**Environmental Justice and Title VI and Air Quality**	Summary information about the findings of the Joint Air Toxics Assessment Project study is provided as background information in the Draft and Final Environmental Impact Statements, but the study itself is not relevant to the type of analysis done pursuant to the Federal Highway Administration's mobile source air toxics guidance, which is an emissions analysis. Monitored ambient concentrations of mobile source air toxics (the focus of the Joint Air Toxics Assessment Project) do not inform this type of analysis. While monitoring data can be useful for defining current conditions in the affected environment (to the extent that the monitoring data are current), they don't tell us anything about future conditions, or the impacts of the project itself, which is why an emissions analysis was performed. The mobile source air toxic analysis presented beginning on page 4-77 of the Final Environmental Impact Statement is an estimated inventory of mobile source air toxic emissions for the entire Study Area for 2025 and 2035. This approach was used because the inventory estimate accounts for changes in traffic and emissions on all roadways affected by a proposed project, and would, therefore, be a more reliable predictor of changes in exposure to mobile source air toxics. The air quality assessment for the proposed freeway analyzed impacts from carbon monoxide and particulate matter (PM_{10}) and followed U.S. Environmental Protection Agency guidelines. The carbon monoxide and particulate matter (PM_{10}) analyses demonstrated that the proposed freeway would not contribute to any new localized violations, increase the frequency or severity of any existing violation, or delay timely attainment of the National Ambient Air Quality Standards or any required interim emissions reductions or other milestones. For mobile source air toxics, the analysis showed that for the Study Area, constructing the freeway would have a marginal effect on annual emissions in 2025 and 2035 (less than a 1 percent difference in total annual emissions between the Preferred Alternative and No-Action Alternative).With the Preferred Alternative in 2035, modeled mobile source air toxics emissions would decrease by 57 percent to more than 90 percent, depending on the pollutant, despite a 47 percent increase in vehicle miles traveled in the Study Area compared with 2012 conditions. The air quality analyses were updated for the Final Environmental Impact Statement, including a quantitative particulate matter (PM_{10}) analysis, and are more fully described beginning on page 4-68 of the Final Environmental Impact Statement. Congestion relief resulting from the proposed freeway would provide localized air quality emissions reductions on area freeways and arterial streets and at interchanges, benefiting users of area highways and those living near congested roads. The section entitled *Title VI and Environmental Justice*, beginning on page 4-29 in the Draft Environmental Impact Statement, presents acceptable methods, data, and assumptions to assess the potential for disproportionately high and adverse effects from the proposed action on environmental justice populations and disparate impacts to populations protected under Title VI. Based upon the content of the section, no such effects would result from the action alternatives. In light of comments received on the Draft Environmental Impact Statement, the above-referenced conclusions were confirmed in the preparation of the Final Environmental Impact Statement. To provide further clarity, the discussions of environmental justice and Title VI were separated and additional text explaining the relationship of environmental justice and Title VI to various environmental elements was added throughout Chapter 4, *Affected Environment*, *Environmental Consequences, and Mitigation*, as exemplified by the inserted text on page 4-29 of the Final Environmental Impact Statement.

Code	Comment Document
47	***Thus, the failure to properly analyze and/or address the air toxics information from the JATAP study is a deliberate violation of the very Environmental Justice issues that ADOT and FHWA claim to be observing.*** The conclusion is that ADOT and HDR would sacrifice human health and safety to accomplish their goal of building the South Mountain Freeway and Truck Bypass, and would rather see people on the GRIC suffer and die from cancer than simply conduct an honest and objective NEPA process. Again, that appears to be a premeditated violation of the civil rights of the GRIC residents near the St. Johns JATAP monitoring site.
48	**Other Air Toxics Point Sources Impacted by the South Mountain Freeway** On top of the MSATs, there are also local point sources of these air toxics. In particular, the petroleum tank farm complex at 51st Avenue and Van Buren to about 57th Avenue and Van Buren receives transmix from California through a pipeline. There, the transmix is "refined" into diesel fuel and gasoline at this Phoenix location, and these fuels are also loaded into tanker trucks from large storage tanks sited there. The new South Mountain Freeway would be an immediately adjacent truck bypass route towards Casa Grande and the new train complex near Red Rock/Picacho Peak. The DEIS never mentions this, but the extra air pollution from this potential truck traffic from the petroleum tank farm complex in Phoenix using the South Mountain Freeway heading south should be investigated, examined, and quantified, as well the extra air pollution caused by the new truck traffic and the "refining" of more transmix and off-gassing of air toxics from loading and unloading of trucks that would also occur. This would also increase the releases of air toxics into the air into the study area and impact background levels of these air toxics. It is already established that the area has air toxics hot spots. The impacts of the South Mountain Freeway on MSAT levels in the affected areas near the freeway should be examined as a cumulative impact, an indirect impact, and a direct impact with this in mind also.
49	**More Air Quality Issues: The Straw That Broke the Camel's Back** The portion of Maricopa County that is characterized as the Phoenix metro area has had problems for decades meeting the air quality standards for particulate matter (PM) and other criteria pollutants. (Ozone levels are too high in the East Valley and Fountain Hills, for example.) There have been several exceedances of the standards for PM set by EPA under the authorities given the agency by the Clean Air Act (CAA). The problem has been so bad over the years that every possible delay and postponement allowed under the CAA to come up with a plan to meet regulatory levels of particulate matter have now been exhausted. So, currently, EPA is examining sanctions that include blocking a billion dollars in highway funds.
50	Any exceedances of the particulate matter standards of the NAAQS could bring sanctions under the enforcement provisions of the Clean Air Act, including the loss of a billion dollars in highway funds.. This could cost a billion dollars to start with, starting even before the freeway is completed, caused by the construction of the freeway: blasting,

Code	Issue	Response
48	**Air Quality**	As explained on pages 4-69 and 4-77 of the Draft and Final Environmental Impact Statements, respectively, the emissions analysis conducted for the project shows that future mobile source air toxics emissions will be lower than current levels. This analysis included projected truck traffic.
49	**Air Quality**	Information on the attainment status of Maricopa County with the National Ambient Air Quality Standards begins on pages 4-59 and 4-68 of the Draft and Final Environmental Impact Statements, respectively. In May 2012, the Arizona Department of Environmental Quality submitted a revised Maricopa Association of Governments 2012 Five Percent Plan for the region. On July 20, 2012, the U.S. Environmental Protection Agency made an official finding that the Maricopa Association of Governments 2012 Five Percent Plan was administratively complete. This decision ended the sanctions clocks associated with Arizona's decision to withdraw the Maricopa Association of Governments 2007 Five Percent Plan. On February 6, 2014, the U.S. Environmental Protection Agency published a notice in the *Federal Register* proposing to approve the Maricopa Association of Governments *2012 Five Percent Plan for Attainment of the PM-10 Standard* for the Maricopa County Nonattainment Area. In the same notice, the U.S. Environmental Protection Agency stated that it would concur with exceptional event (as a result of haboobs and dust storms) documentation prepared by the Arizona Department of Environmental Quality, which would give the region the 3 years of clean data needed for attainment of the particulate matter (PM_{10}) 24-hour standard. Finally on May 30, 2014, the U.S. Environmental Protection Agency approved the 2012 Five Percent Plan and found the area in attainment of the 24-hour particulate matter (PM_{10}) standard based on monitoring data for the years 2010 to 2012 (see page 4-72 of the Final Environmental Impact Statement for more information). According to the air quality analyses conducted for the proposed freeway, no violations of either the carbon monoxide or particulate matter (PM_{10}) standards were identified, even at worst-case locations along the project corridor. Thus, the carbon monoxide and particulate analyses demonstrated that the proposed freeway would not contribute to any new localized violations, increase the frequency or severity of any existing violation or delay timely attainment of the National Ambient Air Quality Standards or any required interim emissions reductions or other milestones. Therefore, no loss of federal funds would occur.
50	**Air Quality**	40 Code of Federal Regulations § 93.111(c) was followed to conduct a qualitative analysis for particulate matter (PM_{10}) for the proposed action. This analysis complied with National Environmental Policy Act requirements for the development of the Draft Environmental Impact Statement. In December 2010, the U.S. Environmental Protection Agency established transportation conformity guidance for performing quantitative particulate matter ($PM_{2.5}$ and PM_{10}) hot-spot analyses for transportation projects and established a 2-year grace period. U.S. Environmental Protection Agency conformity guidance continues to allow qualitative particulate matter (PM_{10}) hot-spot conformity analyses for analyses that were started before or during the grace period and if the final environmental document for the project is issued no more than 3 years after issuance of the draft environmental document. A particulate matter (PM_{10}) qualitative analysis was performed for this project because the initial air

(Response 50 continues on next page)

Code	Comment Document
50	excavating, moving massive amounts of dirt, etc. Enough of the dust could disperse and drift along the Salt River bed for the mile or so to the 43rd Avenue and Broadway air monitor, which is the monitoring site where the vast majority of the particulate matter exceedances have been recorded. That could trigger an exceedance of the particulate matter standards, which could cost literally, the billion dollars in highway funds. This should be examined as a cumulative impact, an indirect impact, and a direct impact. And the sand and gravel industry (including cement and asphalt operations) in Maricopa County is poised to take sand and gravel from the Salt River bed in the path of the freeway and use it for the freeway's construction. This would be an economic bonanza for the sand and gravel industry, as the distance from excavation to its construction use would be very insignificant. The production of all the asphalt and cement for the freeway would contribute enormous amounts of PM. Several of these sand, gravel, cement, and asphalt plants are located in the same vicinity of the monitor at 43rd Avenue and Broadway. The cumulative effect could certainly trigger PM exceedances at the monitor at 43rd Avenue and Broadway. The DEIS never mentions this, but it should be analyzed and modeled. This should further be examined as a cumulative impact, an indirect impact, and a direct impact. And after the freeway is built, there would likely still be ongoing exceedances. Almost every one of these PM exceedances have been detected at the air quality monitor at 43rd Avenue and Broadway Road, and others have occurred along the Salt River bed in previous years. There were even higher levels recorded at the air monitor at 22nd Avenue and Lower Buckeye Road, but this was moved to 43rd Avenue and Broadway years ago. It was moved from the 22nd Avenue and Lower Buckeye Road because there was going to be significant amounts of dust and PM put into the air when the Rio Salado Habitat Restoration was being built, so much so that more exceedances would have occurred at the 22nd Avenue and Lower Buckeye Road monitor. Also, there was a sand and gravel operation at 19th Avenue and the Salt River bed that had excess emissions of PM that triggered a penalty for it from EPA, so the monitor location was moved to protect the polluter. These exceedances resulted in EPA requiring a special Salt River SIP for the Salt River bed to address the excess PM. In preparing the Salt River SIP, there was extensive air monitoring and modeling. Those models do not include any freeway emissions, but as noted on pages 9 and 10, Roads & Trackout as accounted for in this Salt River SIP do not include any new air pollution from the South Mountain Freeway and Truck Bypass. Roads & Trackout also could be as much as 63.7% of the PM in the air on a calm day. The addition of particulate matter pollution from this freeway would be considerable, that should be modeled at a minimum, and quantified, and the entire calculations for the Salt River SIP would have to be redone including this new data to determine if the models show exceedances of the PM standard could occur. That would support the No-Build Option. http://www.epa.gov/region9/air/phoenixpm/pdf/SaltRiver-tech-support.pdf 12

Code	Issue	Response
50 (cont.)		quality technical analysis report for the proposed action was produced in October 2005. The Arizona Department of Transportation and Federal Highway Administration have updated the qualitative analysis to a quantitative analysis for the Final Environmental Impact Statement to ensure that a state-of-the-art analysis is completed for the proposed project. The results of the analysis are summarized in the prologue to the Final Environmental Impact Statement (page xiii) and are more fully described beginning on page 4-68 of the Final Environmental Impact Statement. The carbon monoxide and particulate matter (PM_{10}) analyses demonstrated that the proposed freeway would not contribute to any new localized violations, increase the frequency or severity of any existing violation, or delay timely attainment of the National Ambient Air Quality Standards or any required interim emissions reductions or other milestones. Sand and gravel mining in the area is regulated by the Maricopa County Air Quality Department. The transportation conformity rule in 40 Code of Federal Regulations § 93.123(c)(5) states that hot-spot analyses are not required to consider construction-related activities that cause temporary increases in emissions. Temporary increases are defined as those that occur only during the construction phase and last 5 years or less at any individual site. Although the duration of the overall construction period of the entire 22- to 24-mile proposed action would be 5 to 6 years, according to page 3-60 of the Final Environmental Impact Statement, any particular portion of the Study Area would not see construction lasting for 5 to 6 years. Construction would be phased based on the factors appearing on page 3-59 of the Final Environmental Impact Statement. Any particular area of the project would not be expected to see construction activities beyond an approximate 2-year period; therefore, the construction effects described above would be temporary and would not require additional analysis. Secondary impacts to air quality are addressed in Table 4-54 on page 4-172 of the Final Environmental Impact Statement. Cumulative impacts to air quality are on page 4-179 of the Final Environmental Impact Statement.

Code	Comment Document
50	The placement of a freeway about a mile to a mile and a half **upwind** from a monitor that has had all these high levels seems foolish and short sighted. And of course, the impacts and risks of this are not even mentioned in the DEIS. This should be examined as a cumulative impact, an indirect impact, and a direct impact. The DEIS does not examine the dust that would be kicked up during the construction phase, when thousands of tons of dirt would be moved around upwind of the monitor. The proposed path of the South Mountain Freeway would take it over the Salt River bed. To construct the bridges would involve extensive earthmoving. Also, blasting South Mountain would also release enormous amounts of dust (PM), and the natural wind currents and prevailing wind patterns would push this PM toward the air monitor at 43rd Avenue and Broadway.
51	The South Mountain Freeway could therefore be **the most expensive freeway ever built.** Not only the construction costs, and the $20 million already spent on the bogus DEIS, but then there would be the loss of the billion dollars in highway funds. This is a gift that keeps on giving, or taking, as there would be subsequent billions lost through the years due to perennial PM exceedances.
52	**Increases in Particulate Matter Levels Correlate to Increased Mortality** In ***Fine Particulate Air Pollution and Mortality in 20 U.S. Cities, 1987–1994***, Jonathan M. Samet, M.D., Francesca Dominici, Ph.D., Frank C. Curriero, Ph.D., Ivan Coursac, M.S., and Scott L. Zeger, Ph.D., published in the New England Journal of Medicine in December 2000, [http://www.nejm.org/doi/full/10.1056/NEJM200012143432401] a direct correlation to increases in particulate matter in ambient air and death was determined. Phoenix and 19 other cities were studied, all with the same types of results. After taking into account potential confounding by other pollutants, the study found consistent evidence that the level of PM_{10} is associated with the rate of death from all causes and from cardiovascular and respiratory illnesses. The estimated increase in the relative rate of death from all causes was 0.51 percent (95 percent posterior interval, 0.07 to 0.93 percent) for each increase in the PM_{10} level of 10 µg per cubic meter. The estimated increase in the relative rate of death from cardiovascular and respiratory causes was 0.68 percent (95 percent posterior interval, 0.20 to 1.16 percent) for each increase in the PM_{10} level of 10 µg per cubic meter. Yet the DEIS never mentions this well-known data. The increases in particulate matter pollution that will be caused by the South Mountain Freeway should be modeled and included in the environmental impact analysis.
53	**Traffic Congestion Issues at West I-10 Junction Adds to PM Issues** The junction of the South Mountain Freeway on its west end with Interstate 10 may have been an idea conceived many years ago, but the traffic congestion that exists at the area between 59th and 51st Avenues on that freeway during morning and evening rush hours is already more than extreme. It is like a parking lot. Yet there is no mention in the DEIS

Code	Issue	Response
51	**Air Quality**	According to the air quality analyses conducted for the proposed freeway, no violations of either the carbon monoxide or particulate matter (PM_{10}) standards were identified, even at worst-case locations along the project corridor. Thus, the carbon monoxide and particulate analyses demonstrated that the proposed freeway would not contribute to any new localized violations, increase the frequency or severity of any existing violation or delay timely attainment of the National Ambient Air Quality Standards or any required interim emissions reductions or other milestones. Therefore, no loss of federal funds would occur.
52	**Air Quality**	The Arizona Department of Transportation conducted a quantitative particulate matter (PM_{10}) hot-spot analysis that is discussed on page 4-76 of the Final Environmental Impact Statement. The carbon monoxide and particulate matter (PM_{10}) analyses demonstrated that the proposed freeway would not contribute to any new localized violations, increase the frequency or severity of any existing violation, or delay timely attainment of the National Ambient Air Quality Standards or any required interim emissions reductions or other milestones.
53	**Traffic**	Construction of the proposed freeway would include widening along Interstate 10 to facilitate entrance and egress of vehicles between the two freeways. Additional information related to the Interstate 10 modifications can be found in Figure 3-26 on page 3-49 and Figure 3-29 on page 3-53 of the Final Environmental Impact Statement. The design of the connection to Interstate 10 and the widening along Interstate 10 were developed in accordance with the Federal Highway Administration's Interstate System Access Informational Guide and have received an initial determination of operational and engineering acceptability from the Federal Highway Administration. Detailed microsimulation models were developed for each of the action alternatives as well as for the No-Action Alternative. The results of the analysis concluded that the action alternatives would not have adverse impacts on the traffic operational characteristics along Interstate 10 and would provide as good or better performance as the No-Action Alternative. An assessment of future traffic conditions with and without the proposed freeway is presented in the Final Environmental Impact Statement beginning on page 3-27. The traffic conditions presented in these sections are consistent with the environmental impacts analysis for elements such as air quality and noise, and the results of those analyses can be found in the respective sections of Chapter 4 of the Final Environmental Impact Statement. The air and noise analyses were updated for the Final Environmental Impact Statement (see sections beginning on pages 4-68 and 4-88, respectively). It is important to note that no substantial differences between the analyses for the Draft and Final Environmental Impact Statements resulted from the update. Secondary impacts to air quality are addressed in Table 4-54 on page 4-172 of the Final Environmental Impact Statement. Cumulative impacts to air quality are on page 4-179 of the Final Environmental Impact Statement.

Code	Comment Document

of the cumulative impacts and effects of traffic congestion at that proposed junction, the effects on traffic flow in the vicinity of the interchange of the SMF and I-10 west. Without modeling that information, it cannot be determined if the freeway will cause more congestion or relieve it, but that step cannot wait until the design phase for that analysis because this step might/will show that the effects on traffic flow in the vicinity of the interchange of the SMF and I-10 west would be negative and traffic congestion worsened. This should be examined as a cumulative impact, an indirect impact, and a direct impact.

54

The overarching and consistent problem with the DEIS is that it utilizes such old and out-dated data from 2004-2007 for its analyses and conclusions that it is not viable or reliable. More recent data about traffic patterns, growth patterns, economic development patterns, etc. must be utilized to get correct projections to establish the need, if there even is one, for the freeway. There was an economic crisis in 2007 that caused major changes in the growth and economy of the Phoenix metropolitan area, and there has been some recovery, but many factors have changed substantially enough that the most up to date information has to be gathered and analyzed for the EIS.

55

A long line of vehicles sitting with engines idling while waiting to get on Interstate 10 at the junction with the SMF would also likely impact the air monitor at 43rd Avenue and Broadway. That could cost a billion dollars in sanctions more than once. What ADOT is doing is playing Russian Roulette with the highway money, with every day a potentially loaded with an air quality violation at the hot spot monitor at 43rd Avenue and Broadway. This should be examined as a cumulative impact, an indirect impact, and a direct impact.

56

There is much talk about the problems at the Broadway Curve, which is near the confluence of Highway 60, the 143, and Interstate 10. Let us be reminded that the Maricopa Association of Governments (MAG) and ADOT caused this problem through their shortsightedness and design problems. The planning of these agencies caused these traffic congestion nightmares. So now these same agencies, failed agencies, want to do this South Mountain Freeway. Will we be talking about the new junction in west Phoenix in the same way as the Broadway Curve? 100 trucks per hour and auto traffic trying to merge onto I-10 west during rush hour?

57

ADOT already completely ignored the recommendations of the original SMCAT, the group ADOT formed to skirt the proper NEPA scoping, in choosing the proposed alignment. The SMCAT, after months of study, had recommended that the SMF connect to the 101 on the west. So ADOT ignored even the recommendations of its own group and planned the SMF to connect with the I-10 at the currently proposed alignment.

This leaves a large question: If ADOT did that at that time long ago, what is to stop it from completely ignoring the current SMCAT should SMCAT vote for a "NO BUILD" option?

Code	Issue	Response
54	**Traffic**	The analyses in the Draft Environmental Impact Statement used socioeconomic and traffic projections at the regional analysis zone and traffic analysis zone levels. At the time of publication of the Draft Environmental Impact Statement, Census 2010-based socioeconomic data at the regional analysis zone and traffic analysis zone levels had not been adopted by the Maricopa Association of Governments and were not available to the project team. Therefore, the data used in the Draft Environmental Impact Statement were the most appropriate information available. The Maricopa Association of Governments approved new population, employment, housing, and traffic projections in June 2013. The new data are presented in the Final Environmental Impact Statement beginning on page 1-11. The purpose and need and analysis of alternatives were updated and reevaluated using these new socioeconomic projections and corresponding projections related to regional traffic. While new projections based on the 2010 Census showed a lower anticipated population and vehicle miles traveled in 2035 than the previous projections, the conclusions reached in the Draft Environmental Impact Statement were validated in the Final Environmental Impact Statement (see Chapter 3, *Alternatives*). The traffic analysis demonstrated that the proposed project is needed today and will continue to be needed into the future.
55	**Air Quality**	The Arizona Department of Transportation conducted a quantitative particulate matter (PM_{10}) hot-spot analysis that is discussed on page 4-76 of the Final Environmental Impact Statement. The carbon monoxide and particulate matter (PM_{10}) analyses demonstrated that the proposed freeway would not contribute to any new localized violations, increase the frequency or severity of any existing violation, or delay timely attainment of the National Ambient Air Quality Standards or any required interim emissions reductions or other milestones. Secondary impacts to air quality are addressed in Table 4-54 on page 4-172 of the Final Environmental Impact Statement. Cumulative impacts to air quality are on page 4-179 of the Final Environmental Impact Statement.
56	**Traffic**	Construction of the proposed freeway would include widening along Interstate 10 to facilitate entrance and egress of vehicles between the two freeways. Additional information related to the Interstate 10 modifications can be found in Figure 3-26 on page 3-49 and Figure 3-29 on page 3-53 of the Final Environmental Impact Statement. The design of the connection to Interstate 10 and the widening along Interstate 10 were developed in accordance with the Federal Highway Administration's Interstate System Access Informational Guide and have received an initial determination of operational and engineering acceptability from the Federal Highway Administration.
57	**Public Involvement**	The Arizona Department of Transportation conducted agency and public scoping process and has included agency and public input in the project development process. See Chapter 6 of the Final Environmental Impact Statement; agency scoping is presented beginning on page 6-2 and public involvement on page 6-6. The South Mountain Citizens Advisory Team and its engagement in the process was a part of the overall outreach program. The South Mountain Citizens Advisory Team's own bylaws are clear in its advisory and partial role in the outreach process. While the South Mountain Citizens Advisory Team recommended the W101 Alternative, all stakeholders' input was accounted for—including regional leaders, municipalities, members of the public, and members of the South Mountain Citizens Advisory Team—before identifying the W59 Alternative as the Preferred Alternative (see Final Environmental Impact Statement pages 3-65 and 3-68). The Final Environmental Impact Statement has detailed discussion regarding the relative merits and problems with the four action alternatives evaluated in the Western Section.

Code	Comment Document
58	**The following are comments related to impacts to hazardous materials:** **DEIS Ignores Risks from Hazardous Materials Transportation Incidents Due to the South Mountain Freeway and Truck Bypass; WQARF Site** The DEIS, starting on page 152, states, "AFFECTED ENVIRONMENT A hazardous materials evaluation for the construction and operation of the proposed freeway was conducted to determine whether: ➢ contaminated soils would be present near potential hazardous materials sites ➢ underground storage tanks would need removal or relocation because of freeway construction ➢ wells and dry wells would be present, providing unintended conduits for preexisting or accidental releases from the construction process to groundwater supplies ➢ during construction activities, workers could encounter soil contaminated with hazardous materials that had not previously been identified" It doesn't mention **at all** the transportation of hazardous materials on the new freeway and their associated risks, or the fact that the area where the freeway would connect with I-10 West crosses a site that was identified in the 1980s as contaminated and added to the list of the state of Arizona's Water Quality Assurance Revolving Fund (WQARF), which is the state's equivalent of a Superfund Site. The site has known groundwater contamination and soil contamination. **Risks from Hazardous Materials Transportation Incidents Due to the South Mountain Freeway and Truck Bypass** But the introduction of hazardous materials and their associated risks into Ahwatukee Foothills by the proposed South Mountain Freeway and Truck Bypass and its truck traffic would be significant. There are no industries using and emitting toxic chemicals in Ahwatukee Foothills that have reporting requirements under either the Toxics Release Inventory of the Emergency Planning and Community Right to Know Act (EPCRA) or the reporting of fixed facility hazardous materials (chemical) inventories required under the emergency planning provisions of EPCA. The latter, Tier Two chemical inventory reports, are annually required, and are reported to the fire department of jurisdiction (Phoenix Fire Department), the local emergency planning committee (Maricopa County LEPC), and the state emergency response commission (AZSERC). (The requirement for retail gas stations to file Tier Two reports was removed many years ago as long as these stations are in compliance with their reporting under the regulations for underground storage tanks.) 15

Code	Issue	Response
58	**Hazardous Materials**	Arizona highways, as are most highways across the United States, are open to all kinds of traffic, so long as the cargo being carried is in accordance with U.S. Department of Transportation regulations for the specific type of cargo. The Arizona Department of Transportation has a few locations in the state with hazardous cargo restrictions, but these restrictions are based on emergency response issues or roadway design limitations specific to that location. For example, the Interstate 10 Deck Park Tunnel has certain hazardous cargo transport restrictions because of the limited ability for emergency responders to address a hazardous materials incident in the tunnel. The South Mountain Freeway, if implemented, is expected to operate under the same rules as other similar facilities in the state; transport of hazardous cargo would be expected to be permissible (see text box on page 4-157 of the Final Environmental Impact Statement). The Arizona Department of Public Safety (which includes the State Highway Patrol) has primary responsibility for enforcing traffic laws. The Department of Public Safety also has primacy when calling in support for traffic accidents, including hazardous materials accidents (see text box on page 4-157 of the Final Environmental Impact Statement). The Arizona Department of Transportation maintains a list of contractors who provide emergency response services, as well as local municipalities whose fire and police departments operate in cooperation with the Department of Public Safety on incidents within their jurisdiction. Requirements for shippers are maintained by the Arizona Department of Transportation's Enforcement Compliance Division. The project team is aware of the Hazardous Materials Commodity Flow Studies that the Arizona State Emergency Response Commission maintains. These studies are used by emergency response planners (such as the Arizona State Emergency Response Commission statewide and the Maricopa County Local Emergency Planning Commission for Maricopa County) as one of the elements considered when developing Emergency Response Plans. If the plan is amended, it is made available to the Arizona Department of Transportation. In the event of an incident with a hazardous materials issue on a state or federal highway, the emergency responders contact the Arizona Department of Transportation's Traffic Operations Center to report the incident. The Traffic Operations Center then contacts the Arizona Department of Transportation's Safety and Risk Management group, who responds to the accident scene and assesses needs in concert with the Incident Commander from the responding agency with jurisdiction. If requested, the Arizona Department of Transportation can assist cleanup activities by engaging specialty subcontractors with whom the Arizona Department of Environmental Quality has contracts for such support. The Arizona Department of Transportation's Safety and Risk Management group's charge is primarily public health protection, with cleanup support being secondary.

(Response 58 continues on next page)

Code	Comment Document
58	The Maricopa County LEPC and the AZSERC are the two emergency planning agencies tasked with developing and updating a comprehensive emergency response plan for Maricopa County and the state of Arizona, respectively. The plan, by statute, requires: "Each emergency plan shall include (but is not limited to) each of the following: (1) Identification of facilities subject to the requirements of this subchapter that are within the emergency planning district, **identification of routes likely to be used for the transportation of substances on the list of extremely hazardous substances referred to in section 11002(a) of this title, and identification of additional facilities contributing or subjected to additional risk due to their proximity to facilities subject to the requirements of this subchapter, such as hospitals or natural gas facilities**. (2) **Methods and procedures to be followed by facility owners and operators and local emergency and medical personnel to respond to any release of such substances.** (3) Designation of a community emergency coordinator and facility emergency coordinators, who shall make determinations necessary to implement the plan. (4) **Procedures providing reliable, effective, and timely notification by the facility emergency coordinators and the community emergency coordinator to persons designated in the emergency plan, and to the public, that a release has occurred** (consistent with the emergency notification requirements of section 11004 of this title). (5) **Methods for determining the occurrence of a release, and the area or population likely to be affected by such release.** (6) A description of emergency equipment and facilities in the community and at each facility in the community subject to the requirements of this subchapter, and an identification of the persons responsible for such equipment and facilities. (7) **Evacuation plans, including provisions for a precautionary evacuation and alternative traffic routes.** (8) **Training programs, including schedules for training of local emergency response and medical personnel**. (9) Methods and schedules for exercising the emergency plan. Due to the unique nature of Ahwatukee Foothills, which is a residential area, and not zoned for heavy industrial uses, few hazardous materials transportation issues and risks exist there because none of these chemicals, other than gasoline and diesel, are being transported into the area, other than incidentally adjacent on Interstate 10, which is east of the area. A catastrophic release of hazardous chemicals along the I-10 corridor would have only an indirect effect on Ahwatukee Foothills. 16

Code	Issue	Response
58 (cont.)		The West Van Buren Water Quality Assurance Revolving Fund site was identified and considered during development of the Draft Environmental Impact Statement (see page 4-165 of the Final Environmental Impact Statement, and the Draft Initial Site Assessment prepared for the proposed project). These sites are primarily groundwater-impact sites, and groundwater is found at a depth of over 60 feet below the footprint of the Preferred Alternative. Given the separation distance between the adversely affected medium (groundwater) and the construction zone (near-surface in these locations), the project team determined that these sites would not pose a risk to construction or to the general public once the facility were completed. This assessment has been clarified in the Final Environmental Impact Statement on page 4-165. The efforts to address security concerns at the petroleum tank farm are discussed on page 3-24 of the Draft Environmental Impact Statement. These included numerous meetings with the Arizona Department of Homeland Security and others and included discussions of barriers to screen the facility from the traveling public and prevent attacks or crashes involving the facility. As noted in the Draft Environmental Impact Statement, these precautions were not necessary after the alignment was shifted from the W55 to the W59 Alternative. The road network in the Maricopa Association of Governments travel demand model includes the Interstate 8 and State Route 85 corridor. So, while the roads are not in the Study Area for the proposed action, traffic and trip distributions along the corridor are included in the traffic analysis for the proposed action. Any traffic that would shift from the Interstate 8 and State Route 85 corridor to the proposed action would be included in the vehicle mix considered in the analysis. A truck driver traveling from Tucson to Los Angeles and choosing to use Interstate 10 and the proposed freeway would travel 15 miles less than one choosing to use the designated truck bypass along Interstate 8 and State Route 85. Choosing to travel on the proposed action versus Interstate 8 and State Route 85 would not translate to any substantial travel-time benefits because the trip would require entering the Phoenix metropolitan area and be subject to potential delays and congestion. Therefore, it is expected that "true" through-truck traffic (not having to stop in the metropolitan area) would continue to use the faster, designated, and posted bypass system of Interstate 8 and State Route 85. The 2008 hazardous material report referenced in the comment was prepared to assist the Arizona Department of Transportation in refining its policies and process for determining hazardous materials routing in the state. It was a preliminary document and intended to form a basis of understanding about how other states' planning processes address this issue. The report was not intended to provide specific recommendations for hazardous materials routing, but rather to provide the Arizona Department of Transportation with information to consider in making possible adjustments to its planning process. The recommendations of the report have been taken under advisement by the Arizona Department of Transportation.

Code	Comment Document
58	To determine the additional risks of hazardous materials transportation, the Maricopa County LEPC and the AZSERC would also need and utilize hazardous materials commodity flow studies to determine the types and amounts of hazardous materials **being transported** through or within the county and/or state to meet their respective planning requirements. Of course, the AZSERC does exactly that periodically, and the data and emergency planning is updated. But that data and the relevant analysis is absent in the DEIS. The planning for response to an incident involving the release into the environment of a hazardous material involves using Aereal Locations of Hazardous Atmospheres (ALOHA), RMP*Comp, and Computer Aided Management of Emergency Operations (CAMEO). All are USEPA approved and provided emergency planning screening tools. RMP*Comp is used to predict the effects of a release that would exceed the ALOHA model limit of six miles. The worst case scenario release for chlorine was the only hazardous material being transported on the highways that, in the event of a catastrophic release, would exceed the six-mile ALOHA modeling limit, so RMP*Comp is used to assess the radius of impact for the worst-case chlorine release. ALOHA, RMP*Comp, and CAMEO are all distributed by the USEPA and are software programs provided and periodically updated by USEPA to determine the distance from a release point there would be a danger to human health and safety. ALOHA can also calculate the levels of a released chemical that could infiltrate nearby buildings, the levels of those chemicals that will likely be in these buildings, and the time it would take for the released chemical(s) to reach their maximum concentration. As stated in the reports of the various hazardous materials commodity flow studies conducted in Arizona, ALOHA modeling already indicates, "a catastrophic release of gasoline from a tanker truck could cause areas up to 1.0 mile away to be affected at LOC 3 (a concentration where the general population could experience severe health effects and death) and areas as far as 3.1 miles away to be affected at LOC 1 (enough to cause discomfort in the general population). Credible and catastrophic releases of sulfuric acid would create an evacuation radius of 0.5 miles from the highway and railroad." (LOC means level of concern; LOCs range from 3 down to 1.) The petroleum tank farm complex at 51st Avenue and Van Buren to about 57th Avenue and Van Buren receives transmix from California through a pipeline. There, the transmix is "refined" into diesel fuel and gasoline at this Phoenix location. The new South Mountain Freeway would be an immediately adjacent truck bypass route towards Casa Grande and the new train complex near Red Rock/Picacho Peak. The DEIS never mentions this, but the extra potential truck traffic from the petroleum tank farm complex in Phoenix using the South Mountain Freeway heading south should be investigated, examined, and quantified, and the additional risks of a hazardous materials transportation incident involving diesel or gasoline should be also investigated, examined, and quantified. This should be examined as a cumulative impact, an indirect impact, and a direct impact.

Code	Issue	Response

Code	Comment Document
58	Ahwatukee Foothills already has some emergency planning needs due to the transportation of gasoline into and within the area. There should already be planning for an incident involving gasoline within a mile of current arterial traffic, including Pecos Road. Schools within a mile of Pecos should have an evacuation plan. The proposed South Mountain Freeway and Truck Bypass would only add **exponentially** to emergency planning needs and risks as more truck traffic of this chemical and others that are potentially more dangerous in the event of a catastrophic release would be transported immediately adjacent to schools, parks, shopping areas, and other vulnerable facilities in Ahwatukee Foothills. **The freeway would be the sole source of these new risks from a hazardous materials incident, thus this would be a very significant impact directly caused by the freeway, and a full analysis of the risks and effects must be examined in the NEPA process.** The data and calculations of risk and distance from certain chemicals carried on the highways are documented in the July 9, 2009, report, *The Hazardous Materials Commodity Flow Study Report I-19 Corridor from I-10 to Mexico Border, Arterial Highways and Railways, Pima and Santa Cruz Counties, Arizona*; the October 30, 2006 report, *Hazardous Materials Commodity Flow Study Report I-8 and I-10 Corridors, Arterial Highways and Railways, Yuma, Maricopa, Pinal, Pima and Cochise Counties, Arizona*; and the December 5, 2008 *Hazardous Material Commodity Flow Study I-10 Corridor from SR 85 to California* prepared for the AZSERC. Previous commodity flow study reports would show the same sorts of information. One piece of data that is missing is the Hazardous Materials Commodity Flow Study Report for the I-8 to SR 85 to I-10 route that was selected as a truck bypass around 2006. (Part of the idea of this particular truck bypass was to route truck traffic away from the Phoenix metro area as a measure to reduce particulate matter air pollution.) This also is part of the CANAMEX highway system that has been approved via treaties with Mexico and Canada, and this truck bypass has now been officially designated as the route of the CANAMEX. "SR 85 is the official truck bypass route around metropolitan Phoenix and has also been designated as part of the official CANAMEX corridor through the North American Free Trade Agreement (NAFTA). In addition to the importance of this route to the trucking industry, this corridor also provides access from the western portion of metropolitan Phoenix to the cities of Yuma and San Diego." [http://www.azdot.gov/highways/valley_freeways/SR85/Access.asp] "SR 85 and B-8 form a corridor that provides a major north-south connection between Interstate 10 west of the metropolitan area of Phoenix and I-8. The project limits of this access management study stretch approximately 36 miles and include the entire length of SR 85 from Gila Bend to I-10 and a portion of B-8 that connects SR 85 with I-8 on the east side of the town of Gila Bend. The route traverses through lands owned by the Bureau of Land Management, trust lands that are administered by the Arizona State Land Department, Arizona Game and Fish land (Robbins Butte State Wildlife Area), Maricopa

Code	Issue	Response

Code	Comment Document
58	to withhold this data, analysis, and discussion, which normally are indeed utilized in DEISs and the NEPA process. Frankly, that HDR obviously knew all of this, and therefore likely so did ADOT, in light of the SPR 64 report to ADOT, the omission and exclusion of this data from the DEIS may be a criminal act of negligence and/or fraud, akin to not warning people that they are entering an area where above ground nuclear testing could happen at any minute. From the beginning of the NEPA process regarding the South Mountain Freeway and Truck Bypass, Ahwatukee Foothills residents and others have consistently and vociferously raised concerns about the added risks to their community from the transportation of hazardous materials on the new South Mountain Freeway and Truck Bypass, and in doing so they have consistently voiced concerns regarding the additional problems with hazardous materials response in the affected area, as well as evacuation and shelter in place issues. Frankly, there is also a risk from the consequences of a hazardous materials transportation incident to the communities on the north side of the pass at South Mountain, and Laveen would be at a particularly heightened risk also. Therefore, the same types of impacts that threaten Ahwatukee Foothills would apply to these other communities, but at least these others have alternate escape routes that the community of Ahwatukee Foothills does not have.
59	As of 2010, the 35.8 square-mile community of Ahwatukee Foothills has a population of 77,249. So if there is a catastrophic release from a 17-ton chlorine tanker along the Pecos Road alignment, almost all of these 77,249 would be at risk of death or severe injury. In Laveen, there are 35,502 residents who would be at a similar risk. There would also be risks to the residents of the Gila River Indian Community along the Pecos alignment. All of these above mentioned communities would be forever at risk of a very terrible, certain, and quick death from a chlorine release if this freeway gets built. All of these communities would have to be forever on hair trigger alert. They, as communities, would need periodic training and drills to protect them, as well as infrastructure in the form of siren systems and other alert systems, telephone ring down systems, and much more.
60	We know that over a hundred trucks per hour would be the number at the beginning of the freeway's opening, just from localized traffic information, but when the I-8 to SR 85 to I-10 truck bypass is negated, there will be much more truck traffic. That number can be quantified, and that is something the DEIS should have done with the millions of dollars already wasted on it. But HDR and ADOT skirt that by claiming in the DEIS that that information is not known and the impacts are unclear. That is patently absurd; that is precisely the sort of data that is quite available, and must be examined, studied, and analyzed.
61	Ahwatukee Foothills has its own unique layout and design, sometimes characterized as a large cul-de-sac, and in the event of a hazardous materials incident requiring shelter in place, or especially involving evacuation, there would be particular problems and risks. Due to the proximity of schools, parks, and other public facilities, as well as densely populated residential areas within areas of risk in the event of an incident involving the release into the environment of hazardous materials, there would have to be extensive

Code	Issue	Response
59	**Hazardous Materials**	The situation described in the comment, would be an indirect effect of the construction of a new freeway such as the proposed action. According to 40 Code of Federal Regulations 1508.8, indirect effects are caused by the action and are later in time or farther removed in distance, but are still reasonably foreseeable. Reasonably foreseeable actions are those that are likely to occur or probable, rather than those that are merely possible.
60	**Traffic**	The road network in the Maricopa Association of Governments travel demand model includes the Interstate 8 and State Route 85 corridor. So, while the roads are not in the Study Area for the proposed action, traffic and trip distributions along the corridor are included in the traffic analysis for the proposed action. Any traffic that would shift from the Interstate 8 and State Route 85 corridor to the proposed action would be included in the vehicle mix considered in the analysis. A truck driver traveling from Tucson to Los Angeles and choosing to use Interstate 10 and the proposed freeway would travel 15 miles less than one choosing to use the designated truck bypass along Interstate 8 and State Route 85. Choosing to travel on the proposed action versus Interstate 8 and State Route 85 would not translate to any substantial travel time benefits. Therefore, it is expected that "true" through-truck traffic (not having to stop in the metropolitan area) would continue to use the faster, designated, and posted bypass system of Interstate 8 and State Route 85.
61	**Hazardous Materials**	Arizona highways, as are most highways across the United States, are open to all kinds of traffic, so long as the cargo being carried is in accordance with U.S. Department of Transportation regulations for the specific type of cargo. The Arizona Department of Transportation has a few locations in the state with hazardous cargo restrictions, but these restrictions are based on emergency response issues or roadway design limitations specific to that location. For example, the Interstate 10 Deck Park Tunnel has certain hazardous cargo transport restrictions because of the limited ability for emergency responders to address a hazardous materials incident in the tunnel. The South Mountain Freeway, if implemented, is expected to operate under the same rules as other similar facilities in the state; transport of hazardous cargo would be expected to be permissible (see text box on page 4-157 of the Final Environmental Impact Statement). The Arizona Department of Public Safety (which includes the State Highway Patrol) has primary responsibility for enforcing traffic laws. The Department of Public Safety also has primacy when calling in support for traffic accidents, including hazardous materials accidents (see text box on page 4-157 of the Final Environmental Impact Statement). The Arizona Department of Transportation maintains a list of contractors who provide emergency response services, as well as local municipalities whose fire and police departments operate in cooperation with the Department of Public Safety on incidents within their jurisdiction. Requirements for shippers are maintained by the Arizona Department of Transportation's Enforcement Compliance Division.

(Response 61 continues on next page)

Code	Comment Document
	planning and drills for shelter in place and evacuation, an assessment of the types and amounts of hazardous materials traffic and the chemicals involved, and much more. Siren systems and appropriate training and drills would have to be instituted to mitigate the additional risks.
62	In addition to this, the fact that the proposed freeway would eliminate the exits from the community at 32nd Street and Pecos would only exacerbate an already difficult position that this community would be in if there were an evacuation or the need for a response to a catastrophic hazardous materials incident. Regular traffic is already voluminous at that intersection: • Pecos (west approach) - Total 22,313 veh/day (2012 count) including 11,727 westbound and 10,586 eastbound volumes. • Pecos (east approach) - Total 28,178 veh/day (2012 count) including 14,331 westbound and 13,847 eastbound volumes • 32nd Street (north approach) - Total 7,807 veh/day (2011 count) including 3,761 northbound and 4,406 southbound volumes. With that access to Pecos Road being removed by the freeway, all of that traffic would have to find another way out and further clog and congest other exit routes. Yet there is no mention or analysis of these issues in the DEIS.
63	What the DEIS fails to mention and analyze about the risks from a catastrophic release of hazardous chemicals due to a transportation incident MUST be fully reviewed and analyzed in the EIS. In the matter of evacuation of Ahwatukee Foothills, the GRIC community near the freeway, and Laveen, a detailed traffic flow analysis and evacuation plan utilizing street maps of Ahwatukee Foothills must be prepared to determine if it is feasible at all, especially in the case of Ahwatukee Foothills. **If the analysis shows that the community of Ahwatukee cannot be evacuated within 5-10 minutes, then the No Build option is the only logical and humane result.** The caveat of evacuation within 5-10 minutes is due to the very real threat to the community due to a catastrophic release of chlorine gas from a 17-ton tanker truck during a transportation incident.
	The October 30, 2006 report, *Hazardous Materials Commodity Flow Study Report I-8 and I-10 Corridors, Arterial Highways and Railways, Yuma, Maricopa, Pinal, Pima and Cochise Counties, Arizona*, also mentions the risk from a release of **chlorine gas** and the risks of a catastrophic release during a transportation incident. As stated, RMP*Comp is an USEPA approved emergency planning screening tool used when ALOHA predicts the effects of a release would exceed the ALOHA model limit of six miles. The worst case scenario release for chlorine was the only material to exceed the six-mile ALOHA limit.
	Since Ahwatukee Foothills is not six miles wide from Pecos Road to South Mountain, it is easy to conclude that, in the event of a catastrophic release of chlorine from a 17-ton tanker of chlorine gas, **all of Ahwatukee Foothills** would have to either evacuate or shelter in place. Further, an ALOHA modeling indicates that buildings within two miles of the point where the chlorine release occurred would have high enough levels of chlorine gas infiltrate into them to become lethal, which means that shelter in place strategies would not work. The only option would be evacuation, but as chlorine gas

Code	Issue	Response
61 (cont.)		In the event of an incident with a hazardous materials issue on a state or federal highway, the emergency responders contact the Arizona Department of Transportation's Traffic Operations Center to report the incident. The Traffic Operations Center then contacts the Arizona Department of Transportation's Safety and Risk Management group, who responds to the accident scene and assesses needs in concert with the Incident Commander from the responding agency with jurisdiction. If requested, the Arizona Department of Transportation can assist cleanup activities by engaging specialty subcontractors with whom the Arizona Department of Environmental Quality has contracts for such support. The Arizona Department of Transportation's Safety and Risk Management group's charge is primarily public health protection, with cleanup support being secondary
62	**Traffic**	The determination to not include an interchange at 32nd Street was made in coordination with the City of Phoenix (see Figure 3-8 on page 3-15 of the Draft Environmental Impact Statement). The interchange was eliminated based on undesirable residential displacements and cost. In 2006, the City of Phoenix conducted a traffic circulation study to evaluate the impacts of the proposed freeway on the local street system, including the shift of access to Foothills Reserve and Calabrea from Pecos Road to Chandler Boulevard. The City study found no adverse effects on the local street system from the freeway (see Appendix 3-1 in the Final Environmental Impact Statement). In the event of an incident with a hazardous materials issue on a state or federal highway, the emergency responders contact the Arizona Department of Transportation's Traffic Operations Center to report the incident. The Traffic Operations Center then contacts the Arizona Department of Transportation's Safety and Risk Management group, who responds to the accident scene and assesses needs in concert with the Incident Commander from the responding agency with jurisdiction. If requested, the Arizona Department of Transportation can assist cleanup activities by engaging specialty subcontractors with whom the Arizona Department of Environmental Quality has contracts for such support. The Arizona Department of Transportation's Safety and Risk Management group's charge is primarily public health protection, with cleanup support being secondary.
63	**Hazardous Materials**	There are no requirements in 23 Code of Federal Regulations 771 Environmental Impact and Related Procedures or in the Federal Highway Administration Technical Advisory T 6640.8A Guidance for Preparing and Processing Environmental and Section 4(f) Documents to address releases of hazardous chemicals due to a transportation incident in National Environmental Policy Act documents for transportation projects like the proposed action. As discussed above, reasonably foreseeable actions are those that are likely to occur or probable, rather than those that are merely possible. If the proposed action is the Selected Alternative in a record of decision, planning for emergency situations would be initiated. If the plan is amended, it is made available to the Arizona Department of Transportation.

Code	Comment Document
63	flows rapidly at ground level because it is heavier than air, it is unlikely that people would survive long enough to evacuate. Depending on the size of the hole or the rupture of the tanker of chlorine, the tanker could completely empty in a minute or so. And these chlorine truck tankers are quite vulnerable to bullets and other physical trauma. For an objective examination of issues related to a catastrophic release from a chlorine tanker truck, see *Mathematical Modeling and Decision Analysis for Terrorism Defense: Assessing Chlorine Truck Attack Consequence and Countermeasure Cost Effectiveness,* Anthony Michael Barrett. It notes: "Adapting our modeling system to ruptures emptying a tank via flashing two-phase flow through an orifice [80], forming horizontal jets, indicates that such releases could result in approximately the same number of fatalities as an instantaneous release, if such a release takes 10 minutes or less. " page 42 "People in vehicles may be as well off staying where they are, turning off the air-supply fan and sealing the vents, as heading into a nearby building. It may also be dangerous for them to try to drive away, since they may unintentionally drive into higher-concentration areas." "Without fast and effective defense response, release of 17 tons of chlorine from a tank truck in a generic urban area with 2.5 m/s wind and Pasquill stability class F, could result in approximately 4000 (half within ~10 minutes) to 30,000 fatalities (half within ~20 minutes), depending on dose-response model." " Rapid release of the entire cargo of 17 tons of chlorine from one tank truck could result in the formation of a toxic cloud stretching over tens of city blocks within a few minutes. Predicted fatalities are strongly sensitive to wind speed, atmospheric stability class, amount of chlorine released, and dose-response model parameters. Without defensive response, under highest-fatality weather conditions, using the Withers and Lees dose-response model, we estimate approximately 8000 fatal exposures, with 50% occurring within 15 minutes. With other dose-response models, under the same weather conditions, no-defense-response fatality estimates range from approximately 4000 to approximately 30,000 fatalities. Total fatalities under median-fatality weather conditions are approximately 10-20% of total fatalities under highest-fatality weather conditions, depending on dose-response model." "If chlorine is released outdoors, exposure risk is much higher for people outdoors than indoors. We assumed that people in the area were 7% outdoors and 93% indoors, but the fraction of estimated fatalities that are people outdoors in the no-response case, under highest-fatality weather conditions, ranges from 60-90%. Most fatalities indoors are people on the first few floors, so it greatly can reduce hazard for those indoors if air intakes are at roof level instead of on each floor. Changes in mass of chlorine released result in roughly proportional increases in outdoor fatalities, though disproportionately high increases in indoor fatalities, probably because larger-mass releases lead to larger

Code	Issue	Response

Code	Comment Document
61	and longer-lasting clouds. Changes in some parameters, such as indoor and outdoor population densities, would produce proportional changes in fatality estimates in the no-defense-response case. If implemented quickly and widely enough, rapid public responses such as sheltering-in-place and evacuation could significantly reduce fatalities from a chlorine attack. However, practical response times may be significantly longer, with the result that the reduction in mortality would be small. Under highest-fatality weather conditions, with the Withers and Lees dose-response model, to achieve a 50% reduction in fatalities for people outdoors at the time of attack by taking shelter in nearby buildings, people would need to move indoors approximately ten minutes after a chlorine release. However, estimated delays from chlorine exposure effectively add four to seven minutes to ingress time, increasing fatalities by ~1000. To achieve a 50% reduction in fatalities for people indoors at the time of the attack, building air intakes would need to be shut approximately two to six minutes after the attack depending on building air exchange rates before and after shutdown, though later 45 shutdowns can increase fatalities by trapping poison inside. To achieve a 50% reduction in estimated outdoor fatalities, evacuation crosswind at 50 m/min would need to begin after approximately 12 minutes if chlorine exposure does not cause movement delays. Achieving a 50% reduction in estimated outdoor fatalities with only a security perimeter would require a distance between the chlorine release and people outdoors of approximately 1200 m. For mitigation measure cases, trends in sensitivities to weather conditions and dose-response model are generally similar to those for no-defense-response cases. Fatality estimates for the models and scenario we consider in this chapter are much higher than the numbers of fatalities in the 2006-2007 chlorine attacks in Iraq. When our estimates are adjusted to correspond to the conditions in those attacks, as estimated from publicly available information, we obtain fatality predictions roughly similar to, but often higher than, the numbers actually seen in Iraq. We expect that our models and assumptions are biased towards overestimating fatalities. We suggest readers use caution in applying our results, and place less importance on specific values of our model predictions than on trends in those prediction (pages 44-46) [http://research.create.usc.edu/cgi/viewcontent.cgi?article=1010&context=nonpublished_reports] Chlorine gas in even small concentrations is harmful. A person encountering chlorine gas will have a hard time seeing as the chlorine reacts with the moisture in the eye to create hydrochloric acid. The eyes will tear up and make seeing very difficult. At high enough levels, severe scarring and blindness will result. The same formation of hydrochloric acid will occur in the throat and lungs. People won't be able to take a deep breath or breathe without choking, as mucous membranes in the respiratory system will be quite irritated and will start to weep. Lungs will blister, and the ability to pass oxygen to the blood through the lung membranes will be compromised

Code	Issue	Response

Code	Comment Document

63 immediately. Walking, much less running, will be very difficult. A half blinded, gasping person who cannot take a deep breath is not going to be a match for a cloud of chlorine, and any evacuation, or rescue on any scale, after the arrival of the chlorine gas will be virtually impossible. Handicapped and elderly people, as well as children, would be at a particular disadvantage. People outside would have no place to go to for sheltering in place. Shelter in place strategies, i.e. having people shelter in a building, stop ventilation systems, and block up and seal all air flow, will have to be successful before the chlorine gas arrives. Otherwise, those sheltering will bottle themselves up with a harmful gas.

ALOHA modeling indicates that certainly all buildings within a mile of the chlorine release from a 17-ton tanker truck would have such high levels of chlorine gas infiltrate into them that most people there would die, or be very severely injured. Some models put that circle of assured death at closer to two miles away. There are schools and residential areas on the north side of the Pecos Road alignment within a mile of the proposed South Mountain Freeway and Truck Bypass, and many more within two miles of the freeway alignment. There would be thousands of people at an extreme risk.

64 The prevailing winds push across GRIC land toward the north, toward South Mountain, and also to the west through the 51st Avenue pass. Chlorine fumes from an incident on the Pecos Road alignment will certainly be most likely to blow the cloud into all of Ahwatukee Foothills, then on to the GRIC at 51st Avenue, then into Laveen.

63 ALOHA modeling has a six mile limit to its calculation, but in this case, that limit is more than Ahwatukee Foothills is wide, north to south. All 77,000+ people there would be at a severe risk with no way out.

64 There is a pass at 51st Avenue where the proposed truck bypass/freeway is planned. The prevailing winds do push through this from the south, mostly, and there is a westerly breeze that eventually pushes the air from Ahwatukee Foothills to and through that pass. After the chlorine cloud takes out Ahwatukee Foothills, it will drift through the pass, killing and harming any people on the GRIC in its path who have not evacuated or sheltered already. Then it would seep towards Laveen, where it would also wreak havoc. Laveen residents have many options to evacuate, roads east and west, but there is still lack of easy travel there. The time before the chlorine cloud got there might give Laveen area residents and visitors more time, and the dissipation of the chlorine by the time it reached that distance from the source, several miles, could better enable shelter in place strategies.

63 However, if the chlorine incident happened at the 51st Avenue pass and/or Laveen, the one to two mile kill zone and six+ miles of harm would apply there with just a few minutes to take appropriate action to evacuate or shelter in place.

All these communities would be forever just minutes from annihilation. All these communities would need extensive education and drills, special planning, and additional resources, such as telephone ring down systems, siren and flashing light warning systems, and other notification strategies.

Code	Issue	Response
64	**Air Quality**	According to the Arizona Department of Transportation, 2013, *Air Quality Assessment South Mountain Freeway 202L Draft Report*, review of wind data from the Gila River Indian Community monitoring site at St. Johns suggests that during the morning hours and associated with mountain-drainage air flows and stable atmospheric conditions, wind flows are from the southeast and follow the Gila River channel to the north. Locations to the east of St. Johns experience flow from the east to the lower elevations along the Gila River. During the warmer hours' improved mixing, flows typically follow the river channel and come from the north and northwest. Likewise, during a 1-month-long meteorological monitoring period (November 20, 2006 through December 21, 2006) at Pecos Road and 40th Street and a second 1-month-long monitoring period at Pecos Road and 24th and 40th streets (April 19, 2007 through May 21, 2007), winds during the morning hours typically were from the northeast. During the warmer hours, and with improved mixing, winds typically were from the west.

Code	Comment Document

(63)

There is the additional problem of handling the people outdoors at parks, bicycling, hiking, shopping, and other activities if such an incident occurred. Strategies would have to be determined well in advance. Law enforcement personnel and emergency responders would need to be trained, drilled, equipped properly, and otherwise prepared for this scenario. If the 17-ton tanker of chlorine empties in minutes, there won't be much the emergency responders can do to stop the leak, but patch kits are available for that purpose. A rupture or hole may be too large to patch, and that size of opening would vent all the chlorine anyway by the time any responders arrived. With such limited freeway access and egress, that becomes a response hindrance also.

(65)

One responder strategy would be to try to "knock down" the cloud of chlorine with water. To prepare for that, the freeway would have to have a hydrant system with enormous amounts of water and water pressure, as no fire truck would have enough water to last very long. All that water and chlorine would make plenty of hydrochloric acid. The hydrochloric acid would eat away and decay the responding vehicles and equipment, the concrete on the freeway, its culverts, degrade the asphalt pavement, and ruin any metal cables and metal where the acid solution washed to. The freeway would have to be designed so that such an incident would not also destroy it.

(63)

There would also be residual effects. The January 2005 chlorine disaster in Graniteville, South Carolina illustrates some of these. Following the chlorine disaster, Avondale Mills (textile company) officials had spent more than $140 million on cleaning, repairs and damage mitigation from the textile mills machinery that was corroded so severely by the chlorine gas that it had to be replaced, only to find that new equipment brought to the plant quickly corroded because chlorine was still present and reacting with other agents.

That the corrosive effects of the chlorine from such a large release would last so long needs to be taken into account into assessing the costs associated with such an incident. The chlorine reacted with moisture to form hydrochloric acid, but even after time, one would expect that this would diminish. In assessing the damages from a large-scale chlorine release, emergency responders and emergency planning agencies should look for this lasting effect. The corrosive effects could harm pavement, concrete, industrial infrastructure, and even residential structures and the electrical wiring. A much more detailed decontamination, including pH samplings, should be undertaken in the recovery phase of operations to prevent such devastation.

Chlorine gas also has other effects on the infrastructure and electronics. The dryness of the Phoenix area might somewhat mitigate the tendency of airborne chlorine gas to form hydrochloric acid with moisture, but the chlorine and the moisture in the air form weak acids that can affect cell phones, car ignitions, and a host of other devices. Arizona has a moist season, monsoon in the summer, and it has normal rainfall events, and if there is sufficient moisture in the air, hydrochloric acid will form. Dry acid deposition from a chlorine disaster would also be a lingering source of problems.

Code	Issue	Response
65	**Hazardous Materials**	According to the Arizona Department of Transportation's 2012 Roadway Design Guide, "Within the highway design philosophy and the Arizona Department of Transportation project team approach to project development, the roadway designer has the responsibility to contribute the most desirable design parameters consistent with safety, service, environment, and cost effectiveness and to apply these parameters with sound engineering judgment." In general, to limit costs but still protect public safety, roads are not designed for the worst possible incident, but they are designed to accommodate most foreseeable incidents with moderate damage. This is similar to the National Environmental Policy Act's direction that an environmental impact statement must discuss reasonably foreseeable actions. These are actions that are likely to occur or probable, rather than those that are merely possible.

Code	Comment Document

66

NEPA requires examination of cultural, social, and economic impacts, and the new hazardous materials traffic and risks caused by the South Mountain Freeway and Truck Bypass would certainly affect all of these topic areas.

67

Despite all of this, there is nothing in the DEIS that even mentions the hazardous materials transportation and risks issue! This raises many issues, from the $20+ million spent on this deficient study, to the scoping for the DEIS that was designed to restrict citizen input rather than allowing and encouraging it, to the blatant ignoring of actual, well documented statements of these concerns about the risks from hazardous materials transportation incidents by citizens participating in this particular NEPA process.

But it is evident that ADOT knew that there would be hazardous materials being transported on this proposed highway. A tunnel through South Mountain was rejected as an option by ADOT because that would prevent placarded traffic (traffic with hazardous materials) from traveling on the freeway. [Chapter five, page 20. "The inclusion of a tunnel could result in hazardous materials restrictions along the entire proposed action. Therefore, hazardous cargo carriers would have to continue to use existing routes."]

DEIS Ignores WQARF Site

Hazardous Materials has been mostly limited in the DEIS to a discussion of hazardous materials that might be encountered in the soils during construction. Yet, despite this alleged concern, the fact that the proposed path of the freeway crosses contaminated property near Interstate 10 near 55th Avenue is neither mentioned nor examined, much less the financial liability the taxpayers might be assuming by purchasing the contaminated property. That would certainly be an enormous economic impact. Since the 1980s, there has been well-documented groundwater contamination in the area around 51st avenue and Van Buren to 59th Avenue and Van Buren, enough so that it was added to the list of the state of Arizona's Water Quality Assurance Revolving Fund (WQARF), which is the state's equivalent of a Superfund Site.

From: http://www.azdeq.gov/environ/waste/sps/download/phoenix/wvb.pdf

"Site History:
1987: The November 13 Decision Record created the Van Buren Tank Farm WQARF area. The amended decision record dated December 11 changed the name to the West Van Buren Area."

"The West Van Buren WQARF (site) is located in the western portion of Phoenix, Arizona. The site is bounded approximately by Interstate 10 to the north, 7th Avenue to the east, Buckeye Road to the south and 75th Avenue to the west. In addition, a finger shaped plume exists between 7th Avenue and 27th Avenue between Buckeye Road and Lower Buckeye Road."

Code	Issue	Response
66	**Hazardous Materials**	According to 46 *Federal Register* 18026 (March 23, 1981), the environmental impact statement must discuss reasonably foreseeable actions. These are actions that are likely to occur or probable, rather than those that are merely possible. Arizona highways, as are most highways across the United States, are open to all kinds of traffic, so long as the cargo being carried is in accordance with U.S. Department of Transportation regulations for the specific type of cargo. The Arizona Department of Transportation has a few locations in the state with hazardous cargo restrictions, but these restrictions are based on emergency response issues or roadway design limitations specific to that location. For example, the Interstate 10 Deck Park Tunnel has certain hazardous cargo transport restrictions because of the limited ability for emergency responders to address a hazardous materials incident in the tunnel. The South Mountain Freeway, if implemented, is expected to operate under the same rules as other similar facilities in the state; transport of hazardous cargo would be expected to be permissible (see text box on page 4-157 of the Final Environmental Impact Statement).
67	**Hazardous Materials**	If the proposed action is the Selected Alternative in the record of decision, planning for emergency situations would be initiated. If the plan is amended, it is made available to the Arizona Department of Transportation. Hazardous materials transport is described on page 4-157 of the Final Environmental Impact Statement. Arizona highways, as are most highways across the United States, are open to all kinds of traffic, so long as the cargo being carried is in accordance with U.S. Department of Transportation regulations for the specific type of cargo. The Arizona Department of Transportation has a few locations in the state with hazardous cargo restrictions, but these restrictions are based on emergency response issues or roadway design limitations specific to that location. For example, the Interstate 10 Deck Park Tunnel has certain hazardous cargo transport restrictions because of the limited ability for emergency responders to address a hazardous materials incident in the tunnel. The South Mountain Freeway, if implemented, is expected to operate under the same rules as other similar facilities in the state; transport of hazardous cargo would be expected to be permissible (see text box on page 4-157 of the Final Environmental Impact Statement).
	Public Involvement	The effort represents the Arizona Department of Transportation's most extensive public involvement program undertaken in the Phoenix area leading up to publication of the Draft Environmental Impact Statement in April 2013. Examples, such as holding over 200 presentations were made to neighborhood groups, homeowners' associations, chambers of commerce, village planning committees, trade associations, and other interested parties, can be found in text beginning on page 6-6 of the Final Environmental Impact Statement. The purposes of the outreach were in accordance with requirements established under the National Environmental Policy Act and include: obtain public input to assist in developing a well planned, researched, and defensible environmental impact statement for the proposed action; provide ongoing information on the study and obtain input from the primary stakeholders and broader public; identify key issues and concerns of the public and ensure that these are appropriately considered during the process; develop and implement a process that maintains open and continuing communications among the public, Arizona Department of Transportation, Federal Highway Administration, and the project team; and use multiple communication tools to effectively engage all population segments, thereby ensuring equal access to the environmental impact statement process.

Code	Issue	Response
68	**Hazardous Materials**	As disclosed on page 4-157 of the Final Environmental Impact Statement, the Arizona Department of Transportation has a few locations in the state with hazardous cargo restrictions, but these restrictions are based on emergency response issues or roadway design limitations specific to that location. For example, the Interstate 10 Deck Park Tunnel has certain hazardous cargo transport restrictions because of the limited ability for emergency responders to address a hazardous materials incident in the tunnel. The comment infers the only reason for elimination of tunnels as a reasonable option was due to the potential to restrict hazardous materials transport. On the referenced page of the Draft Environmental Impact Statement, there are seven other reasons associated with design, operational, maintenance, costs and impacts cited for the elimination of the tunnels as a reasonable option. Arizona highways, as are most highways across the United States, are open to all kinds of traffic, so long as the cargo being carried is in accordance with U.S. Department of Transportation regulations for the specific type of cargo. The South Mountain Freeway, if implemented, is expected to operate under the same rules as other similar facilities in the state; transport of hazardous cargo would be expected to be permissible.
69	**Hazardous Materials**	Analysis of hazardous materials followed state-of-the-practice methods as reviewed by the U.S. Environmental Protection Agency and as used in a multitude of environmental studies for transportation projects across the country. Methods and results are presented on page 4-152 of the Draft Environmental Impact Statement. In summary, during the environmental impact statement process, properties potentially having hazardous waste on site are identified. These sites are considered during the corridor selection process and are ranked according to the likelihood of further assessment or potential cleanup activities being needed. The risk ranking method is used to inform the design team about which properties would likely need further assessment during the property acquisition phase of the project if an action alternative were to become the Selected Alternative. No sites were identified as "high risk." Some sites were identified as "high priority." High-priority sites are those with high potential for releasing hazardous materials to the soil or groundwater, or those that have a recorded release issue. Examples of high-priority sites include current service stations, bulk fueling terminals, sites listed in the environmental database, or a known release that has not been remediated. (See page 4-152 of the Draft Environmental Impact Statement.) The corridor analysis revealed sites that would need further assessment during the property acquisition phase of the project, if an action alternative were to become the Selected Alternative. The Arizona Department of Transportation employs a phased approach to site assessment that allows time for cleanup of any sites found to have hazardous waste issues. The project team concluded from the level of analysis conducted during the environmental impact statement process that the types of sites likely to be acquired contain common hazardous waste issues like underground storage tanks, asbestos and lead paint in buildings, and other commonly found issues (see page 4-153 of the Draft Environmental Impact Statement). The Arizona Department of Transportation maintains a process for addressing these issues in accordance with all applicable environmental laws and regulations.

(Response 69 continues on next page)

Code	Comment Document
69	The current contaminants of concern in groundwater include tetrachloroethene (PCE),trichloroethene (TCE), 1,1-dichloroethane (1,1-DCA), cis-1,2-dichloroethene (cis-1,2-DCE), 1,1-dichloroethene(1,1-DCE) and chromium. Contaminants of concern at the site may change as new data become available." By purchasing this contaminated land for the freeway, the state of Arizona would assume the liability for the clean up of these contaminants, along with the liability for adverse health impacts suffered by workers in the area. This would be an enormous economic impact. This is a type of corporate welfare, as it would remove the liability costs from the various polluters and current property owners that have ground and groundwater pollution issues and transfer it to the people of Arizona. This would be a huge economic impact. This should be examined as a cumulative impact, an indirect impact, a direct impact, and an economic impact.
70	There are other issues and other data not included in the DEIS that relate to truck traffic and hazardous materials. What would be the effect on traffic flow and congestion in the event of a hazardous materials incident of any type or volume?
	The following are comments related to impacts to environmental justice:
	The DEIS section titled TITLE VI AND ENVIRONMENTAL JUSTICE [Section 4(f) Evaluation Chapter 4 Affected Environment, Environmental Consequences, and Mitigation 4-29] starts with: "The U.S. Environmental Protection Agency (EPA) and FHWA define environmental justice as "fair treatment for people of all races, cultures, and incomes, regarding the development of environmental laws, regulations, and policies." Environmental justice principles and procedures are followed to improve all levels of transportation decision making. Title VI prohibits discrimination on the basis of race, color, or national origin. The 1994 Executive Order12898 on environmental justice addresses minority and low-income populations. The rights of women, the elderly, and the disabled are protected under related statutes. This Presidential Executive Order and other related statutes fall under the umbrella of Title VI. The U.S. Department of Transportation Order 5610.2(a) requires that environmental justice principles be considered in all the Department's programs, policies, and activities. Three fundamental environmental justice principles apply to the transportation project development process: ➢ to avoid, minimize, or mitigate disproportionately high and adverse human health and environmental effects, including social and economic effects, on minority populations and low-income populations ➢ to ensure the full and fair participation by all potentially affected communities in the transportation decision-making process ➢ to prevent the denial of, reduction in, or significant delay in the receipt of benefits by minority and low-income populations." Then the section goes on to identify some of the low-income and minority communities that would be affected, but it ignores all of the adverse, disproportionate impacts on them.
71	

Code	Issue	Response
69 (cont.)		The construction contractor would be required to comply with a host of regulations that protect the environment from undue impacts, including those from hazardous materials. Examples are the support yards or staging areas that are temporarily used for construction equipment. To control any releases of hazardous waste, fueling and maintenance areas for trucks would be required to have spill protection measures and stormwater management plans in place (see pages 4-111, 4-112, 4-153, and 4-154 of the Draft Environmental Impact Statement). The West Van Buren Water Quality Assurance Revolving Fund site was identified and considered during development of the Draft Environmental Impact Statement (see page 4-165 of the Final Environmental Impact Statement, and the Draft Initial Site Assessment prepared for the proposed project). These sites are primarily groundwater-impact sites, and groundwater is found at a depth of over 60 feet below the footprint of the Preferred Alternative. Given the separation distance between the adversely affected medium (groundwater) and the construction zone (near-surface in these locations), the project team determined that these sites would not pose a risk to construction or to the general public once the facility were completed. This assessment has been clarified in the Final Environmental Impact Statement on page 4-165.
70	**Hazardous Materials**	The Arizona Department of Public Safety (which includes the State Highway Patrol) has primary responsibility for enforcing traffic laws. The Department of Public Safety also has primacy when calling in support for traffic accidents, including hazardous materials accidents (see text box on page 4-157 of the Final Environmental Impact Statement). The Department of Public Safety would determine, based on the incident, whether a partial or full closure of the facility would be required in the event of a hazardous materials spill. The Arizona Department of Transportation maintains a list of contractors who provide emergency response services, as well as local municipalities whose fire and police departments operate in cooperation with the Department of Public Safety on incidents within their jurisdiction. Requirements for shippers are maintained by the Arizona Department of Transportation's Enforcement Compliance Division.
71	**Environmental Justice and Title VI**	The section entitled *Title VI and Environmental Justice*, beginning on page 4-29 in the Draft Environmental Impact Statement, presents acceptable methods, data, and assumptions to assess the potential for disproportionately high and adverse effects from the proposed action on environmental justice populations and disparate impacts to populations protected under Title VI. Based upon the content of the section, no such effects would result from the action alternatives. In light of comments received on the Draft Environmental Impact Statement, the above-referenced conclusions were confirmed in the preparation of the Final Environmental Impact Statement. To provide further clarity, the discussions of environmental justice and Title VI were separated and additional text explaining the relationship of environmental justice and Title VI to various environmental elements was added throughout Chapter 4, *Affected Environment, Environmental Consequences, and Mitigation*, as exemplified by the inserted text on page 4-29 of the Final Environmental Impact Statement.

Code	Comment Document

71

It concludes:
No undue hardship or disproportionate adverse impacts on populations afforded protection under Title VI, Executive Order 12898, the U.S. Department of Transportation Order 5610.2(a), and other related statutes would occur and, therefore, no mitigation would be required.

Nothing could be farther than the truth.

72

Air Toxics:
The JATAP monitoring at the St. Johns monitoring site on the GRIC found certain air toxics attributed to "mobile sources," or vehicular traffic burning hydrocarbons. These findings of the air toxics were many times the "accepted" cancer risk standard set by USEPA.

The St. Johns monitoring site's annual mean concentrations of mobile source air toxics (MSATs):

- benzene at 4.7 times the accepted cancer risk standard;
- 1,3 butadiene at 3.9 times the accepted cancer risk standard

The JATAP study also found other air toxics associated with transportation exhaust. Acetaldehyde, formaldehyde, ethylbenzene, m,p-Xylene, o-Xylene, and toluene were detected at high levels at the St. Johns monitoring site.

Residents of the GRIC living around and adjacent to the monitoring site are currently being subjected to all of these carcinogens, not just one. And if a freeway were to be built near this monitoring site on the GRIC, there would be more air toxics in addition to the ones detected at levels that far exceed the USEPA risk standard.

At the West Phoenix monitoring site, which is the same 43rd Avenue and Broadway site that has had many exceedances of the particulate matter standards, even higher levels of air toxics were found. This site is about a mile or so downwind from the proposed route of the South Mountain Freeway, and air toxics levels would be impacted by the freeway.

The West Phoenix monitoring site's annual mean concentrations of mobile source air toxics (MSATs):

- benzene at 18.7 times the accepted cancer risk standard;
- 1,3 butadiene at 21.5 times the accepted cancer risk standard

The JATAP study also found other air toxics associated with transportation exhaust. formaldehyde, ethylbenzene, m,p-Xylene, o-Xylene, and toluene were detected at high levels at the West Phoenix monitoring site.

One of the JATAP's findings presented to the EPA National Air Monitoring Conference in November 2006 was, "**Annual average concentrations of formaldehyde,**

Code	Issue	Response
72	**Air Quality**	The Draft and Final Environmental Impact Statements present information and analysis about the proposed action and the enhanced conditions when compared against the No-Action Alternative and would not cause substantial adverse effects. The results of the analysis are summarized in the prologue to the Final Environmental Impact Statement (page xiii) and are more fully described beginning on page 4-68 of the Final Environmental Impact Statement. The carbon monoxide and particulate matter (PM_{10}) analyses demonstrated that the proposed freeway would not contribute to any new localized violations, increase the frequency or severity of any existing violation, or delay timely attainment of the National Ambient Air Quality Standards or any required interim emissions reductions or other milestones. The Draft Environmental Impact Statement provided the results of modeling for each of the seven priority mobile source air toxics, in both the Eastern and Western Subareas, and compared relative mobile source air toxics emissions that would result from three different potential alternatives (W59, W71, W101) as compared with the No-Action Alternative. It also included modeling of mobile source air toxics emissions in the overall mobile source air toxics study area assuming the W59 Alternative (see pages 4-70 to 4-74 of the Draft Environmental Impact Statement) along with implementation of recent U.S. Environmental Protection Agency mobile source air toxics rules. The updated emission modeling developed for the proposed action showed that for the mobile source air toxics study area, there would be little difference in total annual emissions of mobile source air toxics emissions between the Preferred and No-Action Alternatives (less than a 1 percent difference) in 2025 and 2035. With the Preferred Alternative in 2035, modeled mobile source air toxics emissions would decrease by 57 percent to more than 90 percent, depending on the pollutant, despite a 47 percent increase in vehicle miles traveled in the Study Area compared with 2012 conditions (see discussion beginning on page 4-77 of the Final Environmental Impact Statement). For mobile source air toxics, the project would have a negligible effect on emissions in the mobile source air toxics study area. The Preferred Alternative would also reduce in-vehicle mobile source air toxics exposure as opposed to the No-Action Alternative. The U.S. Environmental Protection Agency has found that in-vehicle benzene concentrations were between 2.5 and 40 times higher than nearby ambient concentrations, based on a review of studies discussed in the Regulatory Impact Analysis for the U.S. Environmental Protection Agency's 2007 mobile source air toxics rule-making (Final Regulatory Impact Analysis, Environmental Protection Agency 420-R-07-002, 3-17 [February 2007]). Construction of the South Mountain Freeway would result in a reduction in benzene exposure to drivers and passengers for two reasons: decreased travel times (motorists would spend less time in traffic to reach their destinations) and lower emissions rates (attributable to speed improvements). Reducing on-road exposure would provide a health benefit for motorists using the freeway under consideration. Congestion relief resulting from the proposed freeway would provide localized air quality emissions reductions on area freeways and arterial streets and at interchanges, benefiting users of area highways and those living near congested roads.

Code	Comment Document

72 **acetaldehyde, benzene and 1,3 butadiene were on the high end of the range reported in EPA funded assessments of other US cities."**

In the December 2006 ANALYSIS OF AIR TOXICS COLLECTED AS PART OF THE JOINT AIR TOXICS ASSESSMENT PROJECT FINAL REPORT, Page 3-6, it states this with more precision:
"How Do Air Toxics Concentrations Compare with Typical National Levels? Phoenix area urban concentrations of1,3-butadiene, acetaldehyde, formaldehyde, chloroform, benzene, and tetrachloroethene were typically on the high end of the national urban scale (i.e., above the 75th percentile). Other air toxics concentrations were typically within the interquartile range of national concentrations (25th to 75th percentile)."

This finding relates to any future proposed freeway in the JATAP study area, which includes in entirety the route of the proposed South Mountain Freeway and Truck Bypass. It also has huge environmental justice implications because, in other words, some of the worst air in the country, in terms of air toxics, was found in the JATAP study, and the high readings on the GRIC are among these highest readings.

So the air toxics are already worse than most other areas of the United States, and the proposed freeway would add even more. Obviously, adding more vehicular traffic emissions by building a freeway where there had not been one would add to this toxic burden. Yet despite its claims about environmental justice, these real environmental problems are not mentioned, nor is a plan to mitigate these impacts ever mentioned.

The JATAP also showed serious air toxics problems at the West and South Phoenix monitoring sites, and these monitoring sites are in the midst of other low-income and ethnic minority communities, mostly of Hispanic origin. These would be exacerbated by the addition of another source of mobile toxics, also. The JATAP and its results mentioned "toxic hot spots near freeways" specifically because freeways cause toxic hotspots for air toxics.

73 One must conclude that the DEIS itself is an extreme example of environmental injustice, despite its assertions.

72 ***Thus, the failure to properly analyze and/or address the air toxics information from the JATAP study is a deliberate violation of the very Environmental Justice issues that ADOT and FHWA claim to be observing.***

73 The conclusion is that ADOT and HDR would sacrifice human health and safety to accomplish their goal of building the South Mountain Freeway and Truck Bypass, and would rather see people on the GRIC, West and South Phoenix suffer and die from cancer than simply conduct an honest and objective NEPA process. Again, that appears to be a premeditated violation of the civil rights of the GRIC residents near the St. Johns JATAP monitoring site, as well as the low-income and ethnic minority communities of west and South Phoenix.

Code	Issue	Response
72 (cont.)		Summary information about the findings of the Joint Air Toxics Assessment Project study is provided as background information in the Draft and Final Environmental Impact Statements, but the study itself is not relevant to the type of analysis done pursuant to the Federal Highway Administration's mobile source air toxics guidance, which is an emissions analysis. Monitored ambient concentrations of mobile source air toxics (the focus of the Joint Air Toxics Assessment Project) do not inform this type of analysis. While monitoring data can be useful for defining current conditions in the affected environment (to the extent that the monitoring data are current), they don't tell us anything about future conditions, or the impacts of the project itself, which is why an emissions analysis was performed. The mobile source air toxic analysis presented beginning on page 4-77 of the Final Environmental Impact Statement is an estimated inventory of mobile source air toxic emissions for the entire Study Area for 2025 and 2035. This approach was used because the inventory estimate accounts for changes in traffic and emissions on all roadways affected by a proposed project, and would, therefore, be a more reliable predictor of changes in exposure to mobile source air toxics. The West Phoenix monitoring site is not the same as the West 43rd Avenue monitoring site.
73	**Environmental Justice and Title VI**	The section entitled *Title VI and Environmental Justice*, beginning on page 4-29 in the Draft Environmental Impact Statement, presents acceptable methods, data, and assumptions to assess the potential for disproportionately high and adverse effects from the proposed action on environmental justice populations and disparate impacts to populations protected under Title VI. Based upon the content of the section, no such effects would result from the action alternatives. In light of comments received on the Draft Environmental Impact Statement, the above-referenced conclusions were confirmed in the preparation of the Final Environmental Impact Statement. To provide further clarity, the discussions of environmental justice and Title VI were separated and additional text explaining the relationship of environmental justice and Title VI to various environmental elements was added throughout Chapter 4, *Affected Environment, Environmental Consequences, and Mitigation*, as exemplified by the inserted text on page 4-29 of the Final Environmental Impact Statement.

74

Hazardous Materials Incidents

The GRIC areas along the proposed freeway have extremely limited access and egress. A hazardous materials transportation incident such as a spill of gasoline, sulfuric acid, or chlorine and the potential consequences of that are detailed in the comments regarding the DEIS' complete failure to even mention the risks from a hazardous materials incident, much less mitigating the risks. Such an incident would certainly harm and/or doom the residents of the GRIC around the 51st Avenue pass, as well as the low-income, minority residents in portions of South and west Phoenix. This is another severe example of environmental injustice, as no consideration is made for the Native Americans on the GRIC, their lifestyle, and no plan or means for preparing for response to such a disaster is even mentioned in the DEIS. This is beyond the pale; it is akin to casually planning to set up small scale genocide. That is certainly an environmental injustice.

75

No Real Outreach to Environmental Justice Organizations

There is mention in the DEIS of a myriad of organization and tribes that were approached about the DEIS, but not one environmental justice group in South or West Phoenix, or on the GRIC, were ever contacted. That has to be a deliberate step, as some of these groups even tried to approach ADOT and were rebuffed.

All of this pattern of environmental racism is consistent with the theme of keeping out of the DEIS any mention of a negative against the construction of the freeway, even if it means, lying, obfuscating, ignoring data and organizations, and pretending problems don't exist, even when they are identified as some of the worst in the United States.

The following are comments related to impacts related to the CANAMEX highway:

The DEIS uses figures purposefully to overstate population and job growth based on the 2005 numbers. As disclosed at the meeting ADOT was aware of the discrepancies, but chose not to update with the 2010 census figures. Doesn't this discrepancy require correction before the final EIS ?

There are some issues with the traffic studies in chapter three, they are quite convoluted:

FOR THE E-1 Alignment

1) ADOT and MAG cite the organic population growth(postulated in 2005) in the East valley as creating traffic flows along the 60 west bound to the i-10, and along the south mountain 202 (Pecos Road) also west bound and flowing to the 10. There is no indication of growth or traffic volumes originating along I-10 between Riggs Road and Pecos road because they are outside the study area…However these flows also course along I-10 into

Code	Issue	Response
74	**Hazardous Materials**	According to 46 *Federal Register* 18026 (March 23, 1981), the environmental impact statement must discuss reasonably foreseeable actions. These are actions that are likely to occur or probable, rather than those that are merely possible. The section Hazardous Materials beginning on page 4-152 of the Draft Environmental Impact Statement, discusses in sufficient detail the issues of hazardous spills, and the text box "Transport of Hazardous Materials on the Regional Freeway System" on page 4-154, describes response procedures to hazardous spills. The chance of spills in the referenced area is no different and no higher than the chance near Ahwatukee or Laveen or Estrella Villages. Therefore, there is no disproportionately high potential for spills to occur at specific locations of the freeway. The comment also makes reference to indigenous populations. As shown in Table 4-10 of the Draft Environmental Impact Statement, "*Environmental Justice and Title VI Population percentages, Affected Study Area Jurisdictions*" on page 4-30, indigenous populations are accounted for in the impact analyses. Further, Chapter 2, *Gila River Indian Community Coordination*, discloses the comprehensive nature of consultation and coordination efforts with the Gila River Indian Community. Important to note is the history of impact study on Gila River Indian Community land. For much of the project, the tribe did not, as is its right as a sovereign nation (see page 2-1), permit any form of impact analyses on its resources, nor did it wish to have any information about the Gila River Indian Community disclosed in the Draft Environmental Impact Statement. In 2007, right-of-entry was granted, but expired 1 year later. In 2010, the permit was reissued to study an alignment on Gila River Indian Community land (which is discussed in Chapter 3, *Alternatives*), but was later withdrawn once consideration by the tribe for a Gila River Indian Community-located alignment was withdrawn. But despite the Gila River Indian Community's directive to neither study nor report on tribal resources and assets, the potential for such impacts is highly unlikely. Populations would not be directly affected by the proposed action. While the action may pose indirect impacts such as restricted access to place of tradition, adequate mitigation has been committed to ensure access would not be impeded. Further, in addition to the overall public outreach efforts, tribal members also had specific access to Gila River Indian Community-specific outreach. As outlined in Chapter 2, the Gila River Indian Community-specific outreach efforts were exhaustive.
75	**Public Involvement**	As noted in the section *Conclusions* on page 6-29 of the Final Environmental Impact Statement, the Arizona Department of Transportation and Federal Highway Administration exceeded National Environmental Policy Act requirements pertaining to public outreach. The measures are described in Chapter 6, *Comments and Coordination*, as well as throughout the Final Environmental Impact Statement. The Arizona Department of Transportation made effort to make all population sectors and representatives aware of the proposed action. Organizations, by default, are invited to participate in the environmental impact statement process. The public hearing for the proposed action was widely advertised. Newspaper ads in six newspapers of area-wide distribution ran advertisements at least twice each. Announcements occurred on five radio stations and six television stations. Mailers were sent on May 6, 2013 to 73,564 individuals (approximately 311 on the Gila River Indian Community) who had previously expressed an interest in the project. The Arizona Department of Transportation utilized the Government Delivery system to distribute to over 12,000 recipients. E-newsletters were distributed on three different occasions. All materials were also provided to the Gila River Indian Community Public Information Officer.

No Real Outreach to Environmental Justice Organizations

There is mention in the DEIS of a myriad of organization and tribes that were approached about the DEIS, but not one environmental justice group in South or West Phoenix, or on the GRIC, were ever contacted. That has to be a deliberate step, as some of these groups even tried to approach ADOT and were rebuffed.

76

All of this pattern of environmental racism is consistent with the theme of keeping out of the DEIS any mention of a negative against the construction of the freeway, even if it means, lying, obfuscating, ignoring data and organizations, and pretending problems don't exist, even when they are identified as some of the worst in the United States.

The following are comments related to impacts related to the CANAMEX highway:

77

The DEIS uses figures purposefully to overstate population and job growth based on the 2005 numbers. As disclosed at the meeting ADOT was aware of the discrepancies, but chose not to update with the 2010 census figures. Doesn't this discrepancy require correction before the final EIS ?

78

There are some issues with the traffic studies in chapter three, they are quite convoluted:

FOR THE E-1 Alignment

1) ADOT and MAG cite the organic population growth(postulated in 2005) in the East valley as creating traffic flows along the 60 west bound to the i-10, and along the south mountain 202 (Pecos Road) also west bound and flowing to the 10. There is no indication of growth or traffic volumes originating along I-10 between Riggs Road and Pecos road because they are outside the study area…However these flows also course along I-10 into

Code	Issue	Response
76	**Impacts**	The environmental impact statement process and the Draft Environmental Impact Statement documenting the process represent a transparent, disclosed examination of the potential for the proposed action to cause significant, adverse environmental impact and to propose mitigation where necessary. Throughout the Draft Environmental Impact Statement, adverse impacts are disclosed. Compliance with the environmental impact statement process is described throughout the entire Draft Environmental Impact Statement and is summarized in Figure S-3, Environmental Impact Statement Process, on page S-3.
77	**Purpose and Need**	The analyses in the Draft Environmental Impact Statement used socioeconomic and traffic projections at the regional analysis zone and traffic analysis zone levels. At the time of publication of the Draft Environmental Impact Statement, Census 2010-based socioeconomic data at the regional analysis zone and traffic analysis zone levels had not been adopted by the Maricopa Association of Governments and were not available to the project team. Therefore, the data used in the Draft Environmental Impact Statement were the most appropriate information available. The Maricopa Association of Governments approved new population, employment, housing, and traffic projections in June 2013. The new data are presented in the Final Environmental Impact Statement beginning on page 1-11. The purpose and need and analysis of alternatives were updated and reevaluated using these new socioeconomic projections and corresponding projections related to regional traffic. While new projections based on the 2010 Census showed a lower anticipated population and vehicle miles traveled in 2035 than the previous projections, the conclusions reached in the Draft Environmental Impact Statement were validated in the Final Environmental Impact Statement (see Chapter 3, *Alternatives*). The traffic analysis demonstrated that the proposed project is needed today and will continue to be needed into the future.
78	**Traffic**	The road network for the Maricopa Association of Governments regional travel demand model includes all of Maricopa County and a substantial portion of Pinal County. While a road may not be within the Study Area for the proposed action, because it is included in the Maricopa Association of Governments travel demand model road network, its influence is considered in the traffic analysis for the proposed action. Location #7, Pecos Road to Wild Horse Pass Boulevard, shown on Figure 1-8 on page 1-15 of the Final Environmental Impact Statement, illustrates the anticipated growth along Interstate 10 from locations south of Pecos Road (including the Riggs Road to Pecos Road section identified in the comment). Between 2012 and 2035, the Interstate 10 traffic volume is projected to increase from around 96,000 to 134,000 vehicles per day (a 40 percent increase).

Code	Comment Document

Maricopa county This increased traffic growth created the gridlock at the Broadway curve, and will be even more constricted by 2035..

This congestion according to ADOT is to be relieved by the SM202 alignment and is a pillar to support the E-1 Alignment.

79 The traffic flows exhibited in chapter 3 of the DEIS only describe how traffic originates on the 60 and SM202 and flows into or along the i-10. They merely describe how this creates constriction at the Broadway curve. There is no analysis of the traffic flows along I-10 and where they exit. This missing element creates a critical miss (in my opinion) to the purpose and need.

80 The majority of Traffic Westbound on I-10 flows onto 143 N to the airport and the 202 (red mountain) or to SR 51 North. These flows demonstrate a Northern flow of traffic North/ East Phoenix or even Western Scottsdale and Tempe, they do not flow through to downtown or I-17. Arterial Street traffic in downtown Phoenix in the AM does not support the argument that the traffic flows into or even past downtown into the West Valley.

81 This is demonstrated by showing a statistically insignificant (7 %) reduction in traffic at the Broadway curve using the current flawed assumptions. Adjusting for actual through flows to the 143 and SR 51 I believe the reduction in congestion at the curve to be less than 2 or 3 %.

82 The majority of traffic analysis is within the Western alignment where the West valley traffic needs relief to access I-10 along the northern route of the alignment….but this local commuter savings is not effected by the E-1 alignment. The E-1 alignment will not be utilized by this commuter traffic and will be utilized primarily as a truck bypass as acknowledged by ADOT on 6-11-13.

83 As for the CANAMEX

2) Chapter three cites statistics that "more than one third", or 34 % of the nations freight flows through Phoenix, today. There is no data cited to support that number. If correct it is understated for 2035 projections

84 Further the study is lacking because there is no analysis of the current or enhanced increase in freight volume resulting from the port activity in Guyamas and Puerto Colonet and the Union Pacific rail efforts moving that freight form those ports into Tucson and then north to Phoenix.

Tucson is now recognized internationally as a "Virtual Port". As of 2013 Union Pacific has agreed to move and receive 50,000 additional containers to be dispersed via truck and train north and East (correction from west). The ports of Long Beach and LA thus being obviated by the Ports and Rail lines in Mexico (Arizona Daily Star and SALEO Southern Arizona Logistics

31

Code	Issue	Response
79	**Traffic**	Chapter 1 of the Draft Environmental Impact Statement discloses the purpose and need for the proposed action. The analyses results disclose existing and future capacity deficiencies throughout the regional system including as noted in the comment at the Broadway Curve. The transportation problem identified specific to the purpose and need relates to east-west regional mobility in the southwest valley unique from the Broadway Curve. While the Draft Environmental Impact Statement further discloses the proposed freeway would help reduce congestion at the Broadway Curve, improvements to Interstate 10 through the curve are a part of another planned project adopted in the region's Long Range Transportation Plan.
80	**Traffic**	While a portion of the traffic through the Broadway Curve is airport-related, an equal portion extends west to Interstate 17 and even to Interstate 10 west of downtown Phoenix.
81	**Traffic**	Chapter 1 of the Draft Environmental Impact Statement discloses the purpose and need for the proposed action. The analyses results disclose existing and future capacity deficiencies throughout the regional system including as noted in the comment at the Broadway Curve. The transportation problem identified specific to the purpose and need relates to east-west regional mobility in the southwest valley unique from the Broadway Curve. While the Draft Environmental Impact Statement further discloses the proposed freeway would help reduce congestion at the Broadway Curve, improvements to Interstate 10 through the curve are a part of another planned project adopted in the region's Long Range Transportation Plan.
82	**Traffic**	An analysis of the origins and destinations of projected freeway users is presented in Figure 3-18, on page 3-36 of the Final Environmental Impact Statement. Freeway users are defined as those motorists who pass through the bend of the freeway (around the South Mountains). Therefore, this would not count motorists in Laveen Village who go to Interstate 10 (Papago Freeway) and motorists in Ahwatukee Foothills Village who go to Interstate 10 (Maricopa Freeway). The results of the origin-destination analysis show that 73 percent of the traffic going around the South Mountains has origins or destinations in the area within or around the Study Area and supports the conclusion that the proposed action would serve east–west mobility consistent with commuting movements. In reference to the comment regarding trucks using the proposed freeway to avoid Interstate 10 through downtown Phoenix, the vehicle mix and specifically the percentages of trucks using the facility is similar in vehicle mix ratios found throughout the region's existing freeway system.
83	**Traffic**	The citation "MAG 2010c" is provided at the end of the first sentence of the third paragraph of the first column on page 3-64 of the Draft Environmental Impact Statement.
84	**Traffic**	As detailed in Chapter 1, *Purpose and Need*, in the Draft Environmental Impact Statement, the proposed action is not needed in response to national freight movement, nor is it intended to provide service primarily for freight movement. The proposed action is needed to address local capacity deficiencies and has been developed in response to local growth in population, housing, employment, and travel levels.

Code	Comment Document

Education Organization). To accommodate this volume the " port of Tucson" has received a 10 X expansion since 2012. (KVOA Tucson). This information is omitted in the DEIS because it is outside the scope of the Study, which only encompasses Maricopa county, not the tri county (Maricopa, Pinal and Pima) alignment of the I-10 from Phoenix to Tucson, AKA the first leg of the CANAMEX.

85

ADOT will not address traffic flows originating outside Maricopa County.

Also excluded from the DEIS because it is outside the scope of the report is that Union Pacific is currently negotiating with Arizona and the state land department to purchase state trust land to open a 950 acre rail yard at Picachio Peak. It is Planned to be the largest yard between Texas and California, multiple sources (AZ republic., AZ Starnet) the yard will handle tens of thousands of containers originating in California and Tucson ports

The additional planned container traffic terminating at hubs in Pima (Tucson) county and the planned Pinal (Picachio peak) hubs create a significant increase in freight flows to Phoenix specifically to the hubs along 51st Ave.

Arizona has identified the Intermodal Transportation industry as a critical potential "Pillar Industry" in Arizona.

Chapter three describes freight and trucks as pass through, but that is a mis-statement. The assessment is technically correct, but not accurate. As a hub, Freight Enters Phoenix from Points south west and East. Those freight "Loads" are deposited and "exchanged" for loads heading in the opposite direction, So even though 70 % of the freight passes through Phoenix it terminates in Phoenix as a transfer point.

Those volumes will increase by virtue of the intermodal transportation plans In Pima and Pinal counties, but were conveniently left out of the "study area".

86

ADOT admitted the 202 is a truck bypass while attempting to minimize the utilization of the loop as a potion of the CANAMEX. In the 6-11 SMCAT meeting it was freely discussed how Congress has not dictated the exact route, and how the CANAMEX' own web site self identifies the I-10 corridor, not any other. Additionally there is the current lack of suitability along the I-8/ 85 future I-11 route, which is obviated by the completion of the 202 highway anyway. In addition all Phoenix based shipping hubs are located "within" the new 202 loop and would be more efficiently accessed by ALL traffic types by using the 202.

87

ADOT surveyed truck drivers about routes in the early days of traffic review. Their surveys indicated that most traffic never passed through Phoenix. However the system of intermodal transport is hub and spoke, so freight comes in to a terminal and the driver drops the load and picks a new one, never passing through. So the Driver survey was

Code	Issue	Response
85	**Traffic**	The road network for the Maricopa Association of Governments regional travel demand model includes all of Maricopa County and a substantial portion of Pinal County. While a road may not be within the Study Area for the proposed action, because it is included in the Maricopa Association of Governments travel demand model road network, its influence is considered in the traffic analysis for the proposed action.
86	**Purpose and Need**	The statements made on June 11, 2013, as paraphrased in the comment as trucks would use the proposed freeway to avoid Interstate 10 through downtown Phoenix is misleading. The proposed freeway is part of a transportation system developed to improve mobility in the region by increasing capacity and allowing traffic—including truck traffic—to access a segment of the "loop" system (see pages 1-21, 1-22, 3-1, and 3-3 of the Final Environmental Impact Statement) in the Phoenix metropolitan area. The proposed South Mountain Freeway would be a commuter corridor, helping to move local traffic. As with all other freeways in the region, trucks would use it for the through-transport of freight, for transport to and from distribution centers, and for transport to support local commerce. Recognition of the trucking contribution to traffic in the region is disclosed on page 3-64 of the Final Environmental Impact Statement. As supported by the traffic analysis presented in the Final Environmental Impact Statement, the primary user vehicles of the proposed freeway would be automobiles. The Maricopa Association of Governments regional travel demand model projects that truck traffic would represent approximately 10 percent of the total traffic on the proposed action, similar to what is currently experienced on other regional freeways such as Interstate 10, State Route 101L, and U.S. Route 60. As disclosed in the Final Environmental Impact Statement, trucking destinations in the Phoenix metropolitan area would still prompt truck drivers to enter congested areas. Choosing to travel on the proposed freeway versus Interstate 10 would not produce substantial travel-time benefits. Therefore, it is expected that "true" through-truck traffic (not having to stop in the metropolitan area) would continue to use the faster, designated, and posted bypass system of Interstate 8 and State Route 85.
87	**Purpose and Need**	The statements made on June 11, 2013, as paraphrased in the comment as trucks would use the proposed freeway to avoid Interstate 10 through downtown Phoenix is misleading. The proposed freeway is part of a transportation system developed to improve mobility in the region by increasing capacity and allowing traffic—including truck traffic—to access a segment of the "loop" system (see pages 1-21, 1-22, 3-1, and 3-3 of the Final Environmental Impact Statement) in the Phoenix metropolitan area. The proposed South Mountain Freeway would be a commuter corridor, helping to move local traffic. As with all other freeways in the region, trucks would use it for the through-transport of freight, for transport to and from distribution centers, and for transport to support local commerce. Recognition of the trucking contribution to traffic in the region is disclosed on page 3-64 of the Final Environmental Impact Statement.

(Response 87 continues on next page)

Code	Comment Document
87	correct. What is not accurate is the notion that the freight stays behind. As indicated in Chapter three of the Study Nearly 35 % of US freight passed through Phoenix. Phoenix is not a train hub so all of these containers are by truck. The DEIS is inadequate in its description of this container traffic and its effect Understand that the two ports in Mexico mentioned below are developed in partnership with Union Pacific to obviate the need to expand Long Beach and Los Angeles Harbors. This is stated frequently by supporters of the CANAMEX. See also the description by PAG, Pima Association of Governments http://www.pagnet.org/programs/transportationplanning/intermodaltransportation/freight/tabid/245/default.aspx http://azttca.org/20130601-feature.aspx I-11http://interstate11.org/exhibits.aspx
88	**The following are comments related to impacts related to the Deficiencies in Description of Proposed Action:** A. The description of the proposed action is deficient. The action is described generally as building a freeway in compliance with the RTP. Lacking from the description are the following:
89	1. The typical cross-section of the freeway should be included, listing major deviations, if any, from the typical cross-section for each of the three West Alternatives and the single East Alternative. While at the outset the cross-section was not known, the 10-lane alternative was eliminated in the fourth-tier screening. A freeway with three general purpose (GP) and one High Occupancy Vehicle (HOV) lane in each direction, plus auxiliary lanes where necessary, was established for all alternatives.
90	2. The profile for the freeway should be described in general terms for each Alternative.
91	3. The location of proposed interchanges for each alternative should be shown.
92	4. The fact that park-and-ride lots would be provided at interchanges should be stated. The term park-and-ride appears only once in the Summary (Page S-19) in the context of a mitigation measure for Displacements and Relocations. The term park-and-ride does not appear at all in Chapter 1 (Purpose and Need); it appears three times in Chapter 3 (Alternatives) first on Page 3-6 as part of the discussion of Modal Screening Results, the second time on Page 3-15, Figure 3-8 (indicating that the park-and-ride lot at the 40th Street Interchange potentially would be expanded, and for the third time on Page 3-40 in the context of the No-Action Alternative. Thus unless a reader studied Figure 3-8 very carefully, he or she would not be aware of the potential expansion of the park-and-ride lot at the 40th Street Interchange.
	33

(Comment code 93 is on the next page)

Code	Issue	Response
87 (cont.)		As supported by the traffic analysis presented in the Draft and Final Environmental Impact Statements, the primary user vehicles of the proposed freeway would be automobiles. The Maricopa Association of Governments regional travel demand model projects that truck traffic would represent approximately 10 percent of the total traffic on the proposed action, similar to what is currently experienced on other regional freeways such as Interstate 10, State Route 101L, and U.S. Route 60. As disclosed in the Final Environmental Impact Statement, trucking destinations in the Phoenix metropolitan area would still prompt truck drivers to enter congested areas. Choosing to travel on the proposed freeway versus Interstate 10 would not produce substantial travel-time benefits. Therefore, it is expected that "true" through-truck traffic (not having to stop in the metropolitan area) would continue to use the faster, designated, and posted bypass system of Interstate 8 and State Route 85.
88	**Proposed Action**	While the proposed action is summarily defined on page 1-1 of the Draft Environmental Impact Statement as the "construction and operation of a major transportation facility," design specifics for each action alternative are found in text beginning on page 3-40 of the Final Environmental Impact Statement. Sufficient detail is provided to: ensure meaningful comparison and analyses of the alternatives in reference to operational characteristics, cost, and impacts; and to convey sufficient information to reviewers of the characteristics of each alternative in accordance with 23 Code of Federal Regulations 771 Environmental Impact and Related Procedures or in the Federal Highway Administration Technical Advisory T 6640.8A Guidance for Preparing and Processing Environmental and Section 4(f) Documents.
89	**Alternatives**	Key elements of the alternatives studied in detail are presented in the Draft Environmental Impact Statement, beginning on page 3-40. A typical section of the proposed freeway is depicted in Figure 3-34, on page 3-58 of the Draft Environmental Impact Statement.
90	**Alternatives**	The vertical alignment of each action alternative is described beginning on page 3-40 of the Draft Environmental Impact Statement. The profiles are shown graphically in Figures 3-20 to 3-25.
91	**Alternatives**	The proposed interchange locations for each action alternative are shown in Figure 3-28, on page 3-51 of the Draft Environmental Impact Statement.
92	**Alternatives**	Inclusion of park-and-ride lots is not part of the scope of the proposed action. No new park-and-ride lots are proposed as part of the proposed action. Locations of future park-and-ride lots would be determined by the City of Phoenix and Valley Metro (see discussion of potential enhancements on page 3-60 of the Draft Environmental Impact Statement).
93	**Transit**	Inclusion of park-and-ride lots is not part of the scope of the proposed action. No new park-and-ride lots are proposed as part of the proposed action. Locations of future park-and-ride lots would be determined by the City of Phoenix and Valley Metro (see discussion of potential enhancements on page 3-60 of the Draft Environmental Impact Statement).

Code	Comment Document

93 There is no mention of park-and-ride in the Traffic Overview Report.

94 For the public in general, the Regional Transportation Plan (RTP) and complying with the RTP are abstract and perhaps foreign concepts. The Description of the Proposed Action should have sufficient information to help the public visualize what is being proposed on the ground.

95 **Deficiencies in Evaluation of Alternatives**

B. **The evaluation of alternatives is deficient because there is no analysis of traffic impacts on local streets and local access.** A specific example would be how Pecos Road would be impacted by the Proposed Action. With the Proposed Action, the South Mountain Freeway (SMF) would obliterate and replace existing Pecos Road (as described as Alternative E1); access to the street system in the area would be provided via interchanges at 40th Street, 24th Street, Desert Foothills Parkway, and 17th Avenue.

96 1. The DEIS does not indicate what type of interchange would be constructed at these locations. Because there would be no access to the Gila River Indian Community (GRIC) on the south side, neither of the two typical interchanges depicted on Page 3-14, "Diamond Interchange" and "Single Point Urban Interchange," would be applicable. The DEIS should indicate the type of interchange to be provided, at least conceptually and with a simple graphic.

97 2. The DEIS should present recent traffic volume counts for Pecos Road and turning movement counts at the existing signalized intersections at 40th Street, 32nd Street, 24th Street, Desert Foothills Parkway, and 17th Avenue. Then it should discuss the impacts on existing traffic due to the loss of access at 32nd Street and how existing traffic patterns will change. Then, 2035 peak hourly traffic volumes at the interchanges should be presented so that the public can be informed of how present routings will be affected and what the impacts will be in 2035. The impacts on the cross streets are not dependent on the specific design details and can be evaluated based on the traffic volume projections.

98 3. The DEIS should discuss how the Proposed Action would affect emergency vehicle access times for the communities now served by the signalized intersection at Pecos Road/32nd Street.

99 4. With the Proposed Action, the eastbound left-turn and westbound right turn direct access to the park-and-ride facility at 40th Street will be lost, shifting the ride-share traffic to the two park-and ride access points via 40th Street. The southern access driveway is less than 300 ft (center-to-center) north of Pecos Road. The construction of the freeway ramps will shorten the spacing between the junction of the westbound ramp terminal and the southern access driveway for the park-and-ride lot. The impacts to traffic operations along 40th Street, impacts to park-

Code	Issue	Response
94	**Alternatives**	As described in the responses above, the elements of the proposed freeway and the potential action alternatives were described in the Draft Environmental Impact Statement.
95	**Alternatives**	See responses to specific comments below. The alternatives analysis process of developing and screening documents was a disclosed, robust, comprehensive, objective and consistent with the National Environmental Policy Act's intent to use a logical, sequential interdisciplinary approach to establish a range of reasonable alternatives (as concluded in text beginning on page 3-26 of the Draft Environmental Impact Statement).
96	**Alternatives**	The third bullet in the third column on page 3-51 of the Draft Environmental Impact Statement states that "The diamond interchange configuration (see sidebar on page 3-14) was used to evaluate service traffic interchange needs." The comment is incorrect in assuming that there would be no access to the Gila River Indian Community to the south. At 40th Street, there is an existing road to the south, and the planned interchange at that location would provide access onto Gila River Indian Community land. Similarly, the interchanges at 24th Street, Desert Foothills Parkway, and 17th Avenue would be constructed to allow for future connections from Gila River Indian Community land. The initial layout would be similar to the interchanges at State Route 202L (Red Mountain Freeway) and Dobson Road. Figure 3-28 indicated whether the interchanges would include full access or half access. In some locations, a single-point urban interchange or other interchange type may be used to address higher traffic volumes. The determination of the interchange type would be made during final design in coordination with the local jurisdiction.
97	**Traffic**	Text beginning on page 3-60 of the Final Environmental Impact Statement presents the traffic analyses for the action and no action alternatives for existing and future conditions. The analyses used state-of-the-practice methods and analytical tools to demonstrate the traffic operational performance of each alternative. Ancillary to the effort, in 2006, the City of Phoenix conducted a traffic circulation study to evaluate the impacts of the freeway on the local street system, including the shift of access to Foothills Reserve and Calabrea from Pecos Road to Chandler Boulevard. The City study found no adverse effects on the local street system from the proposed freeway.
98	**Traffic**	Emergency responders would address the construction of the proposed freeway by amending the local emergency response plan to include the facility. As concluded in the section, *Social Conditions*, in Chapter 4 of the Draft and Final Environmental Impact Statements, response times for police, fire, and medical emergency services would be faster when compared with response times under the No-Action Alternative. Circulation on major arterial streets would be improved through better distribution of traffic onto the overall transportation network, the provision of alternative routes, and through localized operational improvements such as grade separations and planned interchanges.
99	**Traffic**	In addition to access from 40th Street, access to the park-and-ride lot would be provided from the westbound on-ramp. This is similar to the park-and-ride operations at Happy Valley Road and Interstate 17. Bus operations and circulation would continue to function as they do today. Traffic operational characteristics along 40th Street and at the Cottonwood Lane intersection would not be adversely affected by the freeway. The park-and-ride lot has been expanded to its ultimate configuration.

Code	Comment Document

and-ride access, impacts on bus operations, impacts at the intersection of 40th Street/E Cottonwood Lane/bus access to park-and-ride should be evaluated, both for existing and 2035 traffic volumes. The long-term expansion of the park-and-ride facility should also be discussed.

100 5. The DEIS should discuss how access will be provided to the existing U-Haul Dealer on the south side of Pecos Road, now accessed directly via the signalized intersection at 32nd Street. Since there will be no interchange at 32nd Street with the Proposed Action, this property will become land-locked. It is unclear based on the information in Tables 4-12 and 4-13 (Pages 4-39 and 4-42, respectively) if this facility is being displaced.

101 C. **The evaluation of alternatives is deficient because** the presentation of the results of the "select link" analysis is misleading. On Page 3-36, Figure 3-18 presents the contribution of traffic to the select link by geographical areas, some of which are very large. The select link is at a point between the 51st Avenue and 17th Avenue interchanges on the South Mountain Freeway. The text accompanying Figure 3-18 states that *"A projected 73 percent of the travelers who might use the proposed action would have origins and/or destinations near the proposed action."* This statement is misleading, since it implies that 73% of the traffic using the South Mountain Freeway would have origins in close proximity to the proposed freeway.

A review if a larger scale map in the Traffic Overview Report, which is the source of the information presented in Figure 3-18, indicates that about 15% of the selected link traffic would have origins or destinations within the Study Area as defined in Figure S-2 of the DEIS. If the definition of "proximity" were to be extended to the area within a 20-mile radius of the select link, the contribution of this entire 20-mile radius area would be about 40 to 50%.

102 **The following are comments related to impacts related to the Religious and Racial Discrimination and Civil Rights Violations in the South Mountain Freeway DEIS:**

The DEIS clearly discriminates on the basis of religion and race, and the ongoing ADOT plans for blasting *Muhadagi Doog* (South Mountain) are ongoing civil rights violations.

Throughout the DEIS, it is acknowledged that the GRIC and other native American tribes hold *Muhadagi Doog* as a sacred site. From the actual language of the DEIS: "The South Mountains are highly valued and considered sacred by some Native American communities. The Community, which includes the Akimel O'odham (River Pima) and Pee Posh (Maricopa) tribes, and other Native American entities—including the Colorado River Indian Tribes and three O'odham groups: the Salt River Pima-Maricopa Indian Community, the Ak-Chin Community, and the Tohono O'odham Nation—consider the South Mountains to play a role in their cultures, identities, histories, and oral traditions."

Code	Issue	Response
100	**Traffic**	The determination to not include an interchange at 32nd Street was made in coordination with the City of Phoenix (see Figure 3-8 on page 3-15 of the Draft Environmental Impact Statement). The interchange would have displaced more than 100 homes and would have been located near an existing high school. In 2006, the City of Phoenix conducted a traffic circulation study to evaluate the impacts of the proposed freeway on the local street system, including the shift of access to Foothills Reserve and Calabrea from Pecos Road to Chandler Boulevard. The City study found no adverse effects on the local street system from the freeway (see Appendix 3-1 in the Final Environmental Impact Statement). The storage facility is located on Gila River Indian Community land and would not be displaced. Reasonable access to the facility would remain available from 32nd Street, Chandler Boulevard, and other east–west local streets. A grade-separated bridge would be constructed for the freeway to go over 32nd Street.
101	**Traffic**	The quotation noted in the comment has been changed to be consistent with a similar statement made in the caption to Figure 3-18: "Seventy-three percent of travelers anticipated to use the proposed action would be involved in trips beginning or ending in the Study Area itself or in the areas immediately surrounding it." The figure does portray the locations of the cities included in the different areas. The proposed action would serve regional travel from the southwestern to southeastern portions of the region (not just internal Study Area travel). The analysis does consider traffic that passes through the Phoenix metropolitan area It should also be noted that, by definition, these freeway users would not include traffic from Laveen Village to Interstate 10 (Papago Freeway) or from Ahwatukee Foothills Village to Interstate 10 (Maricopa Freeway). Therefore, the 15 percent of trips identified in the comment as Study Area-originated are by motorists traveling to the other side of the South Mountains.
102	**Cultural Resources**	The cultural and religious places of importance, like the South Mountains, are acknowledged in the Draft Environmental Impact Statement in several locations, notably pages 4-132 and 5-26. The proposed project, would accommodate and preserve (to the fullest extent possible from the available alternatives) access to the South Mountains for religious practices. The section entitled *Title VI and Environmental Justice*, beginning on page 4-29 in the Draft Environmental Impact Statement, presents acceptable methods, data, and assumptions to assess the potential for disproportionately high and adverse effects from the proposed action on environmental justice populations and disparate impacts to populations protected under Title VI. Based upon the content of the section, no such effects would result from the action alternatives. In light of comments received on the Draft Environmental Impact Statement, the above-referenced conclusions were confirmed in the preparation of the Final Environmental Impact Statement. To provide further clarity, the discussions of environmental justice and Title VI were separated and additional text explaining the relationship of environmental justice and Title VI to various environmental elements was added throughout Chapter 4, *Affected Environment, Environmental Consequences, and Mitigation*, as exemplified by the inserted text on page 4-29 of the Final Environmental Impact Statement. Since the beginning of the environmental impact statement process, the Federal Highway Administration and Arizona Department of Transportation have been carrying out cultural resource studies and engaging in an ongoing, open dialogue with the Gila River Indian Community Tribal Historic Preservation Office regarding

(Response 102 continues on next page)

Code	Issue	Response
102 (cont.)		the identification and evaluation of places of religious and cultural importance to the Gila River Indian Community that may be adversely affected by the proposed freeway. Such places are referred to as traditional cultural properties. As a result of these discussions and of studies conducted by the Gila River Indian Community's Cultural Resource Management Program, the Gila River Indian Community has identified traditional cultural properties that are eligible for listing in the National Register of Historic Places and that could be affected by construction of the proposed freeway. In certain cases, listing these properties on the National Register of Historic Places may offer them protection under Section 4(f) of the Department of Transportation Act. The traditional cultural properties identified are culturally important to other Native American tribes as well. For more discussion of traditional cultural properties, see the section, *Cultural Resources*, beginning on page 4-140 of the Final Environmental Impact Statement and pages 5-26 through 5-28. Section 106 of the National Historic Preservation Act requires a government-to-government relationship between the Federal Government and Indian tribes as described beginning on page 4-140 of the Final Environmental Impact Statement. Section 106 requires that federal agencies take into account the effects of their undertakings on historic properties. This process requires consultation with tribal authorities. Consultation has occurred with Gila River Indian Community government officials, the Tribal Historic Preservation Officer, the Cultural Resource Management Program, many different tribal authorities, and the State Historic Preservation Office. The consultation has resulted in concurrence from the Gila River Indian Community Tribal Historic Preservation Office and the State Historic Preservation Office on National Register of Historic Places eligibility recommendations (including traditional cultural properties), project effects, and proposed mitigation and measures to minimize harm. This consultation has been ongoing and will continue until any commitments in a record of decision are completed. The Draft Environmental Impact Statement, after consultation and coordination efforts, accommodates and preserves (to the fullest extent possible from the available alternatives) access to the South Mountains for religious practices. A very small portion of the mountain would be impacted by the proposed freeway (less than 0.03 percent of the total area). Although the Draft Environmental Impact Statement describes the impact on the South Mountains as adverse, Native Americans would not be kept from practicing their beliefs, access to the mountain would be maintained, and mitigation measures would be implemented based on input from members of the Gila River Indian Community.

Code	Comment Document
102	There is plenty of correspondence in the DEIS and its Appendices in which the GRIC repeatedly asserts and reminds ADOT of this, to no avail. ADOT plans to blast Muhadagi Doog. If we were to take a look at the same issue and frame it as a danger to a sacred site that plays a role in cultures, identities, histories, and oral traditions of a white, European-based religion, such as the Vatican, a sacred site for the Roman Catholic Church, we can illuminate how this is clearly religious discrimination, and likely racial discrimination. If Rome, Italy decided there needed to be a freeway that needed to take out part of the Vatican, well, that would just be unthinkable to the people there of the Roman Catholic faith. Think of the outrage and outcry such a proposal would muster, even worldwide! So what is the difference between the Vatican and Roman Catholics' beliefs, and Muhadagi Doog and the "Native American entities?"
103	This attitude and planned action deliberately and intentionally violates the civil rights of the "Native American entities." In a 1979 consultation on the issue, the United States commission on civil rights defined religious discrimination in relation to the civil rights guaranteed by the Fourteenth Amendment to the United States Constitution. [**Section 1.** All persons born or naturalized in the United States, and subject to the jurisdiction thereof, are citizens of the United States and of the State wherein they reside. No State shall make or enforce any law which shall abridge the privileges or immunities of citizens of the United States; nor shall any State deprive any person of life, liberty, or property, without due process of law; nor deny to any person within its jurisdiction the equal protection of the laws.] As for racial discrimination, the equal protection clause was originally added to deal with the lack of equal protection provided by law to all in the course of administering justice in the states that had Black codes. The United States commission on civil rights noted, "Whereas religious civil liberties, such as the right to hold or not to hold a religious belief, are essential for Freedom of Religion (in the United States secured by the First Amendment), religious discrimination occurs when someone is denied "**the equal protection of the laws, equality of status under the law, equal treatment in the administration of justice**, and equality of opportunity and access to employment, education, housing, public services and facilities, and public accommodation **because of their exercise of their right to religious freedom**." (Emphasis added.) Also, the **American Indian Religious Freedom Act** (commonly abbreviated to AIRFA) is a US federal law and a joint resolution of Congress that was passed in **1978**. It was created to protect and preserve the traditional religious rights and cultural practices of American Indians, Eskimos, Aleuts and Native Hawaiians. These rights include, but are not limited to, **access of sacred sites, repatriation of sacred objects held in museums, freedom to worship through ceremonial and traditional rites, including within prisons,** and **use and possession of objects considered sacred**. (Emphasis added.) The

Code	Issue	Response
102 (cont.)		Several action alternatives were subject to the alternatives development and screening process; not just the E1 Alternative and alternatives located on the Gila River Indian Community (Figure 3-6 on page 3-10 of the Final Environmental Impact Statement illustrates a representation of such alternatives). Ultimately the other alternatives were eliminated from further study in the screening process and the Gila River Indian Community decided not to give permission to study alternatives on its land (see Final Environmental Impact Statement page 3-25). Therefore, the Arizona Department of Transportation, with concurrence from Federal Highway Administration, identified the E1 Alternative as the eastern section of the Preferred Alternative (which includes the W59 Alternative in the Western Section of the Study Area). In reaching its determination, the Arizona Department of Transportation sought to balance its responsibilities to address regional mobility needs while being fiscally responsible and sensitive to local communities.
103	**Title VI, 14th Amendment**	Since the beginning of the environmental impact statement process, the Federal Highway Administration and Arizona Department of Transportation have been carrying out cultural resources studies and engaging in ongoing, open consultation with the Gila River Indian Community Tribal Historic Preservation Office regarding the identification and evaluation of places of religious and cultural importance to the tribe that may be adversely affected by the proposed freeway. Such places are referred to as traditional cultural properties. As a result of these discussions and of studies conducted by the Gila River Indian Community's Cultural Resource Management Program, the Gila River Indian Community has identified traditional cultural properties that are eligible for listing in the National Register of Historic Places and that could be affected by construction of the proposed freeway. In certain cases, listing these properties on the National Register of Historic Places may offer them protection under Section 4(f) of the Department of Transportation Act. The traditional cultural properties identified are culturally important to other Native American tribes as well. For more discussion of traditional cultural properties, see the section, *Cultural Resources*, beginning on page 4-140 of the Final Environmental Impact Statement and pages 5-26 through 5-28. Section 106 of the National Historic Preservation Act requires a government-to-government relationship between the Federal Government and Indian tribes as described beginning on page 4-140 of the Final Environmental Impact Statement. Section 106 requires that federal agencies take into account the effects of their undertakings on historic properties. This process requires consultation with tribal authorities. Consultation has occurred with Gila River Indian Community government officials, the Tribal Historic Preservation Officer, the Cultural Resource Management Program, many different tribal authorities, and the State Historic Preservation Office. The consultation has resulted in concurrence from the Gila River Indian Community Tribal Historic Preservation Office and the State Historic Preservation Office on National Register of Historic Places eligibility recommendations (including traditional cultural properties), project effects, and proposed mitigation and measures to minimize harm. This consultation has been ongoing and will continue until any commitments in a record of decision are completed.

(Response 103 continues on next page)

Code	Comment Document
103	Act required policies of all governmental agencies to **eliminate interference with the free exercise of Native religion** (Emphasis added.), based on the First Amendment, and to accommodate access to and use of religious sites to the extent that the use is practicable and is not inconsistent with an agency's essential functions. It also acknowledged the prior violation of that right. Clearly, the No Build Alternative is the only viable option that does not constitute a violation of the 14th Amendment to the Constitution and a violation of the American Indian Religious Freedom Act as any freeway alternative proposed in the DEIS of the South Mountain Freeway requires blasting away part of Muhadagi Doog.

Code	Issue	Response
103 (cont.)		The American Indian Religious Freedom Act, 42 United States Code Section 1996, provides a policy statement of the United States "to protect and preserve for American Indians their inherent right of freedom to believe, express, and exercise the traditional religions of the American Indian . . . including but not limited to access to sites, use and possession of sacred objects, and the freedom to worship through ceremonials and traditional rites." The Arizona Department of Transportation and Federal Highway Administration complied with the policy stated in the American Indian Religious Freedom Act throughout the environmental impact statement process, as evidenced by consultation efforts, mitigation measures, and a discussion of cultural resource issues in the Draft Environmental Impact Statement. The study would not violate the American Indian Religious Freedom Act because, as stated above, the Gila River Indian Community would not be prohibited from continuing to practice their beliefs even if the project goes forward, since access to the mountain will be maintained, impacts will be mitigated based on input by the Gila River Indian Community and others, and only a small fraction of the mountain would be affected.

Code	Comment Document
104	**Failure to Provide Timely Access to NEPA Documents and Public Records; Obstruction** ADOT made it extremely difficult for the public to actually review the DEIS, Appendices, and Technical Reports. ADOT was evasive and not at all forthcoming with these, even when proper processes to gain access to these were employed. This is in violation of NEPA regulations.
105	Despite the statements on page 6-23 of the South Mountain Freeway (Loop 202) DEIS and Section 4(f) Evaluation Chapter 6, Comments and Coordination that printed copies of the documents were "available for review only and at no charge at the following repositories throughout the Study Area," the Appendices and Technical Reports were not ever at these for review, even when this was pointed out to ADOT. (These repositories were: Phoenix Public Library – Ironwood Branch, 4333 East Chandler Boulevard, Phoenix, AZ 85048; Phoenix Public Library – Burton Barr Central Library, 1221 North Central Avenue, Phoenix, AZ; Sam Garcia Western Avenue Library, 495 East Western Avenue, Avondale, AZ 85323, and the Tolleson Public Library, 9555 West Van Buren Street, Tolleson, AZ 85353.)
106	This page, which was available on the Internet, also claimed that these documents were available, by appointment, "at the ADOT Environmental Planning Group, 1611 West Jackson Street, Phoenix, AZ 85007, (602) 712-7767" but no one ever answered this number or returned my repeated phone calls and messages.
107	The posting also claimed, "Compact disks are available at no charge and can be obtained by request by calling (602) 712-7767." Again, no one ever answered this number or returned phone calls, after I started calling and leaving messages on Thursday, June 6, 2013. I also requested them through the Public Information Officer for ADOT, to no avail. This led me to contact the ADOT director's office several times to ask for these materials on June 10, 2013, and I was finally handed a CD of the Technical Reports at 5PM of that day after driving to ADOT's offices to retrieve them.
108	However, when I loaded the CD on my computer, I found that three of the Technical Reports were not on the CD. I had to repeatedly call ADOT and request and re-request these, asking about the interminable delays in producing them. After 16 calendar days from that, I was finally allowed to see the final Technical Report on Cultural Resources. Brock J Barnhart, ADOT Assistant Communication Director, even tried to assert that some of these were confidential and restricted, claiming on June 18, 2013, when he finally did email me the Scoping Report,: "The reports are indeed confidential and are protected by the National Historical Preservation Act. Section 304

Code	Issue	Response
104	**Public Involvement**	The Draft Environmental Impact Statement was made available at five public locations throughout the area and was available for purchase at one location. The Draft Environmental Impact Statement was available also by compact disc by request, at the public hearing, and on the Web site at <azdot.gov/southmountainfreeway>. These locations were well advertised and documented on page 6-23 of the Draft Environmental Impact Statement. Technical reports and other information were available by request.
105	**Public Involvement**	Hard copies of the Draft Environmental Impact Statement and Section 4(f) Evaluation were made available at the repositories. All copies placed for public viewing contained the appendices as a compact disc in pockets in the back of the document. The comment is correct that the technical reports supporting the Draft Environmental Impact Statement were only available by request.
106	**Public Involvement**	The first record of a call placed to the Arizona Department of Transportation Environmental Planning Group by the commenter, was Saturday, June 8, 2013. The call was returned to the commenter on Monday, June 10, 2013 and a disc containing the technical reports was provided on the same day.
107	**Public Involvement**	The technical reports were provided to the commenter, as requested, on June 10, 2013, the same day they were requested.
108	**Public Involvement**	On June 17, 2013, the commenter contacted the Arizona Department of Transportation by e-mail to request a scoping technical report, if one existed. The scoping technical report was provided on June 18, 2013. Two of the technical reports requested (Cultural Resources and Section 4[f]) contained confidential information. After discussion with the Federal Highway Administration, release of the reports, in redacted form, was approved. Additional time was required for the Arizona Department of Transportation's cultural staff to review the documents and to redact the information deemed confidential. However, the redacted technical reports were provided on June 28, 2013.

Code	Comment Document

[16 U.S.C. 470w-3(a) — Confidentiality of the location of sensitive historic resources]
(a) The head of a Federal agency or other public official receiving grant assistance pursuant to this Act, after consultation with the Secretary, shall withhold from disclosure to the public, information about the location, character, or ownership of a historic resource if the Secretary and the agency determine that disclosure may —
(1) cause a significant invasion of privacy;
(2) risk harm to the historic resources; or
(3) impede the use of a traditional religious site by practitioners."

108

Of course, this statute refers to information, not whole reports. When I pointed that out in an email, he agreed to produce the report, but that took another eight days.

I gained access to the last of these Technical Reports on June 26, 2013, with portions redacted. That was less than 30 days before the close of comment.

Proj. No. 130601

Subject: DEIS for Loop 202, South Mountain Freeway

Dear Ms. Lawlis:

Per your request, I have reviewed the Draft Environmental Impact Statement (DEIS) for Loop 202, South Mountain Freeway (SMF) and related documents pertaining to travel modeling, traffic, circulation, and transportation and traffic engineering/planning.

I am a Registered Civil and Traffic Engineer in the State of California (Registration Numbers 20137 and 525, respectively) and a Registered Engineer (in retired status) in the States of Washington, Arizona, and Florida. I have over 50 years of experience in traffic and transportation engineering, traffic modeling and forecasting, parking studies, and the preparation of traffic impact studies. I have personally prepared or had a key role in the preparation of over 400 reports, including environmental documents, in various jurisdictions in California, Arizona, Washington, Oregon, Nevada, Colorado, Montana, Louisiana, and Ohio, as well as several multi-State projects sponsored by the U.S. Department of Transportation. My curriculum vitae (cv.) is attached.

Code	Issue	Response
109		See responses to direct comments below.

Code	Comment Document

Based on my review of the documents cited above and my education, professional knowledge and many years of experience, I have identified deficiencies and/or omissions in the environmental documentation for the Loop 202 South Mountain Freeway project. These deficiencies and/or omissions are discussed in my report, attached. In view of these deficiencies and/or omissions, I have concluded that the DEIS leads to the selection of a Preliminarily Preferred Action Alternative, improperly.

In my opinion, based on the information presented, the No Action Alternative should have been selected as the preferred course of action.

Please contact me if I can provide further details or clarification about any matters covered in this letter and the attached report.

Sincerely,

Herman Basmaciyan. P.E.

REVIEW AND CRITIQUE
of
DEIS FOR LOOP 202 (SOUTH MOUNTAIN FREEWAY)

Prepared for

Protect Arizona's Resources and Children (PARC), et al.
Phoenix, Arizona

by
Herman Basmaciyan, P.E.
July 17, 2013

Code	Issue	Response

Code	Comment Document

SECTION I - SUMMARY OF FINDINGS AND CONCLUSIONS

Following is a summary of the findings and conclusions of the review of the DEIS for Loop 202 (South Mountain Freeway) focused on traffic, travel forecasting, circulation, and related matters:

111 1. The socio-economic data projections presented in the Purpose and Need and elsewhere in the DEIS are faulty.

111 2. Since socio-economic data are the starting point for the MAG Travel Model, the travel-related forecasts presented in the Purpose and Need and elsewhere in the DEIS are faulty.

112 3. The forecast of vehicle miles of travel (VMT) lacks credibility. The DEIS states that VMT will grow at a higher rate compared to population and employment growth. This premise is contrary to actual national trends which uniformly show decreases in VMT. Moreover, in the DEIS the methodology used for computation of VMT is not adequately explained.

113 4. As presented in the DEIS, the Purpose and Need defines the need as "completing the Regional Freeway System," "adding capacity to the regional freeway and arterial system," and "serving travel needs in the Southwest area." No compelling need specifically for the South Mountain Freeway (SMF) is presented in the Purpose and Need.

5. The Description of the Proposed Action in the Summary Chapter of the DEIS fails to provide details essential for informed decision-making.

6. Some reasonable and feasible alternatives were not considered in the DEIS or were improperly eliminated early in the screening process.

7. Since the evaluation and selection of alternatives is based largely on the travel forecasts (among other considerations), the evaluations and selection are fatally flawed. As stated in Item 2 above, the travel forecasts were prepared based on faulty socio-economic forecasts.

8. Some impacts, including impacts on the arterial street system adjoining proposed interchanges, construction impacts, and the impacts of truck traffic are not addressed at all or are not adequately addressed in the DEIS.

Code	Issue	Response
111	**Purpose and Need**	The analyses in the Draft Environmental Impact Statement used socioeconomic and traffic projections at the regional analysis zone and traffic analysis zone levels. At the time of publication of the Draft Environmental Impact Statement, Census 2010-based socioeconomic data at the regional analysis zone and traffic analysis zone levels had not been adopted by the Maricopa Association of Governments and were not available to the project team. Therefore, the data used in the Draft Environmental Impact Statement were the most appropriate information available. The Maricopa Association of Governments approved new population, employment, housing, and traffic projections in June 2013. The new data are presented in the Final Environmental Impact Statement beginning on page 1-11. The purpose and need and analysis of alternatives were updated and reevaluated using these new socioeconomic projections and corresponding projections related to regional traffic. While new projections based on the 2010 Census showed a lower anticipated population and vehicle miles traveled in 2035 than the previous projections, the conclusions reached in the Draft Environmental Impact Statement were validated in the Final Environmental Impact Statement (see Chapter 3, *Alternatives*). The traffic analysis demonstrated that the proposed project is needed today and will continue to be needed into the future.
112	**Traffic**	The local conditions and setting of the Phoenix metropolitan area are not consistent with areas of high-density cities in other parts of the country. In Maricopa County, daily vehicle miles traveled levels increased by almost 2 percent between 2011 and 2012, and the 2012 daily vehicle miles traveled are approaching the prerecession peak in 2007. (*Source*: the Arizona Department of Transportation's Multimodal Planning Division's Highway Performance Monitoring System Data for calendar years 2012 and 2011).
113	**Purpose and Need**	The actual need defined in Chapter 1 of the Draft Environmental Impact Statement is based on socioeconomic factors (see page 1-11) and on regional transportation demand and existing and projected transportation system deficiencies (see page 1-13). The proposed action is the construction and operation of a major transportation facility. Chapter 1, *Purpose and Need*, defines the need or the problem the proposed action would solve. Chapter 3 evaluates alternatives for addressing this need. The responsiveness of the proposed freeway to the purpose and need criteria is presented in the Draft Environmental Impact Statement, beginning on page 3-27.

SECTION I - SUMMARY OF FINDINGS AND CONCLUSIONS

Following is a summary of the findings and conclusions of the review of the DEIS for Loop 202 (South Mountain Freeway) focused on traffic, travel forecasting, circulation, and related matters:

1. The socio-economic data projections presented in the Purpose and Need and elsewhere in the DEIS are faulty.

2. Since socio-economic data are the starting point for the MAG Travel Model, the travel-related forecasts presented in the Purpose and Need and elsewhere in the DEIS are faulty.

3. The forecast of vehicle miles of travel (VMT) lacks credibility. The DEIS states that VMT will grow at a higher rate compared to population and employment growth. This premise is contrary to actual national trends which uniformly show decreases in VMT. Moreover, in the DEIS the methodology used for computation of VMT is not adequately explained.

4. As presented in the DEIS, the Purpose and Need defines the need as "completing the Regional Freeway System," "adding capacity to the regional freeway and arterial system," and "serving travel needs in the Southwest area." No compelling need specifically for the South Mountain Freeway (SMF) is presented in the Purpose and Need.

114 5. The Description of the Proposed Action in the Summary Chapter of the DEIS fails to provide details essential for informed decision-making.

115 6. Some reasonable and feasible alternatives were not considered in the DEIS or were improperly eliminated early in the screening process.

116 7. Since the evaluation and selection of alternatives is based largely on the travel forecasts (among other considerations), the evaluations and selection are fatally flawed. As stated in Item 2 above, the travel forecasts were prepared based on faulty socio-economic forecasts.

117 8. Some impacts, including impacts on the arterial street system adjoining proposed interchanges, construction impacts, and the impacts of truck traffic are not addressed at all or are not adequately addressed in the DEIS.

Code	Issue	Response
114	**Purpose and Need**	As pointed out on page S-1, in the sidebar, "*What you will find in the Summary chapter,*" the text in the Summary is not the "final word," and readers are urged to turn to the main text when questions about Summary content arise.
115	**Alternatives**	In accordance with the National Environmental Policy Act, a range of reasonable action alternatives to carry forward for further analysis was determined through application of multidisciplinary criteria in a logical, step-wise progression. Alternatives were not disposed of or dismissed without a thorough evaluation using the multidisciplinary criteria outlined in the alternatives development and screening process presented in Chapter 3 of the Draft Environmental Impact Statement. The preferred alternative was the outcome to this process. Text beginning on page 3-26 of the Draft Environmental Impact Statement establishes conclusions associated with the process.
116	**Traffic**	The Federal Highway Administration and the U.S. Environmental Protection Agency approved the air quality conformity determination that includes the Maricopa Association of Governments regional travel demand model that produced the traffic projections used in the traffic analysis for the project (see page 3-27 of the Draft Environmental Impact Statement). Traffic projections are regularly updated by the Maricopa Association of Governments. The traffic projections in the Draft Environmental Impact Statement are from a model adopted in 2011. The Maricopa Association of Governments approved new population, employment, housing, and traffic projections in June 2013. The new data are presented in the Final Environmental Impact Statement beginning on page 1-11.
117		See responses to specific comments following.

Code	Comment Document

(118)

9. Even assuming arguendo that the demographics used to demonstrate the need for the project are accurate (they are not), none of the Action Alternatives considered will alleviate the anticipated capacity deficiencies identified in the Purpose and Need. Despite the expenditure of about $2 billion to $3 billion to build the South Mountain Freeway and despite the displacement of many residences and business establishments, there will be capacity deficiencies at levels comparable to the No Action Alternative on freeways and arterials throughout the Metropolitan Area and on the South Mountain Freeway itself.

(119)

10. Appropriate mitigation measures are not proposed to mitigate the impacts of the Action Alternatives.

(120)

11. Based on these traffic and circulation considerations, none of the Action Alternatives should have been selected as the Preferred Alternative. Indeed, when correct socio-economic data is used, the No Action Alternative largely achieves the desired outcomes without exorbitant costs and/or negative impacts.

Supporting information for the summary of findings and conclusions is presented in Section II of this report. Exhibits are presented following the last page of Section II.

Code	Issue	Response
118	**Purpose and Need**	Chapter 1 shows that there is a need for a major transportation facility (an action alternative) within the Study Area today and that without a major transportation facility in the Study Area in the future (the No-Action Alternative), the region would continue to suffer even greater congestion, traffic delays, and impacts on the movement of people and goods and the delivery of services. Capacity deficiencies would be substantially greater in the foreseeable future under No-Action when compared against the action alternatives.
119	**Impacts**	The comment provides no specifics. The Arizona Department of Transportation and Federal Highway Administration have included mitigation measures based on the level of impact associated with the proposed action. These mitigation measures have been coordinated and reviewed by local, regional, State, and federal agencies. Specific responses are made to specific comments later in this document.
120	**Alternatives**	The Arizona Department of Transportation, with concurrence from the Federal Highway Administration, has determined that the proposed freeway (as made up by the W59 and E1 Alternatives) is the appropriate solution to the transportation problem identified in the Draft Environmental Impact Statement. All of the alternatives were subject to a thorough evaluation using a multidisciplinary set of criteria in accordance with National Environmental Policy Act and Federal Highway Administration guidance.

Code	Comment Document

SECTION – II SUPPORTING INFORMATION FOR THE SUMMARY OF FINDINGS AND CONCLUSIONS

In this Section of the report, information is presented to support each of the numbered items 1 through 11 in Section I.

121

1. **The socio-economic data projections presented in the Purpose and Need and elsewhere in the DEIS are faulty.** The socio-economic data used in the DEIS was developed by MAG, relying primarily on information from the 2005 special census and not considering the 2010 U.S. Census. As a result, MAG's 2035 forecasts of population, households, and employment are overstated. The procedure MAG used to prepare the forecasts is explained below in a direct quote from the Traffic Overview Report.

A special census was conducted for Maricopa County in 2005 to capture the boom in population, housing, and employment that much of the region experienced during the first half of the decade. In 2007, MAG released socioeconomic projections for Maricopa County based on the results of the 2005 census through 2030. In 2009, MAG subsequently extended these projections through 2035. Table 3 presents the projections for Maricopa County.

Table 3. Projected Growth in Population, Housing, and Employment in Maricopa County, 2005–2035

Year	Population	Housing	Employment
2005	3, 681, 000	1, 480, 000	1, 748, 000
2010	4, 216, 000	1, 685, 000	2, 157, 000
2020	5, 230, 000	2, 104, 000	2, 788, 000
2030	6, 136, 000	2, 502, 000	3, 379, 000
2035	6, 545, 000	2, 676, 000	3, 600, 000

Source: Maricopa Association of Governments, 2007 and 2009

Based on the 2010 U.S. Census data, which should have been reflected in the DEIS, it is obvious that MAG's forecast of socio-economic data based on the 2005 special Census were too high by a large margin. The following table, presents a comparison of MAG's 2010 forecast to actual data from the 2010 U.S. Census.

Code	Issue	Response
121	**Purpose and Need**	The analyses in the Draft Environmental Impact Statement used socioeconomic and traffic projections at the regional analysis zone and traffic analysis zone levels. At the time of publication of the Draft Environmental Impact Statement, Census 2010-based socioeconomic data at the regional analysis zone and traffic analysis zone levels had not been adopted by the Maricopa Association of Governments and were not available to the project team. Therefore, the data used in the Draft Environmental Impact Statement were the most appropriate information available. The Maricopa Association of Governments approved new population, employment, housing, and traffic projections in June 2013. The new data are presented in the Final Environmental Impact Statement beginning on page 1-11. The purpose and need and analysis of alternatives were updated and reevaluated using these new socioeconomic projections and corresponding projections related to regional traffic. While new projections based on the 2010 Census showed a lower anticipated population and vehicle miles traveled in 2035 than the previous projections, the conclusions reached in the Draft Environmental Impact Statement were validated in the Final Environmental Impact Statement (see Chapter 3, *Alternatives*). The traffic analysis demonstrated that the proposed project is needed today and will continue to be needed into the future. Chapter 1 shows that there is a need for a major transportation facility (an action alternative) within the Study Area today and that without a major transportation facility in the Study Area in the future (the No-Action Alternative), the region would continue to suffer even greater congestion, traffic delays, and impacts on the movement of people and goods and the delivery of services. The Arizona Department of Transportation, with concurrence from the Federal Highway Administration, has determined that the proposed freeway (as made up by the W59 and E1 Alternatives) is the appropriate solution to the transportation problem identified in the Draft Environmental Impact Statement.

Comparison of 2010 Census Data to MAG/DEIS Growth Projections, 2005-2010

TOTAL	2005 Actual	2010 Projected	2005-2010 Projected Annual Growth Rate	2010 Actual	2005-2010 Actual Annual Growth Rate
Population - County	3,681,025	4,216,499	2.75%	3,817,117	0.73%
Population - Study Area	1,951,251	2,274,221	3.11%	2,117,619	1.65%
Total Housing Units - County	1,479,767	1,685,134	2.63%	1,639,279	2.07%
Total Housing Units - Study Area	471,484	589,087	4.55%	478,340	0.29%

122

MAG's forecast of Maricopa County population for 2010 is 4,216,499 compared to the actual U.S. Census population of 3,817,117. The MAG forecast is too high by approximately 400,000, or about a 10% overstatement compared to the actual 2010 U.S. Census population. Housing units for Maricopa County are overestimated by about 3%. Population for the Study Area is overestimated by about 7%, and housing units for the Study area are overestimated by MAG by about 23%. Likewise there are large discrepancies in the forecast and actual annual growth rates between 2005 and 2010 in all categories.

Because of these inaccuracies in the MAG socio-economic forecasts even for a short term of five years (2005 to 2010), the long term forecasts for a 30-year period (2005 to 2035) are substantially overstated and are not reliable. If the DEIS had taken into account the information from the 2010 U.S. Census, the 2035 socio-economic forecasts would have started at a lower reference point for 2010. The resulting 2035 forecasts would have been lower even if all other procedures and modeling parameters were unchanged from those used in the 2007/2009 MAG forecasts.

123

2. **Since socio-economic data are the starting point for the MAG Travel Model, the travel-related forecasts presented in the Purpose and Need and elsewhere in the DEIS are faulty.** The DEIS should have presented travel forecasts based on correct socio-economic data in all affected text, tables and figures in the DEIS. Faulty travel forecasts affect the Air Quality and Noise impact analyses in addition to the analysis of traffic and circulation impacts.

3. **The forecast of vehicle miles of travel (VMT) lacks credibility. The DEIS states that VMT will grow at a higher rate compared to population and employment growth. This premise is contrary to actual national trends which uniformly show decreases in VMT. Moreover, in the DEIS the methodology used for computation of VMT is not adequately explained.** Figure 1-4 in the Purpose and Need chapter of the DEIS indicates that the number of daily vehicle miles of travel (VMT) will be approximately 185,000,000 and that VMT growth will outpace the growth in population, employment and housing units. This premise is contradictory to the following quote from the Traffic Overview Report (Page 2-5).

Code	Issue	Response
122	**Purpose and Need**	The historical growth in the Maricopa Association of Governments region is discussed in the Draft Environmental Impact Statement, beginning on page 1-5. Critical factors such as available land, mild climate, affordable cost of living, and employment opportunities that led to the historical growth rates in the region remain unchanged. The Maricopa Association of Governments approved new population, employment, housing, and traffic projections in June 2013. The new data are presented in the Final Environmental Impact Statement beginning on page 1-11. The purpose and need and analysis of alternatives were updated and reevaluated using these new socioeconomic projections and corresponding projections related to regional traffic. While new projections based on the 2010 Census showed a lower anticipated population and vehicle miles traveled in 2035 than the previous projections, the conclusions reached in the Draft Environmental Impact Statement were validated in the Final Environmental Impact Statement (see Chapter 3, *Alternatives*). The traffic analysis demonstrated that the proposed project is needed today and will continue to be needed into the future.
123	**Purpose and Need**	The analyses in the Draft Environmental Impact Statement used socioeconomic and traffic projections at the regional analysis zone and traffic analysis zone levels. At the time of publication of the Draft Environmental Impact Statement, Census 2010-based socioeconomic data at the regional analysis zone and traffic analysis zone levels had not been adopted by the Maricopa Association of Governments and were not available to the project team. Therefore, the data used in the Draft Environmental Impact Statement were the most appropriate information available. The Maricopa Association of Governments approved new population, employment, housing, and traffic projections in June 2013. The new data are presented in the Final Environmental Impact Statement beginning on page 1-11. The purpose and need and analysis of alternatives were updated and reevaluated using these new socioeconomic projections and corresponding projections related to regional traffic. While new projections based on the 2010 Census showed a lower anticipated population and vehicle miles traveled in 2035 than the previous projections, the conclusions reached in the Draft Environmental Impact Statement were validated in the Final Environmental Impact Statement (see Chapter 3, *Alternatives*). The traffic analysis demonstrated that the proposed project is needed today and will continue to be needed into the future.

123

"Historical and Projected Travel in the MAG Region

Historical population growth in the region (see Table 2) greatly pressured the region's transportation system. As shown in Table 7, the growth in travel, as measured in vehicle miles traveled (VMT), has mirrored the growth in population in Maricopa County (an annual compound growth rate of approximately 5.4 percent). In 2010, travel demand reached 101 million VMT per day (MAG 2010a) and is projected to reach 185 million VMT per day in 2035 (MAG 2010a)."

The growth in VMT from 101 million in 2010 to 185 million in 2035 would represent an annual compound growth rate of about 2.5%. On the other hand, Table 20-4 on Page 20-8 (Exhibit 1) of the RTP states that in 2030 VMT will be approximately 139,740,000 if the RTP improvements are implemented. Accordingly, the 2035 VMT (per the DEIS) of 185,000,000 would represent a compound growth rate of about 7% per year for the 5 years between MAG's 2030 VMT forecast and the 2035 VMT forecast in the DEIS. These apparent discrepancies amongst the various sources cited cast serious doubt on the credibility of the VMT estimate presented in the DEIS. Notwithstanding the foregoing, if correct socio-economic data forecasts were used in the DEIS, the 2035 VMT would have been even lower.

ADOT's over-statement of VMT in the DEIS is further compounded when viewed in the context of recent travel trends and forecasts. Travel surveys nationally and in the MAG region indicate that travel statistics such as trip length, VMT per person, and VMT per household have actually decreased in recent years or have been steady. According to the National Household Travel Survey (NHTS), which is a periodic travel survey sponsored by the US DOT, the average vehicle trip length was 9.9 miles in 2001 and 9.7 miles in 2009 (Table 3, Page 10) (see Exhibit 2). Since the 95% confidence interval stated by the survey is 0.2, statistically there was no change in the average trip length. Also the number of daily vehicle trips per household dropped from 5.95 in 2001 to 5.66 in 2009. Since the confidence interval in this case is .06, the decrease is statistically significant. Figure 6, Page 32 (Exhibit 3) indicates that average time spent in vehicles and miles traveled were lower in metropolitan areas in all population ranges and in rural areas.

MAG was a participant in the 2009 NHTS Survey (surveys were conducted between April 2008 and April 2009) and augmented the national data base by added household surveys within the MAG Region. MAG documented the results of the survey in its publication "MAG 2008 NHTS Dataset for the MAG Region." Table 7 on Page 107 (Exhibit 4) of this publication daily trip rates in the MAG Region are presented. The daily trip rates range from a low of 3.72 on Sunday to

Code	Issue	Response
123 (cont.)		Under the National Environmental Policy Act, it is common for new data to avail itself and to, therefore, update the environmental impact statement as new data become available. It is not a requirement, however, to stop the environmental impact statement process in its entirety to wait for new information to become available. Completing an environmental impact statement under those terms would be quite difficult and, arguably, the public would not receive benefits associated with a proposed public infrastructure action. In this case, the project team experts were aware that socioeconomic projections were to be made available but it was likely (based on the Draft Environmental Impact Statement content and processes and a qualitative understanding of what the updated information would show and reveal) that conclusions affected by such data would not substantially change. The team undertook a quite acceptable, common, and understood practice of publishing the Draft Environmental Impact Statement while new data was developing and then present the new information in the Final Environmental Impact Statement. The new information would not automatically assume the need for a supplemental document.

Code	Comment Document

Code	Issue	Response

123

a high of 7.26 on a Tuesday. The 7-day weekly numerical average is 4.99 vehicle trips per household, and the numerical average of the five weekdays is 5.45 vehicle trips per household. The trip rates in the MAG data set are comparable to the NHTS national rates. The DEIS does not reference the 2009 NHTS results which do not support the projections of VMT levels relied on to support the South Mountain Freeway (SMF).

In 2001 MAG conducted the Maricopa Regional Household Travel Survey. A Final Report was prepared making it possible to compare several trip-making characteristics and trends/changes between the 2001 and the 2008/2009 data sets. Trip rates per household for all modes increased between 2001 and 2008/2009 from 7.38 to 10.50, as reported on Page 120 of "MAG 2008 NHTS Dataset for the MAG Region" (Exhibit 5) The duration of trips in 2001 and 2008 (trip length in minutes) appears to be comparable, since the tabulated data for the 2001 survey (Pages 76 through 78 of the Final Report) (Exhibit 6) follows the same curve pattern illustrated in Figure 7-10 in the report "MAG 2008 NHTS Dataset for the MAG Region" (Exhibit 7). Again, comparing MAG data for 2001 and 2009, the drastic increases in VMT presented in the DEIS cannot be supported.

Several sources, including the U.S. PIRG Education Fund, the Economist, and the New York Times, have published reports and articles about declining trends in VMT. Some of the downturn or flattening in VMT trends may be attributable to major events such as the recession in the early 1990s, bursting of the high tech bubble, the bursting of the housing bubble, and rises in fuel costs. On the other hand, changes in travel habits and the "travel time budget," or the concept that the time a driver will devote to driving on any given day is limited, could also have contributed to the flattening or reductions in vehicle miles of travel. In addition, factors to be considered include increased use of on-line shopping, a larger proportion of elderly persons who tend to make fewer, and/or shorter, driving trips, and other factors.

The VMT numbers presented in the DEIS are at odds with this generally recognized downward trend in VMT. The reason for this apparent divergence from documented trends is not clear. Was the estimate of VMT for 2035 a direct unadjusted output generated by the MAG Regional Travel model or was it computed by another methodology? If not generated by the model, why not? What was the methodology used? A reliable forecast of VMT is important for the Air Quality impact analysis in addition to the analysis of traffic and circulation impacts.

4. **As presented in the DEIS, the Purpose and Need defines the need as "completing the Regional Freeway System," "adding capacity to the regional freeway and arterial system," and "serving travel needs in the Southwest area." No compelling need specifically for the South Mountain Freeway (SMF) is presented in the Purpose and Need.** The Purpose and Need statement in the DEIS is very general and is focused on the need to add freeway capacity but

Code	Comment Document

123

not focused on building the SMF. The problems identified that lead to the proposed action (not direct quotes) are:

- Accommodating population and employment growth in the Phoenix Metropolitan Area.
- Completing the Regional Freeway and Highway System, that was delineated about 30 years ago.
- Providing additional freeway capacity to reduce congestion in the Urban Core.
- Serve travel needs in the Southwest portion of the Metropolitan Area.

The stated needs point to Regional level problems and not to a specific facility such as the proposed South Mountain Freeway, Loop 202 (SMT). Following is a discussion of each of the stated problems and why they do not define the need for a specific facility:

124

- There is no question that historically, the Phoenix Metropolitan Area has grown very rapidly. Going forward, however, growth will likely not occur at a steady pace. Undoubtedly, there will be cyclical ups and downs. In the long-range future, the trend will likely be upwards, although it appears that the actual amount and rate of growth reached by the planning horizon year 2035 will be significantly less than forecasted in the DEIS. Nevertheless, in view of the anticipated growth, the case is made in the Purpose and Need (P&N) chapter of the DEIS that the transportation infrastructure needs to be improved. The P&N, however, does not support construction of the SMF (Loop 202), as would be appropriate for a DEIS that may lead to an action, in this case the construction of the freeway.

125

- The justification in the P&N that Loop 202 is in the RTP and has been on the books for 30 years is a self-fulfilling objective. The presentation of historical data in the P&N is beneficial because it gives the public a sense of what has transpired in the last 25 to 30 years. The Purpose and Need for the South Mountain Freeway however, should have been supported, in addition, by specific problems that Loop 202 would reasonably be expected to alleviate or address, since this DEIS is for a proposed implementation action and not for a programmatic action such as the adoption of the RTP.

126

- The P&N emphasizes that additional freeway capacity would be needed in the Phoenix Metropolitan Area. But, the capacity deficiencies are concentrated in the Urban Core and along I-10, I-17, S1, US 60 and other freeways to the east and north. The P&N does not identify the travel components (origin and destination combinations) that Loop 202 would divert away from the freeways that are congested now or are expected to be congested in 2035. The question arises whether all reasonable

Code	Issue	Response
124	**Purpose and Need**	Chapter 1, *Purpose and Need*, follows Federal Highway Administration guidance with respect to complying with the National Environmental Policy Act, which is to define the transportation problem. This Draft Environmental Impact Statement chapter analyzing the purpose and need for the proposed action does not identify a specific facility as the solution. That is addressed in Chapter 3. The comment notes that it is unlikely that growth will occur at a steady pace. First, there is no basis upon which this statement is made. Regardless, as illustrated in Chapter 1 of the Draft and Final Environmental Impact Statement, historical growth rates and trends are described that support the idea that growth has not occurred at a steady pace but is subject to external factors such as new technology, changes in market conditions, cost of living. However, the growth model for future planning purposes does take historical growth trends and "level" them out; a common practice in growth models used by metropolitan planning organizations such as the Maricopa Association of Governments.
125	**Purpose and Need**	Nowhere in the Draft Environmental Impact Statement is reference made that the proposed action is needed to comply with the *Regional Transportation Plan*. The analysis of purpose and need would have ended the environmental impact statement process at that point if a need in the form of a transportation problem had not been identified, and this is disclosed in the Draft Environmental Impact Statement. As observed in the comment, this information is provided for historical perspective. That is why it is presented in the section, *Historical Context of the Proposed Action*. By objectively examining travel in the region and establishing need as presented in Chapter 1 of the Draft Environmental Impact Statement, the alternatives process focused on a systematic, sequential, interdisciplinary approach to establishing a range of reasonable alternatives. An incidental benefit of the results as presented in text beginning on page 3-35 is consistency with local planning. In fact, as disclosed in Chapter 1, it is further explained that the analysis of purpose and need would have ended the environmental impact statement process at that point if a need in the form of a transportation problem had not been identified.
126	**Purpose and Need**	The analyses in the Draft Environmental Impact Statement used socioeconomic and traffic projections at the regional analysis zone and traffic analysis zone levels. At the time of publication of the Draft Environmental Impact Statement, Census 2010-based socioeconomic data at the regional analysis zone and traffic analysis zone levels had not been adopted by the Maricopa Association of Governments and were not available to the project team. Therefore, the data used in the Draft Environmental Impact Statement were the most appropriate information available. The Maricopa Association of Governments approved new population, employment, housing, and traffic projections in June 2013. The new data are presented in the Final Environmental Impact Statement beginning on page 1-11. The purpose and need and analysis of alternatives were updated and reevaluated using these new socioeconomic projections and corresponding projections related to regional traffic. While new projections based on the 2010 Census showed a lower anticipated population and vehicle miles traveled in 2035 than the previous projections, the conclusions reached in the Draft Environmental Impact Statement were validated in the Final Environmental Impact Statement (see Chapter 3, *Alternatives*). The traffic analysis demonstrated that the proposed project is needed today and will continue to be needed into the future. Information related to the origin and destination, including pass-thru, of vehicles that would use the proposed freeway is presented in Figure 3-18 on page 3-36 of the Draft Environmental Impact Statement.

(Response 126 continues on next page)

Code	Comment Document

alternatives have been considered in the DEIS, or if they may have been eliminated too early in the tiered screening process. Also please see the next item.

127

- The information in the P&N indicates that congestion on I-10 (Papago) extends to the West almost as far as Loop 101 (Agua Fria) and on I-10 (Maricopa as far South as Loop 202 (Santan) and beyond. Traffic volumes in the P&N (2010 and 2035) indicate that traffic volumes on the north south arterials in the Study Area go up approaching I-10 (Papago) and that traffic on the east-west arterials go up approaching I-10 (Maricopa). Clearly travel from the southwest area is oriented to the north and east, rather than to the west. Since traffic to/from the Southwest area will continue to use the congested portions of I-10, it is unclear how the SMF will alleviate congestion in the urban core.

128

- The north-south portion of Loop 202 (South Mountain), may be beneficial for north-south traffic destined for I-10 because some traffic that would be on the arterials would be able to use Loop 202 instead. However, on I-10, motorists would encounter congestion whether traveling east or west. The east-west portion of Loop 202 would not be an alternative to the congested east-west arterials because there is no north-south access across South Mountain. Therefore, congested arterials such as Baseline Road and other east-west arterials further north are not likely to receive much, if any, benefit from the east-west portion of Loop 202.

129

The P&N should have identified and itemized the problem (s) that create the need for the proposed action in specific terms such as:

- Alleviating a specific current or expected future capacity deficiency (for example, I-10 between Point A and Point B) on the freeway system or on the arterials.
- Providing an adequate roadway network to serve the circulation needs within the Study Area and identifying deficiencies in terms such as Baseline Road between Point A and Point B.
- Accommodating commuters to/from the Study Area. Number of work trips between the Study Area and other parts of the Metropolitan Area should have been presented to support the need.
- Serving pass-through truck traffic between major truck origins and destinations. An example might have been: About 1,000 trucks use I-10 through Phoenix now en route between the East Coast and Los Angeles, without stopping in Phoenix. This number is forecast to increase to 4,500 in 2035, contributing to worsening congestion on I-10.

In summary, even if the supporting demographic forecasts are presumed accurate, the P&N in the DEIS does not support the construction of SMF (Loop 202). The DEIS should have but failed to identify, let alone analyze, the compelling

Code	Issue	Response
126 (cont.)		In accordance with the National Environmental Policy Act, a range of reasonable action alternatives to carry forward for further analysis was determined through application of multidisciplinary criteria in a logical, step-wise progression. Alternatives were not disposed of or dismissed without a thorough evaluation using the multidisciplinary criteria outlined in the alternatives development and screening process presented in Chapter 3 of the Draft Environmental Impact Statement. The preferred alternative was the outcome to this process. Text beginning on page 3-26 of the Draft Environmental Impact Statement establishes conclusions associated with the process.
127	**Purpose and Need**	The comment states that "Clearly travel from the southwest is oriented to the north and east, rather than to the west." First, there is no basis upon which this statement is made. The purpose of a major transportation facility in the Study Area is to help address increased travel from the southwest to the east. The major transportation facility would provide an alternate route to congested portions of Interstate 10. The purpose and need analysis as described in Chapter 1 of the Draft and Final Environmental Impact Statements confirmed the Study Area as the appropriate area in which to define the transportation problem. While other transportation problems may existing in the region's transportation network, this environmental impact statement process focused appropriately on the identified problem in the southwest region of the Phoenix metropolitan area.
128	**Alternatives**	The purpose and need analysis as described in Chapter 1 of the Draft and Final Environmental Impact Statements confirmed the Study Area as the appropriate area in which to define the transportation problem. While other transportation problems may existing in the region's transportation network, this environmental impact statement process focused appropriately on the identified problem in the southwest region of the Phoenix metropolitan area. As stated in text in the Draft Environmental Impact Statement, beginning on page 3-27, the proposed freeway would appropriately shift traffic from some other freeway segments and the arterial network. Figure 3-12, in this section, illustrates positive effects on arterial roads such as the referenced Baseline Road.
129	**Purpose and Need**	In response to the comment, the reader is referred to both Chapters 1 and 3 of the Draft and Final Environmental Impact Statements. Text in each of these chapters speaks specifically to the context of purpose and need in terms of the four bulleted points in the comment. The proposed freeway would alleviate identified capacity deficiency, would enhance the circulation needs with the Study Area, would serve commuter travel, and would accommodate truck traffic at vehicle mix percentages similar to those percentages found throughout the region's freeway network.

problems and needs in the Study Area that the SMF would be intended to alleviate. Specific evaluation criteria could then have been developed to assess the effectiveness of each alternative to alleviate, wholly or partially, each of the problems in the Study Area. This lack of specificity in the Purpose and Need affects the identification of alternatives and the evaluation of alternatives.

130 5. **Some reasonable and feasible alternatives were eliminated early in the screening process, possibly due to the faulty Purpose and Need. With a revised and appropriately framed Purpose and Need, additional alternatives may emerge.** On Page 3-3 of the DEIS, the alternatives screening criteria are presented as quoted below.

---

131 *The following general categories reflect the criteria established for the screening process (Alternatives Screening Report [2003]):*

- *ability to satisfy purpose and need*
- *ability to minimize impacts on the human and natural environments*
- *ability to improve operational characteristics of the region's transportation system*
- *degree of public and political acceptability*
- *consideration of overall conceptual cost estimates*

---

132 Since one of the criteria is satisfying the Purpose and Need, a faulty Purpose and Need would result in a faulty screening process. In addition, the third bullet item in the criteria is one of the needs identified in the Purpose and Need; it is duplicative and is not a separate and distinct criterion.

133 Alternatives that should have been but were not included in the evaluations or those that should have been evaluated in greater detail include:

134 a) As discussed previously, the No Action Alternative should have been identified as the preferred alternative in the DEIS. The No Action Alternative is dismissed in the DEIS simply because it does not meet the Purpose and Need. Since the Purpose and Need is faulty, this reason for dismissing the No Action Alternative is not defensible. The No Action Alternative would have no physical impacts, including no impact on South Mountain. It may also have beneficial air quality and noise impacts because the No Action Alternative would result in less VMT, compared to the Preferred Action Alternative as indicated by the comparison of VMT for the "RTP 2030" and "No Build" Alternatives presented in the MAG RTP, Table 20-4 on Page 20-8 (Exhibit 1). Notwithstanding, there were other Action alternatives that would have met the Purpose and Need but were not considered in the DEIS or were not adequately addressed.

Code	Issue	Response
130		See response to specific comments below.
131		See response to specific comments below.
132	**Purpose and Need**	The analyses in the Draft Environmental Impact Statement used socioeconomic and traffic projections at the regional analysis zone and traffic analysis zone levels. At the time of publication of the Draft Environmental Impact Statement, Census 2010-based socioeconomic data at the regional analysis zone and traffic analysis zone levels had not been adopted by the Maricopa Association of Governments and were not available to the project team. Therefore, the data used in the Draft Environmental Impact Statement were the most appropriate information available. The Maricopa Association of Governments approved new population, employment, housing, and traffic projections in June 2013. The new data are presented in the Final Environmental Impact Statement beginning on page 1-11. The purpose and need and analysis of alternatives were updated and reevaluated using these new socioeconomic projections and corresponding projections related to regional traffic. While new projections based on the 2010 Census showed a lower anticipated population and vehicle miles traveled in 2035 than the previous projections, the conclusions reached in the Draft Environmental Impact Statement were validated in the Final Environmental Impact Statement (see Chapter 3, *Alternatives*). The traffic analysis demonstrated that the proposed project is needed today and will continue to be needed into the future. Past determinations surrounding the alternatives development and screening process, including the reasons for the elimination of alternatives, as outlined in Chapter 3 of the Final Environmental Impact Statement, were reviewed for appropriateness based on the new data and were determined to remain appropriate screening determinations. The noted duplicate criterion has been deleted from the Final Environmental Impact Statement.
133		See response to specific comments below.
134	**Alternatives**	As stated on page 3-40 of the Final Environmental Impact Statement, the No-Action Alternative would not satisfy the purpose and need of the proposed action because it would result in further difficulty in gaining access to adjacent land uses, increased difficulty in gaining access to Interstate and regional freeway systems from the local arterial street network, increased levels of congestion-related impacts, continued degradation in performance of regional freeway-dependent transit services, increased trip times, and higher user costs. Further, the No-Action Alternative would be inconsistent with Maricopa Association of Governments' and local jurisdictions' long-range planning and policies. The No-Action Alternative was included in the Draft and Final Environmental Impact Statements for detailed study to compare impacts of the action alternatives with the consequences of doing nothing (impacts can result from choosing to do nothing).

Code	Comment Document
135	b) The initial list of modal alternatives does not include a hybrid consisting of freeway spot improvements where needed, new freeway segment (s), more lanes on selected arterials beyond the improvements included in the RTP, additional arterials not included in the RTP. A well-defined hybrid alternative should have been considered and evaluated. An example of a hybrid alternative, that would include some of the features of the Preferred Action Alternative and that would avoid any impacts on South Mountain, is presented in attached Exhibit 8. The salient features of the hybrid alternative would be: • Construction of a freeway along the alignment of the Preliminarily Selected Action Alternative (59th Avenue/63rd Avenue) between I-10 and W. Carver Road, • Construction of a new four-lane arterial along W. Carver Road between 59th Avenue and 51st Avenue, • Arterial improvements along 51st Avenue between W. Carver Road and W. Pecos Road (extended westerly from the western terminus of Pecos Road), • Construction of a new four-lane arterial between 51st Avenue and the present western terminus of Pecos Road (generally east west along an alignment approximating an extension of W. Pecos Road) • Extensive arterial improvements in the Southwest area.
136	c) Dismissal of all alternatives impacting GRIC land without thorough evaluation is not appropriate. When the complete set of benefits, costs and impacts are assessed one or more alternatives through GRIC may emerge to be a better choice than the Preferred Action Alternative. Alternatives not considered or not evaluated fully include: • The "Community Alternative" that is depicted in Figure 3-11 on Page 3-25 of the DEIS. This alternative would not have any impacts on South Mountain. An alignment similar to the Community Alternative is shown in an article on the Arizona Republic website. The link to the article is: http://www.azcentral.com/community/ahwatukee/articles/20130308south-mountain-freeway-plan-ignored.html • The various alternatives through GRIC land that parallel W. Pecos Road, depicted in Figure 3-5 on Page 3-7 of the DEIS.

Code	Issue	Response
135	**Alternatives**	According to 23 Code of Federal Regulations §771.111(f)," the action evaluated in the environmental impact statement must connect logical termini and be of sufficient length to address environmental matters on a broad scope...". The proposed action should satisfy the project need and should be considered in the context of the local area socioeconomics and topography, the future travel demand, and other infrastructure improvements in the area. A partial freeway from Interstate 10 (Papago Freeway) to Laveen Village is not feasible because it would not meet the proposed freeway's identified purpose and need. Construction of Carver Road between 59th and 51st avenues is included in the City of Phoenix General Plan transportation element. Improving 51st Avenue between Carver Road and Pecos Road would require permission of the Gila River Indian Community. Any alternative on Gila River Indian Community land must consider tribal sovereignty. Tribal sovereignty is based in the inherent authority of Native American tribes to govern themselves. While this notion of sovereignty is manifested in many areas, generally Native American land is held in trust by the United States. Native American communities have the authority to regulate land uses and activities on their lands. States have very limited authority over activities within tribal land (see page 2-1 of the Final Environmental Impact Statement). From a practical standpoint, this means that the Arizona Department of Transportation and Federal Highway Administration do not have the authority to survey tribal land, make land use (including transportation) determinations directly affecting tribal land, or condemn tribal land for public benefit through an eminent domain process. Based on previous comments from the Gila River Indian Community related to pass-through traffic using 51st Avenue, the Gila River Indian Community would not support any activities that would increase unwanted traffic through its communities. Extending Pecos Road to 51st Avenue would not be feasible because a portion would be located on Gila River Indian Community land, and the Gila River Indian Community has not provided permission to construct a facility on its land. Based on previous comments from the Gila River Indian Community related to pass-through traffic using 51st Avenue, the Gila River Indian Community would not support any activities that would increase unwanted traffic through its communities. Improvements to the arterial street system in the southwestern area (Laveen and Estrella Villages) are planned in the City of Phoenix General Plan. For these reasons, alternatives similar to the hybrid alternative proposed in the comment were eliminated from detailed study.
136	**Alternatives**	Dismissal of all alternatives affecting Gila River Indian Community land is appropriate. The act by the Gila River Indian Community of not allowing alternatives on its land is sufficient evaluation. The Gila River Indian Community has consistently stated (beginning in 2000, with a Community Council resolution) that it is not interested in an alternative on its land. See Draft Environmental Impact Statement Chapter 2, *Gila River Indian Community Coordination*.

(Response 136 continues on next page)

Code	Comment Document

- The Riggs Road/Beltline Road/51st Avenue Alternative that would avoid any impacts on South Mountain

- The Queen Creek Road Alternative that would have no impact on south Mountain

137

c) A depressed freeway alternative along W. Pecos Road in the Eastern Section of the SMF is discussed in the DEIS starting on Page 3-15 and several pages following. In the third tier screening of alternatives, the depressed freeway alternative was dropped from further evaluation because of drainage design complications, greater right-of-way need compared to the rolling profile, more residential displacements, and increased construction and right-of-way costs. In the third tier screening, the decision to construct the SMF as an eight-lane facility (three general purpose lanes plus one high occupancy lane in each direction) had not been made. The reduction of the SMF from a 10-lane facility to an 8-lane facility was made in the fourth tier screening. Therefore, it is unclear if the additional right-of-way need for about 150 acres is in reference to a 10-lane or an 8-lane design. The DEIS should have considered this matter and verify if, in fact, a depressed profile would require 150 acres of additional right-of-way beyond what ADOT has already acquired plus what ADOT would need to acquire to accommodate the 8-lane SMF rolling profile. Since 90% of the cost difference between the rolling and depressed alternatives is attributed to right-of-way, any reductions in right-of-way would make a large difference in cost and in residential displacements. The matter of a depressed profile should have been re-visited after the decision to use an 8-lane cross section to confirm or revise the previous findings based on the 10-lane alignment. This re-visit should have identified the additional parcels that would need to be acquired and the residential displacements.

On Page 3-18 of the DEIS, Impacts on Ahwatukee Foothills Village are discussed in the following quote:

138

Impacts on Ahwatukee Foothills Village – *The public generally perceives that a depressed freeway would reduce and/or eliminate impacts on visual resources and freeway-related noise. Visual and noise-level impacts from operation of the proposed E1 Alternative would, however, still occur and would require mitigation, as would be the case for the at-grade rolling profile.*

139

It is unclear from the statement in the DEIS if the impacts of the rolling profile and depressed alternatives would be identical or if the depressed alternative would have less impact. The DEIS should have this clear and recognize any advantages the depressed alternative might have, if any. If

Code	Issue	Response
136 (cont.)		Tribal sovereignty is based in the inherent authority of Native American tribes to govern themselves. While this notion of sovereignty is manifested in many areas, generally Native American land is held in trust by the United States. Native American communities have the authority to regulate land uses and activities on their lands. States have very limited authority over activities within tribal land (see page 2-1 of the Draft Environmental Impact Statement). From a practical standpoint, this means that the Arizona Department of Transportation and Federal Highway Administration do not have the authority to survey tribal land, make land use (including transportation) determinations directly affecting tribal land, or condemn tribal land for public benefit through an eminent domain process.
137	**Alternatives**	All of the design options and refinements (such as tunnel and bridge options and depressed freeway options) considered in the Third-Tier screening were revisited after the determination to change the proposed freeway from ten to eight lanes. The comparisons presented in the Draft Environmental Impact Statement section, *Depressed Freeway Options*, reflect an eight-lane freeway concept for the at-grade/ elevated profile and the depressed profile.
138		Quote from Draft Environmental Impact Statement.
139	**Drainage**	As noted on page 3-18 of the Draft Environmental Impact Statement, drainage served as the primary design constraint for the Pecos Road segment of the E1 Alternative. Assessments were performed to determine constructibility and effectiveness in avoiding or reducing impacts and to evaluate whether a depressed profile would generate other desired or undesired outcomes. Based on the results of these assessments, further design options were developed and refined in attempts to reduce impacts on the adjacent community. The modifications incorporated alternative drainage designs, use of retaining walls, and other features to reduce right-of-way requirements.

Code	Comment Document

the depressed alternative would have less impact than the rolling profile alternative, less mitigation would be needed.

140 d) The Ray Road and Chandler Boulevard Alternatives were improperly dismissed from further consideration in the second tier screening on the basis of "substantial" impacts that were not quantified in the DEIS. In the western portion of the SMF, several location alternatives and variations were studied in detail. By comparison, in the eastern portion W. Pecos Road became the sole survivor of the screening process very early in the evaluation process.

141 e) In the screening process, the "freeway" alternatives of the westerly extension of the Superstition Freeway, the southerly extension of SR 51, and the southerly extension of I-10 to the Superstition Freeway (extended) were dismissed in the second tier of screening. The rationale for elimination from further consideration was not supported by substantive analysis in the DEIS. If there was any substantive analysis, it should have been presented in the DEIS. Because of the location of these alternatives, there would be no impacts on South Mountain.

142 f) Freeway improvements on the congested freeways in the urban core should have been considered and discussed in the DEIS. Possible improvements to alleviate congestion where the congestion now exists (rather than build the SMF) could include addition of high occupancy/toll lanes (HOT lanes), auxiliary lanes, interchange improvements, and others. If such improvements were deemed to be not feasible after substantive analysis, the conclusions should have been documented more thoroughly in the DEIS along with the rationale for rejecting such alternatives. Because of the location of such improvements, there would be no impacts on South Mountain.

143 g) The I-8/SR 85 Alternative, mentioned on Page 3-9, is dismissed because it does not meet the Purpose and Need for the proposed action. Since the Purpose and Need is faulty, the dismissal of this alternative on the basis of the Purpose and Need is also faulty. The benefits of this alternative, that would avoid any impacts on South Mountain, should have been quantified and presented in the DEIS.

144 h) The development of a complete arterial system in the Southwest area was not considered in the DEIS. As discussed in Item 5.b), the MAG RTP does not indicate any arterial improvements except one new arterial facility in the Southwest area. A complete arterial system would alleviate much of the forecasted congestion in the area and would meet the Purpose and Need objectives of adding capacity and improving circulation in the

Code	Issue	Response
140	**Alternatives**	In accordance with the National Environmental Policy Act, a range of reasonable action alternatives to carry forward for further analysis was determined through application of multidisciplinary criteria in a logical, step-wise progression. As noted in Table 3-5 on page 3-12 of the Draft Environmental Impact Statement, the Ray Road and Chandler Boulevard alternatives would result in hundreds of residential and business displacements and would split the Ahwatukee Foothills Village. For these reasons, the two alternatives were eliminated from detailed study.
141	**Alternatives**	In the Eastern Section, the initial screening identified clear, undesirable aspects of the alternatives, with only the E1 Alternative being prudent and feasible. In the Western Section, the three action alternatives studied in detail each had positive and negative aspects, however none were substantial enough to eliminate the alternative (or other alternatives). The Draft Environmental Impact Statement is a summary of technical analyses providing the necessary details associated with the decision-making process. Additional details and quantities are documented in technical reports and memos. Alternatives were not disposed of or dismissed without a thorough evaluation using the multidisciplinary criteria outlined in the alternatives development and screening process.
142	**Alternatives**	The Draft Environmental Impact Statement is a summary of technical analyses providing the necessary details associated with the decision-making process. Additional details and quantities are documented in technical reports and memos. Alternatives were not disposed of or dismissed without a thorough evaluation using the multidisciplinary criteria outlined in the alternatives development and screening process. Improvements to other freeway corridors such as Interstate 10, other new freeways such as State Route 303 Loop, arterial street improvements, and expansion of the existing bus and light rail systems are included in the *Regional Transportation Plan*. See discussion beginning on page 1-9 of the Draft Environmental Impact Statement. The analysis of future conditions includes the assumption that all of the planned improvements identified in the *Regional Transportation Plan* would be in place by 2035. Draft Environmental Impact Statement Chapter 1, *Purpose and Need*, concludes that, even with these improvement in place, there is a clear need for a major transportation facility in the Study Area.

(Responses continue on next page)

Code	Comment Document

Code	Issue	Response
143	**Alternatives**	The analyses in the Draft Environmental Impact Statement used socioeconomic and traffic projections at the regional analysis zone and traffic analysis zone levels. At the time of publication of the Draft Environmental Impact Statement, Census 2010-based socioeconomic data at the regional analysis zone and traffic analysis zone levels had not been adopted by the Maricopa Association of Governments and were not available to the project team. Therefore, the data used in the Draft Environmental Impact Statement were the most appropriate information available. The Maricopa Association of Governments approved new population, employment, housing, and traffic projections in June 2013. The new data are presented in the Final Environmental Impact Statement beginning on page 1-11. While new projections based on the 2010 Census showed a lower anticipated population and vehicle miles traveled in 2035 than the previous projections, the need for the freeway has not changed. The traffic analysis demonstrated that the proposed project is needed today and will continue to be needed into the future. Past determinations surrounding the alternatives development and screening process, including the reasons for the elimination of alternatives, as outlined in Chapter 3 of the Final Environmental Impact Statement, were reviewed for appropriateness based on the new data and were determined to remain appropriate screening determinations. The Interstate 8/State Route 85 Alternative is in place today and will be in place in the future as an alternative route for motorists to use to bypass the entire Phoenix metropolitan area. The alternative serves that purpose, but provides no benefits to support regional travel within the Phoenix metropolitan area. For this reason, it was eliminated from further study.
144	**Alternatives**	The *Regional Transportation Plan* is not the primary source of funding for expansion of the arterial street system. Funding for the arterial street system generally comes from the local jurisdiction or through impact fees for development. It is anticipated that the arterial street network in the Study Area will be expanded in this same manner. The Maricopa Association of Governments regional travel demand model includes assumptions related to arterial street expansion based on local jurisdiction general planning. In the case of the Study Area, it is assumed that most of the arterial street network would be built out by 2035. Draft Environmental Impact Statement Chapter 1, *Purpose and Need*, concludes that, even with these improvement in place, there is a clear need for a major transportation facility in the Study Area. The Maricopa Association of Governments approved new population, employment, housing, and traffic projections in June 2013. The new data are presented in the Final Environmental Impact Statement beginning on page 1-11. The purpose and need and analysis of alternatives were updated and reevaluated using these new socioeconomic projections and corresponding projections related to regional traffic. While new projections based on the 2010 Census showed a lower anticipated population and vehicle miles traveled in 2035 than the previous projections, the conclusions reached in the Draft Environmental Impact Statement were validated in the Final Environmental Impact Statement (see Chapter 3, *Alternatives*). The traffic analysis demonstrated that the proposed project is needed today and will continue to be needed into the future.

Code	Comment Document

Southwest area. This alternative would avoid any impacts on South Mountain.

145 In summary, several reasonable and viable alternatives were not considered in the DEIS or were dismissed from further consideration without an appropriate level of analysis, even though many of them would not have any impacts on South Mountain. This is a major deficiency, since a major requirement of the DEIS is that all reasonable alternatives be evaluated with appropriate level of detail.

146 6. **The Description of the Proposed Action in the Summary Chapter fails to provide details essential for informed decision-making.** The action is described generally as building a freeway in compliance with the RTP. Lacking from the description are the following:

147 • The typical cross-section of the freeway, preferably with dimensions that ADOT commonly uses, should have been included. Major deviations, if any, from the typical cross-section for each of the three West Alternatives and the single East Alternative should have been identified.

148 • While at the outset the cross-section was not known, the 10-lane alternative was eliminated in the fourth-tier screening. A freeway with three general purpose (GP) and one High Occupancy Vehicle (HOV) lane in each direction, plus auxiliary lanes where necessary, was established for all alternatives.

149 • The profile for the freeway should have been described in general terms for each Alternative.

150 • The location of proposed interchanges for each alternative should have been shown.

151 • The fact that park-and-ride lots would be provided at/near some or all interchanges, if true, should have been stated. The term park-and-ride appears only once in the Summary (Page S-19) in the context of a mitigation measure for Displacements and Relocations. The term park-and-ride does not appear at all in Chapter 1 (Purpose and Need); it appears three times in Chapter 3 (Alternatives) first on Page 3-6 as part of the discussion of Modal Screening Results, the second time on Page 3-15, Figure 3-8 indicating that the park-and-ride lot at the 40th Street Interchange potentially would be expanded, and for the third time on Page 3-40 in the context of the No-Action Alternative. Thus unless a reader studied Figure 3-8 very carefully, he or she would not be aware of the potential expansion of the park-and-ride lot at the 40th Street Interchange. There is no mention of park-and-ride in the Traffic Overview Report.

Code	Issue	Response
145	**Alternatives**	Alternatives were not disposed of or dismissed without a thorough evaluation using the multidisciplinary criteria outlined in the alternatives development and screening process. A thorough feasible and prudent avoidance analysis of the South Mountains was conducted as presented in Chapter 5 of the Draft and Final Environmental Impact Statements and concluded avoidance to the direct use of the resource was not feasible and prudent. In support of this response and given the concerns about the South Mountains, consider the following review from the U.S. Department of the Interior on the Draft Environmental Impact Statement: "Following our review of the Section 4(f) Evaluation, we concur that there is no feasible or prudent alternative to the Preferred Alternative selected in the document, and that all measures have been taken to minimize harm to these resources." The complete letter can be found in Appendix 7, Volume III, on page B4.
146	**Purpose and Need**	As pointed out in the Draft Environmental Impact Statement on page S-1, in the sidebar, "*What you will find in the Summary chapter,*" the text in the Summary is not the "final word," and readers are urged to turn to the main text when questions about Summary content arise. It is clear, as pointed out in Chapter 3, *Alternatives*, that a beneficial outcome of the alternatives screening process—a "... logical, sequential, step-by-step process using data and expertise from multiple disciplines ..." (page 3-27)—was that the mode determined to be appropriate for addressing the identified transportation problem was a highway that, in turn, was consistent with local and regional plans (as supported by stakeholder jurisdictions). Nowhere in the Draft Environmental Impact Statement is reference made that the proposed action is needed to comply with the *Regional Transportation Plan*. The analysis of the proposed action's purpose and need would have ended the environmental impact statement process at that point if a need in the form of a transportation problem had not been identified, and this is disclosed in the Draft Environmental Impact Statement.
147	**Design**	A typical section is provided in Figure S-9 on page S-10 of the Draft Environmental Impact Statement. As noted on page S-8 at the end of the section, *Action Alternatives*, "Chapter 3, *Alternatives*, has detailed descriptions of features of the alternatives." This information begins on page 3-40 of the Draft Environmental Impact Statement.
148	**Design**	Agree.
149	**Design**	This information is presented in Chapter 3 of the Draft Environmental Impact Statement. Descriptions of the horizontal and vertical alignments of the action alternatives are provided, beginning on page 3-40. Graphical depictions are shown in Figures 3-20 to 3-25.
150	**Design**	This information is presented in the Summary Chapter of the Draft Environmental Impact Statement; see Figure S-8. It is also presented in Chapter 3; see Figure 3-28.
151	**Design**	The inclusion of park-and-ride lots is not part of the scope of the proposed action. No new park-and-ride lots are proposed as part of the proposed action. Locations of future park-and-ride lots would be determined by the City of Phoenix and Valley Metro. As described in the responses above, the elements of the proposed freeway and the potential action alternatives were described in the Draft Environmental Impact Statement.

Code	Comment Document

For the public in general, the Regional Transportation Plan (RTP) and complying with the RTP are abstract and perhaps foreign concepts. The Description of the Preliminarily Proposed Action should have had sufficient information to help the public visualize what is being proposed on the ground.

(152) 7. **Since the evaluation of alternatives is based on the travel forecasts (among other considerations), the evaluations are faulty. As stated in Item 2 above, the travel forecasts, in turn, are faulty because they are based on faulty socio-economic forecasts.** The MAG travel forecasting model was run with faulty data inputs. As a result, all figures and tables in the DEIS that present data from the model are incorrect, resulting in conclusions in the DEIS that cannot be supported by reliable analysis. The faulty travel forecasts affect the Air Quality and Noise impact analyses, as well, because they rely on traffic forecasts, as one of the inputs. On the basis of this fatal flaw alone, the DEIS should be thrown out, and the analysis should be done properly from the beginning.

(153) 8. **Some potential impacts, including impacts on the arterial street system adjoining proposed interchanges, construction impacts, and the impacts of truck traffic are not addressed at all or are not addressed in detail sufficient for a DEIS for an Action Alternative (as opposed to a programmatic action such as the adoption of the RTP).**

(154) a) The DEIS does not present an analysis of traffic impacts on arterials in the vicinity of the proposed interchanges and impacts on local access. A specific example of this type of deficiency, that may be applicable elsewhere in the Study Area, is the lack of analysis as to how W. Pecos Road would be impacted by the Proposed Action. With the Proposed Action, the South Mountain Freeway (SMF) would obliterate and replace existing Pecos Road (described in the DEIS as Alternative E1); access to the street system in the area would be provided via interchanges at 40th Street, 24th Street, Desert Foothills Parkway, and 17th Avenue. There will be no interchange at 32nd Street. Under existing conditions, a signalized intersection at the intersection of W. Pecos Road and 32nd Street provides access to the community on the north side of W. Pecos Road. This access for the community will not be available when the SMF is built, and traffic that now uses 32nd Street will have to use other routes. Please see Item c) on Page 16 for more details about how this matter should have been addressed in the DEIS.

A similar problem will be created at the western terminus of W. Pecos Road at 27th Avenue which is the sole access for the existing Foothill Reserve and Calabrea communities. When the SMF is constructed as proposed, this access will no longer be available and existing traffic will be forced to use another route. ADOT has proposed to construct an extension of Chandler Boulevard, between its existing terminus at 19th Avenue and 27th Avenue, to provide access to Foothill Reserve and

Code	Issue	Response
152	**Purpose and Need**	The analyses in the Draft Environmental Impact Statement used socioeconomic and traffic projections at the regional analysis zone and traffic analysis zone levels. At the time of publication of the Draft Environmental Impact Statement, Census 2010-based socioeconomic data at the regional analysis zone and traffic analysis zone levels had not been adopted by the Maricopa Association of Governments and were not available to the project team. Therefore, the data used in the Draft Environmental Impact Statement were the most appropriate information available. The Maricopa Association of Governments approved new population, employment, housing, and traffic projections in June 2013. The new data are presented in the Final Environmental Impact Statement beginning on page 1-11. The purpose and need and analysis of alternatives were updated and reevaluated using these new socioeconomic projections and corresponding projections related to regional traffic. While new projections based on the 2010 Census showed a lower anticipated population and vehicle miles traveled in 2035 than the previous projections, the conclusions reached in the Draft Environmental Impact Statement were validated in the Final Environmental Impact Statement (see Chapter 3, *Alternatives*). The traffic analysis demonstrated that the proposed project is needed today and will continue to be needed into the future. All impact analyses affected by the updated socioeconomic data, including air quality and noise, were updated accordingly and those updates are reflected in the Final Environmental Impact Statement. Determinations relating to the identification of the Preferred Alternative were also confirmed in accounting for the new population, employment, housing, and traffic projections.
153		See responses to specific comments below.
154	**Traffic**	The determination to not include an interchange at 32nd Street was made in coordination with the City of Phoenix (see Figure 3-8 on page 3-15 of the Draft Environmental Impact Statement). The interchange would have displaced over 100 homes and would have been located near an existing high school. In 2006, the City of Phoenix conducted a traffic circulation study to evaluate the impacts of the proposed freeway on the local street system, including the shift of access to Foothills Reserve and Calabrea from Pecos Road to Chandler Boulevard. The City study found no adverse effects on the local street system from the freeway (see Appendix 3-1 in the Final Environmental Impact Statement).

Code	Comment Document

Calabrea. The DEIS should have analyzed the traffic implications of this rerouted traffic on 17th Avenue, Chandler Boulevard, and major intersections along the route, using methodology and data as described in Item c) on Page 16. The need for traffic controls (traffic signals, stop signs, and others) should have been identified in the DEIS.

155

This extension of Chandler Boulevard is identified as a "Newly constructed local street" in Figure 3-33 on Page 3-57 of the DEIS. East of 19th Avenue, Chandler Boulevard is constructed with a five-lane cross-section (two lanes in each direction, plus a two-way left-turn lane in the center. The DEIS should have stated that if the extension of Chandler Boulevard were to be constructed, it should continue the existing five-lane cross-section. This cross section would be necessary in order to accommodate the traffic increases due to the re-routing of Foothill Reserve and Calabrea traffic, as well as other traffic that would use Chandler Boulevard if it were to be constructed. Such other additional traffic would include:

- Traffic to and from the 247 acres of vacant land the City of Phoenix has purchased that lies north of Chandler Boulevard, between 19th and 27th Avenues. In addition to about 100 acres of open space, under consideration for this land would be 40 to 60 acre community park, a library, and other uses that may be identified in the City's future planning and community outreach processes.

156

- Traffic to and from the vacant land (bounded by Chandler Boulevard on the north, W. Pecos Road on the south, 19th Avenue on the east, and 27th Avenue on the west) that was rezoned by the City of Phoenix to permit 11 acres of commercial uses, 11 acres of multi- family housing, and 650 to 1,050 single-family residences.

155

- Any other traffic increases that would affect Chandler Boulevard.

157

Even with the construction of Chandler Boulevard between 19th Avenue and 27th Avenue, residents in Foothill Reserve and Calabrea will incur substantial out-of-direction travel and additional travel time to access the SMF, compared to the present route. To get home, these residents will have to exit the SMF at 17th Avenue, travel north on 17th Avenue to Chandler Boulevard, then southwest on Chandler Boulevard to connect with the street system within the two communities. The DEIS should have quantified the added time and distance of travel and should have considered the construction of a two lane access road between 17th Avenue and 27th Avenue on the north side of the SMF. In addition to facilitating access for the residents of Foothill Reserve and Calabrea, such an access road would help reduce future traffic on 17th Avenue and would help maintain emergency vehicle response times at levels comparable to existing.

Code	Issue	Response
155	**Design**	The Chandler Boulevard extension was developed in close coordination with the City of Phoenix and supports the ultimate lane configuration and planned development in the area.
156	**Design**	Additional local roads would be constructed along with the development of this land (as identified in the City's General Plan).
157	**Design**	Reasonable access would remain to the noted developments. The travel time savings as a product of using the South Mountain Freeway in comparison to use of Pecos Road would likely offset any additional travel time attributable to the change in access. Emergency responders would address the construction of the proposed freeway by amending the local emergency response plan to include the facility.

Code	Comment Document
158	The SMF will cause similar alterations in local traffic patterns elsewhere along the route, primarily in the Western portion of the SMF. The DEIS should have discussed traffic impacts in the vicinity of all interchanges along the proposed action, with appropriate analysis, similar to that described in Item c), below.
159	b) The DEIS does not indicate what type of interchange would be constructed at the interchanges along W. Pecos Road. Because there would be no access to the Gila River Indian Community (GRIC) on the south side, neither of the two typical interchanges depicted on Page 3-14 of the DEIS, "Diamond Interchange" and "Single Point Urban Interchange," would be applicable. The DEIS should have indicated the type of interchange to be provided, at least conceptually and with a simple graphic.
160	c) The DEIS should have presented recent traffic volume counts for W. Pecos Road (between I-10 and 27th Avenue) and turning movement counts at the existing signalized intersections at 40th Street, 32nd Street, 24th Street, Desert Foothills Parkway, and 17th Avenue. Traffic counts should also have been made at major intersections along the path motorists would use to access Foothill Reserve and Calabrea when the construction of the SMF would cut off the present access via W. Pecos Road/ 27th Avenue. Then it should have discussed the impacts on existing traffic due to the loss of access at 32nd Street and 27th Avenue and how existing traffic patterns would change. Then, 2035 peak hourly traffic volumes at the interchanges should have been presented so that the public could be informed of how present routings would be affected and what the impacts would be in 2035. The impacts on the cross streets are not dependent on the specific design details and can be evaluated based on the traffic volume forecasts from the MAG travel model. Analyses with similar methodology should have been performed at interchanges along the entire route of the SMF.
161	d) The DEIS should have discussed how the Proposed Action would affect emergency vehicle access times for the communities now served by the signalized intersection at Pecos Road/32nd Street and via W. Pecos Road/27th Avenue (Chandler Boulevard). Extending this example, the DEIS should have discussed how emergency vehicle access would be affected at all locations along the proposed action where the arterial street pattern would be altered.
162	e) With the Proposed Action, the eastbound left-turn and westbound right turn direct access to the park-and-ride facility north of W. Pecos Road at 40th Street will be lost, shifting the park-and-ride traffic to the two access points via 40th Street. The southern access driveway is less than 300 ft (center-to-center) north of Pecos Road. The construction of the freeway

Code	Issue	Response
158	**Traffic**	The proposed freeway would include improvements along arterial streets at interchange locations to facilitate the movement of traffic on, off, and across the freeway. The arterial street improvements are included within the right-of-way footprint used for the analysis of impacts.
159	**Traffic**	The third bullet in the third column on page 3-51 of the Draft Environmental Impact Statement states that "The diamond interchange configuration (see sidebar on page 3-14) was used to evaluate service traffic interchange needs." The assumption that there would be no access to the Gila River Indian Community to the south is incorrect. At 40th Street, there is an existing road to the south, and the planned interchange at that location would provide access onto Gila River Indian Community land. Similarly, the interchanges at 24th Street, Desert Foothills Parkway, and 17th Avenue would be constructed to allow for future connections from Gila River Indian Community land. The initial layout would be similar to the interchanges at State Route 202L (Red Mountain Freeway) and Dobson Road. Figure 3-28 indicated whether the interchanges would include full access or half access. In some locations, a single-point urban interchange or other interchange type may be used to address higher traffic volumes. The determination of the interchange type would be made during final design in coordination with the local jurisdiction.
160	**Traffic**	Existing traffic volumes on the City of Phoenix's streets is available at the City's Web site, <phoenix.gov/streets/traffic/volumemap>. In 2006, the City of Phoenix conducted a traffic circulation study to evaluate the impacts of the proposed freeway on the local street system. The City study found no adverse effects on the local street system from the freeway (see Appendix 3-1 in the Final Environmental Impact Statement).
161	**Traffic**	Emergency responders would address the construction of the proposed freeway by amending the local emergency response plan to include the facility. This would include emergency response on the freeway and alternative routes for diversion of traffic in the event that an incident occurred along the freeway. As concluded in the section, *Social Conditions*, in Chapter 4 of the Draft Environmental Impact Statement, response times for police, fire, and medical emergency services would be faster when compared with response times under the No-Action Alternative. Circulation on major arterial streets would be improved through better distribution of traffic onto the overall transportation network, the provision of alternative routes, and through localized operational improvements such as grade separations and planned interchanges.
162	**Traffic**	In addition to access from 40th Street, access to the park-and-ride lot would be provided off of the westbound on-ramp. This is similar to the park-and-ride operations at Happy Valley Road and Interstate 17. Bus operations and circulation would continue to operate as-is today. Traffic operational characteristics along 40th Street and at the Cottonwood Lane intersection would not be adversely affected by the freeway. The park-and-ride lot has been expanded to its ultimate configuration.

Code	Comment Document

ramps will shorten the spacing between the junction of the westbound ramp terminal and the southern access driveway for the park-and-ride lot. The impacts to traffic operations along 40th Street, impacts to park-and-ride access, impacts on bus operations, impacts at the intersection of 40th Street/E Cottonwood Lane/bus access to park-and-ride should have been evaluated, both for existing and 2035 traffic volumes. The long-term expansion of the park-and-ride facility should also have been discussed.

163

f) The DEIS should have discussed how access would be provided to the existing U-Haul Dealer and storage facility on the south side of Pecos Road, now accessed directly via the signalized intersection at 32nd Street. Since there will be no interchange at 32nd Street with the Proposed Action, this property will become land-locked. It is unclear based on the information in Tables 4-12 and 4-13, (Pages 4-39 and 4-42, respectively in the DEIS, if this facility is being displaced.

g) Construction period impacts are not adequately addressed in the DEIS. Solely from the standpoint of transportation, traffic, and circulation matters, the discussion provided in Section 4 under "Temporary Construction Impacts" and "Materials Sources and Waste Material" on Pages 4-161 through 4-164 in the DEIS is very general. While the estimate of "borrow" material is site-specific, the amount is expressed in millions of cubic yards, and not by some other measurement more easily understood by the public. The discussion of construction impacts should have been expanded to include more site specific information and should have included such items as:

164

- the number of truckloads of export or import materials
- haul routes (the route trucks will use to haul away excess dirt or bring in dirt) during the grading of the route
- number of trucks to bring in aggregate, asphalt/concrete, reinforcing steel, and any other construction materials
- duration of construction
- how traffic will be handled on the existing street system when useable segments of the freeway are opened to traffic prior to the completion of the entire freeway
- impacts on traffic on I-10 (both Papago and Maricopa) during the construction period
- detour routes and the traffic impacts of the detours
- other considerations

165

h) The Construction Sequencing described in the DEIS (Page 3-59) is not consistent with Figure 8-4, the Plan Phasing - Freeways/Highways in the 2010 Update of the Regional Transportation Plan (RTP) (Exhibit 9). The RTP presents the following phasing schedule:

Code	Issue	Response
163	**Traffic**	The determination to not include an interchange at 32nd Street was made in coordination with the City of Phoenix (see Figure 3-8 on page 3-15 of the Draft Environmental Impact Statement). The interchange would displace more than 100 homes and would have been located near an existing high school. In 2006, the City of Phoenix conducted a traffic circulation study to evaluate the impacts of the proposed freeway on the local street system, including the shift of access to Foothills Reserve and Calabrea from Pecos Road to Chandler Boulevard. The City study found no adverse effects on the local street system from the freeway (see Appendix 3-1 in the Final Environmental Impact Statement). The storage facility is located on Gila River Indian Community land and would not be displaced. Reasonable access to the facility would remain available from 32nd Street, Chandler Boulevard, and other east–west local streets. A grade-separated bridge would be constructed for the freeway to go over 32nd Street.
164	**Construction**	Information related to haul routes, number of trucks, traffic routing, and detouring is discussed in general terms because more detailed information is not available. These details depend highly on the construction sequencing and construction methods, which have not been determined at this stage in the process. As noted on page 6-23 of the Draft Environmental Impact Statement, during construction, the Arizona Department of Transportation typically holds information meetings at the beginning of construction activities regarding the upcoming improvements and work schedules. The public can be informed through construction updates/newsletters or many other means. The Arizona Department of Transportation is evaluating construction delivery methods for the proposed freeway. One concept is to deliver it as a single design-build project. This method would accelerate the construction duration for the entire project to around 3 to 3.5 years. Another concept would be to deliver the project in a more traditional method, breaking the 22-mile corridor into nine segments (each 1 to 3 miles long) and constructing them in phases. Each segment would be under construction for 1 to 3 years, and the total construction duration for the entire corridor would be 5 to 6 years. A discussion of construction implementation is provided beginning on page 3-59 of the Final Environmental Impact Statement. Any particular area of the Preferred Alternative would not be expected to see construction activities beyond an approximate 2-year period.
165	**Implementation**	The Arizona Department of Transportation is evaluating construction delivery methods for the proposed freeway. One concept is to deliver it as a single design-build project. This method would accelerate the construction duration for the entire project to around 3 to 3.5 years. Another concept would be to deliver the project in a more traditional method, breaking the 22-mile corridor into nine segments (each 1 to 3 miles long) and constructing them in phases. Each segment would be under construction for 1 to 3 years, and the total construction duration for the entire corridor would be 5 to 6 years. A discussion of construction implementation is provided beginning on page 3-59 of the Final Environmental Impact Statement. Any particular area of the Preferred Alternative would not be expected to see construction activities beyond an approximate 2-year period. As noted in the Draft Environmental Impact Statement on page 3-59, "Construction sequencing and duration could change based on several factors, including funding availability, traffic volumes, coordination with other major freeway projects, earthwork balancing, utility relocation schedules, and regional priorities."

Code	Comment Document

166

- In Fiscal Year (FY) 2011-2015 : Segment between I-10 (Papago) and Baseline Road also Segment between 51st Avenue and 19th Avenue
- In FY 2016-2020 : Segment between I-10 (Maricopa) and 19th Avenue
- In FY 2021-2025 : Segment between Baseline Road and 51st Avenue

The phasing sequence in the DEIS, presented without an explanation of the rationale for the change from the RTP, is:

- I-10 (Papago) to Baseline Road and concurrently, I-10 (Maricopa) to approximately 51st Avenue (along Pecos Road and through the South Mountains)
- Baseline Road to 51st Avenue

Despite repeated assertions throughout the DEIS that the Proposed Action is consistent with the RTP, this divergence in phasing between the RTP and the proposed action is not mentioned in the DEIS.

167

i) The evaluation of alternatives is deficient because the presentation of the results of the "select link" analysis is misleading. On Page 3-36 of the DEIS , Figure 3-18 presents the contribution of traffic to the select link by geographical areas, some of which are very large. The select link is at a point between the 51st Avenue and 17th Avenue interchanges on the South Mountain Freeway. The text accompanying Figure 3-18 states that:

"A projected 73 percent of the travelers who might use the proposed action would have origins and/or destinations near the proposed action."

This statement is misleading, since it implies that 73% of the traffic using the South Mountain Freeway would have origins in close proximity to the proposed freeway.

A review of a larger scale map in the Traffic Overview Report, which is the source of the information presented in Figure 3-18, indicates that only about 15% of the selected link traffic would have origins or destinations within the Study Area as defined in Figure S-2 of the DEIS. If the definition of "proximity" were to be extended to the area within a 20-mile radius of the select link, the contribution of this entire 20-mile radius area would be about 40 to 50%. To reach the 73% level of contribution, a radius of about 30 miles would be needed.

168

j) The evaluation of alternatives is deficient because the cut line analysis presented in the Purpose and Need and in the Evaluation Chapters of the DEIS as well as in the Traffic Overview Report is faulty. The following points support this assertion.

Code	Issue	Response
166	**Implementation**	The Arizona Department of Transportation is evaluating construction delivery methods for the proposed freeway. One concept is to deliver it as a single design-build project. This method would accelerate the construction duration for the entire project to around 3 to 3.5 years. Another concept would be to deliver the project in a more traditional method, breaking the 22-mile corridor into nine segments (each 1 to 3 miles long) and constructing them in phases. Each segment would be under construction for 1 to 3 years, and the total construction duration for the entire corridor would be 5 to 6 years. A discussion of construction implementation is provided beginning on page 3-59 of the Final Environmental Impact Statement. Any particular area of the Preferred Alternative would not be expected to see construction activities beyond an approximate 2-year period. As noted in the Draft Environmental Impact Statement on page 3-59, "Construction sequencing and duration could change based on several factors, including funding availability, traffic volumes, coordination with other major freeway projects, earthwork balancing, utility relocation schedules, and regional priorities."
167	**Traffic**	The quote noted in the comment was changed in the Final Environmental Impact Statement to be consistent with a similar statement made in the caption to Figure 3-18: "Seventy-three percent of travelers anticipated to use the proposed action would be involved in trips beginning or ending in the Study Area itself or in the areas immediately surrounding it." The figure does accurately portray the locations of the cities included in the different areas. The observations in the comment further support that the proposed action would serve regional travel from the southwestern to southeastern portions of the region (not just internal Study Area travel). It should also be noted that by definition, these freeway users would not include traffic from Laveen Village to Interstate 10 (Papago Freeway) or from Ahwatukee Foothills Village to Interstate 10 (Maricopa Freeway). So, the 15 percent of trips identified in the comment as Study Area-originated are by motorists making trips to the other side of the South Mountains.
168		See responses to specific comments below.

Code	Comment Document
169	Only two of the six cut lines analyzed, (north-south cut lines 1 and 4, in Figure 3-13 in the DEIS) are in the Study Area. The limits of cut lines 2, 3, 5, 6 extend well beyond the boundaries of the Study Area, in each case with a small portion of the cut line in the Study Area. Therefore, the cut lines as designated do not convey a sense of deficiencies and traffic volume increases within the Study Area.
170	It is customary in presenting the results of a cut line analysis to itemize each of the facilities included in each cut line along with the capacity for each facility (existing or as proposed in the RTP as appropriate) and the traffic volume for each facility (existing, No Action, and Proposed Action as appropriate). Such information is not presented in the DEIS or in the Traffic Overview Report. Only aggregate quantities for Freeways and Arterials are presented in the various tables that address cut lines.
171	To make the cut lines relevant to the analysis of the South Mountain Freeway, cut lines other than 1 and 4 should have been revised as described below:
172	• Cut line 2 addresses north south traffic volumes and capacity. Near its western terminus, it should not include a crossing of SR 30, since this facility, when built would carry east-west traffic. Cut line 2 should have been subdivided into two segments, the first segment extending from the western limit (not including SR 30) of the cut line to 43rd Avenue, and the second from 43rd Avenue to a point just West (or South) of I-10 (Maricopa). I-10 should not be included in this cut line, since a segment of I-10 one interchange removed is included in cut line 6. Including the same facility in more than one cut line, especially at points so closely spaced, is an exaggeration of the effect of I-10 and represents double counting.
173	• Cutline 3 should also have been subdivided into two segments, the first segment extending from the western limit of the cut line to 43rd Avenue, and the second from 43rd Avenue to I-10 (Maricopa). • Cut lines 5 and 6 should have been subdivided into two segments, a southern segment south of South Mountain Park Preserve (SMPP) and a northern segment north of SMPP.
170	Facility-by-facility information, as described in the previous paragraph (paragraph "j"), should have been presented for the re-delineated cut lines.
174	k) The evaluation of alternatives is deficient because a potential freeway weaving problem is not identified and addressed. The distance between

Code	Issue	Response
169	**Purpose and Need**	The purpose and need criteria for the proposed action address regional problems, not just problems localized in the Study Area. For this reason, it is appropriate to include cut lines within and in proximity to the Study Area to better understand the distribution of trips in the region.
170	**Traffic**	The itemized list of traffic volumes by facility has been added to the Traffic Overview Report as an appendix.
171	**Traffic**	As indicated in the responses below, the identified cut lines were selected to present specific travel patterns and are appropriate for the analysis of the proposed action.
172	**Traffic**	Cut line 2 is included to evaluate demand across the Salt River. The proposed changes, eliminating the proposed State Route 30 crossing and the Interstate 10 crossing, would discount two major crossings of the Salt River.
173	**Traffic**	The cut lines as presented represent industry standard practice and were developed in conjunction with leaders of traffic analysis practice in Arizona. The proposed changes would not provide any benefits to the analysis or results. Subdividing the cut lines would eliminate their usefulness in evaluating regional traffic, which is their purpose.
174	**Traffic**	The project development process includes detailed analyses of the freeway operational characteristics, including weaving areas along the entire freeway. Basic level of service information is presented in Figure 3-39 on page 3-63 of the Draft Environmental Impact Statement. In the figure, the noted section is shown to experience less than 2 hours of level of service E or F conditions during the morning and evening commuting periods.

Code	Comment Document

the System Interchange at I-10 (Maricopa) and the signalized intersection at Pecos Road and 40th Street is approximately 3,500 ft. (measured between the signal and the merge point where the Loop 202 mainline and the ramps to and from I-10 come together). When the 40th Street Interchange is constructed, the distance between the ramp merge points will be approximately 2,500 ft. and possibly less. A distance of 2,500 ft between ramp merge and diverge points has the potential of creating a weaving problem on the freeway.

175 This potential problem should have been analyzed and appropriate mitigation proposed, if necessary, and should not have been deferred to the design phase, since the peak hourly traffic volumes are available from MAG, although not reported in the DEIS. Please note that Figure 3-39 in the DEIS indicates congestion at this location, even without a weaving analysis and without specifically considering the effect of bus traffic to/from the 40th Street park-and-ride facility and the effect of potentially high truck traffic volumes on freeway operations.

176 Similar weaving problems may be encountered elsewhere along the freeway.

177 l) The evaluation of alternatives is deficient because no substantive analysis of truck traffic is presented. As a sidebar on Page 3-64, the DEIS presents a good description of the nature of the trucking industry, goods movement in general, and the location of employment areas with heavy truck traffic, along with an illustration of the designated CanaMex route. Also in the sidebar, some general statistics about typical percentages (of trucks as a percent of total traffic) are provided. It is stated that the truck percentage on I-10 "near" the Proposed Action is 8%. Other than the information in the sidebar not much other truck-related statistics are provided. The sidebar also states that providing a truck by-pass is not a Purpose and Need for the SMF. This statement is contradicted by the statement on Page 3-24 of the DEIS, that presents as one of the criteria in the 5th tier screening for selecting a route for the freeway:

> ➢ reduction of truck and commuter traffic on 51st Avenue and Beltline Highway

178 Thus the SMF, if constructed would act, at least, as a by-pass for trucks that now use 51st Avenue.

Figure 4.10 in the "MAG Internal Truck Travel Survey and Truck Model Development Study" is attached as Exhibit 10. The figure indicates that more than 1,000 heavy trucks a day use the route via Riggs Road and Beltline Road to access 51st Avenue.

Code	Issue	Response
175	**Traffic**	To mitigate this issue, the on-ramp from Interstate 10 would be extended beyond the 40th Street exit ramp to allow traffic to merge onto the State Route 202L main line.
176	**Traffic**	The preliminary design of the action alternatives is at a sufficient detail to ensure constructibility and operational feasibility. The analyses to support the environmental impact statement process included weaving considerations in the operational performance of the action alternatives.
177	**Traffic**	The comment incorrectly attributes the quoted text to the purpose and need for the proposed action when it is identified as being criteria that the Gila River Indian Community Governor requested to be addressed by an alignment on Gila River Indian Community land. The "reduction of truck and commuter traffic on 51st Avenue and the Beltline Highway" is consistent with a project goal as disclosed in the Draft Environmental Impact Statement of promoting better distribution of traffic onto the overall transportation network; better distribution does not equate to a "bypass".
178	**Traffic**	It is reasonable to conclude trucks using 51st Avenue are doing so currently to bypass downtown Phoenix. In other words, the bypass of Interstate 10 through downtown Phoenix is already occurring on streets not intended for such use. The proposed freeway would not introduce another bypass route but would better distribute regional and local traffic on the regional network.

Code	Comment Document
179	The ADOT traffic counts indicate that about 2,000 to 2,500 heavy trucks use SR 85 daily between I-8 and I-10. If the SMF is constructed, some through truck traffic would likely prefer to use the SMF for personal reasons and/or because the SMF route would be slightly shorter in miles than the route via I-8 and SR 85. Also the SMF route would avoid the congestion along I-10 through the urban core of the Phoenix Metropolitan Area.
180	The ADOT traffic counts indicate that about 2,400 heavy trucks are on I-10 (Maricopa) just south of SR 202 (Loop 202 Santan) and also north of SR 202. These trucks presumably have origins and destinations within the Phoenix Metropolitan Area. Depending on the location of the origins and destinations within the Metro Area, some of these heavy trucks would use the SMF to avoid traveling on the congested portions of I-10 in the urban core. The Final Report of the "MAG External Truck Travel Model Development" presents in Table 4-8 estimates of external-to-external (E-E) truck trips. These would be truck trips that travel through the area with no need to stop. No categorization of the size of trucks is provided. All trucks, except for small delivery vehicles, pickups, and vans, are included in the numbers. The table indicates that daily truck traffic on I-10 (between a point south of the junction of I-8 and a point west of SR 85) is approximately 6,200 in both directions combined. Since these are long trips, the majority of these trucks would be heavy trucks. Since there are about 2,000 to 2,500 heavy trucks on SR 85, it appears that 3,500 to 4,000 heavy trucks use I-10 to go through the Metropolitan Area or have an origin or destination within the Metro Area. Table 6-4 in the same report indicates that E-E trips between a point south of the junction of I-8 and a point west of SR 85 would grow at an annual rate of 3.7%. Undoubtedly some of this E-E heavy truck traffic would also use the SMF.
181	In addition the "MAG and PAG External Travel Study" and other MAG reports present information about truck movements, truck origins and destinations, both internally and outside the Metropolitan Area. Despite the availability of a substantial amount of data and a state-of-the-art modeling tool (TransCad) the DEIS does not address the impacts of heavy trucks using the SMF.
182	Also not addressed in the DEIS is the potential of the SMF to become an unintended by pass route, for all vehicles including heavy trucks, via Loop 202 (Santan) and Loop 202 (SMF) between US 60 and I-10 (Papago).
183	In summary, the SMF would become an attractive route for heavy trucks for travel to/from the Phoenix Metropolitan Area as well as for heavy

Code	Issue	Response
179	**Trucks**	It is expected that "true" through-truck traffic (not having to stop in the metropolitan area) would continue to use the faster, designated, and posted bypass system of Interstate 8 and State Route 85. That the proposed freeway would avoid congestion along Interstate 10 would not seem material to trucks currently using the Interstate 8/State Route 85 bypass.
180	**Purpose and Need**	The proposed freeway is part of a transportation system developed to improve mobility in the region by increasing capacity and allowing traffic—including truck traffic—to access a segment of the "loop" system (see pages 1-21, 1-22, 3-1, and 3-3 of the Final Environmental Impact Statement) in the Phoenix metropolitan area. The proposed South Mountain Freeway would be a commuter corridor, helping to move local traffic. As with all other freeways in the region, trucks would use it for the through-transport of freight, for transport to and from distribution centers, and for transport to support local commerce. Nevertheless, the primary vehicles using the proposed freeway would be automobiles. The Maricopa Association of Governments regional travel demand model projects that truck traffic would represent approximately 10 percent of the total traffic on the proposed freeway, similar to what is currently experienced on other regional freeways such as Interstate 10, State Route 101L, and U.S. Route 60. As disclosed in the Final Environmental Impact Statement, it is expected that "true" through-truck traffic (not having to stop in the metropolitan area) would continue to use the faster, designated, and posted bypass system of Interstate 8 and State Route 85 (see page 3-64 of the Final Environmental Impact Statement).
181	**Trucks**	Among the factors considered in this study were 1) the amount of truck traffic that would be generated if an action alternative were to become the Selected Alternative and 2) that traffic's potential impact on the surrounding community. The Maricopa Association of Governments regional travel demand model forecasts approximately 10 percent truck traffic on the South Mountain Freeway in 2035 (see Final Environmental Impact Statement page 3-64). This percentage is similar to current conditions on Interstate 10 between Loop 101 and Interstate 17 and on U.S. Route 60. Air quality and noise modeling for the Draft and Final Environmental Impact Statements used this forecast truck traffic (see Final Environmental Impact Statement pages 4-68 and 4-100, respectively).
182	**Traffic**	Location #2 in Figure 3-12, on page 3-29 of the Draft Environmental Impact Statement, indicates that traffic along State Route 202L (Santan Freeway) just east of Interstate 10 would experience substantially higher traffic volumes with the proposed freeway when compared with conditions without the proposed freeway. This is an intended outcome for the region's freeway system. The project team does not anticipate that "all vehicles" would use State Route 202L; a large volume of traffic would continue to use U.S. Route 60 and Interstate 10 (see Figure 3-12).
183	**Trucks**	Among the factors considered in this study were 1) the amount of truck traffic that would be generated if an action alternative were to become the Selected Alternative and 2) that traffic's potential impact on the surrounding community.

(Response 183 continues on next page)

Code	Comment Document

trucks traveling through the Metro Area. The DEIS is deficient in not addressing truck traffic impacts and formulating and evaluating appropriate alternatives to deal with truck traffic, even though ADOT states in the DEIS that heavy trucks will use the SMF and even though a wealth of information is available about freight movements. The DEIS fails to take advantage of this wealth of information to provide an estimate of the number of trucks that can be expected on the SMF. Indications are that heavy trucks will use the SMF to a much greater extent than other freeways in the Metropolitan Area, with the possible exception of I-10. Also, as pointed out earlier, the Purpose and Need is faulty and has led to the elimination of several alternatives that might have been carried forward for further study if the truck traffic issue had been recognized at the outset.

184

m) **Sufficient information is not presented in the DEIS.** Numerous tables and figures carry the notation "Source: MAG, Year, Extrapolated Analysis." The actual source of the data should have been provided and the data provided by MAG should have been included in the Appendix. The Traffic Overview Report, which is the basis of much of Chapter 3 (Alternatives) in the DEIS, does not offer anything further in this matter. Without more backup information, it is not possible to ascertain what constitutes "extrapolation," and whether the extrapolation reflects the full extent and significance of the information available.

185

In Chapter 3 (Alternatives) of the DEIS, traffic volume, capacity, and other information is provided in spotty manner and does not offer the opportunity to ascertain if the information provided for selected locations is reasonable and if it fits in with the overall picture. For example, in Figure 3-38, daily traffic volumes are presented for the length of South Mountain Freeway between I-10 (Maricopa) and I-10 (Papago). However, traffic volumes are not presented for Loop 202 (Santan) and I-10 north, south, east, or west, of the junction (s) of I-10. Therefore routing changes attributable to the Proposed Action cannot be identified.

186

n) **The selection of the preliminarily selected alternative for the Western Section should have been based on a side-by-side comparative evaluation of the three action alternatives plus the No Action Alternative.** In the DEIS, the No Action Alternative is not included in the evaluation that leads to the selection of the preliminarily preferred alternative. In Figure 3-41, Page 3-67 of the DEIS, a comparison of the three action alternatives is presented. On the basis of this evaluation, the W71 Alternative is eliminated, even though it is unclear why it is substantially, if at all, inferior to the W59 Alternative and the W101 Alternative Options. The comparative information presented is:

Code	Issue	Response
183 (cont.)		The Maricopa Association of Governments regional travel demand model forecasts approximately 10 percent truck traffic on the South Mountain Freeway in 2035 (see Final Environmental Impact Statement page 3-64). This percentage is similar to current conditions on Interstate 10 between Loop 101 and Interstate 17 and on U.S. Route 60. Air quality and noise modeling for the Draft and Final Environmental Impact Statements used this forecast truck traffic (see Final Environmental Impact Statement pages 4-68 and 4-100, respectively). Commercial trucks would use the proposed action. As with all other freeways in the Maricopa Association of Governments region, trucks would use it for the through-transport of freight, for transport to and from distribution centers, and for transport to support local commerce. And as with travel on all other freeways in the Maricopa Association of Governments region, the primary users of the proposed action would be automobiles. The proposed freeway is part of a transportation system developed to improve mobility in the region by increasing capacity and allowing traffic—including truck traffic—to access a segment of the "loop" system (see pages 1-21, 1-22, 3-1, and 3-3 of the Final Environmental Impact Statement) in the Phoenix metropolitan area. The proposed South Mountain Freeway would be a commuter corridor, helping to move local traffic. As with all other freeways in the region, trucks would use it for the through-transport of freight, for transport to and from distribution centers, and for transport to support local commerce. Nevertheless, the primary vehicles using the proposed freeway would be automobiles. The Maricopa Association of Governments regional travel demand model projects that truck traffic would represent approximately 10 percent of the total traffic on the proposed freeway, similar to what is currently experienced on other regional freeways such as Interstate 10, State Route 101L, and U.S. Route 60. As disclosed in the Final Environmental Impact Statement, it is expected that "true" through-truck traffic (not having to stop in the metropolitan area) would continue to use the faster, designated, and posted bypass system of Interstate 8 and State Route 85 (see page 3-64 of the Final Environmental Impact Statement).
184	**Traffic**	The sidebar, "*How are MAG data used in the DEIS?*," on page 1-4 of the Draft Environmental Impact Statement explains the citation notations. In general, the source of the traffic data is the Maricopa Association of Governments regional travel demand model, and analyses were performed using Maricopa Association of Governments data as inputs.
185	**Traffic**	The desired information is available in Figure 3-12, on page 3-29 of the Draft Environmental Impact Statement. This figure presents traffic volumes with and without the proposed freeway at locations similar to those noted in the comment.
186	**Alternatives**	The section, *Identification of a Preferred Alternative*, beginning on page 3-65 of the Draft Environmental Impact Statement, provides the logical process that was used by decision makers to identify the Preferred Alternatives. A summary of key elements of each action alternative is provided in Figure 3-41.

(Response 186 continues on next page)

Code	Comment Document

187

- The W71 Alternative would require no Bureau of Land Management (BLM) land reclassification, whereas the W59 Alternative would.
- The W71 Alternative would displace 22 businesses, compared to 41 for the W59 Alternative and 14 to 30 for the W101 Alternative Options.
- The W71 Alternative would result in an annual tax revenue loss of $6.3 million in the City of Phoenix, but no revenue loss in Tolleson and Avondale. By comparison, the W59 Alternative would have a tax revenue loss of $5.1 million in Phoenix and none in Tolleson and Avondale. The W101 Alternative Options would have a tax revenue loss of $7.0 million to $8.0 million for all three cities combined.
- The W71 Alternative would have a total project cost (right-of-way plus construction cost) of $1.54 billion, compared to $1.23 billion for the W59 Alternative and $1.72 to $1.87 billion for the W101 Alternative Options.
- The W71 Alternative would displace 825 residential properties, compared to 733 for the W59 Alternative and 926 to 1304 (single family) for the W101 Alternative Options.
- The W71 Alternative would affect 4 high priority hazardous sites, compared to 5 for the W59 Alternative and 1 for the W101 Alternative Options.
- During the period December 2003 to April 2006, six Cities and Towns passed resolutions in support of the W59 Alternative and opposing the W101 Alternative, with the City of Tolleson passing two separate resolutions. Since the DEIS gives no indication to the contrary, it is assumed that none of these seven to nine year old resolutions opposed the W71 Alternative.

188

In summary, based on the information presented in Figure 3-41, the W71 Alternative would rank, at worst, in the middle of the three alternatives evaluated, and it should not have been eliminated from further consideration. This improper elimination of the W71 Alternative led to a final stage evaluation of the W101 and W59 Alternatives, once again without the inclusion of the No Action Alternative in this final stage of evaluation and with an entirely different set of evaluation criteria.

187

The comparative evaluation of the W101 and W59 Alternatives is described on Pages 3-68 and 3-69 of the DEIS. Notwithstanding the fact that the No Action Alternative was not included in this final evaluation stage and not withstanding the fact that an entirely new set of evaluation criteria was introduced, there are some flaws in the comparison of the two Alternatives as discussed below. While the discussion is focused on travel modeling, traffic, circulation, and transportation and traffic engineering/planning, readily apparent flaws in other subjects are also pointed out. This should not be construed as a complete review of matters pertaining to other subjects.

Code	Issue	Response
186 (cont.)		As stated on page 3-40 of the Final Environmental Impact Statement, the No-Action Alternative would not satisfy the purpose and need of the proposed action because it would result in further difficulty in gaining access to adjacent land uses, increased difficulty in gaining access to Interstate and regional freeway systems from the local arterial street network, increased levels of congestion-related impacts, continued degradation in performance of regional freeway-dependent transit services, increased trip times, and higher user costs. Further, the No-Action Alternative would be inconsistent with Maricopa Association of Governments' and local jurisdictions' long-range planning and policies. The No-Action Alternative was included in the Draft and Final Environmental Impact Statements for detailed study to compare impacts of the action alternatives with the consequences of doing nothing (impacts can result from choosing to do nothing).
187	**Alternatives**	The information on page 3-41 of the Draft Environmental Impact Statement provides the elements that were used by decision makers to determine that the W71 Alternative would not be the Preferred Alternative. The Arizona Department of Transportation, in coordination with the Federal Highway Administration, determined that the W59 and W101 Alternatives would provide more benefits than would the W71 Alternative. The W71 Alternative was not "eliminated" because it is still a viable action alternative; it was just not the Preferred Alternative.
188	**Alternatives**	The information on page 3-41 of the Draft Environmental Impact Statement provides the elements that were used by decision makers to determine that the W71 Alternative would not be the Preferred Alternative. The Arizona Department of Transportation, in coordination with the Federal Highway Administration, determined that the W59 and W101 Alternatives would provide more benefits than would the W71 Alternative. The W71 Alternative was not "eliminated" because it is still a viable action alternative; it was just not the Preferred Alternative. The No-Action Alternative is included for detailed study in accordance with National Environmental Policy Act requirements to compare beneficial and adverse impacts of the action alternatives with those benefits and consequences (adverse impacts) of not proceeding with one of the action alternatives.

Code	Comment Document

Under the heading "Overall Transportation Needs" on Page 3-68:

189 • In reference to the first bullet item – Linking the southern areas of the region with the central metropolitan area was not identified as a goal in the Purpose and Need, so this should not be a basis for evaluation. Both Alternatives would provide an alternative route to I-10 for regional connectivity, as asserted elsewhere in the DEIS, so this cannot be used as a distinguishing factor. Also, based on this bullet item, the proposed action will merely change how traffic accesses I-10, not keep traffic out of the central metropolitan area. Ultimately, traffic will use the congested facilities in the central metropolitan area.

190 • In reference to the third bullet item – The statement is true and would be a point favoring the W101 Alternative.

191 • In reference to the fourth and fifth bullet items – These bullet items state that for the W101 Alternative widening improvements would be needed on Loop 101 and that for the W59 Alternative widening improvements would be needed on I-10. What the comparison fails to mention is that in addition to the widening of I-10, the W59 Alternative will necessitate the construction of a new freeway-to-freeway interchange, modifications of the existing interchanges at 51st Avenue, 59th Avenue, and 67th Avenue, as well as the construction of service roads between 51st and 67th Avenues. Likewise, in addition to widening improvements on Loop 101, a partial or full reconstruction of the interchange at I-10/Loop 101, relocation of ramps at McDowell Road and Thomas Road as well as modification of existing interchanges at 99th Avenue and 91st Avenue would be necessary. There is no indication as to the relative ease or difficulty of constructing the widening improvements and associated interchange modifications on I-10 and Loop 101. It is unclear how these two bullet items are used to select one alternative over the other.

Under the Heading "Consistency with Regional and Long-range Planning Goals" on Page 3-69:

192 In reference to the first bullet item – If less land is converted to freeway use, obviously more land would potentially be available for development. The rationale for the statement: ".....thereby optimizing opportunities for planned development" is unclear and should have been explained.

Under the Heading "Environmental and Societal Impacts" on Page 3-69:

193 In reference to the first bullet item – Per Figure 3-41, Page 3-67 of the DEIS, the W101 Alternative Options would displace 926 to 1,304 single-

194

Code	Issue	Response
189	**Alternatives**	The comparative analysis was not confined to evaluating purpose and need criteria for the proposed action. It had already been determined that the W59 and W101 Alternatives met those purpose and need criteria. Otherwise, they would not have advanced to this stage of the alternatives development and screening process. The primary observation is that the W59 Alternative would provide a more direct route to the central metropolitan area as compared with the W101 Alternative. This is an accurate observation and a point favoring the W59 Alternative.
190		Comment noted.
191	**Alternatives**	The bullets are provided to offset the impacts of each. Neither provides a substantial improvement over the other with respect to improvements associated with the connections at Interstate 10 (Papago Freeway).
192	**Alternatives**	Further explanation has been provided on page 3-69 of the Final Environmental Impact Statement.
193		Comment noted.
194	**Alternatives**	The breakdown by type of displacement is presented in the section, *Displacements and Relocations*, on page 4-39 in the Draft Environmental Impact Statement. See Table 4-12. The 733 residential displacements for the W59 Alternative include 680 multifamily units.

Code	Comment Document

family residential properties, and the W59 Alternative would displace 733 residential properties. For the W59 Alternative, the mix of multi-family and single-family residential properties is not stated, making it impossible to compare the number of housing units that would be displaced. Following is a direct quote from the "Title VI and Environmental Justice Report", Page 4-3.

---

194 *In addition to the single-family displacements, the W59 Alternative would result in the potential displacement of two apartment complexes having a total of 680 units. These apartments fall within a census block where greater than 50 percent of the population is minority. The majority of the apartment units are "market-rate" rents; however, one of the apartment complexes currently accepts Section 8housing vouchers. (Of the 264 units in the complex, 16 currently use Section 8 vouchers.*

---

195 Taking into consideration the 680 multi-family units, the W59 Alternative would result in the displacement 1411 housing units, which would be more than any of the W101 Alternative options.

Under the heading "Operational Differences" on Page 3-69:

196 In reference to the first bullet item – Based on the information in Figure 3-40 on Page 3-66 of the DEIS, the statement in this bullet item is true. The DEIS fails to point out that Figure 3-40 also indicates, however, that operating conditions would be virtually identical for the two alternatives east of 59th Avenue, closer to the central metropolitan area.

197 In reference to the second bullet item - The statement is true and would be a point favoring the W101 Alternative.

198 In reference to the third bullet item – It is unclear what travel movements and how many motorists would benefit from this "direct access to downtown Phoenix." Regardless of which and how many motorists would benefit from this "direct access," travel would continue to be under congested conditions on I-10 east of 59th Avenue.

199 In reference to the fourth bullet item - The statement is true and would be a point favoring the W101 Alternative, although the number of motorists that would benefit from this "better access" is not presented.

200 In reference to the fifth bullet item – Since the location of SR 30 (called SR 801 in the RTP) and the timetable for its construction are unknown, this bullet item is speculative.

Code	Issue	Response
195	**Acquisitions and Relocations**	The 680 multifamily units have already been counted in the total for the W59 Alternative. See Table 4-12, on page 4-39.
196	**Traffic**	Agree.
197	**Alternative**	Comment noted. The identification by the Arizona Department of Transportation, with concurrence from the Federal Highway Administration, of the W59/E1 Alternative as the Preferred Alternative (which includes the W59 Alternative in the Western Section of the Study Area) sought to balance agency responsibilities to address regional mobility needs while being fiscally responsible and sensitive to local communities and environmental conditions.
198		Comment noted.
199		Comment noted.
200	**Alternatives**	Projects in the *Regional Transportation Plan* historically have been funded and constructed. Therefore, the project is reasonably foreseeable.

Code	Comment Document
200	In reference to the sixth bullet item – Since the location of SR 30 (called SR 801 in the RTP) and the timetable for its construction are unknown, this bullet item is, in part, speculative.
	Under the heading "Estimated Costs" on Page 3-69:
201	Planning level cost estimates presented in Figure 3-36 and accompanying text on Page 3-59 of the DEIS do not indicate that an allowance for contingencies was included in the cost estimates. A contingency allowance of about 30 to 40 percent of the construction cost (excluding right-of-way) is typically included in the cost estimate at this level of project development. It is also noted in the DEIS that right-of-way costs will depend on growth in the region, and the actual right-of-way costs may differ from the estimates. Because of these unknowns, the actual difference in cost between the two alternatives may be lower or higher than the $490 million to $640 million range cited in this bullet item.
202	In summary, the comparative evaluation in the DEIS does not support the selection of the W59 Alternative as the Preliminary Preferred Alternative because: • The No Action Alternative was not included in the final comparative evaluation. • The W71 Alternative was unjustifiable eliminated. • Uniform comparative evaluation criteria were not used. • There were data and rationale flaws in the comparative evaluation process. • Viable alternatives to the proposed eastern portion of the project, discussed previously, would affect the selection of alternatives for the western alignment. The DEIS should have had a discussion of this matter in the comparative evaluation of the western alignments.
203	9. **None of the Action Alternatives will alleviate the anticipated capacity deficiencies identified in the Purpose and Need. Despite the expenditure of about $2 billion to $3 billion to build the South Mountain Freeway and despite the displacement of many residences and business establishments, there will be capacity deficiencies at levels comparable to the No Action Alternative on freeways and arterials throughout the Metropolitan Area and on the South Mountain Freeway itself.** While the levels of congestion may be slightly less, Level of Service E and F conditions will prevail at approximately the same levels and durations in 2035 with or without an Action Alternative. In all graphics that present congestion levels throughout the DEIS, no distinction is made between Level of Service (LOS) E and LOS F. Therefore it is impossible to ascertain if an improvement from LOS F to LOS E is achieved or a degradation from LOS E to LOS F.
204	Most, if not all, jurisdictions differentiate between LOS E and LOS F in their analyses. The reason is that, as stated on Page 1-14 of the DEIS, LOS E
	Review and Critique of DEIS for Loop 202 (SMF) Page 26

Code	Issue	Response
201	**Alternatives**	The cost estimates for all of the action alternatives include contingencies for construction and right-of-way. The same assumptions were made for each alternative. The estimates are identified as planning-level cost estimates and consideration of such estimates is appropriated in the environmental impact statement process.
202	**Alternatives**	The Draft Environmental Impact Statement presents the information that was used by the Arizona Department of Transportation, with concurrence from the Federal Highway Administration, to identify the W59 and E1 Alternatives as the Preferred Alternatives. The No-Action Alternative is included for detailed study in accordance with National Environmental Policy Act requirements to compare beneficial and adverse impacts of the action alternatives with those benefits and consequences (adverse impacts) of not proceeding with one of the action alternatives. (Impacts can occur through choosing to do nothing.) The No-Action Alternative would not satisfy the purpose and need of the proposed action (see Draft Environmental Impact Statement page 3-40) and was, therefore, not identified as the Preferred Alternative. The W71 Alternative was not eliminated; it was determined to be the least desirable of the three action alternatives in the Western Section (reasons are noted previously). There is no restriction on what ultimately become the determining factors among alternatives. The Draft Environmental Impact Statement presents those factors that were actually used by the Arizona Department of Transportation and Federal Highway Administration to identify the Preferred Alternative. The alternatives development and screening process was sound, and the information used was disclosed in the Draft Environmental Impact Statement. None of the other Eastern Section alternatives identified in the Draft Environmental Impact Statement or new alternatives proposed in the comment would change the alternatives development and screening process; they were all eliminated from detailed study.
203	**Traffic**	The comparison of traffic operational characteristics between the action alternatives and the No-Action Alternative is presented in the Draft Environmental Impact Statement, beginning on page 3-27 of the Draft Environmental Impact Statement. The analysis shows that the action alternatives would: · reduce overall traffic on the arterial street system (see Figures 3-12 and 3-13) · optimize travel on the region's freeway system (see Figure 3-12) · reduce the capacity deficiency to levels better than experienced today (see Figures 1-12 and 3-14) · reduce the duration of level of service E or F conditions in key areas of the region's freeway system (see Figure 3-15) · improve travel times on trips within the Study Area and across the region (see Figure 3-17 and Table 3-8) · provide improved regional mobility for areas projected to experience growth in the next 25 years (see Figures 1-7 and 3-18) When all of this is considered in the realm of travel time savings for motorists in the region, the user benefits approximate $200 million per year (see Table 4-26).

(Response 204 begins on the next page)

Code	Comment Document
204	represents unstable traffic flow with traffic volume approaching capacity or at capacity. LOS F, on the other hand, represents congested and stop-and-go conditions, with traffic volumes over capacity. Yet in the Traffic Overview LOS E is defined as a condition where the volume to capacity ratio (V/C ratio) is greater than 0.86 (Table 10, Page 2-8) (Exhibit 11). In other words, the DEIS asserts that congestion prevails when the traffic volume reaches 86% of capacity, contrary to the statement on Page 1-14 of the DEIS. Most jurisdictions (including the California Department of Transportation, Caltrans) define the upper limit of LOS D to be a V/C ratio of 0.89. V/C ratios in the range of 0.91 to 1.00 represent LOS E, and 1.01 and above represent LOS F.
205	Furthermore, as indicated in Exhibit 11, the DEIS uses a freeway capacity value of 2,030 vehicles per hour per lane (v/ph/pl), whereas the Highway Capacity Manual (a publication by the Transportation Research Board that is widely used by many jurisdictions for capacity calculations, including ADOT) cites a service volume of 2,250 passenger cars per hour per lane (pc/ph/pl) at LOS E. The reason for this difference is not explained.
206	Also no explanation is provided as to how the duration of congestion is determined. The DEIS should have provided a good explanation of how duration of congestion is determined for planning purposes on the basis of the V/C ratio, especially in the analysis in this DEIS, where no distinction is made between LOS E and LOS F.
207	Figure 3-14 on Page 3-31 of the DEIS states that the Proposed Freeway will accommodate 6% of the regional travel demand, but that 5% of the travel demand will remain unmet. The same illustration indicates that arterial system enhancements would accommodate 5% of the regional travel demand. Figure 9-3 in the MAG RTP (Exhibit 12) presents the planned arterial improvements. Only one arterial improvement, an easterly extension of SR 801, is shown within the Study Area even though the Summary and Purpose and Need Chapters stress that there will be large amounts of growth in the southwestern portion of the Metropolitan Area. Additional arterial improvements in the study area along with arterial system enhancements throughout the modeling area may be able to accommodate the remaining unmet travel demand. The addition of the freeway segment included in the hybrid alternative illustrated in Exhibit 8 would also help reduce the unmet travel demand. As a side note, it is not explained in Figure 3-14 why it was necessary to use "data extrapolated from the 41st Street cut line." MAG's TransCad model is capable of summarizing travel time, vehicle hours of travel, vehicle miles of travel by any geographic area, by facility type, by Level of service, and other selected filters. The use of "extrapolated data" appears to be unwarranted.
208	Figures 3-15 and 3-16 (Pages 3-32 and 3-33 in the DEIS) present changes in congestion with the No Action compared to the Proposed Action conditions. The differences are very subtle. Without the distinction between segments operating

Code	Issue	Response
204	**Traffic**	Because much of the region's freeway system is congested, merely noting the level of service of a segment of freeway would not provide adequate information. Therefore, the project team provided the duration of congested conditions and defined congested conditions as being level of service E or F. The Arizona Department of Transportation typically uses level of service D as a threshold for acceptable conditions, so anything in excess of that was determined to be labeled as congested. The thresholds used in the analysis were determined in coordination with the Maricopa Association of Governments and based on observed traffic conditions in the Phoenix metropolitan area.
205	**Traffic**	Capacity levels used in the Draft Environmental Impact Statement were based on the thresholds used in the Maricopa Association of Governments regional travel demand model. The Maricopa Association of Governments model is calibrated to reflect conditions on Phoenix metropolitan freeways.
206	**Traffic**	The thresholds used to calculate duration of level of service E or F are provided in the Traffic Overview Report in Table 10. This level of detail is appropriate for the technical report.
207	**Traffic**	The *Regional Transportation Plan* is not the primary source of funding for expansion of the arterial street system. Funding for arterial streets generally comes from the local jurisdiction or through impact fees for development. It is anticipated that the arterial street network within the Study Area will be expanded in this same manner. The Maricopa Association of Governments regional travel demand model includes assumptions related to arterial street expansion based on local jurisdiction general planning. In the case of the Study Area, it is assumed that most of the arterial street network would be built out by 2035. Chapter 1, *Purpose and Need*, concludes that even with these improvements in place, there is a clear need for a major transportation facility in the Study Area. The analysis of capacity deficiency (unmet demand) in the region is presented in Figures 1-12 and 3-24. The analysis shows that the unmet demand in 2010 is 19 percent; in 2035, without the proposed freeway, the unmet demand increases to 24 percent; in 2035, with the proposed freeway, the unmet demand would be only 18 percent. The cut-line analysis (see Figure 3-13) shows that with the proposed freeway there would be a substantial shift in regional travel from arterial streets to freeways. The 41st Street cut line was used as a way to focus the analysis on the east–west movement that would be influenced by the proposed freeway. The noted information from the Maricopa Association of Governments travel demand model was used in other analyses.
208	**Traffic**	Because much of the region's freeway system is congested, merely noting the level of service of a segment of freeway would not provide adequate information. Therefore, the project team provided the duration of congested conditions and defined congested conditions as being level of service E or F. The Arizona Department of Transportation typically uses level of service D as a threshold for acceptable conditions, so anything in excess of that was determined to be labeled as congested. The thresholds used in the analysis were determined in coordination with Maricopa Association of Governments and based on observed traffic conditions in the Phoenix metropolitan area. The thresholds used to calculate the duration of level of service E or F are provided in the Traffic Overview Report in Table 10.

Code	Comment Document

at LOS E and LOS F and without an explanation of how the duration of congestion is determined, the information presented is not very useful for a thorough evaluation by the public and for decision-making.

209 **10. Appropriate mitigation measures are not proposed to mitigate the impacts of the Action Alternatives.** Assuming for discussion purposes only, that the Preliminarily Preferred Action Alternative is implemented, appropriate mitigation measures should have been addressed in the DEIS. Some appropriate mitigation measures would include:

210
- Placement of truck weight limits on the SMF
- Upgrading the Route via I-10/I-8/SR 85/I-10 to full freeway standards and obtaining Congressional approval for the designation of this route as the CanaMex Route
- Development of an east-west truck route to by-pass the Phoenix Metropolitan Area
- Formulation and inclusion in the RTP of a plan for arterials in the Southwest area to help guide development patterns so that desirable options are not precluded
- Restricting the transporting of hazardous materials on the SMF
- Others

211 **11. Based on these traffic and circulation considerations, none of the Action Alternatives should have been selected as the Preferred Alternative for the following reasons.**

212 a. It is understood that the Preliminarily Preferred Alternative would add capacity to the Regional Freeway System. On the other hand, the added capacity would have nominal effect on alleviating congestion in the central metropolitan area, where the need is greatest. This raises the question if the proposed SMF is the correct tool to deal with congestion in the central metropolitan area.

213 b. The Preferred Alternative is not consistent with the RTP because the phasing of construction presented in the DEIS differs from the phasing plan in the RTP.

214 c. There are many deficiencies in the DEIS, including:

215
- use of faulty socio-economic data;
- faulty forecasts of vehicular travel resulting from the use of faulty socio-economic data as input to the travel model;

Code	Issue	Response
209		See response to specific comments below.
210	**Trucks**	As it relates to truck weight limits and transport of hazardous materials, Arizona highways, as are most highways across the United States, are open to all kinds of traffic, so long as the cargo being carried is in accordance with U.S. Department of Transportation regulations for the specific type of cargo. The South Mountain Freeway, if implemented, is expected to operate under the same rules as other similar facilities in the state; truck traffic would be expected to be permissible (see text box on page 4-157 of the Final Environmental Impact Statement). Improvements to State Route 85 are included in the *Regional Transportation Plan*, and the plan is to continue to improve this corridor until it is completely access-controlled with a freeway section north of the Gila River. The *Regional Transportation Plan* is not the primary source of funding for expansion of the arterial street system. Funding for arterial streets generally comes from the local jurisdiction or through impact fees for development. It is anticipated that the arterial street network within the Study Area will be expanded in this same manner. The Maricopa Association of Governments regional travel demand model includes assumptions related to arterial street expansion based on local jurisdiction general planning. In the case of the Study Area, it is assumed that most of the arterial street network would be built out by 2035. The Arizona Department of Transportation has a few locations in the state with hazardous cargo restrictions, but these restrictions are based on emergency response issues or roadway design limitations specific to that location. For example, the Interstate 10 Deck Park Tunnel has certain hazardous cargo transport restrictions because of the limited ability for emergency responders to address a hazardous materials incident in the tunnel.
211		See responses to specific comments below.
212	**Alternatives**	The comment infers the transportation problem is congestion in the central metropolitan area. As presented in Chapter 1 of the Draft and Final Environmental Impact Statements, the purpose and need analysis demonstrated a transportation problem associated with east-west regional mobility in the southwestern region of the Phoenix metropolitan area. The Arizona Department of Transportation, with concurrence from the Federal Highway Administration, has determined that the South Mountain Freeway (as made up by the W59 and E1 Alternatives) is the appropriate solution to the described transportation problem. A contribution of the Preferred Alternative to alleviate congestion in the central metropolitan area would be an incidental benefit of the project and would support a goal of better distribution of regional traffic across the network.
213	**Implementation**	Construction phasing of a project is not an indicator of "consistency." The location and facility type are indicators of consistency. Nowhere in the Draft Environmental Impact Statement is it referenced that the proposed action is needed to comply with the *Regional Transportation Plan*.
214		Comment noted.

- unreliable Air Quality and Noise impact analyses, since they are based on faulty travel forecasts;
- failure to analyze viable alternatives with appropriate detail;
- deficiencies in the evaluation process and methodology;
- failure to analyze crucial potential impacts, such as truck traffic, impacts on arterials connecting to and near proposed interchanges, and others identified in this report.

216 These deficiencies in the DEIS render the DEIS useless as a decision-making tool. The selection of a Preliminarily Preferred Alternative on the basis of a faulty DEIS is inappropriate.

217 Because of these considerations and because it avoids any physical impacts on the environment, the No Action Alternative should have been selected as the Preferred Alternative.

Code	Issue	Response
215	**Traffic**	The analyses in the Draft Environmental Impact Statement used socioeconomic and traffic projections at the regional analysis zone and traffic analysis zone levels. At the time of publication of the Draft Environmental Impact Statement, Census 2010-based socioeconomic data at the regional analysis zone and traffic analysis zone levels had not been adopted by the Maricopa Association of Governments and were not available to the project team. Therefore, the data used in the Draft Environmental Impact Statement were the most appropriate information available. The Maricopa Association of Governments approved new population, employment, housing, and traffic projections in June 2013. The new data are presented in the Final Environmental Impact Statement beginning on page 1-11. The purpose and need and analysis of alternatives were updated and reevaluated using these new socioeconomic projections and corresponding projections related to regional traffic. While new projections based on the 2010 Census showed a lower anticipated population and vehicle miles traveled in 2035 than the previous projections, the conclusions reached in the Draft Environmental Impact Statement were validated in the Final Environmental Impact Statement (see Chapter 3, *Alternatives*). The traffic analysis demonstrated that the proposed project is needed today and will continue to be needed into the future. The new projections were also used to update the air and noise analyses for the Final Environmental Impact Statement (see sections beginning on pages 4-68 and 4-88, respectively). All of the alternatives were subject to a thorough evaluation using a multidisciplinary set of criteria in accordance with National Environmental Policy Act and Federal Highway Administration guidance. Among the factors considered in this study were 1) the amount of truck traffic that would be generated if an action alternative were to become the Selected Alternative and 2) that traffic's potential impact on the surrounding community. The right-of-way footprints for the action alternatives include the necessary widening of arterial streets connecting to the proposed freeway. Additional traffic-related impacts have been coordinated with the appropriate local jurisdictions.

Code	Issue	Response
216	**Alternatives**	All analyses presented in the Draft Environmental Impact Statement used state-of-the-practice, scientific community accepted methods, data and assumptions and were updated as appropriate as new data and/or regulatory requirements were disclosed. Updating analyses throughout an environmental impact statement process is common and expected. The Final Environmental Impact Statement reflects those updates. The Arizona Department of Transportation and Federal Highway Administration, in cooperation with the U.S. Army Corps of Engineers, the U.S. Bureau of Indian Affairs, and the Western Area Power Administration, prepared the Draft and Final Environmental Impact Statements and Section 4(f) Evaluation in accordance with the National Environmental Policy Act of 1969 [42 United States Code § 4332(2)(c)], Section 4(f) of the U.S. Department of Transportation Act of 1966 (49 United States Code § 303, as amended), and Section 404 of the Clean Water Act of 1977 (33 United States Code § 1251). All of these agencies are experienced in the review of National Environmental Policy Act documents and have found the logical sequence of decision making to be sound and in line with National Environmental Policy Act requirements. The Draft Environmental Impact Statement and Section 4(f) Evaluation 1) satisfies Federal Highway Administration and Arizona Department of Transportation's environmental analysis requirements; 2) provides a comparison of the social, economic, and environmental impacts that may result from implementation of the proposed action—construction and operation of a major transportation facility; and 3) identifies measures to avoid, reduce, or otherwise mitigate adverse impacts.
217	**Alternatives**	The No-Action Alternative would not avoid all physical impacts on the environment. In contrast, the No-Action Alternative would result in: · further difficulty in gaining access to adjacent land uses · increased difficulty in gaining access to Interstate and regional freeway systems from the local arterial street network · increased levels of congestion-related impacts such as deterioration of air quality · continued degradation in performance of regional freeway-dependent transit services · increased trip times and higher user costs For these reasons, the Arizona Department of Transportation, with concurrence from the Federal Highway Administration, did not select the No-Action Alternative, instead identifying the W59 and E1 Alternatives as the Preferred Alternatives.

Summary of Travel Trends

The trends data indicate that the *per capita* growth in travel that the U.S. experienced over the last four decades may be slowing. Statistically, of the ten major travel indicators shown in Table 3, in 2009 seven estimates were lower than the same estimate in 2001 estimates and the remainder are statistically the same (within the confidence interval).

Importantly, all of the travel estimates related to households are slightly lower in 2009 than 2001--including person and vehicle trips and the average daily person and vehicle miles generated by U.S. households. The longstanding decline in household size continued between 2001 and 2009. In addition, the average number of vehicle trips and vehicle miles of travel per driver are significantly lower than the 2001 estimate. The data shows both average person trip length and average vehicle trip length to be about the same as in 2001 (that is, within the confidence interval).

Table 3. Summary of Travel Statistics
1969, 1977, 1983, 1990, and 1995 NPTS, and 2001 and 2009 NHTS.

	1969	1977	1983	1990	1995	2001	2009	95% CI
Per Person								
Daily Person Trips	2.02	2.92	2.89	3.76	4.30	3.74	3.79	0.03
Daily PMT	19.51	25.95	25.05	34.91	38.67	36.89	36.13	1.35
Per Driver								
Daily Vehicle Trips	2.32	2.34	2.36	3.26	3.57	3.35	3.02	0.03
Daily VMT	20.64	19.49	18.68	28.49	32.14	32.73	28.97	0.71
Per Household								
Daily Person Trips	6.36	7.69	7.20	8.94	10.49	9.66	9.50	0.09
Daily PMT	61.55	68.27	62.47	83.06	94.41	95.24	90.42	3.38
Daily Vehicle Trips	3.83	3.95	4.07	5.69	6.36	5.95	5.66	0.06
Daily VMT	34.01	32.97	32.16	49.76	57.25	58.05	54.38	1.34
Per Trip								
Average person trip length (miles)	9.67	8.87	8.68	9.47	9.13	10.04	9.75	0.36
Average vehicle trip length (miles)	8.89	8.34	7.90	8.85	9.06	9.87	9.72	0.22

Notes:

- Average trip length is calculated using only those records with trip mileage information present.
- 1990 person and vehicle trips were adjusted to account for survey collection method changes (see 2001 Summary of Travel Trends Appendix 2).
