1.0 INTRODUCTION

This document fulfills the obligation, under the Code of Federal Regulations (CFR), Title 40, Section 58.10(a), requiring Arizona Department of Environmental Quality (ADEQ) to complete and submit to the United States Environmental Protection Agency (EPA) an annual network monitoring plan for the year 2011.

This plan informs EPA (Region 9) of the monitoring activities ADEQ will undertake July 1, 2011 through December 2011. However, some changes may occur after the plan is published and approved due to unforeseen events at monitoring sites, funding changes, or changes in EPA monitoring requirements. Data from ADEQ's monitors are reported to EPA's Air Quality System(AQS) database and to AIRNow. Please refer to ADEQ's Annual Air Quality Report for summaries of these data.

In 40 CFR 51, EPA requires states to create, submit, and adopt State Implementation Plans (SIPs) to address the various issues and responsibilities involved with creating and implementing air quality programs. Subpart J of Part 51 specifies that Part 58 Subpart B contains the requirements for establishing air quality surveillance systems to monitor ambient air quality.

Air quality surveillance systems consist of networks of monitors at carefully-chosen physical locations referred to as sites or stations. Some of the networks, sites, and monitors are:

- State and Local Air Monitoring Stations (SLAMS)
- National Core multipollutant monitoring stations (NCore)
- Photochemical Assessment Monitoring Stations (PAMS)
- Chemical Speciation Network (CSN)
- National Air Toxics Trends Sites (NATTS)
- Special Purpose Monitors (SPM)
- Urban Haze monitoring sites
- Interagency Monitoring of PROtected Visual Environments (IMPROVE)
- ADEQ visibility stations located in or near mandatory Class I areas (national parks and wilderness areas). Class I monitoring sites are subject to specific siting and operational guidance developed by the IMPROVE Steering Committee.
- AIRNow information sites
- Source-oriented monitoring sites operated independently by permittees (Industry)
- Meteorological sites

This Annual Monitoring Network Plan identifies the purpose(s) of each monitor and provides evidence that both the siting and the operation of each monitor meet the requirements in 40 CFR Part 58 appendices A, C, D, and E as follows:

- Appendix A – Quality Assurance Requirements for SLAMS, SPMs, and Prevention of Significant Deterioration (PSD) Air Monitoring
- Appendix C – Ambient Air Quality Monitoring Methodology
- Appendix D – Network Design Criteria for Ambient Air Quality Monitoring
- Appendix E – Probe and Monitoring Path Siting Criteria for Ambient Air Quality Monitoring

Results of the annual network review and planning are used to determine how well the network is achieving its required air monitoring objectives, how well it meets data users' needs, and how it should be modified (through termination of existing stations, relocation of stations, establishment of new stations, monitoring of additional parameters, and/or changes to the sampling schedule) in order to continue to meet its objectives and data needs. The network review and planning are performed for the purpose of improving the network and ensuring that it provides adequate, representative, and useful air quality data.

2.0 ADEQ PROGRAM AND NETWORK DESCRIPTIONS

ADEQ operates ambient air quality equipment for a variety of Federal and State monitoring programs. Detailed descriptions of the equipment deployed for each monitoring program are presented in Appendix C. The equipment is grouped by monitoring program or parameter, to easily compare instrument specifics across the networks. Appendix D lists the information about each of ADEQ's 49 monitoring sites, including those sites which ADEQ shares with other agencies or serves as the local site operator. General information about the monitoring programs ADEQ participates in is described in the following sections.

2.1 NAAQS Compliance Network

The largest compliance network in Arizona consists of monitoring sites operated for the purpose of demonstrating compliance with the **National Ambient Air Quality Standards** (**NAAQS**) for the "criteria" pollutants: carbon monoxide (**CO**), nitrogen dioxide (**NO_2**), sulfur dioxide (**SO_2**), ozone (**O_3**), particulate matter (**PM_{10}** and **$PM_{2.5}$**), and lead (**Pb**). The criteria pollutants are measured using instruments that have been certified by the EPA as Federal Reference Methods (FRM) or Federal Equivalent Methods (FEM). 40 CFR Part 58 specifies the minimum requirements for determining NAAQS compliance including the following network and site criteria:

- Number and types of monitors required per metropolitan statistical area (MSA) by pollutant
- Objectives and spatial scales
- Sampling frequency
- Collocation
- Special NCore-related requirements
- Meteorology
- Probe location and other restrictions within a site
- Periodic performance evaluations
- Quality Assurance
- Data reporting

2.1.1 Changes to the NAAQS

Pb - In November 2008, EPA revised the Pb NAAQS from 1.5 $\mu g/m^3$ to 0.15 $\mu g/m^3$. New requirements for the placement of monitors were added: (1) near Pb sources (by January 1, 2010) having annual ambient air Pb emissions that are expected to exceed one ton and (2) in non-source urban areas (by January 1, 2011) with populations greater than 500,000. In December 2009, EPA proposed revisions to these monitoring requirements. In December 2010, the EPA finalized the Pb monitoring requirements which required Pb monitoring near sources with Pb emissions greater than 0.5 tons. Monitors near these 0.5 to one ton sources are to be operational one year from the date of the final rule. Additionally, the final rule adjusted the non-source monitoring requirement to be limited to NCore sites, as opposed to the 500,000 population requirement mentioned in the original November, 2008 final rule. ADEQ has installed Pb monitors at the Globe Highway site as well as the Miami Golf Course site, effective October, 2010. ADEQ is currently exploring options for Pb monitoring methods at JLG Supersite and will have this monitor installed by December, 2011. The Pb monitoring final rule also clarified that Pb

monitoring will not be required in the Prescott area, despite Ernest A. Love Field Airport exceeding the 0.5 ton Pb emissions threshold.

O_3 - In March 2008, EPA revised the eight-hour O_3 standard from 0.08 parts per million (ppm) to 0.075 ppm. Monitoring network revisions included the requirement for locating monitors in urban areas with populations between 50,000 and 350,000 and requiring states to operate three non-urban monitors. In January 2010, EPA proposed revisions to the level of the standard, requesting comments on lowering the standard to a level within 0.060 to 0.070 ppm. No changes were proposed for the monitoring requirements. The final O_3 NAAQS will be issued in July 2011.

SO_2 - In June 2010, EPA revised the primary SO_2 standard by establishing a new one-hour standard at a level of 75 parts per billion (ppb). The new form is the three-year average of the 99th percentile of the annual distribution of daily maximum one-hour concentrations. It is also revoking the two existing primary standards of 140 ppb evaluated over 24 hours and the 30 ppb evaluated over a year. Additionally, the EPA required changes to data reporting requirements to include reporting the maximum five minute concentration for each hour in addition to the hourly averaged concentrations. ADEQ began collecting and processing hourly maximum five minute SO_2 concentrations in July and August, 2010. New monitoring requirements for placement of monitors were also issued, and monitors must be operational by January, 2013. The new monitoring requirements do not result in any SO_2 network changes for ADEQ, as population oriented monitors will be covered by Maricopa and Pima County agencies and the source oriented monitors have been established for years.

NO_2 - In January 2010, EPA set a new one-hour standard for NO_2 of 100 ppb. EPA is retaining the annual standard of 53 ppb. The form of the standard is the three-year average of the 98th percentile of the annual distribution of daily maximum one-hour average concentrations. New monitoring requirements were established including near roadway monitors in urban areas, additional urban monitors in large urban areas, and monitors in areas with populations susceptible to NO_2 related health effects. The new monitoring requirements are not expected to result in any NO_2 network changes for ADEQ, as population oriented monitors and near roadway monitors will be operated by Maricopa and Pima County agencies.

2.2 State Implementation Plan (SIP) and Maintenance Area Network

ADEQ maintains several air monitoring sites for the purpose of tracking compliance in areas that are currently not attaining one or more of the NAAQS and in areas where the NAAQS has been met, but on-going demonstration of compliance is required. Monitoring requirements for these areas are described in their associated SIPs.

2.3 Source Oriented Network

Historically, ADEQ has required several of the major point sources in the state to conduct ambient monitoring for criteria pollutants, primarily PM_{10} and SO_2, in and around the permitted facility. These monitors constitute a subset of the compliance monitoring network described above. ADEQ activities with respect to this network have been limited to performance audits and review of ambient data summaries submitted by the individual sources. Recently, however, SIP support has required the submittal of data by some sources to the AQS, including review of quality assurance documents kept by

the sources to support their ambient monitoring programs. ADEQ continues to work with the permitted facilities to obtain all ambient air quality data that are required to be reported to AQS.

2.4 NCore Network

EPA describes the nationwide NCore network composed of approximately 70 urban and 20 rural sites as a multipollutant network that integrates several advanced measurement systems for particles, pollutant gases, and meteorology. Some of the missions of the NCore network are:

- Tracking long-term trends of criteria and non-criteria pollutants;
- Support for long-term health assessments that contribute to ongoing reviews of the NAAQS;
- Support to scientific studies ranging across technological, health, and atmospheric process disciplines; and
- Support to ecosystem assessments recognizing that national air quality networks benefit ecosystem assessments and, in turn, benefit from data specifically designed to address ecosystem analyses.

As required under 40 CFR Part 58.13, ADEQ's NCore site (JLG Supersite) was operational by January 1, 2011. All ambient monitoring data required by 40 CFR Part 58 Appendix D(3)(b) will be reported to EPA's AQS database no later than June 30th, 2011. In addition to the above missions and the NCore monitoring requirements set forth in the CFR, ADEQ will use the JLG Supersite to test new technologies that may be adopted in various ADEQ monitoring networks. Examples would include advanced communications and serial data collection, remote span checks and calibrations, high sensitivity instrumentation, and instruments that monitor pollutants that may be added to the current CFR requirements. Additional NCore information is available from the EPA website: http://www.epa.gov/ttn/amtic/ncore/index.html

2.5 Meteorological Network

ADEQ collects meteorological data at sites throughout the state to support the analysis of ambient air quality data and to provide support for exceptional event reporting. Meteorological measurements are also required for the NCore and PAMS networks. ADEQ currently meets the meteorological monitoring requirements for the NCore and PAMS networks. It is a goal of ADEQ to add meteorological instrumentation to most of ADEQ's monitoring sites that are not currently equipped. Additions will occur as time and funding permits.

2.6 Photochemical Assessment Monitoring Stations (PAMS)

Section 182(c)(1) of the 1990 Clean Air Act (CAA) Amendments requires the Administrator to promulgate rules for enhanced monitoring of O_3 that includes concurrent monitoring of oxides of nitrogen (NOx), speciated volatile organic compounds (VOC), carbonyls, CO, and meteorology to obtain comprehensive and representative O_3 data. Immediately following the promulgation of those rules, the affected states began to implement a program to improve ambient monitoring activities and the monitoring of emissions of NOx and VOCs. Each SIP for the affected areas must contain commitments to implement the appropriate ambient monitoring network for such air pollutants. The subsequent revisions to 40 CFR 58 (1993) required states to establish PAMS as part of their SIP monitoring networks in O_3 non-attainment areas classified as serious, severe, or extreme. The principal reasons for

requiring the collection of additional ambient air pollutant and meteorological data are the widespread non-attainment of the O_3 NAAQS and the need for a more comprehensive air quality database for O_3 and its precursors. ADEQ operates two PAMS sites, JLG Supersite and Queen Valley, to represent the Phoenix metropolitan area.

EPA has recently constructed a workgroup to discuss the evaluation and possible re-invention of the PAMS program. The scope of the evaluation is extensive and includes PAMS objectives, network design, methods, and quality assurance. ADEQ has been an active participant in the PAMS re-invention process and will follow this activity closely to be aware of possible future implications for the ADEQ PAMS network.

2.7 National Air Toxics Trend Sites (NATTS)

The NATTS network was designed to monitor and record the concentrations of certain air toxics on a national scale. Data from EPA's national monitoring activities are used to estimate national average concentrations for these air toxics compounds and to detect trends. Using this information, EPA, states, and local agencies can estimate changes in the risks of human exposure. These changes can then be used to support changes in environmental policy. As part of the National Air Toxics Assessment (NATA) process, ambient air quality data are used to assess the national toxics inventory and long-term hazardous air pollutant (HAP) trends. ADEQ accepted federal funding and responsibility for this program in Arizona in 2003. The ADEQ JLG Supersite is the designated NATTS site for the Phoenix metropolitan area.

2.8 Chemical Speciation Network (CSN)

The CSN was established to meet the regulatory requirements for monitoring speciated $PM_{2.5}$ to determine the chemical composition of these particles. The purpose of the CSN is to determine, over a period of several years, trends in concentration levels of selected ions, metals, carbon species, and organic compounds in $PM_{2.5}$. The program began in 1999 with 54 Speciation Trends Network (STN) sites across the nation located primarily in or near larger MSAs. The network has increased to 200 sites nationwide. Monitoring at JLG Supersite includes one STN speciation sampler and two IMPROVE samplers as part of the CSN network. The collocated IMPROVE samplers provide precision information for the IMPROVE network and are used for comparison of the speciation results from both programs. In 2009, a URG 3000N carbon sampler was added and data from that sampler was then used in place of the data from the Met One SASS carbon channel. This substitution was made as part of a national program designed to make the characteristics of the CSN carbon method match the IMPROVE carbon method more closely.

2.9 Class I Area Network and IMPROVE Program

Visibility monitoring networks track impairment in specified national parks and wilderness areas. These parks and wilderness areas are called Class I Wilderness Areas and were designated based on an evaluation required by Congress in the 1977 federal CAA Amendments. The evaluation, which was performed by the United States Forest Service (USFS) and National Park Service (NPS), reviewed the areas of parks and national forests which were designated as wilderness before 1977, were more than 6,000 acres, and have visual air quality as an important resource for visitors. Of the 156 Class I Areas

designated across the nation, 12 are located in Arizona. Nine sites are located in USFS areas and three in NPS areas. EPA initiated the nationally-operated IMPROVE monitoring network in 1987 whose purpose is to characterize broad regional trends and visibility conditions using monitoring data collected in or near Class I Wilderness Areas across the United States. ADEQ is involved with the operation of 6 sites with IMPROVE instrumentation. Refer to section 4.12 and Appendix B for additional details regarding ADEQ's Class I Visibility and IMPROVE networks.

2.10 AIRNow Reporting

ADEQ currently utilizes three urban nephelometers to approximate and report $PM_{2.5}$ data to the AIRNow Web site to provide near real-time data for public use in the Phoenix metropolitan area. The $PM_{2.5}$ value is calculated by applying a correlation developed between the nephelometer and filter-based measurements. The program is voluntary and was originally intended to fill gaps in the AIRNow network until actual continuous methods were available. Several years ago, ADEQ attempted to submit additional continuous data to AIRNow via XML format; however, despite assurances that this format would be acceptable, AIRNow was not able to process data in this format. ADEQ has recently renewed these efforts to provide data to the AIRNow system and is currently working with their contractor to modify the existing AIRNow data transfer module. ADEQ hopes to utilize AIRNow's new AQCSV file format to transfer data to AIRNow.

2.11 Urban Haze Network

Historically, ADEQ operated an urban haze network in the Phoenix and Tucson metropolitan areas. The purpose of the networks is to provide policy-makers and the public with information regarding urban haze levels, track short-term and long-term urban haze trends, assess source contributions to urban haze, and better evaluate the effectiveness of air pollution control strategies on urban haze. Equipment used to evaluate urban visibility includes transmissometers, nephelometers, particulate monitors, and digital camera systems. A wealth of urban visibility related data and information have been collected for more than a decade in both the Phoenix and Tucson area. Recently, due to budget cuts, this non-mandatory program was reduced to operate in the Phoenix Metropolitan Area only. This network includes the digital cameras and the nephelometers and transmissometer that support the AIRNow data reporting. Additional details regarding ADEQ's Urban Haze Network can be found in section 4.13.

2.12 E-BAM Network of PM_{10} Special Purpose Monitors

The current network of E-BAM continuous particulate special purpose monitors (listed in Table 2.12-1) is composed of lightweight, portable monitors typically enclosed in self-contained, environmentally sealed containers. They can be battery or solar powered for operation at sites without fixed electrical power. E-BAMs continuously sample and report particulate concentrations. Data are sampled every second and concentrations recorded every minute. E-BAM monitors have been used by many agencies, particularly in the western United Sates, to provide continuous, real-time particulate concentration data that are useful for making informed smoke management decisions related to prescribed burns. E-BAM instruments are used for special purpose monitoring only. They are not classified as FRMs or FEMs and may not be used to demonstrate NAAQS compliance. ADEQ uses these monitors for temporary or short term monitoring of populated areas that could be impacted by smoke from controlled burns or for investigations of complaint responses. Historically, ADEQ's E-BAM monitors have been configured to

measure particles ≤ 10 microns in diameter (PM_{10}). To get a better understanding of smoke impacts in these smaller communities, ADEQ is considering changing the configuration on these monitors to measure only particles ≤ 2.5 microns in diameter ($PM_{2.5}$). Hourly data from the E-BAM monitors can be viewed at: http://www.phoenixvis.net/PPMmain.aspx.

Table 2.12-1 Location of E-BAM Monitors

Site Name	Address
Flagstaff Middle School	755 N. Bonito, Flagstaff, AZ 86001
Prescott College AQD	336 Grove Ave., Prescott, AZ 86301
Sedona Post Office	190 W. Highway 89A, Sedona, AZ 86336
Show Low	561 E. Deuce of Clubs, Show Low, AZ 85901
Springerville	323 S. Mountain Ave., Springerville, AZ 85936
Verde Ranger Station	300 E. Highway 260, Camp Verde, AZ 86322

3.0 MONITORING NETWORK EVALUATION

This section describes changes in ADEQ's current monitoring network that have taken place since the 2010 Network Plan was issued as well as changes planned for the next 18 months.

3.1 Site Closures

Tucson Transmissometer Receiver and Transmitter sites – Both of the sites were part of the Urban Visibility Program and were closed in 2010 due to budget constraints.

Prescott College AQD – The site may be closed following the 2012 ozone season. It does not meet siting requirements because of the close proximity to tall trees and to a nearby road with a high traffic count. These conditions make the Prescott College AQD site unsuitable for continued, long-term placement of the O_3 monitor. In addition, environmental control issues (the O_3 instrument is in a room at the college that may not be temperature-controlled in summer months) have impacted the operation of the seasonal O_3 monitor. A search for a suitable site will continue in 2011. It is ADEQ's goal to run O_3 monitors at two sites in Prescott during the 2012 O_3 season so that data from the two sites can be compared. An E-BAM monitor is also located at this site. At this time, it is not known if this E-BAM monitor will be removed along with the O_3 monitor.

Bethune Elementary School – The following were considerations in deciding to close this site:

1. Current and ongoing budgetary limitations require the redirection of non-essential resources. ADEQ no longer has the resources to conduct monitoring that is not required by regulation. The Bethune Elementary School monitor is an SPM and not required by the CFR.
2. The Maricopa County Air Quality Department (MCAQD) PM_{10} network provides sufficient coverage for attainment / nonattainment determinations in Maricopa County.
3. The West 43rd, Durango, South Phoenix, Greenwood, and Central Phoenix sites provide data that are representative of the Bethune Elementary School monitor.

Snowflake – An E-BAM was added in 2010 for a period of one year for smoke management information. This was a temporary study which ended in May, 2011. This E-BAM monitor will be redeployed to its original location in Show Low, AZ.

3.2 New Sites

Lake Havasu City – Kingman MSA – This area (population between 50,000 and 350,000) may require an O_3 monitor to be sited to capture maximum concentration in the MSA. The location would likely be in or near Lake Havasu City. A suitable site would be selected following careful analysis of the potential sites identified by our search process and in accordance with O_3 network monitoring guidelines. While a site in the Lake Havasu area has been under consideration for the past several years, delays in the promulgation of the O_3 NAAQS and the associated monitoring rule have delayed this process.

Globe Highway – This location was selected for the Hayden area Pb monitor in accordance with monitoring guidance published by EPA. EPA Region 9 has concurred with the selection of this site. Collocated TSP monitors were installed at this site in October 2010 as part of ADEQ's Pb network. A meteorological tower along with instrumentation to measure wind, temperature, and relative humidity were also installed in Spring, 2011.

Miami Golf Course – This location was selected for the Miami area Pb monitor in accordance with monitoring guidance published by EPA. A Pb TSP monitor was installed at this site in October 2010. A meteorological tower along with instrumentation to measure wind, temperature, and relative humidity were also installed in Spring, 2011.

Replacement for Prescott College AQD – An O_3 monitor will be located at a new site in Prescott prior to the start of the 2012 O_3 season. The current site does not meet siting requirements because of the close proximity to tall trees and to a nearby road with a high traffic count. In addition, environmental control issues (the instrument is in a room at the college that may not be temperature-controlled in summer months) have impacted the operation of the seasonal O_3 monitor. A search for a suitable site will continue in 2011. It is ADEQ's goal to run O_3 monitors at two sites in Prescott during the 2012 O_3 season so that data from the two sites can be compared.

3.3 Instrument Changes

Tucson Urban Visibility Monitors – ADEQ discontinued the operation of all nephelometers and transmissometers in the Tucson area due to budget constraints. The affected sites include Children's Park, 22nd & Craycroft, and the Tucson Transmissometer Receiver and Transmitter sites. Supporting meteorological instruments were also closed at these sites. These instruments were shut down in May, 2010.

JLG Supersite CO and SO_2 – High-sensitivity instruments for measurements of CO and SO_2 are required as part of the NCore program. These 'trace-level' monitors were installed at JLG Supersite in the fall of 2010. These instruments were operational by January 1, 2011. The older, traditional CO and SO_2 instruments that were previously used for NAAQS compliance were removed in the spring of 2011. Data from these 'trace-level' monitors will be reported to AQS in place of the traditional monitors.

JLG Supersite PM_{coarse}, PM_{10}, and $PM_{2.5}$ BAMs – Two FEM BAM instruments and an electronic connection between them provide hourly $PM_{10-2.5}$, PM_{10}, and $PM_{2.5}$ measurements to meet NCore requirements. These instruments were installed in the fall of 2010 and were operational by January 1, 2011. Data from these instruments will be reported to AQS.

JLG Supersite PM_{10}, and $PM_{2.5}$ TEOMs – The $PM_{2.5}$ FDMS TEOM and the PM_{10} TEOM instruments will be removed following a period of collocation with the paired BAMs system. Simultaneous TEOM and BAM monitoring is warranted for a period of time to assess the comparability between the two instrument types. After sufficient data are collected, the $PM_{2.5}$ FDMS TEOM and PM_{10} TEOM will be removed.

JLG Supersite $PM_{2.5}$ – The collocated Partisol 2025 $PM_{2.5}$ instruments will be replaced by a Partisol 2000 $PM_{2.5}$. With this change, all $PM_{2.5}$ filter-based instruments in ADEQ's network will be of the same measurement method, eliminating the need for $PM_{2.5}$ collocation at JLG Supersite since the network collocation requirement is already met. This change is scheduled to occur by July 1, 2011.

JLG Supersite Pb – Recent revisions to the Pb monitoring rule required Pb monitoring at NCore sites that are located within a combined statistical area (CBSA) with a population greater than 500,000. The Phoenix CBSA meets this population requirement, therefore, Pb monitoring will be required at ADEQ's NCore site (JLG Supersite). Currently, a PM_{10} low volume sampler produces Pb results as part of the NATTS program. ADEQ is currently reviewing the EPA approved methods for both TSP and PM_{10} collection and analysis methods. ADEQ will continue to review these methods as they become available and determine if Pb-PM_{10} will be an option at JLG Supersite. ADEQ will also determine if an 'attainment' designation is preferred over an 'unclassifiable' designation, since the Pb-PM_{10} data collection method cannot be used to show attainment.

O_3 Analyzers – Prior to the 2011 O_3 season, all O_3 sites were upgraded with newer API Teledyne analyzers, which have remote zero and span capabilities. These API Teledyne O_3 analyzers replaced the TEI 49C analyzers that had been used in prior years.

Queen Valley Meteorology – During the five-year network assessment, it was discovered that the Queen Valley site was not meeting PAMS monitoring requirements as it lacked meteorological measurements of wind, temperature, and relative humidity. Meteorological instrumentation was installed at this site in the Spring, 2011.

Hayden Old Jail Meteorology – Pursuant to the recommendation in ADEQ's five-year network assessment to increase coverage in ADEQ's meteorological network, meteorological measurements of wind, temperature, and relative humidity were added to this site in December, 2010.

3.4 Summary of Network Changes

Table 3.4-1 Instruments Closed or to be Closed in 2011-2012

Site Name	AQS ID	Classification	Scale	Monitor Objective	Parameter(s) Measured	Report to AQS	Reason for Monitor Closure
JLG Supersite	04-013-9997	SLAMS/NCore	Neighborhood	Population	SO_2 , CO	Yes	Replaced by NCore trace-level instruments
JLG Supersite	04-013-9997	SLAMS/NCore	Neighborhood	Population	PM_{10}, $PM_{2.5}$	Yes	$PM_{2.5}$ FDMS TEOM and PM_{10} TEOM replaced by NCore BAMS monitors
JLG Supersite	04-013-9997	SLAMS/NCore	Neighborhood	Population	$PM_{2.5}$	Yes	Partisol 2025 replaced by Partisol 2000
Prescott College AQD	04-025-8033	SLAMS	Neighborhood	Population	O_3	Yes	Site does not meet EPA siting requirements
Bethune Elementary School	04-013-8006	SPM	Neighborhood	Population	PM_{10}	Yes	Budget constraints, not required, redundant with other Phoenix monitors
Snowflake		SPM			PM_{10}	No	Planned one-year EBAM project ended
Ozone Analyzers	Various	SLAMS	Various	Various	O_3	Yes	Thermo 49Cs replaced with API Teledynes
Tucson Transmissometer / Receiver		Urban Haze	Urban	Visibility	Bext	No	Tucson urban visibility and associated meteorology were discontinued due to budgetary constraints
22nd St./Craycroft	04-019-1011	Urban Haze	Urban	Visibility	Bscat, Temp, RH	No

Ozone Analyzers	Various	SLAMS	Various	Various	O_3	Yes	API Teledynes replaces older Thermo 49C

4.0 ADEQ MONITORING NETWORKS

Minimum monitoring requirements for the number of sites in SLAMS networks (including PAMS and NCore) are described in 40 CFR Part 58 Appendix D and are based on the population of urban areas. As EPA reviews the NAAQS for each of the criteria pollutants, additional network monitoring requirements for these standards as well as for the other criteria pollutants may be added. The additional requirements may be based on population or on some other metric, such as non-urban areas, micropolitan areas, or simply at the discretion of the EPA Regional Administration to adequately assess air quality for sensitive population groups. Table 4.0-1 lists Arizona's MSA populations.

Table 4.0-1 Arizona MSAs as of the July 2009 Census Estimate

MSA Name	Area included	Population
Flagstaff	Coconino County	129,849
Lake Havasu City – Kingman	Mohave County	194,825
Phoenix – Mesa – Scottsdale	Maricopa & Pinal Counties	4,364,094
Prescott	Yavapai County	215,503
Tucson	Pima County	1,020,200
Yuma	Yuma County	196,972

4.1 $PM_{2.5}$ Monitoring Network Requirements

The number of $PM_{2.5}$ samplers required in urban areas is based on population (see Table 4.1-1) and design values for $PM_{2.5}$ concentrations (see Table 4.1-2).

Table 4.1-1 Minimum Number of $PM_{2.5}$ Monitors Required (40 CFR 58 Appendix D)

Population (MSA)	Most recent 3 yr design value ≥ 85% of any $PM_{2.5}$ NAAQS *	Most recent 3 yr design value <85% any $PM_{2.5}$ NAAQS *
>1,000,000	3	2
500,000 – 1,000,000	2	1
50,000 – 500,000	1	0

* 85% of Annual NAAQS (15 µg/m3) = 12.75 $\mu g/m^3$; 85% of 24-Hour NAAQS (35 $\mu g/m^3$) = 29.75 $\mu g/m^3$

The frequency of sample collection is based on the type of sampler and the design value calculated from data collected at each FRM (filter monitors) or FEM (continuous) sampler (see Table 4.1-2). 40 CFR Part 58.12 (d)(1) gives the manual $PM_{2.5}$ sample collection frequency requirement at required SLAMS stations as every third day at sites without a collocated continuously operating $PM_{2.5}$ monitor. For SLAMS $PM_{2.5}$ sites with manual and continuous $PM_{2.5}$ monitors, the agency may request approval from the EPA Regional Administrator for a reduction to every sixth day and/or seasonal sampling schedule. Sites with design values ±10 percent of 35$\mu g/m^3$ (31.5 to 38.5$\mu g/m^3$) and sites where 24-hour values exceed the NAAQS for three consecutive years need an every third day frequency. Sites within ±5% of 35$\mu g/m^3$ (33.25 to 36.75$\mu g/m^3$) need to operate on a daily schedule.

Table 4.1-2 $PM_{2.5}$ Design Values and Sampling Frequencies at ADEQ SLAMS Sites

Site Name	2008-2010 24-Hour Design Value ($\mu g/m^3$)	2008-2010 Annual Design Value ($\mu g/m^3$)	Current Sample Frequency	Required Frequency
Douglas Red Cross	14	7.1	1 in 6	1 in 3
Flagstaff Middle School*	13	6.1	1 in 6	1 in 3
JLG Supersite	19	8.1	1 in 3	1 in 3
Nogales Post Office	32	12.2	1 in 6	1 in 3
Prescott Valley*	11	5.0	1 in 6	1 in 3
Yuma Supersite*	14	7.4	1 in 6	1 in 3

* Indicates design value calculations do not meet completeness criteria

ADEQ operates EPA approved FRM samplers at all required $PM_{2.5}$ monitoring sites. Although the required frequency for all $PM_{2.5}$ FRM monitors is every third day, ADEQ operates only the monitor at JLG Supersite at this frequency. Sampling frequencies at the other sites have remained on the original every sixth day schedule established when the $PM_{2.5}$ program was started. Consideration of travel time, shipping costs, laboratory processing workload, and little change in annual values through time have discouraged changing to the more frequent monitoring schedule. Currently, ADEQ operates continuous samplers at two monitoring sites, JLG Supersite and Nogales Post Office. A continuous $PM_{2.5}$ sampler is required at JLG Supersite as part of the NCore requirements. The continuous $PM_{2.5}$ sampler at Nogales Post Office is not an FEM, but is used to supplement the filter-based monitoring at the site so that diurnal patterns in $PM_{2.5}$ can be assessed. Since the $PM_{2.5}$ design value at Nogales Post Office is within 10 percent of the NAAQS, higher frequency monitoring is warranted.

4.1.1 Compliance with 40 CFR Part 58.10 (c)

A process for relocating violating $PM_{2.5}$ monitors is described in 40 CFR Part 58.10 (c). It requires the annual monitoring network plan to document how state and local agencies provide for the review of changes to a $PM_{2.5}$ monitoring network that impact the location of a violating $PM_{2.5}$ monitor or the creation/change to a community monitoring zone, including a description of the proposed use of spatial averaging for purposes of making comparisons to the annual $PM_{2.5}$ NAAQS as set forth in Appendix N to Part 50. The affected agency must document the process for obtaining public comment and include any comments received through the public notification process within their submitted plan.

ADEQ does not intend to establish community monitoring zones as described in the rule or utilize spatial averaging for comparison to the $PM_{2.5}$ NAAQS. A public comment procedure is required prior to relocation of a violating monitor and ADEQ will utilize the following procedure:

1. Evaluation of the potential replacement site will include review and comparison of available pollutant data, meteorology, climatology, terrain, and siting characteristics. This information will be documented in a brief report.
2. Make notice of such a change in the annual monitoring network plan.
3. If the change must be accomplished prior to annual monitoring network plan submittal, ADEQ will make appropriate notice via the agency Web page and invite participation from the public prior to relocation of the affected site.
4. Relocation of the monitor.

4.2 PM_{10} Monitoring Network Requirements

The number of PM_{10} samplers required in urban areas is based on population (see Table 4.2-1) and design values for PM_{10} 24-hour concentrations (see Table 4.2-2). ADEQ has delegated authority for monitoring PM_{10} to Maricopa, Pinal, and Pima Counties, giving them responsibility for the monitoring network for the MSAs within their counties. ADEQ's PM_{10} monitoring network includes the MSAs in all other Arizona counties, as well as the PM_{10} non-attainment areas in those counties. ADEQ operates a PM_{coarse} monitor (difference method using BAM instruments) in the Phoenix metropolitan area at the JLG Supersite NCore site. PM_{10} concentrations are available from the PM_{10} BAM instrument to support the multipollutant measurements at that site.

Table 4.2-1 Minimum Number of PM_{10} Monitors Required (40 CFR 58 Appendix D)

Population (MSA)	High Concentration Exceeds 24-Hour NAAQS by 20% or more (>180µg/m^3)	Medium Concentration Exceeds 80% of 24-Hour NAAQS (>120µg/m^3)	Low Concentration Less than 80% of 24-Hour NAAQS (<120 µg/m^3)
>1,000,000	6-10	4-8	2-4
500,000 – 1,000,000	4-8	2-4	1-2
250,000 – 500,000	3-4	1-2	0-1
100,000 – 250,000	1-2	0-1	0

The monitoring rule in 40 CFR Part 58.12 (e) states that for PM_{10} sites, "…the minimum monitoring schedule for the site in the area of expected maximum concentration shall be based on the relative level of that monitoring site concentration with respect to the 24-hour standard." In rural areas of Arizona where there is only one PM_{10} monitor to represent the area, such as Ajo, Hayden, and Yuma, sites can be considered de facto maximum-concentration sites whose operating frequencies must be determined using the Ratio-to-Standard diagram in 40 CFR Part 58.12 (e). Due to the variability in PM_{10} concentrations from year to year throughout Arizona, the operating frequencies of ADEQ PM_{10} monitors will be evaluated every five years as part of the Five Year Network Assessment. Table 4.2-2 provides the design values and sampling frequencies for ADEQ's PM_{10} monitors. Since exceptional events have a large impact on PM_{10} design values in Arizona, two scenarios are provided.

In recent years, ADEQ has transitioned several PM_{10} monitors from filter-based methods to continuous methods. As stated in ADEQ's Five Year Network Assessment, this transition to continuous PM_{10} samplers continues to be a focus for ADEQ, but there are no plans at this time to transition additional filter-based monitors to continuous samplers. ADEQ will be removing the Bethune Elementary School PM_{10} SPM at the end of the second quarter of 2011. This monitor is not required by regulation and ADEQ does not have the resources to operate non-essential monitors. A further description of the rationale for removing this monitor can be found in Appendix F.

Table 4.2-2 PM_{10} NAAQS Design Value and Sampling Frequencies of ADEQ PM_{10} Monitors

Site Name	Estimated Days PM_{10} >150 ($\mu g/m^3$) 2008-2010 Including Events	Estimated Days PM_{10} >150 ($\mu g/m^3$) 2008-2010 Excluding Events	Current Sample Frequency	Historical Sample Frequency
Ajo [2]	0	0	Continuous	1 in 6
Bullhead City	0	0	1 in 6	1 in 6
Douglas Red Cross [1]	0	0	1 in 6	1 in 6
Flagstaff Middle School	0	0	1 in 6	1 in 6
Hayden Old Jail [2]	0.3	0	Continuous	1 in 6
Bethune Elementary School (SPM)	2	0	1 in 6	1 in 6
JLG Supersite	0	0	Continuous	1 in 6 and Continuous
Nogales Post Office	2.2	0	1 in 6 and Continuous	1 in 6 and Continuous
Paul Spur Chemical Lime Plant	2	0	1 in 6	1 in 6
Payson Well Site	0	0	1 in 6	1 in 6
Prescott Valley [1]	0	0	1 in 6	1 in 6
Rillito [2]	0.7	0	Continuous	1 in 6

[2] Filter-based and continuous records merged to calculate design value
[3] Continuous records from Yuma Courthouse and Yuma Supersite merged to calculate design value

4.3 O_3 Monitoring Network Requirements

The current EPA minimum monitoring requirements for O_3 are shown below in Table 4.3-1. EPA has proposed revisions to the O_3 monitoring requirements, but these revisions have not been finalized. If the proposed revisions go final, there will be an affect on ADEQ's O_3 network. Potential effects include:

- greater coordination with the NPS as their monitors may be used to meet the rural O_3 monitoring requirement
- an additional O_3 monitor may be needed in the Lake Havasu area to meet the population requirement
- an additional O_3 monitor may be needed in a micropolitan statistical area to meet a new population requirement.

ADEQ is basing its current O_3 monitoring network off of the current regulations in 40 CFR Part 58 Appendix D. ADEQ is aware of the potential for changes to the O_3 monitoring rule. If EPA does finalize their proposed rule, ADEQ will address these changes in subsequent network plans.

Table 4.3-1 Minimum Number of O_3 Monitors Required (40 CFR 58 Appendix D)

Population (MSA)	Most recent 3 year 8-hour Design Value ≥ 85% of NAAQS (0.075 ppm) or no Design Value available	Most recent 3 year 8-hour Design Value <85% NAAQS (0.075 ppm)
>10 Million	4	2
4-10 Million	3	1
350,000 - 4 Million	2	1
50,000 – 350,000	1	0

ADEQ operates a network of seven O_3 monitors throughout Arizona (see Table 4.3-2). Authority to operate O_3 monitors has been delegated to Maricopa, Pima, and Pinal counties. ADEQ will be relocating the Prescott College AQD monitor following the 2012 O_3 season due to siting requirements. Prior to the 2011 O_3 season, ADEQ upgraded their O_3 monitoring network by replacing the Thermo 43C analyzers with newer API Teledyne analyzers. The new API Teledyne O_3 analyzers allow for remote zero, span, and precision checks which will improve the overall efficiency of ADEQ's ambient air monitoring group.

Table 4.3-2 O_3 Design Values at ADEQ Sites

Site	Operating Schedule	2008-2010 Design Value (ppm)
Alamo Lake	April - October	0.072
Flagstaff Middle School	April - October	0.069
JLG Supersite	January - December	0.075
Prescott College AQD *	April - October	0.066
Queen Valley	April - October	0.074
Tonto National Monument	April - October	0.073
Yuma Supersite	April - October	0.073

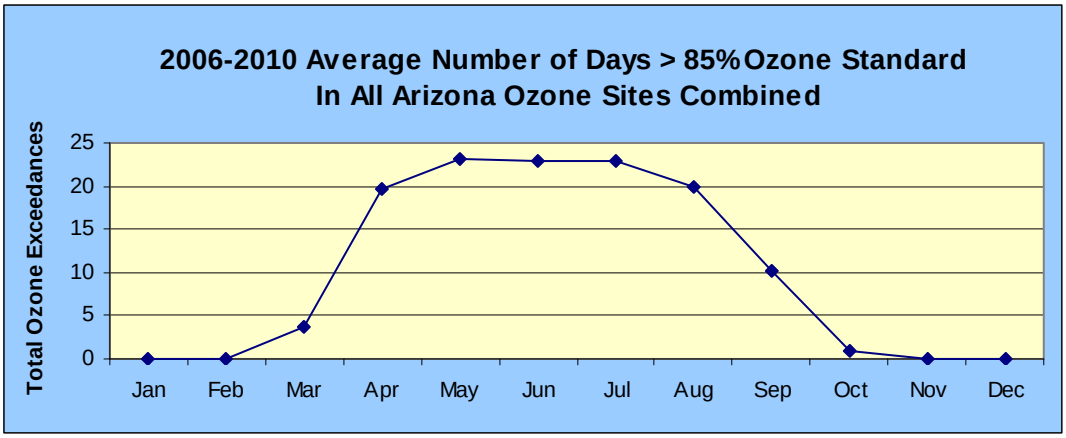
* Based on incomplete data (2008)

4.3.1 O_3 Season

In accordance with 40 CFR Part 58, Appendix D, Paragraph 4.1(i), ADEQ was granted a modification to the January through December O_3 season defined in the regulation. Prior to the 2008 revision to the O_3 NAAQS, the 1998 EPA guidance document entitled, "Guideline for Selecting and Modifying the Ozone Monitoring Season Based on an Eight-Hour Ozone Standard" supported a shorter O_3 season for Arizona (April through October) based upon data collected from 1990-1995. During the Spring of 2011, this analysis was updated to include the 2008 O_3 NAAQS, as well as more recent data. To get the best representation of the entire state, data from all O_3 sites in Arizona were used in the analysis. For the

period 2006-2010, the average number of days above 85 percent of the 2008 NAAQS of 0.075 ppm continues to support the operation of seasonal monitors (see Figure 4.3-1). However, the data indicate that the O_3 season should be extended one month to include the month of March. In 2012 ADEQ plans to extend the O_3 season by starting to monitor O_3 in March instead of April. As shown in Table 4.3-2, the current seasonal sites are Alamo Lake, Flagstaff Middle School, Prescott College AQD, Queen Valley, Tonto National Monument, and Yuma Supersite. The JLG Supersite will continue to operate on a January to December schedule.

Figure 4.3-1 Average Number of Days exceeding 85% of the 2008 O_3 NAAQS



4.4 Pb Monitoring Network Requirements

In November 2008, EPA revised the Pb NAAQS from 1.5 $\mu g/m^3$ to 0.15 $\mu g/m^3$. New requirements for the placement of monitors were added: (1) near Pb sources (by January 1, 2010) having annual ambient air Pb emissions that are expected to exceed one ton and (2) in non-source urban areas (by January 1, 2011) with populations greater than 500,000. In December 2009, EPA proposed revisions to these monitoring requirements. In December, 2010, the EPA finalized the Pb monitoring requirements which required Pb monitoring near sources with Pb emissions greater than 0.5 tons. Monitors near these 0.5 to 1 ton sources are to be operational one year from the date of the final rule. Additionally, the final rule adjusted the non-source monitoring requirement to be limited to NCore sites with CBSA populations greater than 500,000. ADEQ has installed Pb monitors at the Globe Highway site as well as the Miami Golf Course site, effective October, 2010. ADEQ is currently exploring options for Pb monitoring methods at JLG Supersite and will have this monitor installed by December, 2011. ADEQ is hoping to use the current low volume PM_{10} metals speciation sampler as the collection method. However, this collection method will be dependent upon EPA's approval of analysis methods for this type of sampling. ADEQ hopes to use the same PM_{10} metals speciation sample that is used for the NATTS program for the analysis of Pb. Eastern Research Group (ERG) currently analyzes these samples. The Pb monitoring final rule also clarified that Pb monitoring will not be required in the Prescott area, despite Ernest A. Love Field Airport exceeding the 0.5 ton Pb emissions threshold.

4.5 SO_2 Monitoring Network Requirements

ADEQ operates a network of three SO_2 monitors throughout Arizona. Authority to operate SO_2 monitors has also been delegated to Maricopa and Pima counties. ASARCO LLC and Freeport MacMoRan Copper and Gold Inc. also operate SO_2 monitoring networks in Gila County for compliance purposes to support SIP requirements. The SO_2 monitoring requirements set forth in 40 CFR Part 58 Appendix D is based on a Populated Weighted Emissions Index (PWEI) that is calculated for each CBSA. CBSAs with PWEIs greater than 5,000 require at least one SO_2 monitor. CBSAs with PWEIs greater than 100,000 require a minimum of two SO_2 monitors. The Phoenix and Tucson metropolitan areas are the only areas within the state of Arizona that require ambient monitoring of SO_2. The current SO_2 monitors in place that are operated by Maricopa and Pima counties meet or exceed the current monitoring requirements set forth in 40 CFR Part 58 Appendix D. ADEQ will continue to operate at least one SO_2 monitor in the Hayden and Miami areas to support the local facility networks. ADEQ has been working with these facilities to acquire their SO_2 ambient monitoring data for reporting to EPA's AQS database. In the years to come, ADEQ will continue to work with these facilities to review and report ambient SO_2 data to the AQS database where compliance with the SO_2 standard can be easily monitored. ADEQ has and will continue to perform annual performance evaluations for these facilities' SO_2 monitors. ADEQ also operates a trace-level SO_2 monitor at its NCore site (JLG Supersite), as required in 40 CFR Part 58 Appendix D.

4.6 NO_2 Monitoring Network Requirements

ADEQ operates one NO_2 monitor throughout the state of Arizona. This NO_2 monitor is located at the JLG Supersite. Authority to operate NO_2 monitors has also been delegated to Maricopa and Pima counties. The NO_2 monitoring requirements set forth in 40 CFR Part 58 Appendix D are based on a combination of CBSA population and Annual Average Daily Traffic (AADT) counts. The first requirement to be considered is the CBSA population. CBSAs with populations greater than 500,000 are required to operate one near roadway monitor, while CBSAs with populations greater than 2.5 million are required to operate two near roadway monitors. Additionally, CBSAs with populations greater than 500,000 which also contain roadway segments with 250,000 or greater AADT also require two near roadway monitors. As can be seen in table 4.0-1, two CBSAs (Phoenix and Tucson Metro areas) within the state of Arizona contain populations greater than 500,000 and therefore require at least one NO_2 near roadway monitor. The Phoenix CBSA also exceeds the 2.5 million population requirement, therefore two near roadway monitors are needed in the Phoenix CBSA. The required near roadway monitors in Tucson and Phoenix will be operated by the local monitoring agencies in their respected areas. ADEQ has reviewed population and AADT data and has determined that no other areas in the state require near roadway NO_2 monitors.

In addition to the near roadway monitoring requirements set forth in 40 CFR Part 58 Appendix D, there is also a requirement for area-wide NO_2 monitoring. CBSAs with populations of one million or more require one NO_2 monitor to measure NO_2 concentrations that represent neighborhood or larger spatial scales. The Phoenix and Tucson metropolitan areas are the only areas within the state of Arizona that require ambient monitoring of NO_2. The current NO_2 monitors in place that are operated by Maricopa and Pima counties meet or exceed the current monitoring requirements set forth in 40 CFR Part 58

Appendix D. ADEQ will continue to monitor NO_2 at JLG Supersite as part of the NO_x measurements which are required for the PAMS program.

4.7 CO Monitoring Network Requirements

ADEQ operates one CO monitor throughout Arizona. This CO monitor is a trace level monitor that is located at the JLG Supersite to fulfill NCore monitoring requirements. Authority to operate CO monitors has also been delegated to Maricopa and Pima counties. There are no CO minimum monitoring requirements set forth in 40 CFR Part 58 Appendix D, however, continued operation of CO monitors is required until discontinuation is approved by the EPA Regional Administrator. While there are no minimum monitoring requirements for CO set for in 40 CFR Part 58 Appendix D, the EPA has recently proposed new monitoring requirements for CO. Except for those CO monitors that are required as part of the NCore network, the proposed monitoring requirements would not require any area-wide CO monitors. However, the proposed monitoring requirements would require near roadway CO monitors in CBSAs with populations of one million or greater. These near roadway CO monitors would be collocated with the NO_2 near roadway monitoring stations. Since the Tucson and Phoenix CBSAs both exceed the one million population requirement set forth in the proposed rule, the number of near roadway CO monitors would be identical to the number of near roadway NO_2 monitors. The required near roadway monitors in Tucson and Phoenix will be operated by the local monitoring agencies in their respected areas. The one CO monitor that is currently operated by ADEQ meets or exceeds the minimum monitoring requirements for both the NCore and CO network design criteria set forth in 40 CFR Part 58 Appendix D.

4.8 PAMS Monitoring Network Requirements

Network design and monitoring requirements for PAMS stations are provided in 40 CFR 58 Appendix D for areas classified as serious, severe, or extreme nonattainment for O_3. Two sites are required for each area, providing all chemical measurements are made. Measurements include speciated VOCs, carbonyls, NO_x, trace level nitrogen oxides (NO_y), CO, O_3, surface meteorology, and upper air meteorology. In 2008, EPA shortened the PAMS monitoring season to June through August.

ADEQ's PAMS network consists of two ambient air monitoring sites in the Phoenix-Mesa-Scottsdale MSA and a meteorological site for the collection of upper air meteorological data and solar radiation data.

<u>JLG Supersite – Type 2 PAMS Site</u>
The JLG Supersite was designated a PAMS site in 1999. To meet the revised EPA requirement for daily monitoring, ADEQ contracted with an outside vendor for the operation of an automated gas chromatograph mass spectrometer (Auto GC/MS) monitoring system for collection and analysis of PAMS VOCs data at JLG Supersite for the 2007 monitoring season. The hourly data were reviewed and submitted to AQS. A comparison with the canister samples collected for Toxics VOCs indicated the Auto GC/MS measurements were within 15 percent of the canister method results. Analysis of the 2007 results has been completed. The successful operation of the Auto GC/MS and the reliability of the results for analysis plus the additional information that continuous measurements can provide could support a decision to purchase an Auto GC/MS to be operated at JLG Supersite during PAMS season in

lieu of canister sampling. However, consultation with current users of Auto GC equipment in several different agencies confirmed that purchase and installation would cost approximately $100,000 and successful operation would require half of a full time employee on a continuing basis. Since the required manual method of eight three-hour canisters running daily is impractical due to increased expenses for staff, shipping, and analysis, ADEQ returned to the 2006 monitoring schedule of a 24-hour canister sample every sixth day at the JLG Supersite during PAMS season for VOCs. This will be reviewed when the final results of the PAMS re-engineering program are available which may include recommendations for changes to monitoring and possibly new types of instruments. ADEQ also operates carbonyl, O_3, CO, NOx, and surface meteorological monitoring equipment at JLG Supersite (see Table 4.8-1). Carbonyl monitoring at JLG Supersite is not currently required for PAMS and could be discontinued for the 2012 PAMS season but there are no current plans at this time.

Table 4.8-1 JLG Supersite PAMS Instrumentation

Parameter	Dates of Operation	Collection Method	Frequency and Duration
VOC	6/1/11 – 8/31/11	Canister Sampler	Every 6th day, 24 Hr
Carbonyl	6/1/11 – 8/31/11	Multi-port Carbonyl Sampler	Every 6th day, 24 Hr, and 3 - 3hr samples (0500-0800, 0800-1100, 1100-1400)
CO	1/1/11 – 12/31/11	Trace CO	Hourly average
O_3	1/1/11 – 12/31/11	O_3 Analyzer	Hourly average
NOx	1/1/11 – 12/31/11	NOx Analyzer	Hourly average
Meteorology	1/1/11 – 12/31/11	• wind speed/direction • temperature • relative humidity	Hourly average

Queen Valley – Type 3 PAMS Site

Queen Valley was designated a PAMS site in 2001. The site is located near the southeastern edge of the photochemical modeling grid domain and is considered to be downwind of the source of maximum precursor emissions in the Phoenix metropolitan area. Pollutants collected at the site include speciated PAMS VOCs, O_3, total reactive NOx, and surface meteorology measurements. ADEQ's Five-Year Network Assessment identified the Queen Valley site as not meeting PAMS monitoring requirements due to the lack of meteorological measurements. Meteorological instrumentation was added during the second quarter of 2011. Carbonyl samples are not required at Type 3 sites. Table 4.8-2 lists the instrumentation and monitoring schedule at the Queen Valley site.

Table 4.8-2 Queen Valley PAMS Instrumentation

Parameter	Dates of Operation	Collection Method	Frequency and Duration
VOC	6/1/11 – 8/31/11	Multi-port sampler	Every 6^{th} day, 24Hr, and 3 – 3hr samples (0500-0800, 1300-1600, 1600-1900)
O_3	4/1/11 – 10/31/11	O_3 Analyzer	Hourly average

NOy	4/1/11 – 10/31/11	NOy Analyzer	Hourly average
Meteorology	4/19/11 – 12/31/11	• wind speed/direction • temperature • relative humidity	Hourly average

Vehicle Emissions Laboratory – Upper Air Meteorology Site

A radar wind profiler collects continuous upper air meteorological data for determination of mixing heights. This site also includes a pyranometer to measure total solar radiation, UV solar radiation, wind speed, wind direction, temperature, and relative humidity. Barometric pressure and precipitation measurements are collected by the National Weather Service (NWS) site at nearby Sky Harbor Airport.

Table 4.8-3 Vehicle Emissions Laboratory PAMS Instrumentation

Parameter	Dates of Operation	Method	Duration
Meteorology	1/1/11-12/31/11	• Radar Acoustic Sounding System (RASS) • pyranometer (total solar radiation) • ultra-violet (UV solar) • wind speed/direction • temperature • relative humidity	Hourly average

4.9 NCore Monitoring Network Requirements

EPA has identified JLG Supersite as the required NCore site for the Phoenix metropolitan area. JLG Supersite has a long history of multipollutant monitoring since its establishment in 1993. Currently, several monitoring programs are supported at this site, (SLAMS, PAMS, NATTS, and CSN) as well as meteorology. The required NCore parameters are listed in Table 4.9-1. All required NCore monitors were operational by January 1, 2011. EPA approved ADEQ's NCore monitoring plan submitted in 2009, but did not grant the waiver request to substitute NOx monitoring for NOy.

Table 4.9-1 JLG Supersite NCore Instrumentation

Required Measurement	Frequency/Duration	Status
$PM_{2.5}$ FRM mass	24 hour average every 3rd day	Thermo Partisol is current instrument; $PM_{2.5}$ samples collected since 1999
$PM_{2.5}$ speciation - organic and elemental carbon, major ions, and trace metals	24 hour average; every 3rd day	MetOne SuperSASS with URG module is current instrument; STN samples collected since 1999
Continuous PM_{coarse} mass	Hourly	MetOne BAM 1020 FEM pair beginning 1/1/2011
Continuous $PM_{2.5}$ mass	Hourly	MetOne BAM 1020 FEM pair beginning 1/1/2011
O_3	Hourly	API Teledyne 400E beginning 4/1/2011
CO	Hourly	Ecotech EC 9830 beginning 1/1/2011
SO_2	Hourly	Ecotech EC 9850 beginning 1/1/2011
NO/NOy	Hourly	Ecotech EC 9843 beginning 1/1/2011
Surface meteorology	Hourly	RM Young anemometer, Rotronics temperature/relative humidity probe currently in

		operation
Pb	24 hour average; every 6th day	To be determined. Currently Pb measurements are from the NATTS PM_{10} metals sampler.

4.10 SIP Monitoring Network Requirements

ADEQ is responsible for preparation and submittal of SIPs to EPA for the non-attainment and maintenance areas in Arizona. ADEQ is also responsible for conducting ambient air monitoring for these areas with the exception of the delegated agreements with Maricopa, Pima, and Pinal counties and tribal lands. Permitted sources are also responsible for monitoring air quality, if they are the largest source of emissions for that area. Some monitoring sites are specifically named in some SIPs; other monitoring sites are not specifically named, but are representative of the air quality in that SIP area. Table 4.10-1 lists the ADEQ and source operated monitors used to determine SIP compliance.

Table 4.10-1 SIP Network Monitoring Requirements

Note: *Sites in italics are specifically required in SIP*; others meet the general SIP requirement that representative monitoring be conducted (no specific monitoring sites named in SIP).

Area and County	Pollutant	Classification	ADEQ SIP Sites
Phoenix, Maricopa	CO	Maintenance/Attainment	*JLG Supersite*
Phoenix, Maricopa	O_3 1-hr	Maintenance/Attainment	*JLG Supersite, Tonto National Monument*
Phoenix-Apache Junction, Maricopa and Pinal	O_3 8-hr	"Basic" Nonattainment	Alamo Lake, *JLG Supersite*, Queen Valley, *Tonto National Monument*
Ajo, Pima	PM_{10}	Moderate Nonattainment	*Ajo*
Bullhead City, Mohave	PM_{10}	Maintenance/Attainment	*Bullhead City (Post Office)*
Douglas, Cochise	PM_{10}	Moderate Nonattainment	Douglas Red Cross ADEQ also operates one PM_{10} site at the Agua Prieta Fire Station in Mexico.
Paul Spur, Cochise	PM_{10}	Moderate Nonattainment	*Paul Spur Chemical Lime Plant*
Hayden, Gila and Pinal	PM_{10}	Moderate Nonattainment	*Hayden Old Jail*
Miami, Gila	PM_{10}	Moderate Nonattainment	*Freeport McMoRan sites: Golf Course & Miami Ridgeline*
Nogales, Santa Cruz	PM_{10}	Moderate Nonattainment	*Nogales Post Office* ADEQ also operates one PM_{10} site at Nogales Fire Station in Mexico.
Payson, Gila	PM_{10}	Maintenance/Attainment	*Payson Well Site*
Phoenix, Maricopa, and Pinal (Apache Junction portion) Phoenix (Salt River Area)	PM_{10}	Serious Nonattainment	*JLG Supersite*
Rillito, Pima	PM_{10}	Moderate Nonattainment	*Rillito* Both ADEQ and the source, APCC, operate instruments at this site.
Yuma, Yuma	PM_{10}	Moderate Nonattainment	Yuma Supersite ADEQ also operates one PM_{10} site in San Luis Rio Colorado, Mexico.
Nogales, Santa Cruz	$PM_{2.5}$	Nonattainment	Nogales Post Office
Ajo, Pima	SO_2	Maintenance/Attainment	No network or commitment

Area and County	Pollutant	Classification	ADEQ SIP Sites
Douglas, Cochise	SO_2	Maintenance/Attainment	No network or commitment
Hayden, Gila and Pinal	SO_2	Nonattainment – Primary	*ADEQ (SO_2, MET): Hayden Old Jail* *ASARCO (5 SO_2, 3 MET [no met at Jail or Garfield]): Globe Hwy, Garfield Ave., Montgomery Ranch, Hayden Old Jail, Hayden Junction*
Miami, Gila	SO_2	Nonattainment – Primary	*ADEQ: Miami Ridgeline* *Freeport McMoRan (SO_2, MET) Jones Ranch, Miami Townsite*
Morenci, Greenlee	SO_2	Maintenance/Attainment	No network or commitment
San Manuel, Pima and Pinal	SO_2	Maintenance/Attainment	No network or commitment
Regional Haze, 12 Class I areas	Visibility Impairing pollutants (VOC, NOx, SO_2, PM_{10}, $PM_{2.5}$, $PM_{2.5}$ species)	Statewide – IMPROVE monitors	ADEQ Protocol sites: Douglas Red Cross, Organ Pipe Natl Monument, JLG Supersite, Queen Valley, Saguaro West Natl Monument, Meadview NPS / USFS sites: Chiricahua Entrance Station, Greer Water Treatment Plant, Grand Canyon - Indian Gardens, Grand Canyon - Hance Camp, Ike's Backbone, Meadview, Petrified Forest National Park, Pleasant Valley Ranger Station, Saguaro National Park-East, Sycamore Canyon, Tonto National Monument

4.11 Source Compliance Monitoring Network Requirements

Historically, ADEQ has required several of the major point sources in the state to conduct ambient monitoring for selected pollutants in and around specific facilities. Some requirements are for prevention of significant deterioration (PSD) monitoring prior to operation of the facility. Other monitoring requirements are for the duration of the permit. ADEQ activities have been limited to regular performance audits of some equipment at these sites and review of ambient data submitted according to permit requirements. Recently, ADEQ has begun to submit a portion of these data to the EPA AQS database to support SIP compliance. Sources are required to review their data and submit quality assurance documents to ADEQ with the data. Table 4.11-1 lists the monitors operated by ADEQ permitted sources. ADEQ staff are currently working with ASARCO and Freeport McMoRan staff to acquire and report SO_2 data from Miami and Hayden to the EPA AQS database.

Table 4.11-1 Source Compliance Monitoring Network

Site Name	City	Pollutant(s)	AQS Submittal
Rillito	Rillito	PM_{10}, Meteorology	No
Globe Highway	Winkelman	SO_2	Yes, begin w/ 2008 data
ASARCO – Hayden – Garfield Ave.	Hayden	SO_2	Yes, begin w/ 2008 data
ASARCO – Montgomery Ranch	Hayden	SO_2	Yes, begin w/ 2008 data
ASARCO – Hayden Junction	Hayden Junction	SO_2	No
Hayden Old Jail	Hayden	SO_2	No

Site Name	City	Pollutant(s)	AQS Submittal
Chemical Lime Plant	Nelson	Meteorology	No
Drake Cement	Sycamore Canyon	PM_{10}, $PM_{2.5}$ mass and ammonium speciation, Meteorology	No
Miami Ridgeline	Miami	PM_{10} mass and metals speciation	Yes
Miami Golf Course	Miami	PM_{10} mass and metals speciation, collocated	Yes
FMMI – Miami – Jones Ranch	Miami	SO_2	Yes, begin w/ 2008 data
FMMI – Miami – Townsite	Miami	SO_2	Yes, begin w/ 2008 data
PCC – Clarkdale NW	Clarkdale	PM_{10} mass and metals speciation, Meteorology	No
PCC – Clarkdale SE	Clarkdale	PM_{10} mass and metals speciation, Meteorology	No
Carlota Mine – Sanctuary	Globe	PM_{10}, H_2SO_4, Meteorology	No
TEP – Springerville – Coyote Hills	Springerville	NO_2, PM_{10}, SO_2, Meteorology	No
TEP – Springerville – Coal Yard	Springerville	PM_{10}	No

4.12 Class I Visibility Network

Visibility monitoring networks track impairment in specified national parks and wilderness areas. These parks and wilderness areas are called Class I Areas and were designated based on an evaluation required by Congress in the 1977 federal CAA Amendments. The evaluation which was performed by the USFS and NPS reviewed the wilderness areas of parks and national forests which were designated as wilderness before 1977, were more than 6,000 acres in size, and have visual air quality as an important resource for visitors. Of the 156 Class I Areas designated across the nation, 12 are located in Arizona.

For the Class I Area designations, EPA initiated a nationally-operated monitoring network in 1987 called the Interagency Monitoring of PROtected Visual Environments (IMPROVE) program. The purpose of the network is to characterize broad regional trends and visibility conditions using monitoring data collected in or near Class I Areas across the United States. Originally, the national

IMPROVE network was made up of approximately 30 sites at Class I areas. During 1999-2000 the number of sites increased to approximately 110. ADEQ, Pima and Pinal counties, and federal land managers at Arizona's Class I areas cooperatively operate the visibility monitoring network in Arizona. The current network is described in Table 4.12-1. In addition to the Class I IMPROVE monitors listed in Table 4.12-1, ADEQ also operates one IMPROVE monitor at the Douglas Red Cross site, and collocated monitors at the JLG Supersite. These sites serve as urban IMPROVE monitors. The Douglas Red Cross site also serves as a border region IMPROVE site. See Appendix B for a spatial representation of the IMPROVE monitoring network and Class I areas within the state of Arizona.

Table 4.12-1 2010-2011 Arizona Class I Visibility Monitoring Network

Geographic Area Represented	Monitoring Location
Background	Meadview, Organ Pipe National Monument
Chiricahua National Monument, Chiricahua Wilderness Area and Galiuro USFS Wilderness	Chiricahua Entrance Station
Grand Canyon National Park	Hance Camp and Indian Gardens
Mazatzal and Pine Mountain USFS Wilderness	Ike's Backbone
Mount Baldy	Greer Water Treatment Plant
Petrified Forest National Park	Petrified Forest
Saguaro National Park	East Unit and West Unit
Sierra Ancha USFS Wilderness	Pleasant Valley Ranger Station
Superstition USFS Wilderness	Tonto National Monument, Queen Valley
Sycamore Canyon USFS Wilderness	Sycamore Canyon (Camp Raymond)

ADEQ's 1996 monitoring plan for the Arizona Class I areas proposed adding optical and meteorological monitoring equipment to existing IMPROVE sites to supplement data collected by the IMPROVE aerosol monitors with continuous measurements to better characterize the air quality in these areas. ADEQ's 2002 Class I Area Visibility monitoring plan proposed to established protocol sites (completely supported by ADEQ following IMPROVE monitoring requirements) to supplement the IMPROVE network coverage. Part of the motivation for installing integrating nephelometers at IMPROVE sites was a desire to use short term (five minutes) visibility estimates to model the visual experience of a visitor to a Class I area. A second motivation for installing nephelometers at IMPROVE sites was to provide input to mathematical algorithms that create values that can be compared with the IMPROVE measurements to test the performance of the IMPROVE algorithm. Both the original and the revised IMPROVE algorithms tend to over-estimate the lowest extinction values typical of the Arizona IMPROVE sites.

Due to budget constraints, ADEQ shut down the Class I nephelometer network in 2010. Over a decade of data were collected at several of these nephelometer sites. In early 2011, a draft summary report was written which summarizes the nephelometer data that were collected since 1997. The report provides comparisons of calculated visibility impairment between the IMPROVE aerosol monitors and collocated nephelometers. Summaries and trends in visibility data are also presented within the report, as well as meteorological data summaries in the form of wind roses. This report is meant to serve as a final data summary for the Class I Nephelometer network. Information from this report may be utilized in the future if further modifications are needed to the Arizona Class I visibility network.

4.13 Urban Haze Monitoring Network

Historically, ADEQ monitored the Phoenix and Tucson metropolitan areas with a network of instruments to characterize and quantify the extent of urban haze. There are no established federal or state standards for acceptable levels of urban haze. ADEQ began studying the nature and causes of urban hazes by conducting studies during the winter of 1989-90 in Phoenix and during the winter of 1992-93 in Tucson. These studies recommended long-term, year-round monitoring of visibility. In 1993, ADEQ began deploying visibility monitoring equipment in Phoenix and Tucson. These visibility monitoring data are needed to provide policymakers and the public with information, track short and long-term trends, assess source contributions to urban haze, and better evaluate the effectiveness of air pollution control strategies. Equipment currently used to evaluate urban visibility includes transmissometers, nephelometers, particulate monitors, and digital camera systems.

The Phoenix urban haze network consists of a transmissometer for measuring light extinction along a fixed path length of four and a half kilometers, three nephelometers for measuring light scattering, five digital camera systems to record visual characteristics of the urban area, and particulate filters for quantifying and characterizing particulate matter. Due to budget constraints, the Tucson urban haze network was shut down in September, 2010. Approximately a decade of urban haze data were collected in the Tucson area. In early 2011, a draft summary report was written which summarizes the nephelometer and transmissometer data that were collected since 1997. The report provides summaries and trends in urban visibility data, as well as meteorological data summaries in the form of wind roses. This report is meant to serve as a final data summary for the Tucson Urban Haze network. Information from this report may be utilized in the future if further modifications are needed to the Urban Haze Network. The urban haze sites (and their status) are described in Table 4.13-1.

Table 4.13-1 Urban Haze Monitoring Network

Site Name	Parameter(s) Measured
Phoenix Network - Operational	
ADEQ Building	High Resolution Digital Camera
Banner Mesa Medical Center	High Resolution Digital Camera
Dysart	Light Scattering (Bscat) Nephelometer
Estrella	Light Scattering (Bscat) Nephelometer
Estrella Mountain Community College	2 High Resolution Digital Cameras
JLG Supersite	IMPROVE
North Mountain Summit	High Resolution Digital Cameras
Phoenix Transmissometer (Phoenix Baptist Hospital to Holiday Inn Hotel)	Transmissometer (Bext)
Vehicle Emissions Laboratory	Light Scattering (Bscat) Nephelometer
Tucson Network – Closed September, 2010	
22nd St./Craycroft	Light Scattering (Bscat) Nephelometer
Children's Park	Light Scattering (Bscat) Nephelometer
Tucson Transmissometer (U of A Clinical Science Building to Pima County Health & Welfare Building)	Transmissometer (Bext)

4.14 Meteorology Monitoring Network

ADEQ operates meteorological equipment at selected sites throughout its network (Table 4.14-1). Some sites were originally established because other meteorology networks (NWS, AZMet, etc.) were not located near ADEQ's ambient air quality sites. As recommended in ADEQ's Five-Year Network Assessment, ADEQ has begun to expand the meteorology monitoring network. ADEQ has recently added meteorological instrumentation at the following sites:

- Hayden Old Jail
- Queen Valley
- Globe Highway
- Miami Golf Course

As resources and funding permits, ADEQ may add additional meteorological equipment at existing SLAMS sites. At this time, ADEQ plans to only submit meteorological data that are required by 40 CFR Part 58.16 to EPA's AQS database. If future resources allow additional meteorological data submittals to the AQS database, ADEQ may do so on a voluntary basis. A spatial representation of ADEQ's meteorological monitoring network can be found in Appendix B.

Table 4.14-1 Meteorology Monitoring Networks

Site	Temp.	Temp. Lapse Rate System	Relative Humidity	Wind	Total Horizontal Solar Radiation	Ultraviolet Solar Radiation	Wind Profiler	Report to AQS	Comments
Ajo				X				No	
Globe Highway	X		X	X				No	
Hayden Old Jail	X		X	X				No

5.0 MONITORING PLAN QUALITY ASSURANCE

EPA specifies the quality assurance requirements for SLAMS, SPMs, and PSD air monitoring programs in 40 CFR 58 Appendix A. Data quality objectives, measurement quality objective and indicators, quality control (QC) checks for the monitors, calculations for data quality assessments, and data reporting requirements are part of the Air Assessment Section's (AAS) quality management system.

5.1 The Quality System

All environmental data operations (EDOs) contain some level of uncertainty, or error, associated with them. The total measure of uncertainty is the sum of measurement error, which occurs in the data collection process, and population uncertainty, which relates to the representativeness of samples. ADEQ follows EPA's quality system approach which uses data quality objectives (DQOs) which are developed prior to sampling in a program's or project's planning phase. DQOs specify the amount of tolerable error that is not to be exceeded in order to make decisions using the air assessment data collected for each program's or project's specific purpose. To help meet DQOs, measurement quality objectives (MQOs), or performance constraints applied to air monitoring instruments, are used to keep measurement uncertainty within acceptable limits. Population uncertainty is controlled by proper site selection.

ADEQ serves as the Primary Quality Assurance Organization (PQAO) for the air monitoring stations it owns and operates. Being a PQAO streamlines Quality Assurance (QA) efforts by allowing meaningful measurement assessments to take place in a shorter period of time, by allowing expensive assessments such as collocated precision sampling and EPA-required performance evaluation (PE) audits such as the Performance Evaluation Program (PEP) and the National Performance Audit Program (NPAP) to take place at less sites and for results to be aggregated at higher levels that are representative of additional ADEQ sites.

As a PQAO, ADEQ uses precision and bias data from air monitoring instruments to assess how well we are achieving our established DQOs. Precision is defined as the measure of mutual agreement among individual measurements of the same property usually under prescribed similar conditions, and it is the random component of error. Precision data are generated from collocated sites and QC checks performed by the Air Monitoring Unit (AMU). Bias is the systematic or persistent distortion of a measurement process which causes error in one direction. It is determined by estimating the positive and negative deviation from the true value as a percentage of the true value. Bias data are generated from EPA and in-house PE audits.

The measurement uncertainty among all ADEQ stations monitoring for the same pollutant is expected to be reasonably homogeneous, as a result of common factors existing between those stations. Common factors typically include:

- stations being operated by a common team of field operators and according to a common set of field procedures (standard operating procedure (SOP),
- common calibration facilities and standards,
- use of a common quality assurance project plan (QAPP),
- oversight by a common quality assurance organization, and
- support by a common management, laboratory, or headquarters.

5.1.1 ADEQ Quality Assurance Staff

The QA Team is housed in the Data Management & Quality Assurance (DM&QA) Unit and is currently composed of two full-time employees specifically dedicated to QA/QC activities. The QA/QC Lead is a member of ADEQ's agency level QA team which is chaired by the agency's QA/QC and Laboratory Services Manager. The QA/QC Lead participates in technical assistance document (TAD) development with the EPA Office of Air Quality Planning and Standards (OAQPS) when possible. Information concerning changes to TADs is communicated to the QA Auditor and AMU staff so that AAS is able to comment on pertinent QA changes that affect air monitoring quality, logistics, and resources. The QA Auditor manages the PE audit program. In addition, the QA Auditor frequently interacts with air monitoring representatives from the tribes and industrial sources for public outreach or compliance purposes.

The QA Team provides oversight and guidance on air monitoring activities to help ensure EPA's QA requirements and/or best work practices are met. The QA Team primarily interacts with staff from the AMU and Air Filter Laboratory (AFL) both of which are within the AAS.

The QA Team has numerous responsibilities that include, but are not necessarily limited to:

- coordinating the preparation of quality documents such as Quality Assurance Program Plans (QAPrP) which are required by EPA Region 9 and/or Quality Assurance Project Plans (QAPjP) and SOPs as required by EPA OAQPS for operating air monitoring equipment, sample handling, and sample processing,
- conducting Technical Systems Audits (TSAs) of ADEQ air monitoring programs and laboratory services,
- monitoring third-party laboratory performance on TSAs conducted by EPA,
- conducting PE audits on ADEQ, source, and Pinal County Air Quality Control District (PCAQCD) monitors, and
- reviewing documents such as chain-of-custody forms, data forms, and instrument performance forms that relate to DQOs.

For detailed information on the QA Team's activities, see the Annual Audit Report.

5.1.2 ADEQ Quality Documents

ADEQ has an agency-level Quality Management Plan (QMP) that is managed by the QA/QC Manager who reports to the General Services Section in the Administrative Services Division. In 2010, the QA/QC Laboratory Services Manager submitted an updated QMP to EPA Region 9. This version was approved by the Region 9 Quality Assurance Administrator in November 2010. The QMP describes the quality management processes ADEQ uses to maintain a quality management system that supports programs involving environmental data or technology. The QMP is an "Umbrella" document which details in broad terms the strategies used to carry out QA/QC in environmental data collection activities.

Per Region 9 guidance, AAS submitted a QAPrP to EPA Region 9 in November 2001, which was never approved. This document provided a broad overview of all air monitoring programs AAS operates. This document is being replaced by individual QAPrPs which provide more detail for each major air monitoring program. QAPjPs are developed for environmental data operations of limited scope and duration, such as special studies, which have known beginning and anticipated end dates. These projects may involve single or multi-pollutant monitoring, and the QAPjPs may refer to the appropriate QAPrP for the pollutant to reduce duplication of effort. In practice, a QAPrP and a QAPjP are commonly referred to as a Quality Assurance Program/Project Plan (QAPP).

In early 2010, the QA Team updated a schedule for managing new and existing QAPPs. The team's goal is to complete two QAPPs per year in addition to accomplishing other QA tasks. In early 2011, it was determined that QAPPs for criteria pollutants need to be prioritized. The QAPP schedule was revised to reflect the highest priority QAPPs. In 2010, the QA/QC Lead along with staff from AMU began revising the *National Air Toxics Trends Stations, Air Toxics Monitoring Program, & Photochemical Assessment Monitoring Stations QAPP* which was approved by EPA Region 9 in February 2008. Completion of this QAPP was delayed due to other work priorities. In 2010, the QA Team began coordinating the development of a new QAPP for the new Pb monitoring program. This QAPP is nearing completion and expected to be submitted to EPA Region 9 for approval in mid-2011. The QA Auditor audits the new Pb samplers and ADEQ participates in EPA's PEP audit program for these samplers.

Based on communication with EPA, it is not necessary to develop a specific QAPP for NCore. The instruments used in the NCore program will be addressed in several program specific QAPPs that include, but may not be limited to: the $PM_{2.5,}$ PM_{10}, Gaseous Pollutants, and Meteorological QAPPs. The QA Auditor will manage PE audits on these instruments.

AAS follows the EPA's QAPP for the $PM_{2.5}$ STN monitoring program. In late 2009, a new URG 3000 sampler was added for the collection of elemental and organic carbon. The QA Auditor will conduct PE audits on the SuperSASS and URG 3000 four times per year (quarterly) per instrument. An SOP for the URG 3000 from EPA is currently in-use.

SOPs for ambient air quality monitors are included in QAPPs as well as at monitoring sites for technicians and operators. AAS SOPs are being revised to follow EPA's format provided in the *Guidance for Preparing Standard Operating Procedures (SOPs) EPA QA/G-6*. The QA/QC Lead began drafting a new in-house guidance procedure for SOP management and this document is still in development. The goal is to ensure each SOP contains all pertinent procedures from each Unit within

AAS so that all procedures are transparent for staff. This change is expected to improve the usability of each SOP while streamlining review efforts.

5.2 Measurement Quality Checks – Precision and Bias Measurements

AMU QC checks and QA PE audits generate data used to assess the quality of the ambient air quality data collected by AAS. The QC checks are used to assess precision, or imprecision actually, introduced into air quality data by the monitoring system. The PE audits generate data used to assess the amount of bias introduced into air quality data by the monitor. For particulate matter monitors, collocated sampling generates precision data as well. The information gleaned from precision and bias data is important for data certification and user purposes. This QA information is provided via the AMP 255 report which is generated from the EPA's AQS database. The AMP 255 report is included in Appendix G of this plan to demonstrate QA completeness requirements as required in 40 CFR Part 58.10.

The precision and bias data are reviewed for QA purposes by AMU and DM&QA staff to determine the quality of the ambient air data collected. Following reviews, the data are uploaded to the AQS database per 40 CFR 58 requirements for criteria pollutants. To date, the national air monitoring programs not currently accepting/requiring this precision and bias data include the NATTS and PAMS programs.

5.2.1 Particulate Monitors – PM_{10}

ADEQ's current network operates both filter-based and continuous monitors for measuring PM_{10}. Currently, Partisol samplers are used for filter-based measurement and both TEOMs and BAMs are used for continuous measurements. Flow rate verifications are performed once every four weeks and instrument calibrations are performed at minimum once per year or more frequently if needed by AMU staff. The QA Auditor performs PE audits on these samplers once every six months.

Section 3.3.1 of 40 CFR Part 58 Appendix A indicates that 15 percent of the filter-based PM_{10} sites in a network must be collocated. The collocated monitors must be within four meters of each other and at least one meter apart for flow rates less than 200 liters/min. ADEQ has seven sites and according to the rule one collocated site is required. Currently ADEQ runs two collocated filter-based samplers, at Payson Well Site and Paul Spur Chemical Lime Plant, which exceeds this requirement. All concentrations from the collocated samplers are reported to the AQS with parameter occurrence code (POC) 2. Collocated samples are collected every sixth day for precision measurements.

5.2.2 Particulate Monitors – $PM_{2.5}$

ADEQ's current network operates both filter-based and continuous monitors for measuring $PM_{2.5}$. Currently, Partisol samplers are used for filter-based measurements and TEOMs, BAMs and nephelometers are used for continuous measurements. Flow rate verifications are performed every four weeks and calibrations are performed annually or more frequently if needed by AMU. The QA Auditor performs PE audits on these monitors once every six months.

For the $PM_{2.5}$ network, each filter-based sampling method must include collocated sampling at 15 percent of the monitoring sites operated by the reporting agency. If the area has less than four

monitoring sites at least one must have a precision measurement. ADEQ currently operates six $PM_{2.5}$ sites which results in one collocated site being required. This requirement is met with the collocation of Partisols at the Nogales Post Office site. Previously, collocated $PM_{2.5}$ sampling also occurred at the JLG Supersite; however, with the replacement of the Partisol 2025 instruments with a Partisol 2000 instrument, collocation will no longer be required at this site. Section 3.2.5.6 of 40 CFR Part 58 Appendix A requires that the collocated monitors must be within four meters of each other and at least one meter apart for flow rates less than 200 liters/min. Collocated samples are collected every sixth day to ensure an adequate number of precision measurements. All concentrations from the collocated monitors are reported as POC 2. PEP audits are conducted on $PM_{2.5}$ filter-based samplers by the EPA. The PEP audit results are also used for measuring bias and are reported to AQS by the EPA. The ADEQ network has more than five filter-based sites, which requires eight PEP audits distributed evenly over four quarters. According to this schedule, all samplers will receive a PEP audit within a six year period.

ADEQ operates two air samplers, the SuperSASS and the URG 3000, for the $PM_{2.5}$ STN as part of the CSN. Speciation filter samples are collected every third day. There is no collocation requirement for these samplers, but data generated from these samplers complement the data generated from the collocated IMPROVE samplers at JLG Supersite. Flow rate verifications are performed every four weeks and calibrations are performed annually or more frequently if needed. The QA Auditor audits each sampler quarterly. Beginning with 2010, all precision and bias measurements are reported to the AQS.

5.2.3 Gas Monitors – SO_2, O_3, CO, NO_2

One-point precision checks, along with zero and span checks are conducted biweekly and multipoint calibrations are performed quarterly by AMU for all gas monitors. Multi-point PE audits are performed annually by QA. Both measurements are reported to the AQS. NPAP audits are conducted by EPA annually for bias measurements. NPAP results are reported to AQS by the EPA. Beginning in July 2010, the frequency of these audits increased and are now conducted on a semi-annual basis.

All shelters for the gas monitors contain temperature probes. The shelter temperature is checked daily via the data collection system (DCS) to verify proper operating conditions for the monitors. Shelter temperatures are required to be between 20º and 30º C. Shelter temperature probes are audited once every six months by QA.

5.2.4 Air Toxics Monitors

ADEQ's JLG Supersite in Phoenix is a designated air monitoring station for the NATTS program. AMU conducts verifications and calibrations on the samplers used to collect PM_{10} metals, Polycyclic Aromatic hydrocarbons (PAHs), and hexavalent chrome. Calibrations occur once every six months and verifications occur on a monthly or quarterly basis. QA conducts PE audits on the same samplers once every six months. The VOC sampler is currently calibrated annually by ATEC and certified annually by ERG. The carbonyl sampler is currently calibrated annually by ATEC and certified annually by either ATEC or ERG.

5.2.5 Meteorological Equipment

Meteorological equipment is audited by the QA Team annually. The meteorological equipment at the designated NCore site will be audited once every six months.

5.3 Calculations and Reporting

ADEQ submits the required AQS precision and bias report (AMP 255) to Region 9 in the annual Certification Letter per certification guidelines and CFR requirements. As stated above, all collocated particulate mater (PM) measurements are submitted quarterly to AQS as POC 2. AQS then calculates the precision statistics. The PM flow verification data and gaseous biweekly precision check data are submitted quarterly as precision records. Audit data for both PM monitors and gas monitors are also submitted quarterly.

5.4 ADEQ AQD Audit Responsibilities

The QA Team conducts PE audits of AAS monitors, PCAQCD monitors, and some source monitors whose measurements are used for determining NAAQS compliance.

5.4.1 Internal Technical System Audits

In 2010, the QA Team provided support and assistance to AMU in addressing the findings and recommendations from the Southern Regional Office (SRO) and Northern Regional Office (NRO) staff and operator TSAs. To date, the QA Auditor conducts TSAs on 12 IMPROVE samplers at 11 sites operating throughout the state annually. These TSAs are limited to evaluating site conditions and instrument performance with occasional operator interaction. Seven of the 12 samplers are “protocol” samplers meaning they are owned and operated by ADEQ. The other five samplers are owned and operated by EPA. Currently, AAS does not receive funds for the TSAs performed on EPA IMPROVE samplers. This schedule was reviewed in 2010 and there have been no changes to the audit services provided for IMPROVE program at this time.

In late 2009, the QA/QC Lead initiated the startup of an Air Toxics Team whose members include technicians from AMU, the QA Auditor, and the data management lead. The purpose of this team was to prepare for a TSA and to update the NATTS / ATMP / PAMS QAPP and instrument SOPs. The team meets on a regular basis to address issues related to air toxics sampling.

In mid-2010, the QA/QC Lead initiated the startup of a Pb Monitoring Team whose members include staff from Special Projects, AMU, the AFL, DM&QA as well as the manager of AAS. The purpose of the team was to ensure all pertinent staff were able to work together to develop program-related SOPs and the program QAPP.

5.4.2 ADEQ Rankings in EPA Program Reports

In early 2009, the QA Team reviewed the report of EPA's PEP audit program. DM&QA staff began investigating what changes may have occurred within the $PM_{2.5}$ network to cause a shift in program

performance over the last nine years. Based on EPA's Three-Year Quality Assurance Reports for the SLAMS $PM_{2.5}$ Ambient Air Monitoring Program covering years 1999 through 2007, ADEQ's $PM_{2.5}$ network fell from a high rating to a low rating for bias results. Three areas are under review to identify and eliminate source(s) of error occurring in the network in order to reverse this trend. The program elements under review include: the sampler and impactor combination, the AFL gravimetric weighing process, operator training, and the PEP audit and data assessment process. To date, AFL has participated in three round-robins in the Gravimetric Inter-Laboratory Comparison Study conducted by the EPA's National Air and Radiation Environmental Laboratory (NAREL) and scored well on each. AMU is currently working on updating their training procedures for those responsible for operating filter-based PM_{10} and $PM_{2.5}$ instrumentation. Further network evaluation will continue in 2011.

5.4.3 Technical Assistance Document Development

In 2010, the process of verifying flow standards used by AMU and QA underwent some review. This review was initiated by the QA/QC Lead's involvement as a reviewer on a new flow standard TAD by OAQPS. Currently, most AMU and QA flow standards are certified, or verified, annually. The calibrators used by QA for criteria pollutant gases and the O_3 standard are checked twice per year. All gas and flow rate standards used by AMU and QA Team are traceable to the National Institute of Standards and Technology (NIST) flow standard.

5.5 EPA Audit Responsibilities

EPA Headquarters and Region 9 each have responsibilities for auditing ADEQ's ambient air monitoring program.

5.5.2 PEP and NPAP Audits

In 2011, ADEQ will continue to participate in the EPA NPAP and the $PM_{2.5}$ PEP audits. ADEQ consented to have EPA use a portion of ADEQ's grant funds to pay for these audit programs through IFC Consultants. NPAP and PEP audits are expected to occur in 2011 as in previous years. Also, PEP audits for Pb will begin in 2011 and the cost for this will be covered by EPA this year.

5.5.2 Technical System Audits

In September 2009, EPA Region 9 conducted a comprehensive TSA on ADEQ's air monitoring program. Findings and recommendations from the TSA were reviewed by AAS staff and an official Corrective Action Plan was submitted to EPA Region 9 in February, 2011. ADEQ will continue to work with EPA Region 9 on the findings from the 2009 EPA TSA. EPA Region 9 is required to conduct TSAs on the ADEQ monitoring program every three years.

In April 2010, ADEQ underwent a TSA of the NATTS program. The TSA was conducted by RTI, a contractor for EPA. Findings and recommendations from the TSA are being addressed.

Appendix A – Definitions and Abbreviations

AAAD	Air Assessment Ambient Database
AAS	Air Assessment Section
AADT	Annual Average Daily Traffic
ADEQ	Arizona Department of Environmental Quality
AFL	Air Filter Lab
AMU	Air Monitoring Unit
Auto GC/MS	Automated Gas Chromatograph Mass Spectrometer
AQS	Air Quality System (EPA database)
BAM	Beta Attenuation Monitor
Bext	Total Light Extinction
Bscat	Light Scattering
CAA	Clean Air Act
CBSA	Combined Statistical Area
CFR	Code of Federal Regulations
CO	Carbon Monoxide
CSN	Chemical Speciation Network
DCS	Data Collection System
DM&QA	Data Management and Quality Assurance Unit
DQO	Data Quality Objective
E-BAM	Environmental Proof - Beta Attenuation Monitor
EDO	Environmental Data Operation
EPA	Environmental Protection Agency
FEM	Federal Equivalent Method
FRM	Federal Reference Method
HAP	Hazardous Air Pollutants
IMPROVE	Interagency Monitoring of PROtected Visual Environments
MCAQD	Maricopa County Air Quality Department
MET	Meteorological Measurements (wind, temperature, relative humidity)
MQO	Measurement Quality Objective
MSA	Metropolitan Statistical Area
$\mu g/m^3$	Micrograms per Cubic Meter
NAAQS	National Ambient Air Quality Standard

Appendix D – Site Information Data Tables

Note: Some measurements are rounded and/or estimations

Each monitoring site where ADEQ operates ambient air instruments is described in this section. The parameters that are currently measured at the sites are listed with the start date for the parameter and not the monitor. See Appendix C for detailed information on specific monitors grouped by monitoring networks.

ADEQ Building
Site Purpose: monitor urban haze. The high-resolution digital camera sits on the northeast corner of the building and points toward Camelback Mountain, which lies 13.4 kilometers to the northeast. The pictures of the local view are updated every 15 minutes and can be viewed on the internet at http://www.phoenixvis.net/came1/index.html. The area between the site and Camelback Mountain is primarily residential with some commercial areas.

Site Information

Ajo
Site Purpose: NAAQS compliance network. The site is located at the Pima County Maintenance Yard, with the wind system mounted to the north of the instruments. The closest structure to the site is an east-west oriented ADOT office/trailer to the south. To the east lies the stabilized tailings pile associated with the Ajo mining operation which closed in 1985.

Site Information			
AQS ID	04-019-0001	ADEQ ID	16316

Alamo Lake
Site Purpose: NAAQS compliance network and AQI forecasting. The site was established to replace the Hillside site and is located in Alamo Lake State Park, which is approximately 49,000 meters north of Wenden, AZ. The surrounding area consists of mostly desert, with a lake about 1,000 meters to the northeast. A small water pump/storage tank (1,000 gallon) lies 7 meters to the east of the instruments.

Site Information			
AQS ID	04-012-8000	ADEQ ID	34961
Address	Alamo Lake State Park		
County	La Paz	Groundcover	Gravel
CBSA	None	Latitude	34.2439
Surrounding Area	Desert	Longitude	-113.5586
Distance to road	30 m – E	Elevation	403 m

Bullhead City
Site Purpose: NAAQS compliance network. The site is located on the rooftop of the U.S. Post Office Building, northeast of SR 95 and 7th Street. The surrounding area is commercial and residential to the west and south. The Colorado River lies to the west less than 400 meters. To the northeast/east, about 575 meters, is the Bullhead City Airport.

Site Information			
AQS ID	04-015-1003	ADEQ ID	16365
Address	990 Highway 95 Bullhead City, AZ 86429		
County	Mohave	Groundcover	Rooftop

Douglas Red Cross
Site Purpose: NAAQS compliance network. The site is located at the Red Cross building on the south side of 15th Street. The surrounding area is a mix of residential and commercial land use. The site is about 1,685 meters from the Arizona/Mexico border. Also, there is a second AQS ID 04-003-9000 for IMPROVE data.

Site Information			
AQS ID	04-003-1005	ADEQ ID	16503
Address	1445 E. 15th St. Douglas, AZ 85607

Rillito
Site Purpose: NAAQS compliance network and a source permit requirement. In February of 2007 the site was moved from the Water St. location 91 meters southwest to its current location at a city water pumping station. The surrounding area is primarily residential and industrial, with I-10 approximately 250 meters to the east. Arizona Portland Cement Company also maintains PM_{10} monitors at the site.

Site Information			
AQS ID	04-019-0020	ADEQ ID	16499
Address	8840 W. Robinson St. Rillito, AZ 85653		
County	Pima	Groundcover	Dirt

Yuma Supersite
Site Purpose: NAAQS compliance network and AQI forecasting. The site was reopened in 2008 to take the place of the Yuma Game & Fish site and is used to indicate ozone transport into the Phoenix metropolitan area from the Arizona/Mexico border. The particulate and the meteorological monitors have also been moved to this site to create one Yuma monitoring site. The site is located on the southeast corner of the Rural Metro Administration Facility property. The surrounding area is commercial and industrial, with a dirt lot adjacent to the south and I-8 1 kilometer to the northeast.

Site Information			
AQS ID	04-027-8011	ADEQ ID	113219
Address	2323 S. Arizona Ave. Yuma, AZ 85364

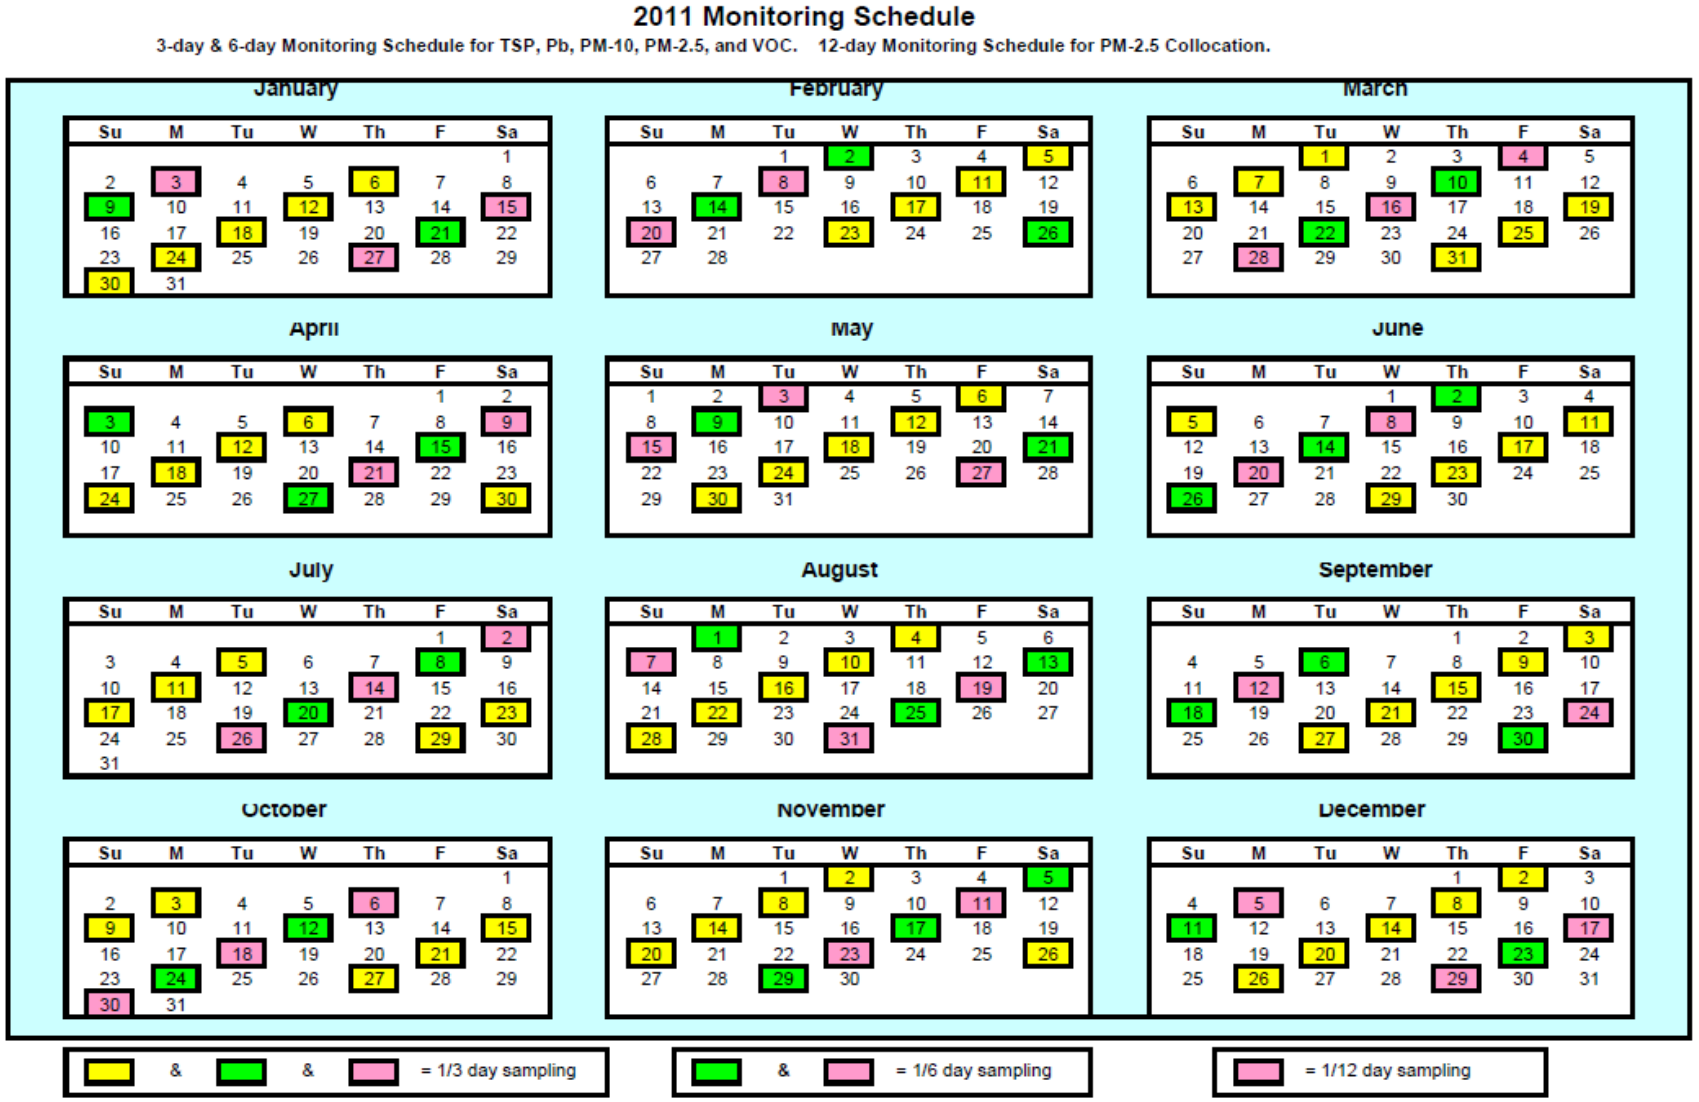
Appendix E – 2011 EPA Monitoring Schedule

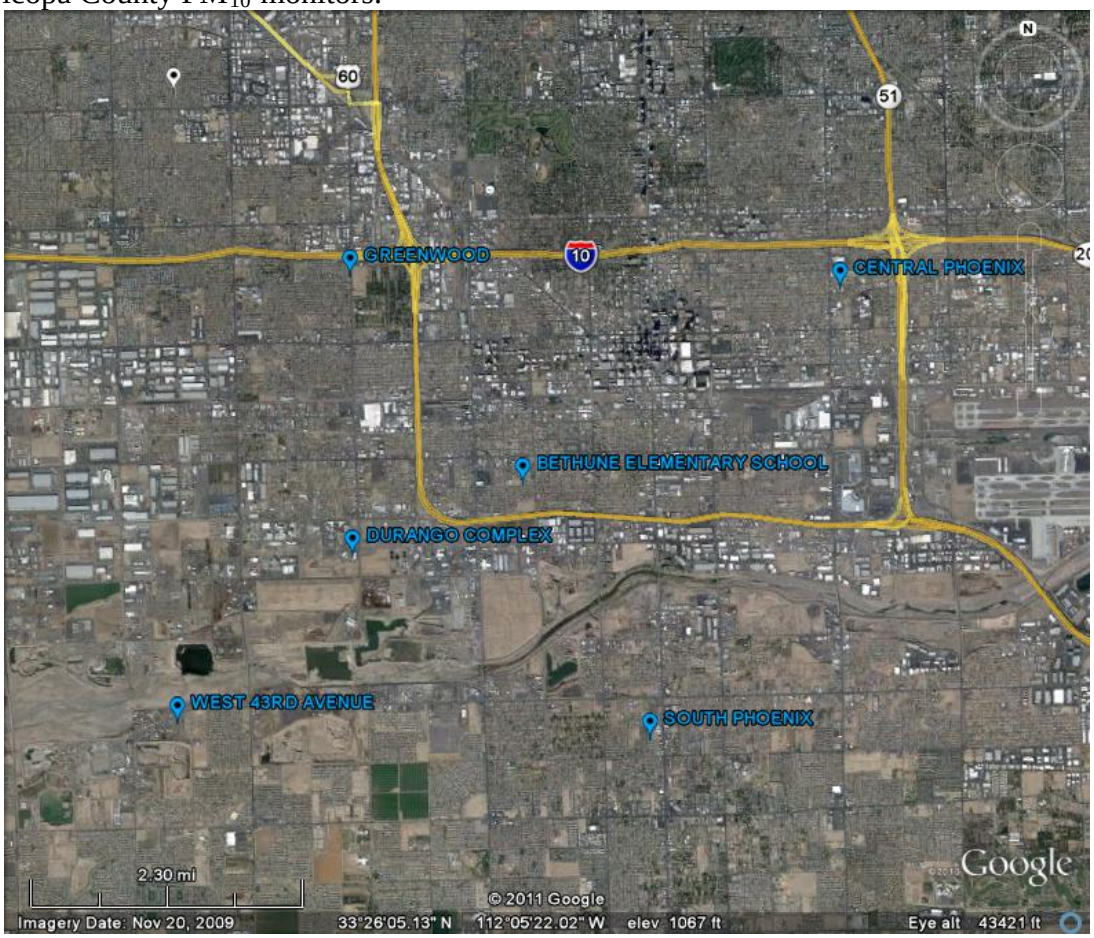


Appendix F – Bethune Elementary School Site Removal Rationale

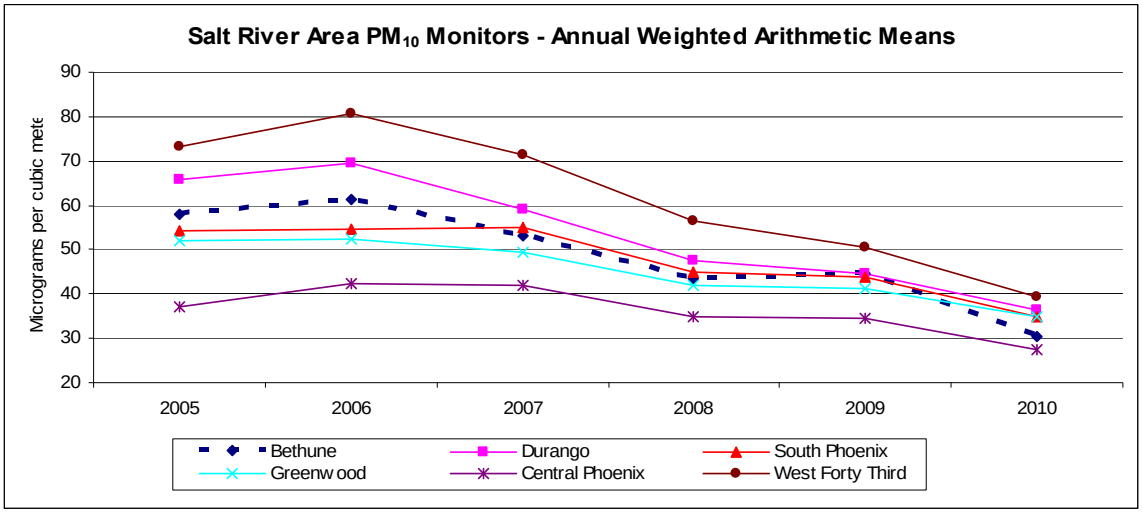
This document explains the Arizona Department of Environmental Quality's rationale for removing the PM_{10} special purpose monitor (SPM) from the Bethune Elementary School at the end of the second quarter 2011. This rationale includes the following issues:

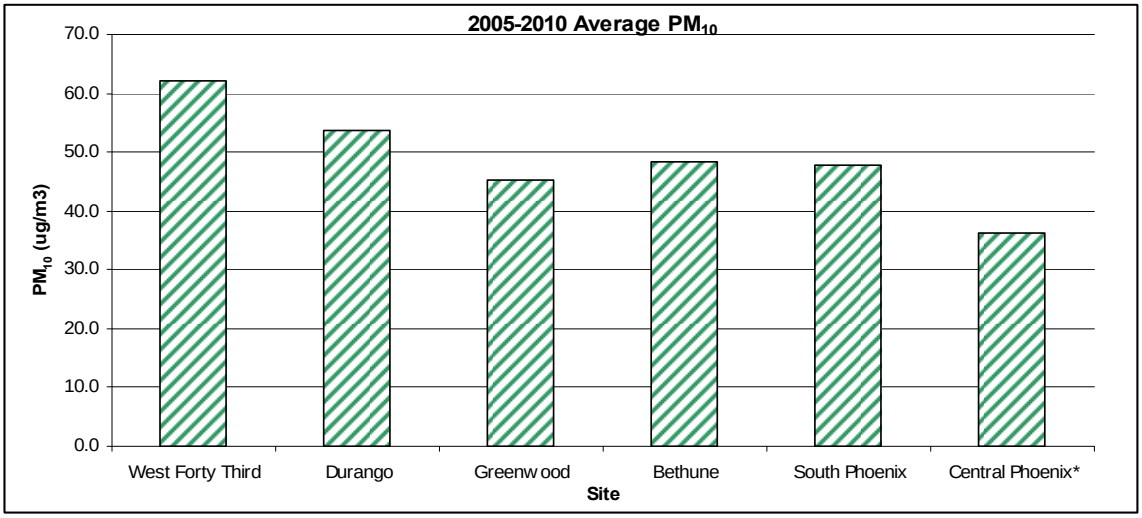
1. Current and ongoing budgetary limitations require the redirection of non-essential (non-regulatory) resources. ADEQ no longer has the resources to conduct monitoring that is not required by regulation. The Bethune Elementary School monitor is an SPM and not required by the CFR.
2. The Maricopa County Air Quality Department's PM_{10} network provides sufficient coverage for attainment / nonattainment determinations in Maricopa County.
3. The West 43rd, Durango, South Phoenix, Greenwood, and Central Phoenix sites provide data that are representative of the Bethune Elementary School monitor.

The first two issues are straightforward and likely well understood by Region 9. The third issue is examined in more detail below. It is evident from the figure, table, and graphs below that the Bethune Elementary School monitor, and the data from this monitor, is closely bracketed by the five Maricopa County monitors. The Bethune Elementary School PM_{10} monitor is located within 3.5 miles of five other Maricopa County PM_{10} monitors.



Site	Annual Weighted Arithmetic Mean (µg/m^3)						2005-2010 Average
	2005	2006	2007	2008	2009	2010	
West Forty Third	73.4	80.8	71.3	56.5	50.6	39.4	62.0
Durango	65.9	69.7	59	47.7	44.4	36.2	53.8
Greenwood	51.9	52.4	49.5	42.1	41.2	34.9	45.3
Bethune	58	61.2	53	43.6	44.6	30.3	48.5
South Phoenix	54.1	54.5	55	44.8	44	35	47.9
Central Phoenix	37.3	42.3	41.9	34.8	34.4	27.4	36.4





Appendix G – Data Quality Indicator Report

This Appendix contains the required Quality Assurance documentation for all SLAMS monitors in ADEQs SLAMS network. The Data Quality Indicator Report is for the calendar year of 2010.

Notes About this Report

For specific information about the fields appearing within this report, please refer to the README.txt file that is included with the WORKFILE output for this report.

M

If you see this value for a column in a summarized row, this means that more than one occurence exist in the summary. For example, if you have a PQAO summary that spans multiple States, you would see this value in the States column.

Code Listing

The following codes may be seen in the "MT" column throughout this report. Please be advised that not all of the codes may appear in the report. They are provided for completeness.
